

APPENDIX A – DATA SOURCES AND METHODOLOGICAL APPROACH

This appendix provides the methodology and data sources used to estimate refined product demand and supply for the study area.

SUPPLY ESTIMATION

The major supply points for the study area are located in New Jersey. The Linden-Newark-Bayonne area, along with Perth Amboy houses some of the largest petroleum port and storage facilities in the United States. These terminals not only supply regions in the study area, but the northern half of New Jersey, western Pennsylvania, southern New York State, and even New England states via tanker and barge. This region is viewed as a central supply point for the entire northeast for three reasons. There are two large refineries, two large port facilities, and the terminus of the largest petroleum product pipeline in the United States: The Colonial Pipeline. ICF's assumption is that any demand not supplied by New York ports in the study area is made up by the distribution of products from New Jersey.

The primary source of supply data is the U.S. Energy Information Administration (EIA). There are two publications that are useful in estimating the supply picture in the study area. The first is EIA *Company Level Import Data*. This data series is reported on a monthly basis using form EIA-814 "Monthly Imports Report". The smallest geographic location for which data is available is port of entry city. There are four ports in this data series that lie within the study area: Albany, NY, New York, NY, Newark, NJ, and Perth Amboy, NJ. The three products of interest that EIA reported data for were distillate fuel oils, residual fuel oils, and kerosene. Data for volumes of shipments by product were extracted from the EIA database for these four ports and three products. From 1996 to 2003, data for distillate fuel oil imports was broken into two categories based on sulfur content, <.05% sulfur content, which is generally diesel fuel, and >.05% sulfur content, which is mostly home heating oil. Beginning in 2004, distillate fuel oil imports were further broken out into four different categories based on sulfur content. These four categories are: <15 PPM, 15<PPM<=500, 500<PPM<=2000, and >2000 PPM. From 1996-2002, data for residual fuel oil was reported on a total residual fuel oil imports basis. In 2003, EIA began to report residual fuel oil imports on a sulfur content basis. Import volumes for residual fuel oil are now reported by <.31% sulfur content, .31-1.00% sulfur content, and >1.00% sulfur content. The New York City area requires 0.3 % sulfur content residual fuel oil

Imports into Port Cities

Energy Information Administration *Company Level Imports* 1996-2004 available on web at:
http://www.eia.doe.gov/oil_gas/petroleum/data_publications/company_level_imports/cli.html.

The second EIA publication used to estimate supply in the study area is EIA *Petroleum Supply Annual*. Table 34 of *Petroleum Supply Annual Volume 2* reports movements of crude oil and petroleum products by tanker and barge between PAD Districts. These data are reported on a monthly basis using form EIA-817 “Monthly Tanker and Barge Movement Report”. Data for movements between PADD 3 and Central Atlantic were extracted because the Central Atlantic region encompasses the study area. Once again the products of interest were distillate fuel oils, residual fuel oils, and kerosene. The breakout of residual fuel oils by sulfur is reported in a similar fashion to how the imports are now reported. Data for volumes of shipments of distillate fuel oils are still broken out by only two sulfur categories.

Movements of Petroleum Products between PAD Districts

http://www.eia.doe.gov/oil_gas/petroleum/data_publications/petroleum_supply_annual/psa_volume2/psa_volume2.html

http://www.eia.doe.gov/oil_gas/petroleum/data_publications/petroleum_supply_monthly/psm.html

Deriving estimates of movements of distillates and residual fuels from New Jersey to the New York portion of the NYSERDA study area

Movements from NYC Metro-NJ to the NYC Metro-NY Area and Long Island were based on filling the demand requirements for those regions. The figures generated represent the difference between the demands in those two study regions minus imports into those two study regions. The demand data from EIA is the total of all the commercial, industrial, residential, transportation, and electricity generation sales. The import data is from the EIA *Company Level Imports* database.

Movements from NYC Metro-NJ to the Albany/Hudson study region are based on movement data from the United States Army Corp of Engineer *Waterborne Commerce Data Series*. Data for volumes of movements of residual fuel oil and distillate fuel oil between the NYC Metro-NJ and the Albany/Hudson study region were extracted from the *Waterborne Commerce* database. ICF also made an assumption regarding the amount of residual fuel oil supplied from NYC Metro-NJ to the Albany/Hudson region. This was based on the assumption that Albany was the distribution point for the surrounding region. As a result, the Albany/Hudson region requires more supply than would be used solely within the area to meet the surrounding demand. Therefore, ICF concludes the Albany/Hudson region most likely supplies the surrounding region with residual fuel oil via rail and truck transport.

Movements between NYC Metro-NJ study region and Albany/Hudson study region

<http://www.iwr.usace.army.mil/ndc/wcsc/wcsc.htm>.

DEMAND ESTIMATION

The primary source of demand data is the Energy Information Administration (EIA). The EIA publishes two data series related to demand, *Consumption* and *Prime Supplier Sales*. The smallest geographic location for which this data is available is the state level. Consumption is a direct estimate of refined products consumed. *Prime Supplier Sales* is based on the survey form EIA-782-C, that measures primary petroleum product deliveries into the states where they are locally marketed and consumed. To avoid double counting volumes, survey respondents are instructed to exclude sales to other prime suppliers and traders. The design of the EIA-782C makes possible accurate measurement of sales volumes for consumption at the United States and regional levels, as well as for most states¹. Since actual consumption data at the state level is only available for years prior to 2002, the sales data was used as a substitute for years 2002 and 2003. Neither sales nor consumption data were available at the state level for 2004.

The major sectors for which state-level data is available and their definitions as per EIA are given below.

Residential. An energy-consuming sector that consists of living quarters for private households. Common uses of energy associated with this sector include space heating, water heating, air conditioning, lighting, refrigeration, cooking, and running a variety of other appliances. Sales to farmhouses are reported under “Farm” and sales to apartment buildings are reported under “Commercial.”

Commercial. An energy-consuming sector that consists of service-providing facilities and equipment of non-manufacturing businesses; Federal, State, and local governments; and other private and public organizations, such as religious, social, or fraternal groups. The commercial sector includes institutional living quarters. Common uses of energy associated with this sector include space heating, water heating, air conditioning, lighting, refrigeration, cooking and running a wide variety of other equipment.

