2019
SINGLE-FAMILY BUILDING ASSESSMENT
RESIDENTIAL BUILDING STOCK ASSESSMENT
Letter from NYSERDA
Senior Vice President

NYSERDA is pleased to present this Residential Building Stock Assessment, an update to the Residential Statewide Baseline Study released in July 2015. This update provides insight into single-family home structures across the State, including energy use and energy efficiency. Detailed data collected and summarized through this study includes home size, systems used for heating and cooling, and other home features such as lighting, electronics, and appliances.

Under Governor Andrew M. Cuomo's leadership, New York State has enacted the historic Climate Leadership and Community Protection Act (CLCPA), which promotes energy efficiency and includes nation-leading targets to reduce greenhouse gas emissions and put New York on a path toward achieving a carbon-free electricity system by 2040.

The snapshot created by this report puts the CLCPA into perspective by helping us recognize the current status of our single-family housing stock and the progress we've made in energy efficiency as well as how far we still need to go to achieve a carbon-neutral building stock by mid-century.

This report is designed to provide you, as an industry stakeholder, with data to inform your work. The information here is also available online on OpenNY at data.ny.gov and at nysatda.ny.gov.

I encourage you to continue to help us move toward New York State's clean energy future and take advantage of these tremendous resources.

Sincerely,

Janet Joseph
Senior Vice President, NYSERDA
NOTICE

This report was prepared by Cadmus in the course of performing work contracted for and sponsored by the New York State Energy Research and Development Authority (hereafter “NYSERDA”). The opinions expressed in this report do not necessarily reflect those of NYSERDA or the State of New York, and reference to any specific product, service, process, or method does not constitute an implied or expressed recommendation or endorsement of it. Further, NYSERDA, the State of New York, and the contractor make no warranties or representations, expressed or implied, as to the fitness for particular purpose or merchantability of any product, apparatus, or service, or the usefulness, completeness, or accuracy of any processes, methods, or other information contained, described, disclosed, or referred to in this report. NYSERDA, the State of New York, and the contractor make no representations, expressed or implied, as to the fitness for particular purpose or merchantability of any product, apparatus, or service, or the usefulness, completeness, or accuracy of any processes, methods, or other information contained, described, disclosed, or referred to in this report. NYSERDA makes every effort to provide accurate information about copyright owners and related matters in the reports we publish. Contractors are responsible for determining and satisfying copyright or other use restrictions regarding the content of reports that they write, in compliance with NYSERDA’s policies and federal law. If you are the copyright owner and believe a NYSERDA report has not properly attributed your work to you or has used it without permission, please email print@nyserda.ny.gov

Information contained in this document, such as web page addresses, are current at the time of publication.

ACKNOWLEDGEMENTS

The Cadmus project team would like to express sincere gratitude and appreciation for NYSERDA Senior Project Manager Carley Murray, whose thoughtful and incisive leadership provided essential support and guidance throughout the project.

We also thank members of the broader NYSERDA project team, including Jennifer Meissner, Victoria Engel-Fowles, and Patricia Gonzales, all of whom provided leadership and guidance critical to the success of the project.

Performance Systems Development (PSD) played an invaluable role in facilitating the rapid ramp up and deployment of field staff necessary for successful completion of the project. We would especially like to thank Kathy Greely for her leadership of the PSD project team, Ethan MacCormick for his technology wizardry, and Dave Abrey for his seasoned field leadership.

Cadmus would also like to thank the project team at Honeywell, which provided crucial recruiting and field staff capabilities, including project team lead Mike Lyons and field manager Nathan Yehle.

Finally, Cadmus expresses whole-hearted appreciation for the field staff who completed the 456 site visits during a two-month period. This report would not be possible without their contributions.

Appendix A: Data Tables from Surveys and Site Visits ................. A-1

Appendix B: Detailed Methodology ............................................ B-1

Appendix C: Survey Instrument .................................................. C-1
The NYSERDA 2019 Residential Building Stock Assessment (RBSA) provides the first update to the 2015 Residential Statewide Baseline Study (RSBS) of New York State, to characterize the estimated 5.3 million single-family homes throughout the State. Like the 2015 RSBS, the RBSA collected data about New York homes through two primary means—web and telephone surveys and site visits.

This report presents a high-level overview of findings from the surveys and site visits conducted for the 2019 RBSA. Appendix A provides more-detailed results across all collected home characteristics in roughly 250 tables. A total of 2,419 participants completed the web and telephone survey statewide. Under the leadership of Cadmus as prime contractor, field staff working with subcontractors PSD and Honeywell completed site visits at 456 single-family homes, which comprised new and existing homes sampled within each of the State’s 10 Economic Development Regions (EDRs).

The project also encompassed two additional components—an HVAC market assessment to inform updating baseline conditions for high-efficiency heating equipment in the State, and a potential study, which estimated three-, five-, and 10-year energy efficiency potential in the State. Documenting the results of these two additional components falls outside of the scope of this report, which presents findings solely for the building assessment component. Separate reports are available for the HVAC market assessment and potential study components of the study.

The following section highlights several key findings from the NYSERDA RBSA study. Some of these findings represent select statistically significant differences relative to the 2015 RSBS; other findings stand out as notable because of other considerations, such as indicating significant potential for savings. All results are weighted to provide estimates representative of single-family homes throughout the State. This study defines single-family homes as any house or living unit in a building with one to four living units. Many tables present findings by Climate Zones 4, 5, and 6, as defined in the 2015 International Energy Conservation Code. The study presents some findings by existing and new homes, with new homes defined as single-family homes constructed in 2015 or after. Throughout this report, findings not indicated as being specific either to existing homes or new homes apply to the total population of single-family homes within a given geographic area. Except where presented by climate zone, findings apply to the statewide population of single-family homes.
More Homes Use Air Conditioning
90% of homes statewide use air conditioning (AC), up from 85% in the 2015 RSBS.

STUDY OVERVIEW

ABOUT THIS REPORT
This report presents findings of the building assessment component of the 2019 RBSA, which consisted of web or telephone interviews with 2,419 respondents throughout the State and site visits to 456 single-family homes. While the body of this report focuses on the most notable or significant findings, Appendix A provides a lengthy collection of tables, including updated versions of nearly all tables provided in the 2015 RSBS. Appendix B provides a detailed record of the study methodology for readers who want more detail than provided in the following pages.

GUIDING PRINCIPLES
As with the 2015 RSBS, providing results representative of homes throughout the State was a key priority. Retaining the ability to compare results against those of the 2015 RSBS was also essential. Finally, to provide results soon enough to inform NYSERDA’s contributions to State policy processes, project timeline did not allow enough time to request and receive customer information. Instead, Cadmus constructed the study sample frame by randomly selecting single-family homes from New York State Department of Taxation and Finance tax assessment rolls. Where necessary, such as for new homes (homes built in 2015 or later) in most areas, Cadmus purchased qualified mailing lists from a third party—Dynata (formerly Research Now SSI).

RECRUITING
With the nested design employed by the RBSA (and the 2015 RSBS before it), the study first recruited participants to complete an extensive survey, which collected a variety of data essential to characterizing single-family homes, including the size and type of the home, characteristics of space and water heating equipment, information about major appliances, and data on many other end-use equipment. The survey also asked respondents whether they would be interesting in participating in a site visit, and respondents who said yes made up the sample frame for recruiting site visit participants. The RBSA provided an incentive of $20 to participants who completed the survey, which required an average of 33 minutes to complete, and $100 to participants who completed a site visit. On average, site visits took 2.6 hours to complete.

The study did not set a formal target for survey completes, but Cadmus estimated that 2,423 respondents would be required to achieve the site visit goals if approximately 20% of survey respondents would go on to complete a site visit. A total of 2,419 participants completed the survey before it was closed on November 30, 2018.

To recruit survey recipients, the study mailed postcards to randomly selected homes within each EDR in sufficient numbers to reach the site visit goals, where practical. An unexpectedly large number of postcards were needed to recruit the required number of survey completions: the study mailed 138,281 postcards (in addition to an email blast to 3,994 recipients). A relatively small number of survey

SAMPLE DESIGN
Cadmus developed a sampling plan with the goal of achieving 90% confidence and ±10% precision for most parameters of interest at the State level and 90% confidence and ±20% precision within each of the 10 EDRs, shown in Figure 1. Based on coefficients of variation for key metrics calculated from the 2015 RSBS data, Cadmus designed a nested approach that involved surveying approximately 2,400 households and visiting 486 homes to collect detailed information from 120 new homes and 366 existing homes.

The 2019 RBSA leveraged data collection methods and tools used in the 2015 RSBS as practical, though the team improved the tools to overcome some previous limitations and to adapt to current trends and priorities.

The 2019 RBSA recruited participants primarily by mailing postcards to homes sampled from New York State Department of Taxation and Finance tax assessment rolls, instead of recruiting from a list of customers provided by investor-owned utilities (as with the 2015 RSBS).

• The 2019 RBSA sampled by EDR to ensure that homes were sampled throughout the State and to provide stratified sampling similar to that of the 2015 RSBS.

• As with the 2015 RSBS, the RBSA also included separate stratified samples for new and existing homes across the 10 EDRs.

• The 2019 RBSA provided an incentive of $20 to participants who completed a site visit, and respondents who said yes made up the sample frame for recruiting site visit participants. The RBSA provided an incentive of $20 to participants who completed the survey, which required an average of 33 minutes to complete, and $100 to participants who completed a site visit. On average, site visits took 2.6 hours to complete.

The study did not set a formal target for survey completes, but Cadmus estimated that 2,423 respondents would be required to achieve the site visit goals if approximately 20% of survey respondents would go on to complete a site visit. A total of 2,419 participants completed the survey before it was closed on November 30, 2018.

To recruit survey recipients, the study mailed postcards to randomly selected homes within each EDR in sufficient numbers to reach the site visit goals, where practical. An unexpectedly large number of postcards were needed to recruit the required number of survey completions: the study mailed 138,281 postcards (in addition to an email blast to 3,994 recipients). A relatively small number of survey

SAMPLE FRAME
Unlike the 2015 RSBS, the 2019 RBSA did not use customer information provided by investor-owned utilities to recruit for the study, largely because the project timeline did not allow enough time to request and receive customer information. Instead, Cadmus constructed the study sample frame by randomly selecting single-family homes from New York State Department of Taxation and Finance tax assessment rolls. Where necessary, such as for new homes (homes built in 2015 or later) in most areas, Cadmus purchased qualified mailing lists from a third party—Dynata (formerly Research Now SSI).

With the nested design employed by the RBSA (and the 2015 RSBS before it), the study first recruited participants to complete an extensive survey, which collected a variety of data essential to characterizing single-family homes, including the size and type of the home, characteristics of space and water heating equipment, information about major appliances, and data on many other end-use equipment. The survey also asked respondents whether they would be interesting in participating in a site visit, and respondents who said yes made up the sample frame for recruiting site visit participants. The RBSA provided an incentive of $20 to participants who completed the survey, which required an average of 33 minutes to complete, and $100 to participants who completed a site visit. On average, site visits took 2.6 hours to complete.

The study did not set a formal target for survey completes, but Cadmus estimated that 2,423 respondents would be required to achieve the site visit goals if approximately 20% of survey respondents would go on to complete a site visit. A total of 2,419 participants completed the survey before it was closed on November 30, 2018.

To recruit survey recipients, the study mailed postcards to randomly selected homes within each EDR in sufficient numbers to reach the site visit goals, where practical. An unexpectedly large number of postcards were needed to recruit the required number of survey completions: the study mailed 138,281 postcards (in addition to an email blast to 3,994 recipients). A relatively small number of survey

participants—197 of 2,419—opted to complete the survey by phone, despite rigorous call attempts to postcard recipients who had not responded. Appendix B of this report provides a detailed breakout of survey disposition, including total calls and call outcome by EDR.

As study team members responsible for completing site visits, Honeywell and PSD each handled recruiting and scheduling site visit participants from the group of survey respondents who expressed a willingness to participate. EDRs were divided among the two companies to avoid confusion during recruiting and to allow each company to realize efficiencies by focusing on a smaller geographic area.

The recruiting process led to the completion of site visits in 361 existing homes and 95 new homes during the 10 weeks provided for primary data collection. The study was able to meet targets for existing and new homes in most EDRs but, as with the 2015 RSBS, new homes in New York City and Long Island proved especially challenging, largely because of difficulty identifying new homes in those locations. Table 2 shows site visit completions by EDR and home vintage.

### CLIMATE ZONES

Consistent with the 2015 RSBS, for the purpose of analyzing and presenting results, the RBSA grouped survey and site visit participants into Climate Zones 4, 5, and 6 (shown in Figure 2), as defined in the 2015 International Energy Conservation Code. Table 3 shows the counties included within each Climate Zone.

### SURVEY

The RBSA web and phone survey collected data from September 28, 2018 through December 3, 2018, and allowed participation by telephone or web. To allow for comparisons with the 2015 RSBS results, the RBSA survey used most of the same questions verbatim. However, the RBSA survey did add numerous questions and, through a feedback process with NYSERDA, adjusted language in some cases to improve survey performance.

Additional questions for the 2019 RBSA collected information about several characteristics:

- Connected devices
- Smart thermostats
- Number of ductless mini-split heat pumps installed
- Supplemental heating systems
- Willingness to pay at various levels for high-efficiency equipment
- Utility bill payment and assistance

### ON-SITE DATA COLLECTION

The study conducted all site visits between October 10 and December 15, 2018, after a two-day in-person training for Honeywell and PSD project field staff. Under the direction of NYSERDA and Cadmus, PSD managed completion of all new home site visits through contracted Home Energy Rating System (HERS) Raters. PSD also managed completion of 170 existing home site visits, and Honeywell staff completed 191 existing home site visits.

Site data were collected with an iPad data collection tool developed by PSD and based on the tool PSD developed for the 2015 RSBS. For the 2019 RBSA, PSD implemented several...
improvements, including an automated check that ensured all required information had been entered before the field technician could complete data submission for a given home.

For the 2019 RBSA, site visit data collection stayed close to 2015 RSBS data scope and methods, including generating a HERS Index score for each new home and running blower door tests on all homes where allowed under Residential Energy Services Network (RESNET) and Building Performance Institute (BPI) standards. New data collected for the 2019 RBSA included information about several types of equipment:

- Connected devices
- Smart thermostats
- LED bulbs
- Extensive information about heat pump systems

The 2019 RBSA does not include data or findings regarding solar photovoltaic (PV) or electrical vehicle (EV) adoption. These data were collected for informational purposes. NYSERDA program data and utility interconnection data can provide close to a census of solar PV projects installed in the State, and Department of Motor Vehicles vehicle registration data can provide a precise count of EVs in use statewide.

**Limitations**

As noted in the Recruiting section above, the RBSA fell well short of meeting targets for new home site visits in the Long Island and New York City EDRs given the short timeline available for recruiting, the inherent challenges of targeting new homes in those areas, and the difficulty of recruiting during the highly active political campaigns of fall 2018. This resulted in a new homes sample size of only five for Climate Zone 4, which is not sufficient to be considered representative. To eliminate the possibility of Climate Zone 4 new homes values skewing other results, the study eliminated data for the five Climate Zone 4 new homes sites when calculating statewide results and Climate Zone 4 results that would otherwise represent both existing and new homes.

The accelerated timeline for the 2019 RBSA made some strategies used in the 2015 RSBS impractical, such as obtaining random samples of customers from utilities for outreach and recruiting, which provides higher-quality contact information than available through tax assessment data and purchased sample. In addition, for the 2015 study, NYSERDA mailed letters in advance to the utility customers to introduce the study and its importance and to let them know the study would be contacting them. The 2019 RBSA ultimately met data collection targets for most EDRs, but meeting targets within the short amount of time available for recruiting and fieldwork required a heavy reliance on mass mailing postcards.

Each of the following sections summarizes notable findings for a given equipment category or building component. Findings are presented by climate zone, home vintage, and/or statewide, depending largely on the topic.

Where practical during analysis, Cadmus tested for statistically significant differences between results of the current study and the 2015 RSBS. Cadmus used two-sided t-tests for means and proportions to test the hypotheses that results for the 2019 RBSA for a given population of interest were equal or not equal to 2015 RSBS results. Cadmus identified metrics with significant differences when tests resulted in p-values of $p < 0.01$; the report denotes these differences by ▲ ▼ symbols to indicate a value that is significantly higher or lower than in the 2015 RSBS results. We did not account for uncertainty of the 2015 RSBS results and treated them as fixed values.

To streamline presentation of results, this report represents only a high-level view of the collected and analyzed data. In most cases, Cadmus rounded values to whole numbers for better readability. In these instances, values may not sum exactly to 100%. Readers may select the button (presented throughout the report) to view more-detailed tables and additional tables in Appendix A. These tables represent a broader selection of data from the study and include sample sizes and error bounds.

**Summary of Building and Equipment Characteristics**

SEE THE DATA

Each of the following sections summarizes notable findings for a given equipment category or building component. Findings are presented by climate zone, home vintage, and/or statewide, depending largely on the topic.

Where practical during analysis, Cadmus tested for statistically significant differences between results of the current study and the 2015 RSBS. We did not account for uncertainty of the 2015 RSBS results and treated them as fixed values.

To streamline presentation of results, this report represents only a high-level view of the collected and analyzed data. In most cases, Cadmus rounded values to whole numbers for better readability. In these instances, values may not sum exactly to 100%. Readers may select the button (presented throughout the report) to view more-detailed tables and additional tables in Appendix A. These tables represent a broader selection of data from the study and include sample sizes and error bounds.
The RBSA collected data on building characteristics and energy use through both surveys and site visits. Only the survey collected information about demographics, such as the number and age of occupants in the home, household income, and highest level of education attained. For data points collected through both data collection methods, each method has its advantage and drawbacks.

Conditioned floor area often correlates well with energy usage, but different definitions of the term lead to different numbers. In the RBSA web and telephone survey, questions regarding home size asked for the square feet of living space not including unfinished basements. In contrast, the conditioned floor area collected during site visits conformed to a RESNET definition, which provides somewhat nuanced direction regarding which spaces should be included. For example, a finished area should always be included in a RESNET conditioned floor area, whether heated or not, while unfinished areas should be included if sufficiently and directly heated.