Industrial. An energy-consuming sector that consists of all facilities and equipment used for producing, processing, or assembling goods. The industrial sector encompasses the following types of activity: manufacturing and mining. Overall energy use in this sector is largely for process heat and cooling and powering machinery, with lesser amounts used for facility heating, air conditioning, and lighting. Fossil fuels are also used as raw material inputs to manufactured products.

¹ Energy Information Administration, Prime Supplier Report, January 2005

Electric Power: An energy-consuming sector that consists of electricity only and combined heat and power (CHP) plants whose primary business is to sell electricity, or electricity and heat to the public. volumes directly imported and used by the electric power companies are included.

Transportation: The transportation sector consists of the following sub-sectors defined by EIA.

Railroad. An energy-consuming sector that consists of all railroads for any use, including that used for heating buildings operated by railroads.

Vessel Bunkering. An energy-consuming sector that consists of commercial or private boats such as pleasure craft, fishing boats, tugboats, an ocean-going vessels, including vessels operated by oil companies. Excluded are volumes sold to the U.S. Armed Forces.

On-Highway Diesel. An energy-consuming sector that consists of motor vehicles: automobiles, trucks, and buses. Vehicles used in the marketing and distribution of petroleum products are also included.

Off-Highway. An energy-consuming sector that consist of farm equipment:

Construction. An energy-consuming sub sector that consist of all facilities and equipment including earthmoving equipment, cranes, generators, air compressors, etc.

Other. An energy-consuming sub-sector that consists of all off-highway uses other than construction. Includes logging, scrape and junk yards, and refrigeration units on trucks.

Deriving County Level Estimates from State level EIA data.

The study region poses a special challenge to determine values for energy consumption, supply and movements, in that the EIA data is only available at the state level, but the study region is at sub-state level. One of the steps taken to make data estimation easier for the study region was to define the region as consisting of distinct counties. This helps estimating numbers for the study region by using demographic and business pattern data that are available in the *County Business Patterns* Report from the U.S. Census. Appropriate characteristics were chosen from Census data that would help ICF estimate the distribution of fuel demand across the various counties. The assumptions used for each of the sectors are given below.

Residential

EIA data provides annual state-wide data for residential consumption of distillate fuel and kerosene for 1960 – 2001 and sales data after that. The U.S. Census Bureau provides the number of housing units using fuel oil for heating on a county-wide level. Housing units within apartment buildings were removed from this total by using the percentage of housing units in multi-unit structures so that only single unit homes were included in the residential data. This information from the Census Bureau was used to calculate the distribution of state energy consumption data among various counties based on the proportion of fuel oil customers within that county. In

cases where counties of interest did not have data on the number of fuel oil customers (only the larger counties have data), the population was used to estimate the proportion of the consumption in that county.

Transportation

EIA has state-wide data on transportation consumption of aviation gasoline, distillate fuel, jet fuel, LPG, lubricants, motor gasoline, and residual fuel for years 1960 to 2001. EIA also provides annual state-wide data on sales of distillate fuel and residual fuel oil for transportation use that is used as a surrogate for demand for the years 2002 and 2003. Since diesel is primarily used for on-road consumption in the transportation sector, its consumption was disaggregated to the county level by using the number of gasoline stations in each county given in the Census Bureau's *County Business Patterns*. The primary use of residual fuel in transportation is for vessel bunkering at the ports. A list of ports in the states of New York and New Jersey is available from the U.S. Army Corps of Engineers. A count of the number of ports in the county is the closest indicator of demand for oil at the county-level that could be found. Other alternatives, like residual storage capacity by county, were explored, but were deemed poor indicators since the storage could be for electricity generation or temporary

storage for oil enroute to another location. Yet another alternative, estimating demand by distribution of vessel tonnage by port, was not considered to be any better an indicator than the number of ports.

Electricity Generation

The EIA-906 “*Power Plant Report*” contains fuel consumption data at the power plant level for both utility and non-utility electricity generation. This data was used for the years 1997 to 2001. Individual plants were mapped to the county and region that they are located in. The consumption from plants that could not be mapped was divided using the same proportions as industrial demand. Although the EIA-906 data is available for the years 2002 and 2003, EIA sales data was used instead in order to be consistent with estimation methodology used for the other sectors. The state-level sales data was distributed among the various counties and regions in the study area using the 2002 demand data from EIA-906.

State Consumption Data

- EIA has state-wide data on electric plant consumption of distillate fuel, jet fuel, LPG, and residual fuel for 1960 – 2001.

State Sales Data

- EIA data provides annual state-wide data on sales of distillate fuel and residual fuel oil for electric plant use.

Plant-Level Data

- The EIA form 906 contains fuel consumption data at the power plant level for both utility and non-utility electricity generation. Individual plants were mapped to the county that they are located in.
- The consumption from plants that could not be mapped was divided using the same proportions as industrial demand.

Daily Approximation

- Consumption from electric power generation was assumed to follow the same pattern as cooling degree days for Brooklyn, NY.

Data Sources for Electric Power Sector

METHODOLOGY FOR DATA EXTRAPOLATION OF GAS DEMAND OF INTERRUPTIBLE CUSTOMERS FOR 2004-2005 HEATING SEASON

ICF extrapolated the monthly gas consumption of interruptible customers from October 2004 to the remaining months of the 2004-2005 winter season in order to assess the number of days coverage that the fuel oil storage capacity would provide to these customers in an event of a gas supply interruption. The extrapolation was done using scaling factors derived from an analysis of sectoral gas consumption in New York State.

The demand ‘scaling factor’ for each month of the 2004-2005 winter season was calculated as the daily average demand in each sector for that month divided by the daily average demand for October 2004. The scaling factor was then applied to the October 2004 gas consumption for only the gas interruptible customers (customers successfully cross-referenced between databases) to estimate their likely gas demand² from December 2004 until March 2005. This estimated gas demand was then used to calculate the number of days coverage that the fuel oil storage capacity will provide. The state level natural gas consumption data from EIA that was used to estimate the scaling factor categorizes apartment buildings in the commercial sector. Exhibits IV-10 and IV-11

² The data for interruptible customers was allocated to either Commercial, Industrial or Electric Sector based on their ‘Site Type’ in Exhibit IV-10. Customers with unclear site type like “Other” or “Unknown” were assigned to the commercial sector and the respective scaling factor was used.

extrapolate the gas consumption for apartment buildings using the same classification as EIA. However, apartment buildings may also exhibit gas usage in a pattern that mirrors the residential sector that shows a greater peak in the winter than the commercial sector. Therefore, Exhibits IV-12 to IV-13 estimate the number of days of fuel backup storage assuming apartment buildings to be in the residential sector in order to evaluate the case of extreme winter demand peak. It should also be noted that sectoral New York state consumption data from the EIA for January 2005 were affected somewhat by interruptible customers being instructed to switch off gas, as the last half of that month was very cold. The specifics of those interruptions were as follows: KeySpan Long Island - customers were interrupted for 3 days, Con Edison - customers were interrupted for approximately 9 days, and Central Hudson - customers were interrupted for 15 days. These gas interruptions result in actual gas consumption being lower than true gas demand since some customers would have switched to alternative fuels during the interruption period.

APPENDIX B – MODELING RESULTS

Appendix on the Fuel-Switching Simulation

The objective of this simulation is to estimate the distribution of fuel switching per heating season caused by natural gas supply interruptions in the study area. Because the frequency with which levels of switching occur is of interest, especially for extreme events, the output of the simulation shows not just the mean, but the full expected range of the quantity of such fuel switching.

Basic Design

The model simulates the markets in the study area for natural gas, No. 2 distillate fuel oil, and No. 6 residual fuel oil. The unit of time in the simulation is one day. While it is difficult to obtain all the data inputs with that frequency, it is necessary to model natural gas interruptions on the daily level as the decision to ask for interruptions is made on a daily basis. Some interruptions may be as short as one day.

The model runs in two modes, calibration and forecasting. During its development, the simulation was run in calibration mode which models the markets for all the days of an historical heating season and then compares the simulated results with actual history. The key comparison is predicted natural gas interruptions to dual-fired customers versus actual interruptions.

Once a good match is found, the model can be run in forecasting mode. To do this it uses models of the behavior of heating degree days (HDD) over the heating season in the study area and the behavior of wholesale prices of the three fuels. These equations generate a large number of simulated heating seasons, and the results by season are collected to estimate the full range of outcomes of interest.

Demand: Sectors, Fuels, and Entities

The simulation models four demand sectors – residential, commercial, industrial, and electric utility. Three fuels are included – natural gas, distillate, and residual. The residential sector demands only distillate and natural gas; the other three sectors utilize all three fuels.

The basic simplifying concept in the model is entities, which are the source of demand for fuels. An entity is defined by its sector and the set of fuels it can burn. Exhibit B-1 lists the 17 entities that were used in the model. As the exhibit shows, the commercial, industrial, and electric utility sectors have five sectors each that burn distillate only, natural gas only, residual fuel only, gas and distillate, and gas and residual fuel.

The exhibit also shows the typical daily demand of each entity and its demand function. The demand functions for the single-fired entities were estimated by regression analysis. Those for the dual-fired entities were made by combining the functions of the corresponding single-fired entities within the same sector. The typical demand levels of the dual-fired entities were calibrated to match the fuel switching observed during some historical gas interruptions.

Exhibit B-1: Model Inputs for Entities

		Typical				
		Consumption	Demand Function Coefficients			Elasticity
Sector	Fuels Burned	(Dth/day)	Intercept	HDD	Price	at Means
Residential	Distillate Oil	1,415,313	241,560	38,175	-65,246	-0.52
Residential	Natural Gas	1,812,341	37,160	48,614	-8,338	-0.23
Commercial	Distillate Oil	599,568	342,892	16,185	-614	-0.57
Commercial	Natural Gas	1,064,285	150,318	33,804	-32,084	-0.31
Commercial	Residual Oil	419,047	144,079	11,312	-307	-0.35
Commercial	Gas & Dist.	176,430	51,068	5,314	-3,550	-0.40
Commercial	Gas & Resid.	106,119	20,622	3,238	-2,381	-0.32
Industrial	Distillate Oil	68,265	51,760	1,843	-97.7	-0.76
Industrial	Natural Gas	227,639	109,180	4,163	-2,274	-0.08
Industrial	Residual Oil	114,429	100,928	3,089	-215	-0.89
Industrial	Gas & Dist.	19,112	10,294	385	-144	-0.23
Industrial	Gas & Resid.	38,898	23,671	820	-75.2	-0.34
Elec. Utility	Distillate Oil	18,038	87,392	487	-196	-4.88
Elec. Utility	Natural Gas	545,982	756,133	27,147	-266,422	-1.71
Elec. Utility	Residual Oil	643,038	308,404	17,358	-656	-0.48
Elec. Utility	Gas & Dist.	3,442	8,227	148	-1,108	-2.63
Elec. Utility	Gas & Resid.	210,932	189,060	7,901	-22,484	-1.05

All the demand curves are linear functions of HDD and the retail price of their fuel. The units of measure are decatherms for quantity and (2000) dollars per decatherm for prices. This uniformity facilitates the fuel switching that goes on as the model seeks a market equilibrium across the three submarkets. As the demand functions are linear, the coefficients show the rate of change in demand with respect to HDD and price. Unlike such functions that use the logs of the dependent and independent variables, the estimated coefficients are not interpretable as elasticities. However, a typical elasticity can be computed at the means of the data, and these elasticities are shown in the far-right column of the exhibit. The elasticities seem reasonable. Residential gas demand is inelastic, as expected, with an elasticity of -0.23 . All the demands are inelastic except for four of the functions in the electric utility sector, but this makes sense, too, as that sector has more substitutes for fuel inputs, including buying outside power.

Inventories

The simulation tracks the levels of tertiary inventories of distillate and residual fuel held by entities. Primary inventories at terminals and bulks storage and secondary inventories held by distributors are not tracked in the model. Entities consume from inventory when the market price is relatively high and can bid for refills when the price is low or equal to the outside price³.