Data collection also differed somewhat for energy usage between the survey and site visits. Whereas the survey simply asked for an estimate of the cost for each utility or type of fuel over the past year, site visits collected annual usage from bills provided by the participants. Scheduling and reminder calls with participants underscored the importance of making bills available. In contrast, the longer timeline and somewhat different recruiting methodology of the 2015 RSBS allowed energy usage to be provided from utility data for survey participants.

### DEFINITIONS

All data collection included only single-family homes, which for this study were defined as buildings with one to four housing units. The study classified each home as one of four types: single-family detached home, single-family attached home, mobile or manufactured home, or apartment building or condominium. Single-family attached homes abut another structure on one or more sides.

The 2019 RBSA defines existing homes as any single-family home constructed before 2015. New homes are defined as any single-family home constructed in 2015 or after. The study classified homes as new or existing based primarily on construction dates provided in the State tax assessment data, where available.

The study generated a HERS rating for each new home. With the HERS Index, a score of 100 equates to the score of a standard new home, meaning one that does not exceed energy efficiency levels required by building codes. A home with a HERS rating of 70 is 30% more energy efficient than a standard new home, according to RESNET documentation.

### KEY FINDINGS

#### SAMPLE COMPARISONS

Profile tables for existing and new homes depict somewhat different populations than the 2015 RSBS samples, though differences are typically minor. The 2019 RBSA existing homes sample appears generally representative when compared with data from other sources, such as the 2013–2017 American Community Survey.

#### SURVEY AND SITE VISIT SAMPLES

For existing homes, RBSA survey and site visit samples appear similar in size of home. With new homes, the site visit sample appears to skew somewhat to larger homes, but differences in the conditioned area definition in the survey and site visits may contribute.

### NEW HOMES USE LESS

New homes appear to use less energy on average. The weighted average HERS rating dropped from 68.5 for the 2015 RSBS to 55.5 in the current study. As expected, 2019 RBSA data also show that new homes use less energy on average than existing homes.

*New homes site visit results for Climate Zone 4 cannot be considered representative because of the small sample size. This limitation also influences statewide results.
The RBSA collected extensive data on heating and cooling in participants’ homes. In the web and telephone survey, respondents reported the type, approximate age, and fuel type of primary heating and cooling equipment. The survey also collected information about thermostats, equipment maintenance, and supplemental heating and cooling systems, including fireplaces and heating stoves. Most of the high-level heating and cooling results discussed in this report are based on survey results because of the larger sample size they provide.

Data collected during the site visits provides the means to verify survey data and dive deeper into the equipment details. Field staff documented the locations of and detailed information about all heating, cooling, and ventilation equipment in each home. They also took pictures of all nameplates and recorded the make, model number, capacity, efficiency, and year of manufacture of equipment. Nameplates do not always include all data, so field technicians often conducted post-visit research of model numbers to determine the missing data.

If multiple systems were present, the field technician determined with the homeowner which system(s) provide the majority of heating and cooling. They also recorded the percentage of conditioned space served by each heating and cooling system. On-site data collection also included information about thermostats, including setpoints, setbacks, and whether participants used programs to control the heating or cooling.

## KEY FINDINGS

### HEATING REMAINS MUCH THE SAME

The 2019 RBSA shows that a small percentage of homes now use ductless mini-split heat pumps for primary heating, and air source and ground source heat pumps retain a small share. Survey results show a higher percentage of central boiler systems and a lower percentage of electric baseboard heating than the 2015 RSBS, but methodological differences explain those apparent changes.

### MORE HOMES USE AC

Survey data show that significantly more homes use air conditioning in every climate zone. The RBSA estimates that only 10% of existing homes and 7% of new homes have no AC equipment, compared with 15% and 11% in the 2015 RSBS. There also has been a significant shift in existing homes from window and room AC equipment to central AC and heat pumps.

### PRIMARY HEATING FUEL OIL SHARE HAS DECLINED

Natural gas remains the predominate statewide fuel type for primary heating and appears to have gained share, with an estimated 65% of single-family homes statewide using natural gas for primary heating. Fuel oil remains the second most common primary heating type, but its share decreased from 25% in the 2015 RSBS to 19%.

### SMART THERMOSTATS GAINED SHARE

Of homes with central heating or cooling systems, 11% statewide use a smart thermostat, in addition to the 66% using a programmable thermostat. Opportunity remains for both types of thermostats, particularly in Climate Zone 6, where 40% of homes use a manual thermostat.

---

### CODE/STANDARDS CHANGES

As of January 1, 2015, federal energy standards increased the minimum Seasonal Energy Efficiency Ratio (SEER) of central air source heat pumps from 13 to 14 and their minimum Heating Seasonal Performance Factor (HSPF) from 7.7 to 8.2.

The 2015 changes also used a new, additional definition for room air conditioner efficiency: the Combined Energy Efficiency Ratio (CEER) is similar to the Energy Efficiency Ratio (EER) but includes standby power. Manufacturers must report both CEER and EER. Minimum CEER values range from 8.7 to 11.0 for 18 product classes, which vary primarily by cooling capacity the presence of louvered sides.

Federal renewable energy tax credits for ground-source heat pumps expired in 2017. Subsequently, after a period of uncertainty, tax credits were renewed for qualifying ground-source heat pumps through 2021, though tax credit levels step down by 4% each year.
PRIMARY HEATING FUEL BY CLIMATE ZONE

Estimates based on survey data show **significantly higher natural gas use** for primary heating than in the 2015 RSBS.

Field technicians identified and characterized all water heaters in each home. Technicians recorded the water heater and fuel type, storage volume, energy factor (EF), recovery efficiency, tank insulation characteristics, pipe insulation characteristics, venting configuration and size, and yellow label (EnergyGuide) energy cost values. They also took pictures of the nameplate and recorded the make and model number and year of manufacture. Technicians recorded the general location of the water heater, specifying whether it was located in a conditioned or unconditioned space. Location information is especially noteworthy for heat pump water heaters, because it can affect both the performance of the water heater and the home heating and cooling load.

The web and telephone survey also collected basic information about water heating, though with mixed results. When compared with site visit data, the water heating fuel reported by survey participants appeared generally accurate. Survey data regarding water heater type appeared less reliable. For example, a surprisingly large percentage of survey recipients reported using a heat pump water heater, which proved inaccurate when compared with site visit data and other available information. Accordingly, results discussed here draw from survey data for water heating fuel, to leverage the larger sample size and allow for directional comparisons to the 2015 RSBS data, but rely on site visit data for water heater type.

### CODE/STANDARDS CHANGES

In 2015, the National Appliance Energy Conservation Act raised the federal minimum efficiency for the most common types of storage water heaters. The new minimum EF value of 2.0 for electric residential water heaters with a storage volume more than 55 gallons effectively prohibits the sale of residential electric resistance water heaters of that size, because the EF of 2.0 can only be achieved by a heat pump water heater. For electric water heaters with storage volume less than 55 gallons, the minimum EF increased modestly to 0.95.

Similarly, the act requires a higher minimum EF for gas storage water heaters above 55 gallons. For example, the minimum EF for a 60-gallon gas-fired water heater increased from 0.56 to 0.75, which effectively requires a condensing design.

### KEY FINDINGS

#### GAS WATER HEATING GAINS SHARE

Weighted survey results show a significant drop statewide in the percentage of single-family homes using electricity, fuel oil, and propane for water heating and a significant increase in natural gas water heater share. According to those data, 67% of single-family homes statewide use natural gas water heating, up from 54% in the 2015 RSBS, though it seems likely that some of that apparent shift results from methodological differences.

#### NEW HOMES ADOPT NEWER TECHNOLOGY

On-demand water heaters are much more common in new homes than in existing, with a share of about 26%. Heat pump water heaters and heating water with ground-source heat pumps are also more common in new homes, with estimated shares of 7% and 6%, respectively.

#### EFFICIENCY STANDARDS MAY HAVE LITTLE EFFECT

RBHS site visit data indicate that only 7% of all storage water heaters in the State have a capacity of greater than 55 gallons, leaving most households unaffected by the most stringent standards.

</tbody>
</table>

**STORAGE WATER HEATER TANK SIZE**

Storage water heaters larger than 55 gallons must achieve much higher energy efficiency ratings under federal standards.

**WATER HEATER AGE**

Based on survey data, 17% of water heaters have reached the end of their estimated useful life of 15 years.
The 2019 RBSA collected a variety of information about the building shell (or envelope) of each home during site visits, including the thickness and type of installed insulation in the ceilings, walls, foundation walls, and floors that make up the thermal boundary of the home. As with the 2015 RSBS, site visits also included a blower door test except where BPI or RESNET standards precluded such testing or where conditions would make it difficult to produce reliable results.

Blower door results included here show air leakage in air changes per hour at 50 Pascals (ACH50) and cubic feet per minute at 50 Pascals (CFM50), with 50 Pascals being the pressure used for the blower door test. Expressing air leakage in air changes per hour takes the size of the home into account to allow for more meaningful comparisons.

Consistent with the 2015 RSBS, surfaces characterized as foundation refer to the exterior walls of foundation spaces—namely basements and crawspaces. Floors correspond to floors over outside or over unconditioned spaces such as garages or vented crawspaces. Field staff also characterized floors over unconditioned basements, but in the great majority of cases these basements were arguably indirectly conditioned, and floors above them should not be considered the thermal boundary of the home.

During site visits, field staff defined like areas of envelope surface, such as walls with the same apparent type and thickness of insulation, as one segment. The field technician also reported the percentage of the total surface of that type (walls, for example) made up by that segment. Tables that present results for these envelope surfaces use these percentage values for each segment when calculating distributions of characteristics such as insulation thickness. Sample size values reported in these tables correspond to the number of defined segments.

Building codes apply to existing homes only when portions of the home are being extensively remodeled or area is being added. New homes in the State outside of New York City are subject to codes such as the State Uniform Fire Prevention and Building Code (Uniform Code) and the State Energy Conservation Construction Code (Energy Code). Buildings in New York City are subject to the New York City Construction Code and New York City Energy Conservation Code. Both jurisdictions updated energy codes in 2016, with the State Energy Code incorporating the 2015 International Energy Conservation Code, with amendments.

Key Findings

New Homes Leak Less
Blower door testing shows much less air leakage in new homes than existing homes, with average ACH50 of 4.0. More than half of the homes tested appear to exceed the 3.0 ACH50 requirement imposed statewide by energy codes in 2016, though many of the new homes represented here began construction before those codes went into effect (and before blower door tests were required by code).

Air Sealing Potential Remains
Blower door testing showed lower air leakage on average in Climate Zones 5 and 6 than Climate Zone 4, but potential remains throughout the State. Results estimate that just over 50% of homes statewide would test at ACH50 of 10.0 or more.

Insulation Opportunities Exist
More than 65% of ceilings statewide have eight inches of insulation or less. Eight inches of insulation generally equates to an R-value of 20 to 30, well under the R-49 required in new homes or additions by current State code. Exterior walls, foundation walls, and floors over garages, vented crawspaces, and outside also show room for improvement, with all having a significant percentage of uninsulated segments.

Few Single- Pane Windows Remain
With a significant reduction in every climate zone relative to the 2015 RSBS, few single-pane windows without storm windows remain—only 3% by window area. Windows with single-pane glazing and with storm windows make up roughly 10% of windows by window area.
**BLOWER DOOR AIR TIGHTNESS BY ACH50 RANGE AND CLIMATE ZONE FOR ALL HOMES**

Climate Zones 5 and 6 show lower ACH50 than Climate Zone 4 but still have room for improvement.

**EXISTING HOMES WINDOW GLAZING**

As little as 3% of single-pane windows without storm windows remain statewide.

**EXISTING HOMES CEILING INSULATION THICKNESS BY CLIMATE ZONE**

More than 65% of ceilings statewide have eight inches of insulation or less.
For lighting data collection, field technicians recorded the quantity and type of bulbs for each room or space type, along with fixture and control type where controls went beyond simple on/off switches. Field technicians collected this data for lighting both inside and outside the home, including bulbs stored for future use.

Where necessary and reasonable, technicians removed lampshades or fixture covers to identify the bulb characteristics. When a given data point could not be identified by visual inspection, field technicians attempted to gather the information from another source, such as the homeowner, or noted that they were unable to identify the bulb type.

Identifying bulb type can be difficult due to accessibility or safety issues, and discerning halogen from incandescent bulbs can be especially challenging. Accordingly, data collected during site visits combined incandescent and halogen bulbs into one category labeled “inefficient.”

Although the RBSA captured data on CFL and LED bulbs separately, some lighting tables combine CFL and LED bulbs into one category to allow for direct comparisons with 2015 RSBS results.

As with the 2015 RSBS, the web and telephone survey also collected information about bulbs, but only for those used two or more hours a day. Accordingly, the survey results cannot be directly compared with the site visit results, but they do allow for comparisons with the 2015 RSBS survey data.

### CODE/STANDARDS CHANGES

The Energy Independence and Security Act of 2007 defined high-efficiency standards for common household lighting. These standards, which phased in between January 1, 2012 and January 1, 2014, likely played a large role in accelerating a shift away from incandescent bulbs. Many specialty bulbs using incandescent designs are still available, such as appliance lamps, three-way bulbs, and others. Additional federal lighting standards may go into effect in August 2021.

### KEY FINDINGS

#### LEDS TAKE THE LEAD

LED has surpassed CFL as the high-efficiency bulb technology of choice. Site visit data found 34% LED bulbs on average statewide, compared with 30% in the 2015 RSBS.

#### EFFICIENT BULBS GAIN SHARE

LEDs and CFLs combined now account for 52% of installed bulbs statewide, up from 30% in the 2015 RSBS.

#### POTENTIAL REMAINS

Despite the rapid transformation of the lighting market, opportunity remains. Site visit data show that inefficient lamps fill more than one-third of sockets, at 37% statewide, though this is down significantly from 60% in the 2015 RSBS.

#### NEW HOMES, OLD BULBS

New homes boast 78% efficient lighting overall, but site visit data show that 37% of bulbs in storage are inefficient bulbs, which could replace efficient bulbs in future years.
### Bulb Type Statewide from Site Visits

**LEDs represent one-third** of all bulbs installed (34%), surpassing CFLs (18%).

### Percentage of Efficient Lighting in New and Existing Homes

New homes have a **much higher percentage of efficient lighting** (78%) than existing homes (52%).

### Bulbs in Storage by Home Vintage

**Incandescents still outnumber** other stored bulbs, but LEDs are close behind in existing homes and have taken the lead in new homes.

### Average Number of Interior Bulbs Used at Least Two Hours Per Day

Survey data show a **dramatic increase** in the number of CFL or LED bulbs used at least two hours a day.

Homeowners tend to know more about their appliances than about some other building characteristics, and the RSBA leveraged that knowledge with an abundance of questions on primary and additional appliances. Survey questions asked not only about the appliance units but also about patterns of usage, such as the number of loads per week where applicable. As with other equipment categories, most questions stayed at least close to those asked in the 2015 RSBS to allow for direct comparisons with the 2015 RSBS results.

Field technicians also collected information about each major appliance during site visits, including year of manufacture, type, fuel, whether it was labeled as ENERGY STAR rated, and for some appliances EnergyGuide information and/or model number. Where model numbers were collected, field staff attempted to look up characteristics such as ENERGY STAR status and EnergyGuide information online.

Appliances provide some striking examples of the differences between surveys and site visits as a means of primary data collection. On one hand, all survey respondents will presumably know how many of each type of major appliance is in their home, along with the basic type or configuration of each appliance. As illustrated in the ENERGY STAR appliances table below, however, a survey participant’s knowledge or memory of whether each appliance is ENERGY STAR rated may be understandably limited.

The ability of field staff to consistently identify ENERGY STAR appliances with accuracy is also up for debate. For this project, for instance, field staff were instructed to look for an ENERGY STAR label and, if not present, to search online for ENERGY STAR status, but it is likely that the site visit data somewhat underestimated the percentage of installed ENERGY STAR appliances because of missing or inaccessible labels. Where collected, model numbers are provided in the site visit data for implementers or researchers who need to determine with more certainty the percentage of qualifying ENERGY STAR appliances.

### Key Findings

#### Old Appliances

About one-half of appliances are 10 years or older, based on site visit data. Clothes washers have the lowest percentage that are at least 10 years old (43%) while stand-alone freezers have the highest (61%).

#### Multiple Refrigerators and Freezers

One in four single-family homes statewide has a second refrigerator, and one in three has at least one stand-alone freezer, according to survey data. One in eight homes has at least one compact refrigerator. According to site visit data, 11% of refrigerators and 57% of stand-alone freezers are located in unconditioned spaces such as a garage.

#### Fuel Differences

Survey data show a significantly larger percentage of homes using natural gas clothes dryers than in the 2015 RSBS, at 43% instead of 32%. Electric clothes dryers make up 54%, compared with 64% in the previous study, and propane usage is down from 4% to 3%.

#### Energy Star Appliances

As with the 2015 RSBS, survey respondents reported a much higher incidence of ENERGY STAR appliances less than 10 years old than identified through site visits. Survey results for the 2019 RSBA show significantly higher percentages of ENERGY STAR appliances than reported in the previous study, but site visit data showed no significant changes.

### Code/Standards Changes

Federal energy efficiency standards can have a significant impact on appliance stock and efficiencies in particular. Appliances impacted by federal efficiency changes during the past five years include refrigerators and freezers (2014) and clothes dryers (2015).
HOMES WITH MULTIPLE REFRIGERATORS AND FREEZERS

One-quarter of homes statewide have two full-size refrigerators. One-third have at least one stand-alone freezer.

REFRIGERATOR AND FREEZER LOCATION

More than half of stand-alone freezers are in an unconditioned space.

CLIMATE ZONE

ZONE 4
ZONE 5
ZONE 6
Few aspects of homes have changed as dramatically as household electronics in recent years, thanks to transformational forces such as the internet and smartphones and the rapid adoption of flat-screen televisions. The RBSA used mostly the same survey questions and site visit procedures as the 2015 RSBS to collect data on household electronics and related plug loads, to ensure that at least most results could be directly compared.

The RBSA relied mostly on site visits to collect information about televisions. During site visits, field technicians characterized each television, including the type and size. Field staff also collected information about a variety of other electronics in each home, including counts of popular electronic components and office equipment. Several results reported in this section draw on survey responses regarding the quantity and sometimes usage of various electronic components, from the number of cell phones used by household members to how many hours per day residents use desktop and laptop computers.