The inventory capacity of all nonresidential entities is equal to the averages obtained by the provided data: 47.5, 33.2, and 41.8 days of consumption for commercial, industrial, and electric utility distillate customers, respectively, and 52.3 and 49.9 days of supply for commercial and industrial residual users. No data were available for electric utility residual customers, so their capacity was assumed to equal that of electric utility distillate users. These tanks are assumed to be 75 percent full at the beginning of the heating season.

For the distillate-burning residential entity, inventory capacity is set equal to one-fifth of the average heating-season consumption. On average, tanks are assumed to be 62.5 percent full at the beginning of the season on November 1.

Inventories have a refill fraction. When stocks fall below the refill level, the entity tries to refill when the price is low. For the residential sector the refill fraction is 0.625.⁴ The other entities are assumed to receive refills that bring their stocks up to 75 percent original capacity. Refills are not assumed to bring stocks up to aggregate capacity in either case because of diversity – all customers do not obtain refills at once. It takes time for sellers to cycle through the entire list of customers, and the first on the list can consume a considerable fraction of the last refill before the last on the list is refilled.

The model's inventories also have a runout fraction, a level at which some members of the entity run out of inventory. Our model of residential inventories indicates this would begin to happen at 37.5 percent of capacity. For other entities, which probably have less fill diversity, runout starts at one-quarter fill.

Supply

The simulation has a model of the supply of each of the three fuels at the retail level for a single day. These models are simple but realistic. Exhibit B-2 provides a generic example, which illustrates the shape of the supply schedule for all three fuels. The supply curves are completely elastic at price P_s from $Q=0$ out to Q_s at which it becomes completely inelastic.

³ See the next section for a definition of the outside price.

⁴ The residential refill fraction value is derived from this model: The typical behavior of heating oil distributors is to refill residential tanks when the fill drops to one-quarter. Once the system is in equilibrium with a diversity of fill levels, the average fill will be the average of one-quarter and full or 5/8 (0.625).

Exhibit B-2:

Q_s is the maximum quantity that can be supplied in a day. For the liquid fuels, ICF estimated these supplies at 24,451,600 gallons of distillate per day and 16,800,000 gallons of residual fuel per day. However, these limits are not constant. For the liquid fuels it clearly varies with ice and snow conditions that affect delivery by truck or barge. We approximate this relationship by reducing the Q_s for distillate and resid at low temperatures, as illustrated in Exhibit B-3. As the exhibit shows Q_s is constant between 0 and 40 HDD, and then falls linearly to 65 HDD where it reaches 70 percent of the maximum. This estimate of 70 percent is taken from responses we received from heating oil distributors. While HDD is not a perfect proxy for ice and snow conditions, there is not sufficient data on actual snow and ice conditions to use them as variables in the model.

B-3: Distillate and Resid Supply Reductions in Very Cold Weather

The natural gas supply is not constant, either. The gas supply comes from an essentially constant component: from pipelines and peaking components from gas storage, cogeneration sources, and winter peak shaving. In a cold heating season, the peaking components can be exhausted before the season ends, so the maximum gas supply can decline. ICF estimated the maximum that could be attained from all gas suppliers into the study area at 6,031 kilodecatherms of which 2,378 kilodecatherms are from flowing pipelines.

The ideal measure for P_s would be a lower-bound price set in the outside market that reflects the general level of prices rather than local conditions. For example, for the liquid fuels, it would reflect the world price of crude oil, and the levels of primary stocks, but not the effect of current, local temperature; that is handled in the model. We chose to use the New York Harbor prices of distillate and residual fuel. They are close to ideal as they are correlated with world prices and with deviations of primary stock levels from normal. However, they are also somewhat correlated with deviations of HDD in the Northeast, but on balance, they are the best available.

However, to use these wholesale prices in the model, we had to connect them to the retail prices needed for the market supply models. We found that regression analysis could estimate the relationship between monthly retail and wholesale prices. The formulas we used are shown in Exhibit B-4. In calibration mode, the model reads in daily wholesale prices and uses those formulas to convert them to the three base prices (P_s).

Exhibit B-4: Equations to Convert Wholesale to Retail Prices

<u>Sector</u>	<u>Fuels Burned</u>	<u>Intercept</u>	<u>Beta</u>
Residential	Distillate Oil	0.77	0.73
Residential	Natural Gas	8.07	0.23
Commercial	Distillate Oil	0.17	1.03
Commercial	Natural Gas	5.09	0.67
Commercial	Residual Oil	0.24	0.84
Industrial	Distillate Oil	0.10	1.08
Industrial	Natural Gas	3.46	0.73
Industrial	Residual Oil	0.24	0.84
Elec. Utility	Distillate Oil	0.02	1.28
Elec. Utility	Natural Gas	0.82	1.12
Elec. Utility	Residual Oil	0.24	0.84

Equilibration

To find an equilibrium set of fuel prices, the model polls each entity in turn and lets it switch an increment of fuel demand from a higher price fuel alternative to one with a lower price. This polling and switching procedure continues until no customer can obtain a lower price from any further switching.

Entities that use only natural gas cannot switch; they simply buy what is indicated by their demand curves at the equilibrium gas price. Entities that do not use gas have two supply alternatives, buy on the market or use some inventory. The price of inventory is conventionally set at one cent above P_s so that inventory will be used only when the market price is being bid up the inelastic part of the supply curve.

When the market price is at the base, no one takes from inventory because they can get all they want at the lowest possible price. Also, when prices are at the base, entities with inventories below the refill level will bid for fuel to refill their tanks to the refill fraction. If the total demand for refilling is greater than the amount that would drive the total demand to Q_s , then the available refill is prorated among the applicants. Thus, the demand for refilling is not allowed to bid up the market price above P_s .

Even though this algorithm does not involve looking ahead or optimizing complex dynamics, it makes the entities mimic optimizing behavior. They buy inventory at a low price and use it when the market price is high.

Running Out

Entities that burn a liquid fuel can run out. Running out occurs when inventory at the beginning of the day is below the runout fraction and the part of an entity's consumption that comes from a liquid fuel is less than its demand for that fuel at P_s . For example, if an entity starts the day with inventory ten percent below the runout level and does not make up that decatherm shortfall by buying a fuel on the market, then ten percent of that entity has run out. Dual-fired entities can make up the shortfall with either fuel if their gas supply has not been interrupted.