### TELEVISION TECHNOLOGY

When characterizing televisions, it helps to be clear about the difference between liquid-crystal display (LCD) and LED televisions. Even with televisions marketed as LED, an LCD panel provides the pixels that make up the image, and a light source is required to bring the images to life. The type of lighting determines whether the television is considered an LED television. With an LED television (really an LCD television with LED lighting), the television uses LEDs behind the LCD panel (or along the edges) rather than cold cathode fluorescent lamps (CCFLs). CCFL lighting is found mostly in older, thicker flat-screen televisions. Organic LED (OLED) technology promises better display quality, thinner screens, and lower energy usage by providing LEDs small enough to provide both the pixels and the light, doing away with the LCD panel.

### LED LEADS THE WAY

LED televisions now make up more than half of all televisions statewide, according to site visit data, and LED and LCD televisions combined account for nearly 90%. CRT televisions show a sharp decline, at 6%, while OLED televisions have begun to appear.

### TELEVISIONS GROW LARGER

Installed LED and LCD televisions screens are larger on average than reported in the 2015 RSBS, bringing the statewide average up significantly to 39 inches (compared with 33 inches in the previous study). CRT, plasma, and rear projection televisions remain about the same size.

### SIGNS OF STREAMING

Survey participants reported significantly fewer traditional electronic components such as DVD players, VCRs, and stereo systems than in the 2015 RSBS. The numbers were not dramatically lower but likely illustrate the trends toward streaming video content and listening to music through phones.

### MORE COMPUTERS USED LESS

Not surprisingly given the proliferation of smartphones, reported computer usage has declined significantly since the 2015 RSBS, down by more than 15%. That said, survey participants also reported having significantly more desktop and laptop computers in their household.
Electronic plug load equipment saw both an increase and decrease in the number of devices per home. Average LED and LCD screen sizes have grown significantly larger.

Data collection of connected devices is new for the 2019 RBSA and comprised survey questions and site visit tasks. Survey questions first asked participants if any equipment in the home could be controlled remotely and then asked them to identify specific types of equipment from a list. During site visits, field technicians identified whether the home included any of eight types of connected equipment. Results varied somewhat for connected equipment collected with the two methods, which may result from self-selection bias and/or from survey participant and field technician error.

RBSA data collection observed the distinction between connected and smart devices: A connected device can be controlled remotely, whereas a smart device can use learned or detected information to automatically alter operation or provide suggestions, such as modifying the temperature setpoint of a heating or cooling system based on learned usage patterns in the case of a smart thermostat. All smart devices are likely connected, but not all connected devices are smart.

**KEY FINDINGS**

**CONNECTED DEVICES GAIN TRACTION**

Almost one-quarter (24%) of homes statewide have at least one device that can be controlled remotely, according to survey responses. These devices span a wide range, from thermostats and lighting to major appliances and pool pumps.

**DIGITAL ASSISTANTS STAND OUT**

Based on site visit data (not shown here), the most prevalent connected device is the digital assistant—smart speakers that use services such as Amazon Alexa, Apple Siri, or Google Assistant to respond to natural language questions and requests. Weighted results estimate that 29% of homes statewide have such a device, which can also control compatible home automation components. In survey results, which focused more on equipment that can be controlled remotely, connected thermostats were by far the most prevalent.

**THERMOSTATS GET CONNECTED**

Survey responses show that 16% of single-family households with a central heating and/or cooling system statewide use a connected thermostat.

**CONNECTED HOMES WITH EACH TYPE OF CONNECTED DEVICE**

Percentages show the proportion of homes with each type of device for homes with at least one connected device.

**CONNECTED AND SMART THERMOSTATS**

Of homes with central heating and/or cooling, 16% statewide have a connected thermostat according to survey data.

---

**Have at Least One Device**

The 2019 RBSA web and telephone survey used similar questions related to energy efficiency programs as the 2015 RSBS, both to collect information about current participation and to note changes relative to the previous study. The survey asked three questions:

- In the past five years, has your household participated in any energy efficiency or energy saving programs offered by NYSERDA or your utility company to make your home or appliances more energy efficient?
- What type of equipment did you install or recycle through a program?
- What do you think are the challenges with participating in energy efficiency programs?

Only the third question differed from its 2015 version, which asked “Why hasn’t your household participated in any energy efficiency programs?” Other survey questions asked about willingness to replace equipment in the next five years and the perception of the level of energy efficiency of the participants’ homes.

### Key Findings

**Participation Remained the Same**
Compared with the 12.2% who reported participating in an energy efficiency program in the 2015 RSBS, the 10.5% reported in the 2019 RBSA was lower but not statistically different.

**AC Participation Increased**
Of respondents who reported participating in energy efficiency rebate or recycling programs, 25% reported participating in an air conditioning rebate or recycling program—up from 14% in the 2015 RSBS.

**Knowledge Remains Key**
As with the 2015 RSBS, more than 50% of survey respondents who did not participate in an energy efficiency program reported that they did not know of any programs. Compared with 2015 respondents, twice the percentage (30%) reported in the current study that they did not know who to contact. The percentage of respondents who reported not being able to afford installing new equipment (29%) also increased significantly from 19% in 2015.

### Reported Program Participation
The table shows program participation for the 10.5% of survey respondents who reported participating in an energy efficiency program.

#### Top Reasons for Not Participating in Energy Efficiency Programs
Significantly more people reported **not knowing who to contact** than in the 2015 RSBS.
APPENDIX A. DATA TABLES FROM SURVEYS AND SITE VISITS

This appendix presents findings for the New York State Energy Research and Development Authority (NYSERDA) 2019 Residential Building Stock Assessment (RBSA) based on data collected through online and telephone surveys and site visits. The title of each table indicates whether that table is based on survey data (Survey), site visit data (Site), or both (Survey and Site). Cadmus developed and applied sampling weights to ensure that all observations were weighted proportionally to the segment of the population represented by the sample. Refer to Appendix B. Detailed Methodology for a description of the weighting methods.

Where practical during analysis, Cadmus tested for statistically significant differences between results of the current study and the 2015 RSBS. Statistically significant differences between the two reports are denoted by either a ▲ or ▼ symbol, indicating whether the 2019 RBSA value is higher or lower than the value in the 2015 RSBS study. These 2019 RBSA tables also identify which table in the previous study, if applicable, was used to draw conclusions about each statistically significant difference.

New tables and categories presented in this document that do not have a corollary in the 2015 RSBS do not have symbols indicating statistically significant increases or decreases from the 2015 RSBS, though statistically significant differences may exist. Without a comparable table in the 2015 RSBS report, statistical testing could not be performed.

Because of the small sample size for new homes site visits in Climate Zone 4, new home site visit results for Climate Zone 4 should not be considered representative. To eliminate the possibility of those results skewing Climate Zone 4 results for existing and new homes or overall statewide results, Cadmus eliminated observations for those five homes when calculating site visit results. For tables that present results for new homes by climate zone, values for Climate Zone 4 remain in the tables with shading and a table note regarding the small sample size, but these Climate Zone 4 values do not impact other results.

All tables include n values to document sample sizes along with error bounds to provide a measure of the uncertainty of the data. Cadmus calculated the error bounds (EB) as the standard error multiplied by a t-statistic and provide the half-width of the 90% confidence interval. Error bounds, or absolute precision, have the same units as the estimate. When reporting precision, absolute precision is typically reported for percentages or distributions while relative precision is typically reported for means or totals. To calculate the relative precision for a given mean or total, divide the EB by the associated estimate. With percentages, the reported EB represents the absolute precision.

</tbody>
</table>

Note: Presents average annual consumption for electricity, natural gas, and other fuels only for homes that use those fuels based on information collected from bills and home occupants during site visits. Average annual fuel use for the all fuels category represents average total fuel consumption for home. For all fuels averages, homes with unknown usage values for any fuel were excluded from the calculation. New York State energy content values for each fuel were drawn from the NYSERDA report Patterns and Trends New York Energy Profiles: 2002-2016. Where necessary, cost per-unit energy consumption values were taken from the U.S. Energy Information Administration. This table is new to the 2019 RBSA and its values cannot be compared with those of any 2015 RSBS table.

a The Other fuel type includes fuel oil, propane, kerosene, wood, wood pellets, and coal, and usage data collected for each are approximate.

Source: On-site fields: ['Electricity Annual Usage (kWh)', 'Natural Gas Annual Usage', 'Natural Gas Annual Usage Units', 'Other Fuel 1 Type', 'Other Fuel 1 Annual Usage Units', 'Other Fuel 2 Type', 'Other Fuel 2 Annual Usage Units', 'Conditioned Floor Space (measured in square feet)', 'Climate Zone'].

</table>

Note: Presents average annual consumption for electricity, natural gas, and other fuels only for homes that use those fuels based on information collected from bills and home occupants during site visits. Average annual fuel use for the all fuels category represents average total fuel consumption for home. For all fuels averages, homes with unknown usage values for any fuel were excluded from the calculation. State energy content values for each fuel were drawn from the NYSERDA report Patterns and Trends New York Energy Profiles: 2002-2016. Where necessary, cost per-unit energy consumption values were taken from the U.S. Energy Information Administration. This table is new to the 2019 RBSA and its values cannot be compared with those of any 2015 RBSB table.

- The Other fuel type includes fuel oil, propane, kerosene, wood, wood pellets, and coal, and usage data collected for each are approximate.

Source: On-site fields: [‘Electricity Annual Usage (kWh)’, ‘Natural Gas Annual Usage’, ‘Natural Gas Annual Usage Units’, ‘Other Fuel 1 Type’, ‘Other Fuel 1 Annual Usage Units’, ‘Other Fuel 2 Type’, ‘Other Fuel 2 Annual Usage Units’, ‘Conditioned Floor Space (measured in square feet)’, ‘Construction Type’].

</table>

Note: Presents the average energy use intensity (EUI) for each home for electricity, natural gas, and other fuels only for homes that use those fuels based on information collected from bills and home occupants during site visits. Average annual EUI for the all fuels category represents average total fuel consumption per square foot for each home. For all fuels averages, homes with unknown usage values for any fuel were excluded from the calculation. Average EUI was calculated by averaging the EUI for each home, not by dividing total consumption by total conditioned area for each stratum; accordingly, multiplying the total number of single-family homes by the average EUI will not yield a highly accurate estimate of total consumption. State energy content values for each fuel were drawn from the NYSERDA report Patterns and Trends New York Energy Profiles: 2002-2016. Where necessary, cost per-unit energy consumption values were taken from the U.S. Energy Information Administration. This table is new to the 2019 RBSA and its values cannot be compared with those of any 2015 RSBS table.

---

Table 46 presents the efficiency of boilers and furnaces by fuel type for a site assessment. The table includes data for different AFUE (Annual Fuel Utilization Efficiency) ranges, with corresponding percentages for gas, oil, and an overall statewide average. The data is new with the 2019 RBSA and cannot be compared with previous years. Gas includes both natural gas and propane. The data is derived from on-site fields for various heating efficiency and HVAC system type attributes.

**Insulation Type (n)**

| | 47 | 47 | 24 | 24 | 21 | 21 | 92 | 92 |

**Note:** This table represents interior or cavity wall insulation type and grade by area. The number of observations equals the number of wall segments with known insulation type and grade defined in the data. More than one wall segment may be defined per home. Each segment includes an indication of the percentage of wall area it accounts for in that home, which was applied to each segment in calculating the percentage of each type of insulation and insulation grade.

\(^a\) The mineral wool and spray foam - combo insulation types were not represented in the corresponding table in the 2015 RSBS.

BACK TO REPORT
This appendix to the New York State Energy Research and Development Authority (NYSERDA) 2019 *Residential Building Stock Assessment* (RBSA) report provides more information about the study methodology than would reasonably fit in the main body of the report. This appendix is intended for readers who use the study and need a deeper understanding of the study methodology.

B.1 PROJECT SUMMARY

B.1.1 Background and Study Objectives
The NYSERDA 2019 RBSA provides the first update to the 2015 Residential Statewide Baseline Study (RSBS) of New York State. NYSERDA, in coordination with lead contractor Cadmus and subcontractors Performance Systems Development (PSD) and Honeywell, developed and implemented a work plan that allowed key study components to be completed in time to inform the State energy plan.

The project team characterized single-family homes throughout the State, with a single-family home defined as a residential structure containing one to four living units, including manufactured homes. Primary data collection included surveys of 2,419 respondents and site visits at 456 homes.

In addition to the building stock assessment, the RBSA included an HVAC market assessment to update baseline conditions for high-efficiency heating equipment in the State and a potential study to estimate three-, five-, and 10-year energy efficiency potential in the State. This appendix provides documentation of methods for the building assessment component only; separate reports and methodology documentation will be made available for the HVAC market assessment and potential study components.

The primary objectives of the RBSA are to provide a profile of new and existing homes in the State based on data from a representative sample of homes and to determine changes in building and equipment stock since the 2015 RSBS, including changes in the saturation of energy-consuming equipment (that uses electric, natural gas, and other fuels); key building characteristics such as insulation, windows types, and air leakage rates; and energy management practices. The RBSA also collected customer household and demographic information.

Information provided in this study will be used by NYSERDA, the New York State Department of Public Service, energy efficiency program administrators throughout the State, and others for a variety of purposes, such as informing program planning and setting baselines for savings calculations. This information also provided necessary inputs to the HVAC market assessment and potential study components of the study, as shown in Figure 1.
B.1.2 Market Segment Definitions

The RBSA characterized single-family homes, which are defined for the study as residential structures comprising one to four living units. While single-family detached homes are by far the most common type of single-family home in the State, the study also collected data on single-family attached homes, such as townhouses, manufactured or mobile homes, and multi-unit buildings.

The study characterized both existing and new homes, with homes classified as new if they were constructed in 2015 or later.

B.1.3 Building Assessment Project Team

The project team for the building assessment component included NYSERDA, Cadmus as the lead contractor, and PSD and Honeywell as subcontractors.

As the lead contractor working under the direction of NYSERDA, Cadmus completed the following tasks:
- Managed all aspects of the project.
• Developed the work plan and sampling plan.
• Developed the sample frame used for recruiting.
• Developed study protocols with input from PSD.
• Conducted all analysis and generated all data tables.
• Designed and created the primary building assessment report.
• Provided all reporting, including designing and creating the primary building assessment report and generating this detailed documentation of the methodology.

Under the leadership and guidance of NYSERDA and Cadmus, PSD completed the following tasks:
• Updated and deployed the iPad-based data collection tool it provided for the 2015 RSBS, which was used to collect data during site visits.
• Modified its internal scheduling software to accommodate project needs, including providing cloud-based access for Cadmus and Honeywell.
• Conducted project training for PSD and Honeywell field staff.
• Conducted site visits for 95 new homes and 170 of the 361 existing homes in the study.
• Performed initial data cleaning and data quality control (QC) of all site visit data.

Under the leadership and guidance of NYSERDA and Cadmus, Honeywell completed the following tasks:
• Designed the postcard used for recruitment.
• Managed the mailing and printing of postcards to addresses provided by Cadmus and following a timeline determined by NYSERDA and Cadmus.
• Provided phone staff to administer the survey to RBSA postcard recipients who called the toll-free number provided on the postcards.
• Provided phone staff to recruit additional respondents by contacting postcard recipients who had not responded.
• Conducted site visits for 191 of the 361 existing homes in the study.

Figure 2 shows many key members of the building assessment project team at NYSERDA, Cadmus, PSD, and Honeywell. Other project staff at each organization made important contributions such as providing guidance, providing additional project management support, or carrying out essential tasks such as scheduling and completing site visits.
B.1.4 Overall Approach

As with the 2015 RSBS, providing results representative of homes throughout New York State was a key priority. It was essential to retain the ability to compare results against those of the 2015 RSBS. Finally, to provide results soon enough to meet NYSERDA’s required timeline, all data collection had to be complete in fall 2018, less than four months after the project kickoff. These requirements led to three decisions:

- The 2019 RBSA sampled by 10 Economic Development Region (EDRs) to ensure that homes were sampled throughout the State and to provide stratified sampling similar to that of the 2015 RSBS.
- As with the 2015 RSBS, the 2019 RBSA also included separate stratified samples for new and existing homes across the 10 EDRs.
- The 2019 RBSA leveraged data collection methods and tools used in the 2015 RSBS as practical, though the team improved those tools to overcome some previous limitations and to adapt to current trends and priorities.

With the nested design employed by the 2019 RBSA (and the 2015 RSBS before it), the project team first recruited respondents to complete an extensive telephone or online survey, which
collected a variety of data essential to characterizing single-family homes. The survey also asked respondents whether they would be interested in participating in a site visit. Respondents who agreed to the site visit made up the sample frame for recruiting site visit participants.

**B.1.5 Sample Design**

Cadmus developed the initial sampling plan during the proposal phase of the project with the goal of achieving 90% confidence and ±10% precision for most parameters of interest statewide and 90% confidence and ±20% precision within each of the 10 EDRs, shown in Figure 3. Based on coefficients of variation for a variety of metrics calculated from the 2015 RSBS data, Cadmus designed a nested approach that called for surveying approximately 2,400 households and visiting 486 homes to collect detailed information from 120 new homes and 366 existing homes.

After project award and further work with the 2015 RSBS data, Cadmus apportioned site visit targets for new and existing homes within each EDR using a combination of EDR population sizes and coefficients of variation calculated from 2015 RSBS data for two key metrics—Home Energy Rating System (HERS) scores for new homes and blower door test results in air changes per hour for existing homes. Cadmus used these metrics because of their importance in characterizing the efficiency of a home and because generating HERS scores and running blower door tests requires a site visit, making these especially good metrics for determining site visit sample sizes. EDRs with the largest populations and greatest variability were assigned a larger proportion of samples, consistent with standard statistical sampling methods.

**FIGURE 3. NEW YORK STATE ECONOMIC DEVELOPMENT REGIONS**

Cadmus reviewed the resulting sample size distributions and reallocated sample sizes to achieve sufficient coverage in each EDR and to ensure that the 90% confidence and ±20% precision target would be met within each EDR. Table 1 illustrates the target site visit completions for each home vintage within each EDR.
B.1.6 Sample Frame

Unlike the 2015 RSBS, the 2019 RBSA did not use customer information provided by investor-owned utilities to recruit for the study, largely because the condensed project timeline did not allow enough time, based on prior experience, to request and receive customer information. Instead, Cadmus constructed the study sample frame by randomly selecting single-family homes from New York State Department of Taxation and Finance tax assessment rolls. To reach postcard recipients who did not respond, Cadmus used a third-party data source, Marketing Systems Groups, to append telephone numbers to homes sampled from tax assessment data. Where necessary, such as for new homes in some EDRs, Cadmus purchased qualified mailing lists from a third party, Dynata (formerly Research Now SSI).