Statistics and Accounting

After the simulation solves for the market equilibrium, it updates the balance sheet for each entity finding its demand, inventory use, inventory refill, and consumption. Statistics on running out, days that demand at P_s exceeded supply, and switching from gas are collected and aggregated for the heating season.

Calibration

The simulation was calibrated against the data we had on the actual interruption experience of the 2002-2003 heating season. We also intended to calibrate against the 2003-2004, but the data for that season were inconsistent. During midwinter, the data we collected showed that HDDs as low as 39 were causing interruptions, but in February and March HDDs as high as 50 were not.

The 2002-2003 heating season was quite cold – the third coldest of the 21 seasons from 1984 to 2004. According to the data we collected for the 2001 through 2004 heating seasons, this one had the most gas supply interruptions at 76 days, and is the logical choice for calibration.

The simulation's summary page of statistics for the calibration is shown in Exhibit B-5. The five lines of documentation record the key input assumptions and parameter values that were adopted for this model run. As the exhibit shows, these include:

- **Gas supply interruptions for nonresidential customers.** The model can let dual-fired entities choose their more economic fuel, or it can use the option adopted in this run to interrupt such entities whenever the demand for gas exceeds the supply.
- **Using 40 tranches of gas surge capacity.** From the load-curve data provided by National Grid, we constructed tranches of gas supplies from storage, cogeneration, and winter peaking. Each tranche has a volume in decatherms and a limiting number of days it can be drawn.
- **Variable supplies of distillate & residual fuels.** As discussed above, the available supplies of distillate and residual fall when the HDD exceeds 40 to reflect the slowing of truck deliveries during extreme weather.
- **Residential distillate inventories started at equilibrium.** The simulation gives the user the option to start residential heating oil full or in equilibrium on November 1. Equilibrium means that the tanks have a steady-state range of fills; some are calling for refill, some have just been filled, etc. The model assumes that the average fill for residential tanks is 62.5 percent in equilibrium.
- **Nonresidential refill factors at 75 percent.** Nonresidential tanks can be started full on November 1 or at 75 percent of capacity, and the model user can choose whether they refill after use to 100 percent or to 75 percent. The former would represent diligent efforts by companies to refill their tanks after use.

The first table on the summary page shows the number of days that each fuel supply was insufficient to meet demand at the base price. For natural gas, this condition means an interruption for dual-fired customers in this run, as explained in the first bullet above. The summary in the exhibit shows that the model predicted that there should have been 71 gas supply interruptions; in fact 76 occurred, which is close agreement. However, these

statistics do not account for whether the predicted and actual interruptions occurred on the same days. The “hits” statistic handles that and shows that 63 of the 73 interruptions predicted by the model match actual interruptions. The summary also shows that distillate fuel supplies fell short of demand on seven days and residual fuel supplies were short on 17 days.

The table of runout days in Exhibit B-5 shows the number of days that each entity ran out of distillate or residual fuel. Only residual-only entities ran out. The commercial entity ran out for just less than one day. This can be interpreted as 96 percent of the companies in the entity ran out for a day. Runout days for the residual-only industrial entity was 0.61; it was 0.91 for the electric utilities burning resid only.

The last table in the summary shows the number of days that the dual-fired entities either chose to switch to a liquid fuel or were forced by an interruption to do so. We expect the minimum here to be about 73, the number of gas interruption days, and the maximum can be more because of voluntary switching, especially in late March when the base price of residual fuel was lower than the price of gas.

Exhibit B-5: 2002-2003 Heating Season

Gas supply interruptions for nonresidential customers
Using 40 tranches of gas surge capacity
Variable supplies of dist. & resid
Residential distillate inventories started at equilibrium
Nonresidential refill factors at 75 percent

Days that Demand at Base Price Exceeded Supply

Key: * = Simulation called a gas interruption
+ = Historical day of gas interruption

Exhibit B-6, above, provides a day-by-day picture of the simulated markets for the three fuels. The first two columns show the day and the historical HDD. The next three labeled columns show the demand for the three fuels in kilodecatherms. Just to the right of the gas demand column, the model indicates with a “+” days of historical gas interruptions and uses an asterisk to mark days that the model predicted were interruptions. Note the close correspondence between the two during the coldest part of the heating season.

The next three columns show supplies. The gas supply generally goes up on colder days as storage is used (until it runs out) while the distillate and residual fuel supplies go down when the HDD is colder than 40.

The last three columns on the right are the shadow prices of the three fuels. When demand is less than supply, this is equal to the outside (or base) price. When demand exceeds supply, its price is bid up.

Exhibits B-7 through B-10 (shown at the end of the Appendix) show how the model keeps track of each entity’s demand and use of inventory. Each exhibit shows a single sector starting with residential. For the dual-fired entities, the exhibits show how they switch from fuel to fuel. Inventory refilling is shown for entities that use a liquid fuel. Runouts occur for entities that use a liquid fuel when their inventories are empty, and they cannot get the decatherms they want from gas. Examination of these exhibits indicates that the entities engage in logical, economic behavior.

Prediction

Having calibrated to a cold heating season, we switched the simulation to prediction mode and ran it for a large number of simulated winters to make a variety of long-run predictions and to examine the effect of a change in policy on holding nonresidential inventories.

To run the predictions we estimated time series models of the daily behavior of HDD and the prices of the three fuels. A model of daily HDD is a key equation required for a simulation of fuel switching. We estimated an equation that simulates the daily HDD in Albany using data from a twenty-year period. The specification is:

$$(1) \text{HDD}_t = \alpha + \beta_1 \text{HDD}_{t-1} + \beta_2 \text{HDD}_{t-2} + \beta_3 \text{HDD}_{t-3} + \sum \delta_i \text{Year}_i + \varepsilon_t$$

where the HDDs are daily deviations from normal;
 α , the β s, and the δ s are parameters to be estimated; and
 ε_t is the error term.

This specification has worked well in other similar applications.⁵ The daily HDD observations are converted to deviations by subtracting the expected HDD for each day given the number of days into the heating season, with day zero being November 1. We estimated a model with Shiller⁶ smoothness priors to establish the normal HDD level for each day of the heating season in Albany. Exhibit B-11 shows the resulting curve.