B.1.7 Recruitment Overview

The project team employed a multimode approach to recruiting. This approach used mail, telephone, and email outreach to encourage participation in a phone or online survey, recruiting from a sample of single-family existing and new homes. The survey asked respondents whether they would be interested in participating in a site visit, and those who agreed made up the sample frame for recruiting site visit participants. The project team provided an incentive of $20 to respondents who completed the telephone or online survey and an additional $100 to those who completed a site visit.

This process began by sending postcards (in batches) to a randomly selected set of households, encouraging them to complete the survey using a link to an online version or by calling a field agent using a toll-free number. Approximately 10 days after each mailing, the project team followed up with telephone calls to nonresponders for each record where a telephone number was matched to the sampled address. Additionally, NYSERDA followed up these attempts with an email reminder to a subset of nonresponders where email addresses were available.

As study team members responsible for completing site visits, Honeywell and PSD each handled recruiting and scheduling site visit participants from the group of survey respondents who expressed a willingness to participate. EDRs were divided among the two companies to avoid confusion during recruiting and to allow each company to realize efficiencies by focusing on a smaller geographic area.
B.1.8 Summary of Data Collection Activities

The 2019 RBSA sample design and recruitment led to completion of 2,419 surveys (2,223 online and 196 phone) between September 28, 2018, and December 3, 2018, as shown in Table 2. The project team completed 456 site visits between October 10 and December 15, 2018.

B.1.9 Climate Zones

The 62 counties within the State vary in climate from Climate Zone 4 to Climate Zone 6, as shown in Figure 4 and as defined in the 2009 and 2015 International Energy Conservation Code. Consistent with the 2015 RSBS, for the purpose of analyzing and presenting results, the 2019 RBSA project team grouped survey and site visit participants into the three climate zones by county, as shown in Figure 5.

B.1.10 Weights

The basic function of a weight is to estimate the number of homes each home represents. If 50 out of 1,000 homes are sampled in a given stratum, the resulting weight would be 20 (Population (N)/sample size (n)). For example, if a single ground-source heat pump is observed in one home (which represents 20 homes), you can estimate that 20 homes in the population have a ground-source heat pump. If you observe an average of eight LEDs in each home, you can estimate that the population of 1,000 homes includes 8,000 LEDs (50 homes * 8 bulbs * 20 weight, or 8 bulbs * 1,000 homes).

For the 2019 RBLSA, stratifying by climate zone within each home vintage—new and existing—results in six distinct strata:

- Climate Zone 4 Existing Homes.
- Climate Zone 5 Existing Homes.
- Climate Zone 6 Existing Homes.
- Climate Zone 4 New Homes.
- Climate Zone 5 New Homes.
- Climate Zone 6 New Homes.

The study assumed that the random sampling within each EDR resulted in representative samples of the populations in each of these six strata. Accordingly, when characterizing specific parameters within each stratum, applying sampling weights to the results is unnecessary.

When calculating totals, means, proportions, or other summary statistics for a population that encompasses more than one of the six strata, a sample weight must be applied to each observation to give it the appropriate contribution for the population. Cadmus calculated a weight for each of the six strata and for each primary data collection method—survey and site visit—by dividing the estimated population of single-family homes in that stratum by the achieved sample size in that stratum.

The analysis for a given characteristic often involved recalculating stratum weights to account for a smaller sample size, because in many cases values for a given characteristic were not known for some of the sampled homes. The project team calculated a new weight for each stratum as the stratum population (which was always the same for that stratum) divided by the number of homes in the sample with observed values. Cadmus recalculated weights only when the subset of homes with observed values were meant to be representative of the population of
that stratum. Site weights that assume a full sample size for each stratum are provided for each observation in the 2019 RBSA survey and site visit datasets.

Cadmus used 2016 American Community Survey (ACS) 5-Year Estimates to estimate the total population of homes in each climate zone and used “Building Permits Survey” data from census.gov to estimate new homes populations. Cadmus subtracted the new homes population from the total population to arrive at estimates for existing homes. Table 5 shows the population estimates used in the weighting calculations for survey and site visit observations. The B.2 Web and Telephone Survey and B.3 Site Visits sections provide tables with the survey weights for observations in both data collection methods.

B.1.11 Estimation Methods

Cadmus used SAS statistical software to calculate weighted mean and proportion tables presented in Appendix A. For tables presenting proportions and distributions, Cadmus used the SAS procedure PROC SURVEYFREQ. For tables presenting means, Cadmus used the SAS procedure PROC SURVEYMEANS. Inputs to these procedures are outlined in Table 6.

\(^b\) https://support.sas.com/documentation/cdl/en/statug/63033/HTML/default/viewer.htm#statug_surveymeans_sect006.htm
Estimates and standard errors produced using the methods outlined above are weighted estimates using stratified estimation methods and are representative of what is expected in the population based on the sample. To understand the methodology of the SAS procedures used in this analysis, or to perform this analysis with a different program, please see the B.1.11.1 Formulas section below.

B.1.11.1 Formulas

Formulas in this section allow estimation of whole-home metrics. If estimating at a component level, replace the population of homes (N) and sample size of homes (n) with the estimated population of components (M̂) and number of sampled components (m). The formulas in this section use the notation provided in Table 7 for stratified estimation.

**TABLE 7. NOTATION FOR STRATIFIED ESTIMATION**

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Y, y</td>
<td>Observation within population (upper case) or sample (lower case)</td>
</tr>
<tr>
<td>i</td>
<td>Home identifier</td>
</tr>
<tr>
<td>l</td>
<td>Stratum defined by a unique combination of climate zone and building type</td>
</tr>
<tr>
<td>N, n</td>
<td>Population of homes (upper case) and sample size (lower case) of homes</td>
</tr>
<tr>
<td>M̂, m</td>
<td>Estimated population of components (upper case) and sample size of components (lower case), where M̂ = N * m</td>
</tr>
</tbody>
</table>

Note that all estimates are parameter-level metrics but will use building-level population stratified estimation formulas. The population sizes, Nl, correspond to building population sizes in each of the six strata.

**B.1.11.1.1 Estimation within a Single Stratum**

Calculating means or proportions within a single stratum, such as for one climate zone and home vintage, does not require stratification weighting. Use the formulas for mean and proportion estimates in Equation 1 through Equation 4. These equations should be used only within a single stratum and, in most cases for the NYSERDA RBSA, Equation 5 through Equation 8 will also be necessary when conducting the analysis on a given characteristic.

**Equation 1: Means**

Means should be calculated using Equation 1, where yil represents the observed metric for home i in stratum l, nil represents the number of instances in the sample in stratum l with that metric observed, and ȳl represents the estimated mean of the observed metric in stratum l.

\[
\bar{y}_l = \frac{1}{n_l} \sum_{i=1}^{n_l} y_{il}
\]

**Equation 2: Stand Errors of Estimated Means**

Standard errors of the estimated means should be calculated using Equation 2, where the y_{il} and nil are the same as in Equation 1, Nl represents the population size of homes in stratum l, and \(SE(\bar{y}_l)\) represents the standard error of the estimated mean in stratum l. Again, this equation is valid only for results within a given stratum and additional equations will be needed when results span two or more strata.
Equation 3: Proportions
Proportions should be calculated using Equation 3, where \( n^* \) represents the number of observations with the characteristic of interest (for example, homes of a certain height) and \( n_l \) represents the number of homes in the sample in stratum \( l \) with a known value for that characteristic. For example, to estimate the proportion of doors within each weatherstripping category, calculate \( n^* \) by counting the number of doors in stratum \( l \) with known values, such as good, fair, poor, or none, then divide each \( n^* \) by \( n_l \), the total number of doors with weatherstripping observed in the stratum. The result will be one \( \hat{p}_l \) value for each characteristic (good, fair, poor, and none).

\[
\hat{p}_l = \frac{n^*_l}{n_l}
\]

Equation 4: Standard Errors of Estimated Proportions
Standard errors of estimated proportions should be calculated using Equation 4, where \( n_l \) is the same as above and \( N_l \) represents the population size of observations in stratum \( l \). The estimate from Equation 3 results in \( \hat{p}_l \), and \( SE(\hat{p}_l) \) represents the standard error of the estimated proportion in stratum \( l \).

\[
SE(\hat{p}_l) = \sqrt{\frac{1 - \frac{n_l}{N_l}}{\frac{n_l - 1}{n_l - 1}} \sum_{l=1}^{n_l} (y_{il} - \bar{y}_l)^2}
\]

B.1.11.1.2 Stratified Estimation: Combining Multiple Strata
Estimating means or proportions for populations that include multiple combined strata requires stratification weighting. Equation 5 through Equation 8 should be used to estimate values that represent more than one stratum, such as statewide values and values that represent all homes (new and existing) within each climate zone. These build on Equation 1 through Equation 4 above.

Equation 5: Combined Means
Means should be calculated using Equation 5, where \( \bar{y}_l \) is the mean within stratum \( l \) and \( N_l \) is the population size of homes in stratum \( l \). The products of the population sizes and mean estimates should be summed, then divided by the sum of the population sizes. In the summation notation, \( L \) represents the total number of strata. The result is a combined mean estimate, \( \bar{y} \). For example, to estimate the mean conditioned floor area for the State, the user should assign \( l=1 \) to \( 6 \) to represent the six strata defined for the study. The user should sum the population sizes from the six strata to calculate the denominator in Equation 5 and divide the sum of the product of each stratum population size \( N_l \) with the stratum mean estimate \( \bar{y}_l \) by the summed population sizes.

\[
\bar{y} = \frac{\sum_{l=1}^{L} N_l * \bar{y}_l}{\sum_{l=1}^{L} N_l}
\]
Equation 6: Standard Errors of Estimated Means

Standard errors of estimated means should be calculated using Equation 6 with the standard error of the estimated mean in each stratum \( l \), \( SE(\bar{y}_l) \), defined above in Equation 2. The products of the squared population sizes, \( N_l \), should be summed with the squared mean standard errors, \( SE(\bar{y}_l) \), then the square root of the sum should be divided by the sum of the population sizes.

\[
SE(\bar{y}) = \frac{1}{\sum_{l=1}^{L} N_l} \sqrt{\sum_{l=1}^{L} N_l^2 \cdot SE(\bar{y}_l)^2}
\]

Equation 7: Proportions

Proportions should be calculated using Equation 7, where \( \hat{p}_l \) represents the proportion in each stratum \( l \) and is defined above in Equation 3. The population size, \( N_l \), represents the number of homes in each stratum \( l \). Similar to the combined mean estimate, the product of the population sizes and the strata proportions should be summed, then divided by the sum of the strata population sizes.

\[
\hat{p} = \frac{\sum_{l=1}^{L} N_l \cdot \hat{p}_l}{\sum_{l=1}^{L} N_l}
\]

Equation 8: Standard Errors of Combined Proportion Estimates

Standard errors of the combined proportion estimates should be calculated using Equation 8, with the standard error of the estimated proportion in each stratum, \( SE(\hat{p}_l) \), calculated using Equation 4 and the strata population sizes \( N_l \). The product of the squared population sizes, \( N_l \), and squared standard errors, \( SE(\hat{p}_l) \), should be summed in each stratum, then square root of the sum should be divided by the sum of the population sizes.

\[
SE(\hat{p}) = \sqrt{\frac{\sum_{l=1}^{L} N_l^2 \cdot SE(\hat{p}_l)^2}{\sum_{l=1}^{L} N_l}}
\]

B.1.12 Comparisons of Weighted Data to Other Data Sources

Cadmus compared weighted results from survey and site visit data to numerous sources, including the following:

- 2016 U.S. Energy Information Administration Electric Sales, Revenue, and Average Price, Table 5.a.

Table 8 shows a comparison of weighted 2019 RBSA statewide results for several key characteristics. Most of the values in the Other State Data Sources column are available only for single-family and multifamily homes combined, making direct comparisons between the 2015 RSBS and 2019 RBSA study results difficult. In addition, the annual energy consumption results for the 2019 RBSA are not directly comparable with those shown for the 2015 RSBS, because the 2019 estimates are based on data taken from bills during site visits; in contrast, the 2015 RSBS results were calculated for survey respondents’ using billing data provided by utilities, which was not practical for the 2019 RBSA given its accelerated timeline.
While Table 8 shows statistically significant differences between the 2019 RBSA and 2015 RSBS studies for several characteristics, values for key parameters such as home size, annual energy consumption, and number of occupants speak well for the representativeness of the sample. As noted in Volume 5 of the 2015 RSBS report, most metrics that may indicate bias in the sample, such as high educational attainment and relatively high income, apply to the home occupants rather than to the home itself, which was the sampling unit for the study. In addition, it is possible that survey respondents may exaggerate their household income and educational attainment.

As noted in reporting for the 2015 RSBS, some of the observed differences in demographic data between the current study and benchmark sources, such as the differences in education, could be explained by differences in methodology. The 2019 RBSA estimates that 39% of households or building units have at least one household member with a graduate degree. In comparison, about 15.4% of respondents to the ACS reported that they have a graduate degree. Note that the 2019 RBSA survey collected the highest level of educational attainment for anyone in household, which may have been interpreted to include grown children who had moved away, while the ACS collected the highest level of education of only the respondent.

B.1.13 Statistical Confidence, Precision, and Error Bounds

As mentioned in the B.1.5 Sample Design section above, Cadmus developed a sampling plan with the goal of achieving 90% confidence and ±10% precision for most parameters of interest statewide. Precision represents uncertainty with a level of confidence. When the study achieves ±10% precision at the 90% confidence level, one can be 90% confident that any random sample of the same population would yield a result within ±10% of the study’s result.

Data tables provided in Appendix A include error bounds for all values. Cadmus calculated the error bounds as the standard error multiplied by a t-statistic, and they provide the half-width of the 90% confidence interval. Error bounds are equivalent to absolute precision and have the same units as the estimate. When reporting precision, absolute precision is typically reported for percentages or distributions, while relative precision is typically reported for means or totals. To calculate the relative precision for a given mean or total, divide the error bound by the associated estimate. With percentages, the reported error bound represents the absolute precision.

With a total sample size of 2,419 across the six strata, the precision for survey results easily falls within the target 90/10 for the State and for each stratum except Climate Zone 4 new homes. Even with that stratum, however, the survey sample size of 38 often delivers results within the 90/10 target given the relatively small coefficients of variation for many characteristics in new homes.

Site visit results for key metrics easily fall within the 90/10 target at the statewide level, with a total sample size of 456 sites, and often meet 90/10 within climate zones. For one key metric mentioned above in the B.1.5 Sample Design section, average air leakage expressed in air changes per hour (ACH50), analysis showed a relative precision of ±7% statewide at the 90% confidence level, ±13% for Climate Zone 4, ±8% for Climate Zone 5, and ±17% for Climate Zone 6. That said, it is worth keeping in mind that air leakage rates in existing homes are highly variable, making it difficult to obtain good precision for this variable.
With a site visit sample size of only five, results for the Climate Zone 4 new homes stratum generally yield poor precision and should not be considered representative due to the small sample size.

B.2 WEB AND TELEPHONE SURVEY

B.2.1 Summary of Approach

The RBSA web and phone survey collected data from September 28, 2018, through December 3, 2018, and allowed participation by telephone or web. Using input from NYSERDA’s evaluation and program staff, Cadmus designed the survey to closely align with the 2015 RSBS baseline survey to ensure that results could be compared. The survey and survey programming were reviewed and approved by NYSERDA prior to the launch.

Additional questions for the 2019 RBSA collected information about several factors:
- Connected devices.
- Smart thermostats.
- Number of ductless mini-split heat pumps installed.
- Supplemental heating systems.
- Willingness to pay at various levels for high-efficiency equipment.
- Utility bill payment and assistance.

The key objectives of the survey were to provide up-to-date, self-reported estimates of equipment types, fuel types and uses, vintages, and efficiencies, as well as information about building characteristics, demographics, homeowner energy consumption attitudes and behaviors, participation in energy efficiency programs, and willingness to pay for different types of efficient equipment. Additionally, the survey was used to recruit households for site visits.

Honeywell conducted the telephone surveys. Phone staff made multiple attempts to reach potential respondents on different days of the week and different times of the day.

The project team offered survey respondents the option to receive a $20 Amazon gift card electronically through email or as a physical gift card mailed to them for their participation in the survey. If requested, the survey respondents were provided with an optional pre-paid Visa card. The project team distributed gift cards on a weekly basis.

B.2.2 Sampling

To identify recipients for RBSA recruiting postcards, Cadmus began by drawing a random sample of single-family households from the 2015 to 2017 New York State Department of Taxation and Finance tax assessment rolls within each EDR. The tax assessment rolls did not include phone numbers or email records. Cadmus matched phone numbers for 85% of the sampled records using a third-party data source, Marketing Systems Groups, to allow outreach to nonresponders by phone.

The tax assessment rolls included ample homes for the existing homes sample (homes built before 2015) for most EDRs but provided too few new homes records to adequately support recruiting for new homes. In addition, the tax assessment roll data included no homes in the New York City EDR and several counties elsewhere in the State. The data included very few new homes in Long Island. After consultation with NYSERDA, Cadmus purchased address lists...
for New York City, new homes, and other segments as needed from a third-party data source, Dynata. Forty-four percent of purchased new homes records included a phone number.

B.2.3 Response Rates

To recruit survey recipients, the project team mailed postcards to randomly selected homes within each EDR in sufficient numbers to reach the site visit goals, where practical. Designed by Honeywell under the direction of NYSERDA and Cadmus, the postcards (see Figure 6 and Figure 7) invited recipients to complete the survey online or by phone and provided a toll-free number. The postcards noted that the survey was offered in Spanish, and Honeywell provided phone staff to conduct surveys in English or Spanish at a toll-free number. Honeywell phone staff also attempted to contact postcard recipients by phone who had not responded.

Your survey ID is Xxxxxx
Like the 2015 RSBS, the 2019 RBSA offered a $20 gift card to respondents who completed the survey, along with an additional $100 gift card to those who went on to complete a site visit. As a default, Cadmus provided an electronic Amazon gift card, which was delivered by email. Alternatively, physical Visa and Amazon gift cards were available on request.