The results of fitting the daily model shown in equation 1 to the HDD deviations are shown in Exhibit B-12. The coefficients on the three lagged HDD deviations decline in magnitude with greater lag, as one would expect. They alternate in sign, which is typical, too, for a series in which all the neighboring members are positively correlated.

By using the estimated parameters from the regression and the standard error of the regression for random shocks, we can simulate heating-season HDD deviations. Then, adding the expected HDD to that which yields an HDD series that behaves just like the original. This is quite useful in a simulation analysis of the fuels markets in the study area.

a. Dependent Variable: HDDDEV

b. Linear Regression through the Origin

As a set, the four models reflect the effects of temperature on prices and the effects of each price on the other two.

Exhibit B-13 shows the averages and other statistics from the base-case simulation, which used all the same assumptions as calibration mode. The average heating season HDD was 5175. By comparison the total HDD for the 2002-2003 heating season was 5645. Again, this indicates how cold that winter was relative to others. The days that each fuel was out of supply are lower, too, at 60, 2, and 10 for gas, distillate, and resid compared to 71, 7, and 16 in the calibration run.

The next column to the right in Exhibit B-13 shows statistics for a once-in-a-century heating season. At 6069 HDD, this extreme heating season is colder than any observed from 1984 to 2004; the season ending in 1994 was the coldest of those at 5826 HDD. The number of gas interruption days goes up by 25 over the mean to 85. Even this very cold heating season does not stress distillate supplies. The number of days that the base-price demand exceeds supply rises to 9, but no distillate burning entity runs out. For residual fuel the number of days of excess demand rises significantly, but still no residual-burning entities run out. The actual output of the model shows the days of runout, but those are not included here because they are all zero.

Exhibit B-13:

Statistics from from 1999 interations of the Simulation				
Entity	Mean	Standard Deviation	Once in a Century	Cold Reduces Supply
HDD	5175	406.7	6069	6181
Days Supply Exceeded:				
Gas	60	20.9	85	85
Distillate	2	2.4	9	18
Resid	10	5.2	21	21

In case our distillate and residual supplies estimates are too high, we ran a scenario to test the effect of reducing that supply. The most important time for supply is during colder weather, so we supposed that the survey data overestimate the ability of trucks to deliver fuel on very cold days and reduced the supply that could be obtained at zero F to 50 percent instead of the 30 percent used in the base case. The results of that run for the once-in-a-century heating season are shown in Exhibit B-13. The only important difference between this case and the last is that the number of days that the distillate demand exceeds supply rises from 9 to 18. This increase, however, does not result in any instances of distillate customers running out.

APPENDIX C – WATERBORNE DATA

This Appendix describes the methodology behind the use of the U.S. Army Corps of Engineers' *Waterborne Commerce* data in this report.

Waterborne Commerce data lists many different ports and waterways. For the purposes of the study area, the data for five different ports/waterways will satisfy the data needs. These five include: the Port of New York Consolidated Report, the Hudson River/Deepwater in Upper Bay, NY to Waterford NY Consolidated Report (includes Port of Albany), Hempstead Harbor, Port Jefferson Harbor, and Oyster Bay. The data that is reported for each of these ports or waterways encompasses all the movements in the study area. Therefore, for each year and each type of movement (foreign, domestic, internal), only data for these five ports/waterways were extracted.

Waterborne Commerce data also is broken out in three different transaction types with the following numbers: 1-cargo, 2-tonmiles, 3-trips. Only data for transaction type 1-cargo, was studied.

In terms of what type of traffic the barge movements are, the data are broken out into several categories. The traffic codes for the data that have been summarized are as follows: 11-foreign imports, 12-foreign exports, 21-Canadian imports, 22-Canadian exports, 30-coastwise, 50-internal.

The *Waterborne Commerce* data also has codes for the "direction" the shipments are moving. These codes are: 1-inbound receiving, 2-outbound shipping, 3-local, 4-thru. Only codes 1 and 2 were used. The use of data that has "direction" codes of 3 or 4 may result in the double counting of shipments. An example of this is if Albany is receiving a foreign import from the Atlantic. This shipment would have to pass through an area that is included in the Port of New York statistics, and therefore, would be reported in the volumes of the Port of New York with code 4. The final destination however is Albany, and the objective is to record the volume reported by the Port of Albany, which is code 1, inbound receiving. Hence, counting the volume of code 4 for the Port of New York and the volume of code 1 for the Port of Albany would double count the shipment.

In compiling the foreign import and export movements, data with traffic codes 11, 12, 21, and 22 were extracted for the five ports/waterways listed above. These four traffic codes with "direction" codes of 1-inbound receiving are foreign imports, and likewise, these four traffic codes with "direction" codes of 2-outbound shipping are foreign exports.

In order to summarize shipments that are strictly domestic, data with traffic code 30-coastwise was used. *Waterborne Commerce* defines coastwise as domestic traffic receiving carriage over the ocean, or the Gulf

of Mexico. Looking at a map, one can see that if any of the five ports/waterways in the study area has a direction code of 1 or 2 and a traffic code of 30, the shipment must have come from or is headed out of the study area. For a shipment to be considered coastwise, it has to touch an ocean at some point. Therefore, the destination or origin of shipments with traffic code 30 is outside of the study area because all five of the ports/waterways are considered on inland waterways.

This leads to the final type of movement, which is internal. Data for internal movements has traffic code 50-internal. *Waterborne Commerce* defines internal movements as vessel movements which take place solely on inland waterways. An inland waterway is one geographically located within the boundaries of the contiguous 48 states or within the boundaries of the State of Alaska. In the study area, only the Port of New York and Hudson/Deepwater in Upper Bay, NY to Waterford, NY (including Port of Albany) had any internal movement data reported. Therefore, this means that any internal movements are basically tracking the shipments north and south on the Hudson River, because there are no other inland waterways connecting the Port of New York and Albany. A data point reported for the Port of New York with traffic code 50-internal and “direction” code 1-inbound receiving means that it was a movement from Albany/Hudson region south to the Port of New York. Likewise, in the same scenario the “direction” code 2-outbound shipping, means that it was a shipment from the Port of New York to a destination on the Hudson, possibly as far as Albany. For all of the products and for a majority of the years, the internal shipping data from the Port of New York matches the internal receiving data for Hudson/Albany region, and vice versa. Discrepancies may possibly be explained by the shipping in canals to and from Albany in upstate New York.