Cadmus built its initial recruiting plan around the 13.6% response rate reported for the previous study. In practice, given the recruiting methodology available during the short timeline and the timing of the November 2018 elections, the actual response rate proved much lower. The project team mailed postcards in successive batches, adjusting the timing, targeted EDRs, and quantities as necessary, with the goal of meeting site visit targets while also minimizing cost. Overall, the project team mailed 138,281 postcards (in addition to sending an email blast to 3,994 recipients) and achieved a response rate of 2%, as shown in Table 10.

Table 10 also shows disposition and response rate by EDR, which ranged from 1% for New York City and Long Island to 3% for Capital District, Finger Lakes, and North Country. Despite rigorous call attempts to postcard recipients who had not responded, an unexpectedly small number of survey respondents—196 of 2,419—opted to complete the survey by phone.

<sup>a</sup> The response rate was calculated as the number of completed telephone and web surveys divided by the total sampled.

<sup>b</sup> The cooperation rate was calculated as the number of completed telephone and web surveys divided by the total sampled minus invalid phone numbers, business lines, language barriers, and ineligible cases.
B.2.4 Data Cleaning

Cadmus performed mostly minimal cleaning of the survey data, largely in the spirit of preserving participant responses, but did make two substantive changes to the survey data.

- Consistent with the 2015 RSBS, the 2019 RBSA survey included “baseboard heat” as an option for the primary heating system, without specifying what type of baseboard heat. Cadmus noted that 200 survey respondents identified their primary heating fuel as something other than electricity and identified their primary heating type as baseboard heat. Cadmus changed the primary heating system for these respondents to “Steam/hot water system with radiators or pipes in each room (central boiler).”

- An unrealistically large number of survey respondents—340—identified their water heating equipment as a heat pump water heater. Roughly 60% of these identified their water heating fuel as natural gas or another fossil fuel rather than electricity. For the 61 sites that were also included in the site visit sample, site visit data showed that only eight had heat pump water heaters, and roughly 80% of the 61 had correctly identified their water heating fuel type. After consultation with NYSERDA, Cadmus changed water heater type to “Don’t know” for 208 survey respondents who identified their water heater as a heat pump water heater but identified their water heater fuel as something other than electricity.

Data cleaning and QC entailed making the styling, capitalization, and spelling of entered values (such as utility names) consistent and categorizing “Other” responses within predefined categories as appropriate.

B.2.5 Stratification Weights

When calculating totals, means, proportions, or other summary statistics for a population that encompasses more than one of the six strata, a sample weight must be applied to each observation to give it the appropriate contribution for the population. Cadmus calculated a weight for each of the six strata by dividing the estimated population of single-family homes in that stratum by the achieved sample size. Table 11 shows the population, survey completion, and calculated survey weight for each of the six strata.

B.2.6 Limitations and Suggestions for Future Studies

The 2019 RBSA survey was an overall success, providing important and useful data for 2,419 respondents throughout the State and creating ample recruits for site visits in most strata. This section highlights the methodologies and choices that worked especially well and then describes challenges and limitations to consider for any future iterations of the project.
Several aspects of the 2019 RBSA survey methodology and process worked well:

- Sampling and recruiting by EDR ensured that the sample included homes throughout the State and provided a convenient geographic structure for organizing and assigning site visits.
- The electronic Amazon gift cards were well-received by most recipients and providing the gift cards to recipients was a relatively easy task to manage. Some people preferred physical gift cards, which increased expense and logistical overhead somewhat.
- Having the 2015 RSBS survey instrument as a starting point was essential to the project team’s ability to deploy the 2019 RBSA survey within the allowed timeframe.

The following items summarize limitations of the methodology and data and provide a few suggestions for future iterations of the project:

- The recruiting approach (using utility customer data) for the 2015 RSBS resulted in an impressive response rate of 13.6% and should be used in future efforts if the project timeline will allow. Providing a lengthy enough timeline to allow the sample to be drawn from utility customer data appears to be key, at least partly because it may allow the study to receive accurate names, telephone numbers, and possibly even email addresses. Being able to recruit through mail, telephone calls, and particularly email would help to reduce the cost of contacting potential respondents and help to achieve the most representative sample practical.
- Survey recruiting succeeded in achieving more than adequate survey sample sizes for most strata, but new home survey completes were not high enough for either Climate Zone 4 or Climate Zone 6 to support meeting site visit goals in those climate zones.
- The comparatively small number of new homes in the State makes meeting new homes quotas especially difficult. If characterizing new homes remains a high priority, special care should be taken to construct a new homes sample from all available sources, focusing especially on EDRs in Climate Zone 4 and Climate Zone 6. These sources should include tax assessment data, purchased sample, and possibly even address lists from high-volume builders. Social media may also prove useful. This approach should be combined with a more deliberate recruiting methodology, such as the one used for the 2015 RSBS, to get the most responses from this typically small population of homes.
- Despite thorough investigation of the tax assessment roll data, Cadmus was able to identify only a small number of quadplexes, and these homes may have been underrepresented in the data.
- Survey length likely contributed to the low response rate for the 2019 RBSA. The survey used the 2015 RSBS survey script as a starting point, but numerous questions were added to investigate respondents’ willingness to pay for different types of energy efficiency improvements and to collect data on additional types of equipment, such as connected devices and smart thermostats. After removing surveys that took longer than two hours, the average survey length was 38 minutes (n=2,216); after removing surveys that took longer than one hour, the average survey length was 33 minutes (n=1,980).
- The fall 2018 elections likely had a significant effect on both overall response rate and the ability of Honeywell phone staff to reach potential respondents by phone. Election-related postcards and letters made it less likely that RBSA postcards would be noticed, and the high volume of robocalls during that period may have caused many potential respondents to avoid answering the phone. Response rates may be higher in the future if the study can be timed to avoid competing with election-related marketing.
- NYSERDA is moving away from offering financial incentives. To allow for a sampling and recruiting approach that eliminates financial incentives, NYSERDA may want to
consider alternative forms of incentives, such as energy saver kits or home energy reports. The challenge will be to find an alternative to financial incentives that works but does not bias the sample more toward those who most value energy efficiency. Cadmus' experience is that financial incentives are critical to securing homeowner participation in surveys and site visits, and the project team recommends that any alternative approach be tested with surveys only and well in advance of the start of site visits.

- In isolated cases, survey response options (such as for baseboard heat) failed to adequately distinguish between the relevant technologies or choices. Should the study be replicated, the next project team should continue to improve the survey instrument.
- Some survey questions appear to require more knowledge about a given topic than many respondents possess, as evidenced by the 340 respondents mentioned above who reported having a heat pump water heater. While surveys excel at collecting many data points accurately and economically, this example underscores the value of and need to continue having site visits in future updates to the study. Being able to compare data from the two sources—sometimes for the same homes—allows confirmation that results are solid and helps identify cases where one data collection method may not be delivering an accurate result.

**B.3 SITE VISITS**

**B.3.1 Summary of Approach**

The project team conducted all site visits between October 10, 2018, and December 15, 2018, after a two-day in-person training for Honeywell and PSD project field staff. Under the direction of NYSERDA and Cadmus, PSD completed all new homes site visits through contracted HERS Raters. PSD also completed 170 existing homes site visits, while Honeywell staff completed 191 existing home site visits. All existing homes site visits were completed by HERS Raters or professionals holding Building Performance Institute (BPI) credentials.

For the RBSA survey, site visit data collection generally followed 2015 RSBS data scope and methods, including generating a HERS score for each new home and running blower door tests on all homes where allowed under Residential Energy Services Network (RESNET) and BPI standards. New data collected for the 2019 RBSA included several measures:

- Connected devices.
- Smart thermostats.
- LED bulbs.
- Extensive information about heat pump systems.

**B.3.2 Sampling and Recruitment**

As study team members responsible for completing site visits, Honeywell and PSD handled recruiting and scheduling of site visit participants from the group of survey respondents who expressed a willingness to participate. EDRs were divided between the two companies to avoid confusion during recruiting and to allow each company to realize efficiencies by focusing on a smaller geographic area. The project team provided site visit participants with an additional $100 gift card. Table 12 shows site visit completions by EDR and home vintage.

B.3.3 Response Rates

The percentage of survey respondents willing to schedule a site visit was relatively high, at 18.9%, as shown in Table 13. On the other hand, the site visit response rate calculated as a percentage of mailed postcards was below 1% for every EDR and was 0.3% overall. Recruiting proved most difficult in Long Island, where the site visit response rate from postcards was a mere 0.1%.

B.3.4 Safety

The project team placed the highest priority on the safety of field staff and participants. Field staff were trained to follow strict carbon monoxide and gas leak protocols, which were developed for the 2015 RSBS. An additional, separate safety protocol developed for the 2019 RBRSa provided further guidance about general safety in participants’ homes, including basics such as ladder safety and removing oneself from unsafe conditions.
B.3.5 Data Quality
The project team ensured a high level of data quality through multi-layered quality assurance and QC processes:
- Field technician training.
- Data collection tool.
- QC site visits.
- Data collection protocols.
- Weekly meetings.
- Data collection tool completeness checks.
- Phase I data cleaning and QC (conducted by PSD).
- Phase II data cleaning and QC (conducted by Cadmus).

B.3.5.1 Field Technician Training
All field staff deployed by PSD and Honeywell hold BPI certifications or are certified HERS Raters, and all are experienced with blower door equipment and other facets of home energy site visits. With oversight and contributions from NYSERDA and Cadmus, PSD performed the initial, two-day in-person project training for PSD, Honeywell, and Cadmus field staff at the NYSERDA offices and at a residential off-site setting. The presenters recorded each classroom session to allow trainees to review the content later and to support training of technicians who could not attend the in-person training on the scheduled dates.

PSD and Cadmus subsequently completed two additional rounds of training for field staff who could not attend the initial training or who were brought onto the project at a later date. These trainings required that the field staff view all recorded sessions from the in-person training as well as participate in a live webinar training. Field staff were also required to shadow a previously trained field technician on a site visit before conducting a site visit on their own.

B.3.5.2 Data Collection Tool
Field staff captured and submitted site visit data using the iPad-based PSD data collection tool, which was an improved version of the software PSD deployed for the 2015 RSBS. One improvement that helped ensure a high level of data quality was a completeness check, which required that all inputs be provided before the data for a given site could be submitted as final. Cloud-based syncing helped minimize the possibility that collected data would be lost, and more data than for the 2015 RSBS were collected through drop-down menus instead of text entry, which provided consistency in data entry. The data collection tool and all data handling processes were implemented with enhanced security in accordance with NYSERDA protocols.

B.3.5.3 Quality Control Site Visits
Cadmus performed follow-up QC site visits for approximately 10% of the site visits performed by each field technician to identify and correct data collection problems. Cadmus staff scheduled, conducted, and evaluated these visits, providing an additional $100 gift card to each participant. During QC data collection, the Cadmus field technician reviewed a copy of the original site report and noted any differences between that report and their own findings. After each QC site visit, Cadmus sent a summary of any identified data collection errors to the relevant field management staff at PSD or Honeywell, who shared the discrepancies with the field technician. QC site visits occurred during the data collection period to allow Cadmus, PSD, and Honeywell to correct any data collection issues before subsequent site visits. In addition, data corrections
for all 50 QCd sites were incorporated into the database during the data cleaning and QC process.

**B.3.5.4 Weekly Field Staff Meetings**

With input and participation from Cadmus, PSD conducted weekly meetings with project field staff from PSD and Honeywell during the period of data collection from early October 2018 to mid-December 2018. Field staff were required to attend the meetings if they were not in the field at that time and if they had completed one or more site visits that week or were scheduled to complete at least one site visit the following week. These meetings provided a mechanism for Cadmus and PSD to reinforce key concepts and were often informed by issues noted during the QC site visits. The meetings also gave field staff a weekly forum for asking questions and raising any issues or concerns regarding the data collection tool, data collection protocols, or other topics related to the site visits.

**B.3.5.5 Data Collection Protocols**

Cadmus created data collection protocols for major data collection categories, such as heating and cooling equipment, building envelope details, and appliances. Given the short project timeline, the data collection protocol documents did not pass through the formal review processes in time to be shared with the field technicians, but the process of generating and reviewing the documents helped ensure that Cadmus and PSD were aligned regarding how data should be collected, which in turn informed communication with field staff and updates to the PSD data collection tool. The data collection protocols will also a valuable resource for those who use the data and need a better understanding of how specific data points were captured, as well as for project staff working on future iterations of the project.

**B.3.5.6 Quality Control and Data Cleaning**

Project staff ensured a high level of data quality through a multi-layered, two-phase approach to QC. The initial phase of QC, which was performed by PSD, included several tasks:

- An initial completeness review.
- An examination of key fields for technical inconsistencies and identification of apparent discrepancies for deeper, technical review.
- Resolution of identified technical discrepancies.
- Extensive cleaning of successive batches of site data using a combination of automated and manual checks.

PSD implemented the automated checks based on checks it identified and on a list provided by Cadmus, which defined numerous data quality checks related to value ranges and consistency across values.

After receiving each batch of draft, clean data, Cadmus performed additional, in-depth data cleaning and QC. The process comprised multiple layers of tasks and included a combination of automated and manual checks:

- Cadmus checked records for completion, verified that values fell within expected ranges, and checked for internal consistency. Project staff verified internal consistency through a QC punch list for each record type. The punch list outlined checks for specific combinations of information within the record.
  - An example of completion: If a furnace record was missing a key field—such as heating capacity—the record was flagged for deeper review.
  - An example of expected ranges: If a furnace record’s heating capacity was entered as “12” and the heating capacity units were entered as “Btuh,” the record was
flagged for deeper review, because 12 Btuh is not within the expected range for furnace heating capacities.

- An example of internal consistency: If a furnace record’s fuel type was entered as “Electricity” and the heating capacity units were entered as “Btuh,” the record was flagged for deeper review, because capacity for electric HVAC equipment typically is not reported in British thermal units.

- For discrepancies found during the 50 sites where QC site visits were performed, Cadmus updated information collected during the original site visit with data collected during the QC site visit. For the QC site visits, technicians were provided with the original set of information collected on site and were directed to verify that the conditions on were accurately reflected in the data. Where necessary, the QC technicians recorded updates or new information.

- Cadmus performed site-level checks to detect and correct contradictory information that may have been entered on site, as well as to identify potential gaps in the site visit data. As an example, if a home’s primary heating system was identified as a gas furnace but no gas utility was entered for the site, that site was flagged for review.

After each site and record was checked for completion and internal consistency, records and sites that had been flagged were reviewed by veteran field staff. Some equipment categories, such as mechanical equipment and building envelope, also received a more rigorous review by subject matter experts. Updates and corrections to the data were validated by reviewing photos and notes from the original site visit, by reviewing photos, notes, and data collected during the QC site visits, by confirming information through online databases, and by comparing site data against the survey or tax assessment data.

Data cleaning continued into the data analysis phase. As preliminary results became available, they were reviewed by a team of subject matter experts. In the case of unusual or unexpected results, the data quality team conducted a detailed review of the information in question using the resources outlined above.

### B.3.5.7 Inferred Values

Insulation values such as type and thickness often cannot be collected during site visits when attic or crawlspace are inaccessible or walls cannot be probed. For certain cases, Cadmus inferred insulation values based on various criteria, including New York State Building Code requirements. Cadmus created a chart for State building code—required R-values and U-factors for floors, walls, ceilings, windows, and slabs. State code insulation values were determined for each home based on an assortment of criteria, including the year the home was built (and the corresponding State code requirements for that year), the county, the heating/cooling equipment efficiency, and the glazing area percentage.

Cadmus also created separate R-value and U-factor tables for general insulation and window values, respectively. The R-value table summarized average R-values per inch for various insulation types. Wherever possible, these values were determined from American Society of Heating, Refrigerating and Air-Conditioning Engineers or U.S. Department of Energy standards. Cadmus also mapped combinations of various window frame and glazing types to window U-factors using National Renewable Energy Laboratory data. Low-e glazing types were assumed to have the same U-factor as non-low-e glazing types, because an accurate and comprehensive U-factor database for low-e glazing types was not available.

To determine inferred inches of insulation, Cadmus divided the State code R-value by the average R-value per inch for the known insulation type. If the insulation type was not known, the
team used an average R-value per inch of 3.0. For wall insulation, where at least two compliance paths were allowed, Cadmus assumed that all insulation was provided in the wall cavities. Insulation type and/or thickness values were inferred for 38 homes in total—23 existing homes and 15 new homes. A data source column in the RBSA site visit dataset indicates whether the insulation values or a given envelope surface were observed or inferred, though in some cases values were inferred by field staff based on other information available on the site.

Window U-factors are not readily available on site, especially in older homes. Cadmus directed field staff to collect only documented U-factor values, but the collected data often included U-factors that appeared to be estimates. To provide U-factors for energy modeling or other purposes, Cadmus inferred window U-factor values based on the State building code requirements in force at the time of the home’s construction (if any) and on window frame and glazing type. Cadmus retained U-factors recorded on site only if the building was a new home and the U-factor met State code. For new and existing homes, if the U-factor did not meet State code requirements, the project team replaced the U-factor with a value from either the State code in force at the time of the home’s construction or from the window assembly table, using whichever value was smaller. Inferred window U-values were applied to 361 existing homes and 18 new homes. A data source column in the RBSA site visit dataset indicates whether a given U-factor value was inferred or collected.

Where applicable throughout the RBSA site visit dataset, data source columns provide an indication of whether provided values (such as year of manufacture or heating equipment efficiency) were known, estimated, or inferred.

### B.3.6 Stratification Weights

When calculating totals, means, proportions, or other summary statistics for a population that encompasses more than one of the six strata, a sample weight must be applied to each observation to provide the appropriate contribution for the population. Cadmus calculated a weight for each of the six strata by dividing the estimated population of single-family homes in that stratum by the achieved site visit sample size. Table 14 shows the population, site visit completion, and calculated survey weight for each of the six strata.

### B.3.7 Limitations and Suggestions for Future Studies

The 2019 RBSA achieved the impressive feat of completing 456 site visits within four months of project award, including assembling the project team, updating necessary project tools and documentation, and implementing all aspects of the required recruiting infrastructure and processes. At the same time, the data quality steps outlined above ensured that the project delivered high-quality data. This section summarizes aspects of the project methodology and processes that worked well, along with areas for improving the next iteration of the study. This section also addresses any notable data reliability issues.
Aspects of the 2019 RBSA site visit methodology and process that worked well include the following:

• With the accelerated timeline of the project, PSD’s ability to update the iPad data collection tool used in the 2015 RSBS quickly enough to support October data collection was critical to project success. In addition, though completing upgrades to the tool carried over into the data collection period, the software proved to be an efficient and reliable data collection solution.

• Distributing site visits among PSD and Honeywell allowed enough bandwidth to complete the site visits within the provided amount of time.

• Recruiting for site visits from the pool of survey respondents generally met expectations, with a response rate of nearly 20%.

• The electronic Amazon gift cards were well-received by most recipients, and providing the cards to recipients was a relatively easy task to manage.

• QC site visits proved invaluable for identifying and correcting data collection problems, whether they resulted from misunderstandings or a lack of alignment regarding the required level of effort. Notable isolated problems found early in the project included incorrectly characterized lighting by some field staff, particularly where bulbs were concealed by shades, and insulation values in accessible attic spaces that appeared to have been assumed rather than observed. Quick action by Cadmus, PSD, and Honeywell helped correct these and other early issues.

• As noted above, weekly field staff meetings were helpful for providing essential communication between field staff and management, and developing the data collection protocols ensured that project team members from Cadmus and PSD had the same understanding of how data points would be collected.

• Extensive data cleaning and QC from PSD and Cadmus provided high-quality, useful data. Combining automated checks with intensive site- and measure-level reviews by subject matter experts allowed for discrepancies and other data quality problems to be identified and corrected, often by reviewing field technician notes and photographs.

• Completing all site visits by mid-December avoided most weather-related problems, which helped minimize the need to cancel or reschedule site visits.

• Of 267 site visit participants who responded to questions about customer satisfaction in a follow-up survey, 99% (264) reported being somewhat or very satisfied with the site visit, and 90% (237) reported being very satisfied. The most common feedback was that participants wanted a report summarizing site visit results, which was not a component of this study.

The following items summarize limitations of the methodology and data and include suggestions for future iterations of the project:

• As mentioned in the B.2.6 Limitations and Suggestions for Future Studies section for surveys above, the recruiting approach used for the 2015 RSBS resulted in an impressive response rate of 13.6% and should be used in future efforts if practical within the project timeline. A long enough timeline to allow the sample to be drawn from utility customer data appears to be key, at least partly because it may allow the study to receive accurate names, telephone numbers, and possibly even email addresses. Being able to recruit through mail, telephone calls, and particularly email would help to reduce the cost of contacting potential respondents and help to achieve the most representative sample practical.
The most notable limitation of project data resulted from the small sample size of only five site visits for new homes completed in Climate Zone 4, which comprises New York City, Long Island, and the Mid-Hudson EDRs. With a sample size of only five homes, results for the Climate Zone 4 new homes stratum cannot be considered representative. After consultation with NYSERDA, Cadmus shaded results for that stratum in data tables that focus on new homes. Further, Cadmus removed observations from those five homes from all other calculations to eliminate the possibility of their introducing significant skew to other results.

As mentioned in the survey limitations and recommendations above, if characterizing new homes remains a high priority, special care should be taken to construct a new homes sample from all available sources, focusing especially on EDRs in Climate Zone 4 and Climate Zone 6. These sources should include tax assessment data, purchased sample, and possibly even address lists from high-volume builders. Social media may also prove useful. This approach should be combined with a more deliberate recruiting methodology, such as the one used for the 2015 RSBS, to obtain the most responses from this typically small population of homes.

The accelerated timeline caused many challenges with deploying field staff and the necessary tools and processes. A longer timeline would allow for more flexibility in project planning. Extending the length of time available for completing site visits would also allow the field work to be completed with fewer field staff, which would simplify project planning and support greater consistency in data collection.

The lower-than-expected response rates caused a slower ramp up in site visits, because fewer survey respondents than expected were available to recruit for site visits. This put further pressure on PSD and Honeywell to complete a high volume of site visits in a short period of time. After consultation with NYSERDA, Cadmus was able to shift the expected timeline to complete site visits by December 15, 2018, instead of November 30. This allowed time for the rapid scale-up in recruiting to take effect, especially for new home participants.

As expected, surveys and site visits delivered notably different results for some characteristics. While the large discrepancy in the number of reported heat pump water heaters is an obvious example that is difficult to fully explain, less dramatic discrepancies such as different reported percentages of appliances with ENERGY STAR ratings result at least partly from differences in methodology: survey questions ask about ENERGY STAR ratings only for appliances less than 10 years old, while site visits collected that data for appliances of any age. Appendix A provides results for many metrics from both survey and site visit data. Where results differ between survey and site visit data, Cadmus endeavored in the report to identify the more credible source using engineering judgement, available market penetration/saturation benchmarks, and other information.

Cadmus recommends that in future studies, the project team continue to align survey and site visit methodology where this can be accomplished without losing the ability to compare key findings with results from the previous study.
APPENDIX C. SURVEY INSTRUMENT

This appendix presents the survey script used during the NYSERDA 2019 Residential Building Stock Assessment (RBSA), for which in-depth surveys were completed with 2,419 occupants of single-family homes throughout the 10 Economic Development Regions of New York State.

The key objectives of the survey were to provide up-to-date, self-reported estimates of equipment types, fuel types and uses, vintages, and efficiencies, as well as information about building characteristics, demographics, homeowner energy consumption attitudes and behaviors, participation in energy efficiency programs, and willingness to pay for different types of efficient equipment. Additionally, the surveys were used to recruit households for site visits.

The RBSA online and phone survey collected data from September 28, 2018, through December 3, 2018. Using input from the New York State Energy Research and Development Authority’s (NYSERDA) evaluation and program staff, Cadmus designed the survey to closely align with the 2015 RSBS baseline survey to ensure that results could be compared. The survey and survey programming were reviewed and approved by NYSERDA prior to the launch.

Questions added for the 2019 RBSA collected information about several details:

- Connected devices
- Smart thermostats
- Number of ductless mini-split heat pumps installed
- Supplemental heating systems
- Willingness to pay at various levels for high-efficiency equipment
- Utility bill payment and assistance

The project team recruited participants to complete this survey either online or by telephone using a multimode approach. The process began with mailing postcards to a random sample of single-family households. These postcards encouraged recipients to complete the survey in English or Spanish using a link to an online version or by calling a field agent using a toll-free number.

Postcards were sent in batches. Approximately 10 days after each mailing, the project team followed up with telephone calls to non-responders for each record where a telephone number was matched to the sampled address. Additionally, NYSERDA followed up these attempts with an email reminder to a subset of non-responders where email addresses were available.

The survey asked respondents whether they would be interested in participating in a site visit, and respondents who said yes made up the sample frame for recruiting site visit participants. The RBSA provided an incentive of $20 to participants who completed the survey and an additional $100 to participants who completed a site visit.
The question included several survey modules:

- Introduction
- Screener
- Building Shell (Section B)
- ENERGY STAR® Awareness (Section E)
- Kitchen Appliances (Section K)
- Heating and Cooling (Section H)
- Water Heating (Section WH)
- Clothes Washing and Drying (Section C)
- Home Lighting (Section L)
- Pool and Spa (Section P)
- Small Household Appliances (Section A)
- Miscellaneous Equipment (Section M)
- Internet Enabled Devices (Section I)
- Utility Company (Section U)
- Energy Efficiency (Section F)
- Purchase Decisions (W)
- Demographics and Recruitment (Section D)

NOTE:

- A code of (-8) means don’t know.
- A code of (-9) means Prefer not to answer.
- Questions were asked of all respondents unless indicated otherwise.
- Categories were read to respondents.
- Respondents were allowed to leave questions blank to move forward in the survey. If a respondent answered some of the categories, then the empty categories were assumed to be zero.
Introduction

INTRO_1 (web) Thank you for taking time out of your busy schedule to provide information on your household’s energy use. The first eight questions will confirm your eligibility. If you are eligible and complete the survey, as a token of our appreciation, we will send you a $20 electronic Amazon gift card upon completion of the survey.

If you would like to complete the survey by phone, please call (844) 756-2858 or send an email to NYSERDASurvey@honeywell.com.

If you experience any technical difficulties, please contact Amanda McLeod by emailing Amanda.McLeod@Cadmusgroup.com or calling (617) 673-7115.

You may exit the survey at any time and your answers will be saved. Re-enter the same ID to come back and complete your survey.

For answers to frequently asked questions, click here (a new window will open).

If you have any questions about the content or use of this survey, you can visit the research study website at www.nyserda.ny.gov/2018-RBSA or by calling (844) 756-2858.

INTRO_2 (web) We are surveying residential customers on behalf of the New York State Energy Research and Development Authority (NYSERDA) to learn more about household energy using equipment and opinions on energy use.

Please be assured that the information you provide will be kept confidential to the extent permitted by law. NYSERDA will only use summary-level data and will not identify individual respondents. This information will be used to design energy efficiency programs to help households throughout New York State increase energy efficiency and reduce energy consumption.

INTRO_3 (WEB) Please enter the survey ID from the NYSERDA postcard in the box below and click the arrow button to enter the survey.

INTRO (phone) Hello, my name is ______________ and I’m calling on behalf of the New York State Energy Research and Development Authority, or NYSERDA. May I please speak with [FIRST NAME] [LAST NAME]?

This is not a sales call. You may have recently received a postcard regarding an important energy study NYSERDA is conducting to learn more about households’ energy using equipment. Our records show that your survey has not been completed and we would like to complete the survey over the phone.

The first eight questions will confirm your eligibility. If you are eligible and complete the survey, as a token of our appreciation, we will send you a $20 electronic Amazon gift card upon completion of the survey. Our records show that your survey has not been completed, and we would like to complete the survey over the phone. The survey will take between 15 and 30 minutes depending on your responses.
This information will be used to design energy efficiency programs to help households throughout New York State increase energy efficiency and reduce energy consumption.

The results of the study will only be reported at the summary level, that is, aggregated (combined) with the results of similar homes. Your answers and information will be kept confidential to the extent permitted by law and will not be identified with you or your home address. For quality assurance and training purposes this call will be recorded.

Do you have time today to help me with this important research study? [IF YES, CONTINUE. IF NOT, ASK FOR A TIME TO CALLBACK AND SCHEDULE A CALLBACK TIME]

[IF NEEDED: If you have any questions about the content or use of this survey, you can visit the research study website at www.nyserda.ny.gov/2018-RBSA.]

**Screener**

S0. The address we have on file is [${e://Field/mailing_address}, ${e://Field/city}, ${e://Field/state} ${e://Field/zip}]. Is this correct?
   1. Yes
   2. No [TERMINATE]
   -9. Prefer not to answer [TERMINATE]

S1. Which utility company provides electric service to your home at [SERVICE ADDRESS]?
   (Check one)
   1. Central Hudson
   2. Con Edison (ConEd)
   3. Long Island Power Authority (LIPA)
   4. National Grid
   5. New York State Electric and Gas (NYSEG)
   6. Orange & Rockland (O&R)
   7. Rochester Gas & Electric (RG&E)
   8. Other [PLEASE SPECIFY]
   9. None of the above – I no longer live at that address [TERMINATE]
   10. Prefer not to answer

[TERMINATE SCRIPT] Thank you for your help but unfortunately your household does not qualify for this survey. Have a nice day!
S2. Do you occupy this home at least part of the year, or did you build this home with the intent to sell it?
   1. Occupy this home at least part of the year
   2. Built the home with the intent to sell [TERMINATE]
   -8. I don’t know [TERMINATE]
   -9. Prefer not to answer [TERMINATE]

[TERMINATE: Thank you for your help but unfortunately your household does not qualify for this survey. Have a nice day!]

**Building Shell**

B1. The size of your home, the number and type of appliances you own, and the number of people living in your home all affects the way you use energy. In this first set of questions, we would like to get some general information about your home at [SERVICE ADDRESS]. Do you own or rent this home? (Check one)
   1. Own or mortgaged
   2. Rent
   4. Other, specify
   -9. Prefer not to answer

B2. How many months per year is this home usually occupied? (Enter months below)
   __ # of months [0-12]
   -8. Don’t know
   -9. Prefer not to answer
B2b. [ASK IF B2 <= 9 months] During which seasons of the year is this home usually occupied? (Select all that apply)

For B2bc1 through B2bc5
0. Not mentioned
1. Mentioned
-9. Prefer not to answer

B2bc1. Spring
B2bc2. Summer
B2bc3. Fall
B2bc4. Winter
B2bc5. Varies (SPECIFY)

B3. Which of the following best describes this home? (Check one)

1. Mobile or manufactured home
2. Single family detached house
3. Single family attached house such as a duplex, townhouse, or rowhouse
4. Apartment building or condominium with 2 to 4 units
5. Apartment building or condominium with 5 or more units [THANK AND TERMINATE]
6. Other [SPECIFY] [THANK AND TERMINATE]
-8. Don’t know [THANK AND TERMINATE]
-9. Prefer not to answer [THANK AND TERMINATE]

[TERMINATE SCRIPT] Thank you for your help but unfortunately your household does not qualify for this survey. Have a nice day!

B3a. [ASK IF B3=3] Including your unit, how many individual housing units are in this attached rowhouse/townhouse? (Enter number of units below)

____ # of units [1-4] [THANK AND TERMINATE IF MORE THAN 4]
-8. Don’t know [THANK AND TERMINATE]
-9. Prefer not to answer [THANK AND TERMINATE]
B3a2. [ASK IF B3=4] Including your unit, how many individual housing units are in your apartment or condominium building? (Enter number of units below)

___ # of units [1-2000] [THANK AND TERMINATE IF MORE THAN 4]
-8. Don’t know [THANK AND TERMINATE]
-9. Prefer not to answer [THANK AND TERMINATE]

[TERMINATE SCRIPT] Thank you for your help but unfortunately your household does not qualify for this survey. Have a nice day!

B3b. Not counting the basement, how many stories are there in this [SELECTED HOME TYPE]? (Enter number of stories below)

___ # of stories [1-4]
-8. Don’t know
-9. Prefer not to answer

B3c. [SKIP TO B4 IF B3<> 4 ] Aside from the building you live in, are there other buildings in this apartment or condominium complex with housing units? (Check one)

1. Yes
2. No
-9. Prefer not to answer

B3d. [ASK IF B3c <> 1 or 2] In total, how many apartment or condominium buildings are at this location? (Enter number of buildings below)

___ # of buildings [1-75]
-9. Prefer not to answer

B3e. [ASK IF B3=2] Which style best describes your home? Is it a …

1. A-Frame
2. Cape Cod
3. Colonial
4. Contemporary
5. Gothic
6. Ranch
7. Split level
8. Victorian
9. Other [SPECIFY]
10. Don’t know
-9. Prefer not to answer
B4. How many bedrooms are there in your home? Include bedrooms currently used for other purposes. (Enter number of bedrooms below)

___ # of bedrooms [0-8]
-9. Prefer not to answer

B5. Not counting an unfinished basement, about how large is your home in square feet? (Enter square footage of home below)

______ square feet [100-12,000]
2. Nonsensical answer
-8. Don't know
-9. Prefer not to answer

B5a. [ASK IF B5=-8] Approximately how large is your home in square feet? Please do not include unfinished basements. (Check one)

1. Less than 1,000 square feet
2. 1,000 to less than 1,500 square feet
3. 1,500 to less than 2,000 square feet
4. 2,000 to less than 2,500 square feet
5. 2,500 to less than 3,000 square feet
6. 3,000 to less than 4,000 square feet
7. 4,000 or more square feet
-8. Don't know
-9. Prefer not to answer

B6. [ASK IF B3 <> 4] Does your home have a heated or unheated basement? (Check one)

1. Yes, a heated basement
2. Yes, a partly heated basement
3. Yes, an unheated basement
4. No basement
-8. Don't know
-9. Prefer not to answer
B7. In approximately what year was your home built? (Check one)
   1. 1939 or earlier
   2. 1940 to 1949
   3. 1950 to 1959
   4. 1960 to 1969
   5. 1970 to 1979
   6. 1980 to 1989
   7. 1990 to 1999
   8. 2000 to 2009
   9. 2010
   10. 2011
   11. 2012
   12. 2013
   13. 2014
   14. 2015
   15. 2016
   16. 2017
   17. 2018
   -8. Don't know
   -9. Prefer not to answer

B8. Has your home undergone any major renovations or additions in the past five years? A major renovation or addition means construction activities like adding a room, or increasing the size of your home's living space, or reconstruction due to flooding or hurricane. (Check one)
   1. Yes
   2. No [SKIP TO B9]
   -8. Don't know [SKIP TO B9]
   -9. Prefer not to answer

B8spe. In what year was this renovation or addition completed? (Enter year below)
   _____ year of renovation [2012-2018]
   -9. Prefer not to answer

B9. [SKIP TO E1 IF B3=3 OR 4] Do you have more than one electric meter at this address? (Check one)
   1. Yes
   2. No [SKIP TO E1]
   -9. Prefer not to answer
o_B9b. What equipment or building is hooked up to this other electric meter? (Please specify other equipment or building below)

ENERGY STAR Awareness

E1. Before asking about the energy using equipment in your home, we would like to ask about your familiarity with the ENERGY STAR® logo. The ENERGY STAR logo is usually a blue and white sticker on an appliance that says “ENERGY STAR” on it.

[PROGRAMMING NOTE: Display the logo on the screen.]

Equipment having the ENERGY STAR logo meets strict energy efficiency guidelines set by the U.S. Environmental Protection Agency and the U.S. Department of Energy. Before now, were you not at all familiar, somewhat familiar, or very familiar with ENERGY STAR or the ENERGY STAR logo? (Check one)

1. Not at all familiar
2. Somewhat familiar
3. Very familiar
-9. Prefer not to answer

E2. [ASK IF B7=14-17] Is your home an ENERGY STAR Certified Home, or does it have any other energy efficiency rating?

1. Yes, ENERGY STAR rated
2. Yes, Home Energy Rating System (HERS) score
3. Yes, Home Energy Score (HES)
4. Yes, other energy efficiency rating
5. No, does not have an energy efficiency rating
6. Don’t know if it has an energy efficiency rating
-9. Prefer not to answer

[PROGRAMMING NOTE: Display the logo on the screen.]