The U.S. Army Corps of Engineers also collects specific data on the ports of origin and the destination port of all individual voyages, although they no longer publish this. The Corps was kind enough to extract the data showing domestic waterborne shipment from southern New Jersey into the study area and from the study area into the New England ports.

APPENDIX D – PERMITS AND REGULATORY PROCESS REQUIRED FOR PETROLEUM STORAGE TANKS AND TERMINALS AND END-USERS

New York Regulations and Permitting for Fuel Oil Storage Tanks

1.- Terminals and Dealers

PERMIT TYPE	AGENCY	DESCRIPTION	STATUTORY AUTHORITY/ APPLICABLE REGULATIONS
New York State Environmental Quality Review (SEQR)	<p>Lead Agency Lead Agency means an involved agency principally responsible for undertaking, funding or approving an action, and therefore responsible for determining whether an environmental impact statement is required.</p> <p>Involved agency means an agency that has jurisdiction by law to fund, approve or directly undertake an action. If an agency will ultimately make a discretionary decision to fund, approve or undertake an action, then it is an "involved agency", notwithstanding that it has not received an application for funding or approval at the time the</p>	<p><u>Step 1</u> Classify the Action <u>Step 2</u> Complete an Environmental Assessment <u>Step 3</u> Coordinate Review <u>Step 4</u> Determine Significance of Action on Environment</p> <ul style="list-style-type: none"> • Issue Negative Declaration If no significant negative impacts • Issue Conditioned Negative Declaration If impacts can be avoided or mitigated • Issue Positive Declaration If there are significant negative impacts <p>Optional steps Scope EIS</p> <p><u>Step 5</u> Preparation of Draft EIS <u>Step 6</u> Determine Adequacy of Draft EIS <u>Step 7</u> Publish Notice that EIS is Accepted for Public Review <u>Step 8</u> Receive Public Comment</p>	<p>6 NYCRR Part 617 State Environmental Quality Review Adopted: September 20, 1995; Effective: January 1, 1996 Amended June 26, 2000; Effective: July 12, 2000</p>

PERMIT TYPE	AGENCY	DESCRIPTION	STATUTORY AUTHORITY/ APPLICABLE REGULATIONS
Air Permits	SEQR process is commenced. The lead agency is also an "involved agency". New York State Department of Environmental Conservation Division of Air Resources. The Bureau of Stationary Sources	<u>Step 9</u> Decide Whether to Hold Public Hearing <u>Step 10</u> Prepare Final EIS <u>Step 11</u> SEQR findings are made by all involved agencies Owners and/or operators of air contamination sources are required to obtain a Title V Facility Permit, State Facility Permit, or Registration certificate for source construction and operation. Authorizations are for all sources at a facility, not for individual emission points.	6NYCRR Parts 200 through 317 Original rule effective 1/12/75 <u>Part 201</u> : Permits and Certificates <i>Original rules effective 7/7/96</i> <u>Part 202</u> : Emissions Verification <i>Effective date 8/14/94</i> <u>Part 204</u> : NOx Budget Trading Program. <i>Effective date 2/25/00</i> <u>Part 212</u> : General Process Emission Sources. Effective date 11/15/85 Revisions effective 9/22/94 <u>Part 229</u> : Petroleum and Volatile Organic Liquid Storage and Transfer Effective date 4/4/1993
Solid Waste, Hazardous Waste And Hazardous Substance Permits	New York State Department of Environmental Conservation Division of Environmental Remediation; Bureau of Spill Prevention and Response; Regional Office	Petroleum Facility Permits - DEC requires that major petroleum facilities (i.e., those that have a storage capacity of 400,000 gallons or more) be licensed. This license controls the transfer and storage of petroleum, while license fees support a fund to ensure prompt cleanup and removal of petroleum discharges. DEC also requires smaller facilities to register petroleum storage tanks. This requirement applies to facilities with an aggregate storage capacity of 1,101 to 399,999 gallons. Heating oil tanks with	6NYCRR 612-614 <u>Part 612</u> : Registration of Petroleum Storage Facilities <u>Part 613</u> : Handling and Storage of Petroleum <u>Part 614</u> : Standards for New and Substantially Modified Petroleum Storage Facilities Effective 12/27/85 Amended 2/12/92 <u>Petroleum bulk storage registration</u> Combined Storage Capacity at Facility 5-Year Fee for Facility

PERMIT TYPE	AGENCY	DESCRIPTION	STATUTORY AUTHORITY/ APPLICABLE REGULATIONS
Hazardous Waste Management Facilities	New York State Department of Environmental Conservation Divisions of Solid and Hazardous Materials	<p>a capacity of 1,100 gallons or less are exempt. The state has delegated program responsibility to the counties of Nassau, Suffolk, Westchester, Rockland, and Cortland. DEC must be notified of the installation of new tanks or modifications to existing tanks (including replacing, repairing or reconditioning a tank) before work begins. Leak Detection and Monitoring: Petroleum storage tanks (including pipes) must be tested for leaks, and the tester must be certified by the manufacturer. All tanks which require testing must be re-tested every five years from the date of the last test.</p> <p>Requires owners to register all tanks containing any of 1,000 hazardous chemicals. Chemical storage regulations</p> <p>Regulates the management of hazardous waste from generation to treatment, storage or disposal (TSD) consistent with, and no less stringently than, the Federal Resource Conservation and Recovery Act (RCRA) of 1976.</p> <p>REGULATED ACTIVITIES: Storage, transfer, processing, recovery, reclamation, combustion or disposal of any hazardous substance</p>	<p>Greater than 1,100 to 2,000 gallons: \$100 per storage facility Greater than 2,000 gallons to less than 5,000 gallons: \$300 per storage facility 5,000 gallons to less than 400,000 gallons: \$500 per storage facility</p> <p>6NYCRR Parts 370, 371, 372, 373, 374 & 376 <u>Part 370</u> : Hazardous Waste Management System--General and <u>Part 371</u>: Identification and Listing of Hazardous Wastes Effective March 15, 2002 <u>Part 372</u>: Hazardous Waste Manifest System and Related Standards for Generators, Transporters and Facilities <u>Part 373</u>: Hazardous Waste Management Facilities Effective April 10, 2004 <u>Part 374</u>: Standards for the Management of Specific Hazardous Wastes and</p>