E2a. [ASK IF E2=4] Please describe the energy efficiency rating below.

E2b. [ASK IF E2=2] What is the HERS index score for your home?
E2c. [ASK IF E2=3] What is the Home Energy Score for your home?

**Kitchen Appliances**
Please think about your kitchen appliances for this next set of questions.

*icon type pending team’s approval*

K1. How many of each of the following do you use in your home? (If none, please enter zero)
   
   For K1a through K1d
   __ # of units [0-9]
   -.9 Prefer not to answer

   - K1a. Microwave ovens
   - K1b. Ovens with burners on top
   - K1c. Separate stove tops
   - K1d. Separate oven units (wall or cabinet)

K2. [SKIP IF K1b=0 OR -9] What type of fuel does your oven(s) with burners on top use? (Select all that apply)
   
   For K2c1 through K2c4
   0. Not mentioned
   1. Mentioned

K4c1. Electricity
K4c2. Natural gas from underground pipes
K4c3. Propane
K4c4. Some other fuel [SPECIFY]

\_K4. [ASK IF K4c4=1] Description of other type of fuel.
K5. Which of the following best describes your primary full-sized refrigerator? Please do not include wine or keg coolers.

1. Full-sized, four doors: two refrigerator doors and two freezer doors on bottom (French style)
2. Full-sized, three doors: two refrigerator doors and a freezer door on bottom (French style)
3. Full-size with two doors, freezer next to the refrigerator (side by side)
4. Full-size with two doors, bottom freezer
5. Full-size with two doors, top freezer
6. Full-size with one door
7. Half-size or compact
8. Other [SPECIFY]
-9. Prefer not to answer

o_K5. [ASK IF K5=8] Description of other type refrigerator.

K6. About how old is your primary refrigerator? (Check one)

1. Less than 2 years old
2. 2 to 4 years old
3. 5 to 9 years old
4. 10 to 14 years old
5. 15 to 19 years old
6. 20 years old or more
-8. Don’t know
-9. Prefer not to answer
K7. [SKIP IF (E1 <> 2 AND 3) OR (K6 =4, 5, OR 6)] Is this refrigerator ENERGY STAR rated (e.g. Does it have the ENERGY STAR logo on it)? (Check one)

1. Yes
2. No
-8. Don’t know
-9. Prefer not to answer

K8. Do you have any other full-size or compact refrigerators plugged in and running in your home? Please do not include wine chillers. (Check one)

1. Yes
2. No [SKIP TO K11]
-9. Prefer not to answer

K9. How many other refrigerators do you have plugged in and running in your home? (If none, please enter zero)

For K9 through K9a

_ # of units [0-9]
-9. Prefer not to answer

K9. Full size refrigerators
K9a. Compact refrigerators
K10a. [SKIP TO K11 IF (K9+K9a)=0 OR -18] About how old is this second refrigerator? (Check one)

1. Less than 2 years old
2. 2 to 4 years old
3. 5 to 9 years old
4. 10 to 14 years old
5. 15 to 19 years old
6. 20 years old or more
-8. Don't know
-9. Prefer not to answer

K10b. [SKIP TO K11 IF (K9+K9a)=1 OR -8] About how old is this third refrigerator? (Check one)

1. Less than 2 years old
2. 2 to 4 years old
3. 5 to 9 years old
4. 10 to 14 years old
5. 15 to 19 years old
6. 20 years old or more
-8. Don't know
-9. Prefer not to answer
K10c. [SKIP TO K11 IF (K9+K9a)=2 OR -7] About how old is this fourth refrigerator? (Check one)

1. Less than 2 years old
2. 2 to 4 years old
3. 5 to 9 years old
4. 10 to 14 years old
5. 15 to 19 years old
6. 20 years old or more
-8. Don’t know
-9. Prefer not to answer

K11. How many wine chillers/coolers do you have plugged in and running in your home? (If none, please enter 0) (Enter number of wine chillers/coolers below)

_ # of units [0-9]
-9. Prefer not to answer

K11a. [SKIP IF (E1 <> 2 AND 3) AND (K11=0 OR >1 OR MISSING)]] Is this wine chiller ENERGY STAR rated? (e.g. Does it have the ENERGY STAR logo on it?) (Check one)

1. Yes

WH6. [SKIP TO WH8 IF WH2=4] Do you use more than one water heating system in your home? (Check one)

   1. Yes
   2. No [SKIP TO WH8]
   -8. Don’t know [SKIP TO WH8]
   -9. Prefer not to answer

WH7. What other type of system do you use as your primary water heating system? (Check one)

   1. Heat pump water heater
   2. Stand-alone storage tank
   3. Tankless or on demand water heater
   4. Part of heating system boiler
   5. Other [SPECIFY]
   -9. Prefer not to answer
o_WH7. [ASK IF WH7=5] Description of other type of water heating system.

WH8. Do you have a dishwasher? (Check one)
   1. Yes
   2. No [SKIP TO C1a]
   -9. Prefer not to answer

WH9. Approximately how old is your primary dishwasher? (Check one)
   1. Less than 2 years old
   2. 2 to 4 years old
   3. 5 to 9 years old
   4. 10 to 14 years old
   5. 15 to 19 years old
   6. 20 years old or more
   -8. Don’t know
   -9. Prefer not to answer

WH10. [ASK IF (E1=2 OR 3) AND WH9 <> 4, 5, OR 6] Is this dishwasher ENERGY STAR rated? (e.g. Does it have the ENERGY STAR logo on it?) (Check one)

   1. Yes
   2. No
   -8. Don’t know
   -9. Prefer not to answer

WH11. Approximately how many loads of dishes does your household wash in a typical week in the dishwasher [IF HOME OCCUPIED<12 MONTHS A YEAR, WHILE THE HOME IS OCCUPIED]? (Enter number of loads below)

   __ # of loads [0-35]
   -9. Prefer not to answer

Clothes Washing and Drying
Please think about your home’s washing and drying equipment to answer the next set of questions.
C1a. [SKIP IF B3=4] Do you have a clothes washer in your home?
   1. Yes [SKIP TO C3]
   2. No [SKIP TO C7a]
   -9. Prefer not to answer

C1b. [ASK IF B3=4] Do you have a clothes washer in your home? Please do not include clothes washers that are located in a laundry room of your apartment or condominium building. (Check one)
   1. Yes
   2. No [SKIP TO C7a]
   -9. Prefer not to answer

C3. Approximately how many loads of laundry does your household wash in a typical week? (Enter number of loads below)
   __ # of loads [0-35]
   -8. Don't know
   -9. Prefer not to answer

C3b. [IF HOME OCCUPIED<12 MONTHS A YEAR, WHILE THE HOME IS OCCUPIED] Approximately how many loads of laundry does your household wash in a typical week while the home is occupied? (Enter number of loads below)
   __ # of loads [0-35]
   -8. Don't know
   -9. Prefer not to answer

C4. What water temperature setting do you usually use for the wash cycle of your clothes washer? (Check one)
   1. Hot
   2. Warm
   3. Cold
   -8. Don't know
   -9. Prefer not to answer
C5. What water temperature setting do you usually use for the rinse cycle of your clothes washer? (Check one)
   1. Hot
   2. Warm
   3. Cold
   -8. Don't know
   -9. Prefer not to answer

C6. About how old is your primary clothes washer? (Check one)
   1. Less than 2 years old
   2. 2 to 4 years old
   3. 5 to 9 years old
   4. 10 to 14 years old
   5. 15 to 19 years old
   6. 20 years old or more
   -8. Don't know
   -9. Prefer not to answer

C6b. [ASK IF (E1=2 OR 3) AND C6 <> 4, 5, AND 6] Is this clothes washer ENERGY STAR rated? (e.g. Does it have the ENERGY STAR logo on it?) (Check one)

   1. Yes
   2. No
   -8. Don't know
   -9. Prefer not to answer

C7a. [SKIP IF B3=4] Do you have a clothes dryer in your home? (Check one)
   1. Yes [SKIP TO C8]
   2. No [SKIP TO L2]
   -9. Prefer not to answer [SKIP TO L2]
C7b. [ASK IF B3=4] Do you have a clothes dryer in your home? Please do not include community clothes dryers that are located in a laundry room of your apartment or condominium building. (Check one)

1. Yes
2. No [SKIP TO L2]
-9. Prefer not to answer [SKIP TO L2]

C8. What type of fuel does your primary clothes dryer use? (Check one)

1. Electricity
2. Natural gas from underground pipes
3. Propane (bottled gas)
4. Other [SPECIFY]
-8. Don’t know
-9. Prefer not to answer

α_C8. [ASK IF C8=4] Description of other type of fuel used for clothes drying.

C9. About how old is your clothes dryer? (Check one)

1. Less than 2 years old
2. 2 to 4 years old
3. 5 to 9 years old
4. 10 to 14 years old
5. 15 to 19 years old
6. 20 years old or more
-8. Don’t know
-9. Prefer not to answer

C10. Is your clothes dryer a heat pump clothes dryer? A heat pump clothes dryer is a fairly new technology that pulls energy from the air just like a heat pump heating and cooling system. The hot air is not vented but is reused to dry the clothes. They use 50% less energy, but take longer to dry clothes. (Check one)

1. Yes
2. No
-8. Don’t know
-9. Prefer not to answer

**Home Lighting**

Now, we would like to learn a little about your home’s lighting equipment.
L2. Do you use any of the following natural lighting in your home during the day? (Select all that apply)

For L2c1 through L2c4
0. Not mentioned
1. Mentioned
-9. Prefer not to answer

L2c1. Skylights
L2c2. Tubular skylights, also referred to as solar tubes or sun tunnels (sun tunnels channel sunlight from your roof, down a highly reflective tube into the room below)
L2c3. Large uncovered window areas
L2c4. None of the above

L3. Which of the following types of lighting controls do you use inside or outside your home? (Select all that apply)

For L3c1 through L3c4
0. Not mentioned
1. Mentioned
-9. Prefer not to answer

L3c1. Dimmer switch
L3c2. 3-way bulb
L3c3. Occupancy/motion sensor
L3c4. Timer
L3c5. None of the above
L4. Compact fluorescent light bulbs – also known as CFLs – usually do not look like regular incandescent bulbs. The most common type of CFL is made with a glass tube bent into a spiral shape and fits in a regular light bulb socket. [Picture of CFL] Before today, were you familiar with CFLs? (Check one)

1. Yes  
2. No  
-9. Prefer not to answer

L4a. LED light bulbs give off directional light, so the light goes where you aim it. They are also very energy efficient and can work with dimmable switches. [Picture of LED] Before today, were you familiar with LED light bulbs? (Check one)

1. Yes  
2. No  
-9. Prefer not to answer

L5. How many light bulbs inside your home are typically used two or more hours each day? (Enter number of bulbs below. If none, please enter zero.) Remember to include can lights or other light bulbs in hard to reach places such as tall ceilings or hallways or closets.

For L5a through L5d  
__ # of bulbs [0-99]  
-8. Don't know  
-9. Prefer not to answer

L5a. CFL Bulbs  
L5b. LED Bulbs  
L5c. Incandescent Bulbs  
L5d. Other bulbs
L7. How many light bulbs outside your home are typically used 2 or more hours each day? Please include only lights that are controlled from your \$q://QID14/ChoiceGroup/SelectedChoices\} (Enter number of bulbs below)

__ # of bulbs [0-95]
-9. Prefer not to answer

L8. [ASK IF (L4 OR L4a=1) AND L7 <> 0 OR -9] How many of the [L7] outdoor lights used two or more hours each day are CFL or LED lights? (Enter number of bulbs below)

__ # of bulbs [0-95]
-8. Don’t know
-9. Prefer not to answer

**Pool and Spa**
The next set of questions pertain to home pools and spas.

P1A. [SKIP IF B3=4] Do you have a swimming pool with a filtering system for your use only? (Check one)

1. Yes [SKIP TO P2]
2. No [SKIP TO P4a]
-9. Prefer not to answer

P1B. [ASK IF B3=4] Do you have a swimming pool with a filtering system for your use only? Please do not include a pool that is shared with others in your apartment or condominium complex. (Check one)

1. Yes
2. No [SKIP TO P4a]
-9. Prefer not to answer

P2. Do you have a pool pump? (Check one)

1. Yes
2. No
-9. Prefer not to answer
P2b. [SKIP TO P3 IF P2 <> 1] Is the pool pump a high efficiency pool pump? (Check one)
   1. Yes
   2. No
   -8. Don’t know
   -9. Prefer not to answer

P2c. Do you have an automatic timer that controls the time of day that your pool pump operates? (Check one)
   1. Yes
   2. No
   -9. Prefer not to answer

P3. Do you have a pool heater? (Check one)
   1. Yes
   2. No [SKIP TO P4a]
   -9. Prefer not to answer [SKIP to P4a]

P3b. What type of fuel does the pool heater use? (Check one)
   1. Electricity
   2. Natural gas from underground pipes
   3. Propane (bottled gas)
   4. Solar
   5. Other fuel [SPECIFY]
   -8. Don’t know
   -9. Prefer not to answer

o_P3b. [ASK IF P3b=5] Description of other pool heater fuel.

P4a. [SKIP IF B3=4] Do you have a hot tub, spa, or jetted tub/Jacuzzi for your use only? (Check one)
   1. Yes [SKIP TO P5]
   2. No [SKIP TO S1]
   -9. Prefer not to answer [SKIP to S1]
P4b. [ASK IF B3=4] Do you have a hot tub, spa, or jetted tub/Jacuzzi for your use only? Please do not include a community hot tub, spa, or Jacuzzi that is shared with others in your apartment or condominium complex. (Check one)
1. Yes
2. No [SKIP TO S1]
-9. Prefer not to answer

P5. What type of fuel is used to heat the water in your hot tub, spa, or jetted tub/Jacuzzi? (Check one)
1. Electricity
2. Natural gas from underground pipes
3. Propane (bottled gas)
4. Solar
5. Other fuel [SPECIFY]
-8. Don't know
-9. Prefer not to answer

o_P5. [ASK IF P5=5] Description of other type of fuel used for hot tub heating.

Small Household Appliances
Please think about your home’s small appliances or equipment for the next set of questions.
A2. How many televisions used in your home are of each of the following types? (If none, please enter zero.)

For A2a through A2d

__ # of TVs [0-20]

-5. Programming change

-8. I'm unsure what type of TV I have

-9. Prefer not to answer

A2a. Standard tube TVs
A2b. Flat screen Plasma TVs
A2c. Flat screen LCD/LED TVs
A2e. Flat screen TV of unknown type
A2d. Rear projection TVs

A3. Of the televisions used in your home, how many are used at least 2 hours every day? (Enter number of televisions below)

For A3a through A3d

__ # of TVs used at least 2 hours every day [0-20]

-5. Programming change

-9. Prefer not to answer

A3a. [SKIP IF A2a=0 OR -9] Standard tube TVs
A3b. [SKIP IF A2b=0 OR -9] Flat screen Plasma TVs
A3c. [SKIP IF A2c=0 OR -9] Flat screen LCD/LED TVs
A3e. [SKIP IF A2e=0 OR -9] Flat screen TV of unknown type
A3d. [SKIP IF A2d=0 OR -9] Rear Projection TVs

A6. Do you have internet access at home? (Check one)

1. Yes

2. No

-9. Prefer not to answer
A7. How many of each of the following types of computer and home office equipment does your household use? (If none, please enter zero. Please scroll down to see all computers and home office equipment.)

For A7a through A7l

__ # of equipment [0-20]
-5. Programming change
-9. Prefer not to answer

A7a. Desktop computer (excluding monitor)
A7d. CRT computer monitor
A7e. LED/LCD flat screen computer monitor
A7b. Laptop computer
A7c. iPads, tablet computers
A7f. eReaders such as a Kindle or Nook
A7h. Printer
A7l. Modems or routers

A7o. Any other type of computer or home office equipment?

1. Yes [SPECIFY]
2. No [SKIP TO A8]

o_A7oop. [ASK IF A7o=1] Description of other type of computer or office equipment.

A8. Do you use a smart strip in your home to turn off computers, printers, and other equipment when not in use? Smart strips are different from regular power strips. They incorporate additional technologies to automatically disconnect power to equipment when not in use. (Check one)

1. Yes
2. No
-8. Don’t know
-9. Prefer not to answer
A8a. [ASK IF A8 <> 2 AND -8] Do you have a Tier 1 or Tier 2 smart strip, or both? Tier 1 smart strips are controlled by a master outlet and Tier 2 smart strips are controlled by motion sensing or a timer. (Check one)
   1. Tier 1 smart strip that turn off when your computer is powered off or goes to sleep
   2. Tier 2 smart strip that turns off when you leave or is programmed to turn off at a certain time of the night or day
   3. Both Tier 1 and Tier 2 smart strip
   -8. Don't know
   -9. Prefer not to answer

A9a. [SKIP IF A7a=0 OR -9] About how many hours each day do all residents typically use the desktop computer(s) in your home? (Enter number of hours below)
   __ # of hours per day on average, per computer [0-24]
   -4. Interviewer/respondent error
   -9. Prefer not to answer

A9b. [SKIP IF A7b=0 OR -9] About how many hours each day do all residents typically use the laptop computer(s) in your home? (Enter number of hours below)
   __ # of hours per day on average, per computer [0-24]
   -4. Interviewer/respondent error
   -9. Prefer not to answer

A11. Does anyone in your household work primarily from home? (Check one)
   1. Yes
   2. No
   -9. Prefer not to answer

A11a. [Ask if A11=1] Does this household have a home-based business?
   1. Yes
   2. No
   -9. Prefer not to answer

A11b. [SKIP TO A12A IF A11<>1] Including yourself, how many people work primarily from your home? (Enter number of people below)
   __ # of people [1-20]
   -9. Prefer not to answer
o_A11bb. [Ask if A11=1] What type of business is this? (Please describe below) [RECORD RESPONSE VERBATIM]

A11c. [Ask if A11=1] Other than computers, printers, and copiers, what other types of energy using equipment do you use for your business?
   1. No other energy using equipment
   2. Specify what types of equipment
   -9. Prefer not to answer

o_A11c. [ASK IF A11C=2] Please describe the other type of energy using equipment.

A12. How many of each of the following other types of entertainment or telecommunications equipment does your household use? (If none, please enter zero. Please scroll to see all equipment options.)

For A12ab through A12k
___ # of units [0-20]
-4. Interviewer/respondent error
-9. Prefer not to answer

A12ab. Combination cable or satellite set-top box with DVR unit
A12a. Cable or satellite set-top box (a set-top box is a device that converts video content to analog or digital TV signals)
A12b. DVR (for example, TiVo)
A12c. DVD/Blu-Ray player or recorder
A12d. VCR
A12e. Digital converter box
A12f. Video gaming system (for example, PS3, PlayStation, Nintendo, XBOX, Wii)
A12g. Home theater system
A12i. Cell phones/Smart phones
A12j. Cordless telephones
A12k. Stereo system

A12n. Any other type of entertainment or telecommunications equipment?
   1. Yes [SPECIFY]
   2. No

o_A12no. [SKIP IF A12n=2] Description of other type entertainment or telecommunications equipment.
A13. Do any of your equipment have the ENERGY STAR logo? (Check one)

For A13a through A13i

1. Yes
2. No
4. Interviewer/respondent error
8. Don’t know
9. Prefer not to answer

A13a. [ASK IF (E1=2 OR 3) AND (A12c OR A12d <> 0 AND -9)] VCRs/DVD players
A13b. [ASK IF (E1=2 OR 3) AND (A2b <> 0 AND -9)] Plasma TV
A13c. [ASK IF (E1=2 OR 3) AND (A2c <> 0 AND -9)] LCD/LED TV
A13d. [ASK IF (E1=2 OR 3) AND (A12k <> 0 AND -9)] Stereo equipment
A13e. [ASK IF (E1=2 OR 3) AND (A7a <> 0 AND -9)] Desktop computer
A13f. [ASK IF (E1=2 OR 3) AND (A7b <> 0 AND -9)] Laptop computer
A13g. [ASK IF (E1=2 OR 3) AND (A7e <> 0 AND -9)] LED/LCD computer monitor
A13h. [ASK IF (E1=2 OR 3) AND (A7g OR A7h OR A7i OR A7k <> 0 AND -9)]
       Printer, scanner, or all-in-one unit
A13i. [ASK IF (E1=2 OR 3) AND (A12ab OR A12a <> 0 AND -9)] Set-top/cable boxes

Miscellaneous Equipment
These questions ask about other miscellaneous equipment you may have in your home.

A12m. Do you have a home security system? This may include a security camera. (Check one)

1. Yes
2. No
9. Prefer not to answer

M3. Do you use a generator, including natural gas, solar, or wind to supply your electric needs? (Check one)

1. Yes
2. No
9. Prefer not to answer
M4. Do you have a . . . ? (Check one for each)
   For M4a though M4f
   1. Yes
   2. No
   -8. Don’t know
   -9. Prefer not to answer

M4a. Well pump (a water well pump is a pump that is used in extracting water from a water well)
M4b. Sump pump (a sump pump is used to remove water where basement flooding may occur or above the foundation of a home)
M4c. Waterbed heater
M4d. Natural gas grill
M4e. Natural gas fire pit
M4f. Radiant floor heating separate from heating system

M5. Does anyone in your household use any other major appliances or equipment in your home that uses a lot of energy such as exercise equipment, welding equipment or heavy tools, or equipment used for a home business? (Check one)
   1. Yes [SPECIFY]
   2. No
   -9. Prefer not to answer

*M5a. [ASK IF M5=1] Please select all the appliances or equipment that are in your home. .
   For M5ac1 through M5ac16
   0. Not mentioned
   1. Mentioned

*M5ac1. Air compressor
*M5ac4. Exercise equipment (elliptical, treadmill, etc.)
*M5ac5. Fish tank
*M5ac7. Heating pad/blanket
*M5ac8. Musical equipment
*M5ac9. Power tools
*M5ac10. Sauna
*M5ac11. Sewing machine
*M5ac14. Water pump
*M5ac15. Welder
*M5ac16. Miscellaneous
M5a. Description of miscellaneous type of other major appliances or equipment.

M6. Does your household use an energy monitoring system? An energy monitoring system provides real-time information on your energy usage and allows you to control temperature settings, turn off lights, and appliances remotely.

1. Yes  
2. No  
-9. Prefer not to answer

Internet-Enabled Devices

The next set of questions are about your home’s internet-enabled devices.

I1. Do you have equipment in your home that you can control remotely by using a cell phone, tablet, computer, or smart speaker (such as Amazon Echo or Google Home)? This might include adjusting your thermostat or controlling the lighting in your home.

1. Yes  
2. No  
-9. Prefer not to answer

I2. Which of the following can be controlled remotely? (Select all that apply)

1. Heating or cooling equipment  
2. Thermostat  
3. Water heating equipment  
4. LEDs or “smart” light bulbs (one to three bulbs)  
5. Whole house humidifying system  
6. Whole house dehumidifying system  
7. Pool pump  
8. Security or video monitoring equipment  
9. Major appliance  
10. Other [SPECIFY]  
-9. Prefer not to answer
I2a.  [ASK IF I2=9] Which major appliances can be controlled remotely? (Select all that apply)

1. Clothes washer or dryer
2. Dishwasher
3. Cooktop, stovetop, or range
4. Stand-alone oven
5. Full-sized refrigerator
6. Stand-alone freezer
7. Other appliance [SPECIFY]
-9. Prefer not to answer

Utility Company
These questions are about your electricity bill. If you prefer not to answer them, please indicate this.

U1. Is the electric utility bill paid by someone who lives in the home, a landlord, or someone else?
   1. Household member/occupant
   2. Landlord
   3. Homeowners Association (HOA)
   4. Someone else [SPECIFY]
   -8. Don’t know
   -9. Prefer not to answer

U2. Does your household receive financial assistance to pay a portion or all of your electric utility bill?
   1. Yes
   2. No
   -8. Don’t know
   -9. Prefer not to answer
U3. [ASK IF U2=1] For what share does your household receive assistance for your electric utility bill? [SELECT ONE]
   1. Less than 25%
   2. Between 26% and 50%
   3. Between 51% and 75%
   4. Between 76% and 100%
   -8. Don't know
   -9. Refused

U10. Please provide your best estimate of the total electric costs your home paid in the last 12 months. Do not include natural gas or other fuels. (Check one)
   1. $500 or less
   2. $501 - $1000
   3. $1,001 - $1,500
   4. $1,501 - $2,000
   5. $2,001 - $2,500
   6. $2,501 - $3,000
   7. $3,001 - $3,500
   8. $3,501 - $4,000
   9. $4,000 or more
   10. We don't pay electric costs because they are included in our rent or condominium fee
   -8. Don't know
   -9. Prefer not to answer

The next questions are about your natural gas bill. If you prefer not to answer them, please indicate this.

U4. [ASK IF K2c2=1, K3c2=1, K4c2=1, H2=2, H7ag>=1, H8ac2=1, WH3=2, C8=2, P3b=2, OR P5=2] Is the gas bill paid by someone who lives in the home, a landlord, or someone else?
   1. Household member/occupant

   1. $500 or less
   2. $501 - $1000
   3. $1,001 - $1,500
   4. $1,501 - $2,000
   5. $2,001 - $2,500
   6. $2,501 - $3,000
   7. $3,001 - $3,500
   8. $3,501 - $4,000
   9. $4,000 or more
   10. We don’t pay natural gas costs because they are included in our rent or condominium fee
   -8. Don’t know
   -9. Prefer not to answer
U12. Please provide your best estimate of the total costs for all fuel types your home paid in the last 12 months. Please include all types of fuel. (Check one)

1. $500 or less
2. $501 - $1000
3. $1,001 - $1,500
4. $1,501 - $2,000
5. $2,001 - $2,500
6. $2,501 - $3,000
7. $3,001 - $3,500
8. $3,501 - $4,000
9. $4,000 or more
10. We don’t pay any fuel costs because they are included in our rent or condominium fee
-8. Don’t know
-9. Prefer not to answer

U13. Energy bill assistance and weatherization assistance are available based on income criteria. Do you qualify for this or any other kind of assistance?

1. Yes
2. No
-8. Don’t know
-9. Prefer not to answer

Energy Efficiency

These questions are about energy efficiency upgrades or improvements to your home.

F1. In the last five years, has your household made any energy-related home improvements such as upgrading thermostats or home insulation, or installed more efficient appliances or more efficient heating and cooling systems?

1. Yes
2. No
-9. Prefer not to answer
F1a. [ASK IF F1=1] What were your reasons for making these energy-related improvements? [RECORD ALL THAT APPLY]
   1. Use less energy
   2. Save money on utility bills
   3. Make home more comfortable
   4. Install better/brighter lighting
   5. Save money on maintenance costs
   6. Receive an incentive or rebate
   7. Protect the environment
   8. Other [SPECIFY]
   -9. Prefer not to answer

F2. In the past 5 years, has your household participated in any energy efficiency or energy saving programs offered by NYSERDA or your utility company to make your home or appliances more energy efficient? (Check one)
   1. Yes
   2. No
   -9. Prefer not to answer

F3. [ASK IF F2=1] What type of equipment did you install or recycle through a program? (Select all that apply)
   For F3c1 through F3c9
   0. Not mentioned
   1. Mentioned
   -9. Prefer not to answer

   F3c1. Insulation or weatherization measures
   F3c2. Heating equipment
   F3c3. Air conditioning equipment
   F3c4. Lighting
   F3c5. Water heating equipment
   F3c6. Clothes washer
   F3c7. Appliances
   F3c8. Refrigerator or freezer recycling
   F3c9. Other [SPECIFY]

F4. [ASK IF F2=1] Did you receive a tax credit for any of these improvements?
   1. Yes
   2. No
   -9. Prefer not to answer
F5. [ASK IF F4=1] Was it a federal, state, or local tax credit?
   1. Federal
   2. State
   3. Local
   4. Other [SPECIFY]
   -8. Don’t know
   -9. Prefer not to answer

F6. [ASK IF F2=2] What do you think are the challenges with participating in energy efficiency programs? (Select all that apply)
   For F6c1 through F6c9
   0. Not mentioned
   1. Mentioned
   -9. Prefer not to answer

   F6c1. Am not aware of any energy efficiency programs
   F6c2. Home does not need energy efficient improvements
   F6c3. Don’t know who to contact about programs
   F6c4. Cannot afford to make home improvements
   F6c5. My energy bills are not that high
   F6c6. I rent and cannot make upgrades
   F6c7. Other [SPECIFY]
   F6c8. Too busy to make home improvements
   F6c9. Recently moved into the home

o_F6. [ASK IF F6c7=1] Description of other reason why household hasn’t participated.
F7. Are you considering replacing or purchasing any of the following in the next five years? (Select all that apply)

For F7c1 through F7c7
0. Not mentioned
1. Mentioned
-9. Prefer not to answer

F7c1. Insulation or weatherization measures
F7c2. Heating equipment
F7c3. Air conditioning equipment
F7c4. Water heating equipment
F7c5. Clothes washer
F7c6. Appliances
F7c7. None of the above

F8. If there was a program available to you that would help pay for part of the cost for purchasing new energy efficient equipment, which of the following would you consider replacing within the next five years? (Select all that apply)

For F8c1 through F8c7
0. Not mentioned
1. Mentioned
-9. Prefer not to answer

F8c1. Insulation or weatherization measures
F8c2. Heating equipment
F8c3. Air conditioning equipment
F8c4. Water heating equipment
F8c5. Clothes washer
F8c6. Appliances
F8c7. None of the above

F9. How much do you agree or disagree with the statement, “My home is as energy efficient as it could be.”

1. Strongly agree
2. Somewhat agree
3. Neither agree nor disagree
4. Somewhat disagree
5. Strongly disagree
-9. Prefer not to answer

F10. [ASK IF B7=14-17 (2015-2018)] When purchasing or building your new home, how important was energy efficiency in your decision?
1. Very important
2. Somewhat important
3. Not too important
4. Not at all important
5. Don't know
6. Prefer not to answer

F11. [ASK IF B7=14-17 (2015-2018)] Thinking about the insulation in your home, does it… [SELECT ONE]
1. Exceed values required by code
2. Meet values required by code
3. Not meet values required by code
4. Don't know
5. Prefer not to answer

Purchase Decisions
It sometimes costs more to purchase energy-efficient products compared to standard products. The next questions ask you about some ways you could save energy in your home.

[RANDOMIZE THE BLOCKS OF QUESTIONS and insert a page break between each block]

LED
[Persistent or intro text for LED block]
LED is short for Light Emitting Diode, which is a type of energy-saving light. A 10 Watt LED gives the same amount of light as a traditional 60W incandescent bulb, costs about $2 more than a less-efficient bulb, and often saves $2 to $6 annually in energy costs.
W1. How likely are you to install energy-efficient LED light bulbs in the next five years?
   1. Very likely
   2. Somewhat likely
   3. Not too likely
   4. Not at all likely
   5. I have LEDs in every light fixture and socket in my home already
   -8. Don’t know
   -9. Prefer not to answer

[ASK IF W1=2-4]

Suppose the cost of an energy-efficient LED light bulb is $2 more than a standard light bulb and might save $2 to $6 per year in energy costs. Please indicate how likely you would be to upgrade to an energy-efficient, LED light bulb in the next five years if you received an incentive of ...

W2. About $0.50 per bulb or 25% of the difference in cost?

Central A/C

[ASK ONLY IF PARTICIPANTS HAVE CENTRAL A/C (H11=1)]

[ Persistent or intro text for Central A/C block]

Energy-efficient central air conditioning units, such as models with an efficiency rating of 16 SEER, cost roughly $1,500 more than standard 13 SEER models and often save $30 to $100 a year in energy costs in New York State.
W6. Assume your home’s central air conditioning unit will need to be replaced within five years. How likely would you be to replace that unit with an energy-efficient central air conditioner in the next five years?

1. Very likely
2. Somewhat likely
3. Not too likely
4. Not at all likely
5. I already have the most efficient central air conditioning system available
-8. Don’t know
-9. Prefer not to answer

[ASK IF W6=2-4]

Suppose the cost of an energy-efficient central air-conditioner is $1,500 more than a standard central air-conditioner and would save $30 to $100 a year in energy costs. Please indicate how likely you would be to upgrade to an energy-efficient central air-conditioner in the next five years if you received an incentive of ...

Weatherization Measures

[ASK IF B1=1 (OWN HOME)]

[Persistent or intro text for weatherization measures]

Weatherizing your home by improving insulation, reducing air leakage, and installing windows often improves comfort and lowers energy bills. The cost and the savings depend on many
factors, including how much insulation you start with, what type of heating system you use, and how much you heat and cool your home.

W26. Assume that improving air sealing and insulation in your attic would cost $2,000 and save about $200 a year in heating and cooling costs. How likely would you be to make this improvement in the next five years?

1. Very likely
2. Somewhat likely
3. Not too likely
4. Not at all likely
5. I don’t have an attic
-8. Don’t know
-9. Prefer not to answer

[ASK IF W26=2-4]

Suppose the cost to weatherize your home by improving air sealing and insulation in your home’s attic was $2,000, please indicate how likely you would be to weatherize your home in the next five years if you received an incentive of ...

Fuel Conversion/Electrification

[ASK IF B1 = 1]
Assume that your current space heating system uses natural gas or other non-electric heating fuel and that it will fail in the next five years. Converting to an electric heating source such as an air-source heat pump, ductless mini-split heat pump, or ground-source heat pump would cost between $1,000 and $3,000 more than simply replacing the old system. This conversion may decrease your natural gas or other non-electric heating fuel bill and may increase your electric bill while creating a more environmentally-friendly, energy-efficient home heating system.

W31. Given the cost of converting, how likely would you be to convert to electric space heating for your home in the next five years?
   1. Very likely
   2. Somewhat likely
   3. Not too likely
   4. Not at all likely
   5. Already have it/have done it
   -8. Don’t know
   -9. Refused

[ASK IF 0=2-4]

Suppose the cost of converting to an electric air-source heat pump, ductless mini-split, or ground-source heat pump is $1,000 to $3,000 more than standard electric heating system. Please indicate how likely you would be to upgrade to one of these heat pump heating and cooling systems in the next five years if you received an incentive of …

Demographics

Last, we have a few demographic questions about your household. If you prefer not to answer, please indicate this.

D2. Some background information about the people living in your household will also help us understand how you use energy. All of your answers will be kept strictly confidential to the extent permitted by law. Including yourself, how many people currently living in your home year-round are in the following age groups? Please exclude anyone who is just visiting, children who may be away at college or those deployed in the military. (If none, please enter zero)

For D2_5 through D2_65
__ # of people [0-25]
-9. Prefer not to answer

D2_5. Less than 5 years old
D2_6. 6-17 years old
D2_18. 18-24 years old
D2_25. 25-34 years old
D2_35. 35-44 years old
D2_45. 45-54 years old
D2_55. 55-64 years old
D2_65. 65 or older

D3. What is the highest level of education a person still living in your household has completed? (Check one)

1. Less than high school
2. Some high school
3. High school graduate or equivalent (e.g., GED)
4. Trade or technical school
5. Some college, no degree
6. College degree (e.g. Bachelor’s degree)
7. Some graduate school
8. Graduate degree (e.g. Master’s or Doctorate degree)
-9. Prefer not to answer
D4. For classification purposes only, which of the following best describes your household’s total income in 2017? (Check one)

1. Less than $25,000
2. $25,000–less than $30,000
3. $30,000–less than $35,000
4. $35,000–less than $50,000
5. $50,000–less than $75,000
6. $75,000–less than $100,000
7. $100,000–less than $150,000
8. $150,000–less than $200,000
9. $200,000 or more
-9. Prefer not to answer

D5. What is your gender?

1. Male
2. Female
-9. Prefer not to answer

D7. NYSERDA is offering select households an additional $100 electronic Amazon gift card to allow a certified and trained technician to visit their home to gather more detailed information about the home’s energy usage. The visit should take about two to three hours depending on the size, age, and complexity of your home and tests to be performed. By saying yes, you are simply agreeing to be re-contacted within the next couple weeks to hear more details about the visit and set up an appointment. The information gathered will only be reported in aggregate with data from other homes to evaluate and improve energy efficiency programs offered by NYSERDA and your utility. Would you be interested in being a part of this type of home site visit for an additional $100 electronic Amazon gift card? This would be for your home at [SERVICE ADDRESS]. (Check one)

1. Yes
2. Possibly, but I need more information
3. No
-9. Prefer not to answer