PERMIT TYPE	AGENCY	DESCRIPTION	STATUTORY AUTHORITY/ APPLICABLE REGULATIONS
State Pollutant Discharge Elimination System (SPDES)	New York State Department of Environmental Conservation Division of Water	<p>as listed in 371 or which exhibits any of the following characteristics:</p> <ul style="list-style-type: none"> o Ignitability. o Corrosivity. o Reactivity. o Leachability of toxic compounds <p>To maintain reasonable standards of purity of the waters of the state consistent with public health and enjoyment thereof, propagation and protection of fish and wildlife, and the industrial development of the state; and to that end require the use of all known available and reasonable methods to prevent and control the pollution of the New York State waters. Need storm water pollution prevention plans.</p>	<p>Specific Types of Hazardous Waste Management Facilities and <u>Part 376</u>: Land Disposal Restrictions Effective March 15, 2002.</p> <p>6NYCRR Parts 750-752 and Federal Regulations 40 CFR (many parts) <u>Subpart 750-01</u>: Obtaining a SPDES Permit <u>Subpart 750-02</u>: Operating in Accordance with a SPDES Permit Effective Date: 05/11/03 Each person required to obtain a permit or certificate pursuant to the SPDES program must annually submit to the department a SPDES program fee. For purposes of determining annual fees for new and existing facilities, the department will use the design flow in the SPDES permit to establish the average daily rate of flow.</p>
Coastal Erosion Hazard Areas	New York State Department of Environmental Conservation Division of Water	To protect and preserve the natural protective features such as dunes and bluffs of coastal areas, limit erosion, and ensure that erosion control structures are properly constructed.	6NYCRR Part 505 Coastal Erosion Management Effective March, 1988

2. - End User underground storage tanks more than 1100 gallons

PERMIT TYPE	AGENCY	DESCRIPTION	STATUTORY AUTHORITY/ APPLICABLE REGULATIONS
Chemical Underground Storage Tanks (USTs)	New York State Department of Environmental Conservation	<p>Leak Detection and Monitoring: Non complying petroleum storage tanks (including pipes) must be tested for leaks, and the tester must be certified by the manufacturer. Must be re-tested every five years from the date of the last test.</p> <p>Unprotected tanks - such as bare steel and tanks retrofitted with cathodic protection or interior linings - must be tested when 10 years old. Tanks installed with corrosion resistant materials, must be tested when 15 years old. Corrosion resistant tanks and pipes equipped with leak monitoring systems do not require testing, but do require periodic monitoring.</p>	<p>6NYCRR Part 614 Standards for New and Substantially Modified Petroleum Storage Facilities</p> <p>RCRA (Subtitle I) requiring the Environmental Protection Agency (EPA) to regulate underground storage tanks (USTs).</p>
Installation, Alteration, Testing and Repairing Permits	New York City's Fire Department	<p>Tank owners must notify the city, town or village building or fire code enforcement official of proposed construction of storage tanks. Local building permits also may be required. Nassau, Suffolk, Rockland and Cortland counties have individual programs through the Fire Commission or Department of Health.</p>	<p>Fire department rules and regulations, Rules of the City of New York (R.C.N.Y.), Title III, Chapter 21, are contained in the NYC Fire Law Handbook. The NYC regulations are additional to the state requirements. These regulations are equal to or more stringent than state requirements and operate in lieu of state regulations</p>
Stage II Vapor Recovery	Local Agencies in Nassau, Suffolk, Rockland, and Westchester counties, in addition to all five boroughs of New York City and parts of Orange County	<p>Stage II Vapor recovery controls are required. Certain USTs may be exempt from the Stage II controls, depending on age and size.</p>	.

New York Air Permit: Article 19 Air Title V Facility

TITLE V - MAJOR STATIONARY SOURCES			
Classification of Area	Affected Area (by Region)	Contaminant	Quantity (TPY)
Attainment	Areas not specifically listed in any of the areas classified as nonattainment.	Regulated Air Pollutants	100
Marginal Nonattainment NOx& VOC	Region 4: Albany, Greene, Montgomery, Rensselaer, Region 5: Schenectady Saratoga, Essex County-Whiteface Region 6: Mtn. area above 4500' Region 9: Jefferson Erie, Niagara	NOx	100
		VOC	50
Moderate Nonattainment NOx, VOC, CO & PM-10	Region 3: Dutchess, Orange County Area except for LOCMA, Putnam [LOCMA = Lower Orange County Metropolitan Area (Towns of Blooming Grove, Chester, Highlands, Monroe, Tuxedo, Warwick and Woodbury)] Region 1: Nassau Region 2: New York City Region 3: Westchester Region 2: Manhattan	NOx	100
		VOC	50
		CO	50
		PM-10	100
Severe Nonattainment NOx& VOC	Region 1: Nassau, Suffolk Region 2: New York City LOCMA, Region 3: Rockland, Westchester	NOx	25
		VOC	25
Ozone Transport Region	All of New York State	NOx	100
	All of New York State	VOC	50

New Jersey Regulations and Permitting for Fuel Oil Storage Tanks

1.- Terminals and Dealers

PERMIT TYPE	AGENCY	DESCRIPTION	STATUTORY AUTHORITY/ APPLICABLE REGULATIONS
Facility-wide Permitting	New Jersey State Department of Environmental Protection Pollution Prevention and Release Prevention Office	Implements the programs which gather information on the use, storage and release of toxic chemicals to the environment. This office also offers project applicants seeking multimedia permits the opportunity to manage their permitting issues through a single point of entry into the Department.	New Jersey Community Right to Know and Superfund Amendments and Reauthorization Act (SARA) Title III
Environmental Assessment(EA) and Environmental Impact Statements (EIS)	New Jersey State Department of Environmental Protection Permit Coordination & Environmental Review Office	The objective of this Order is to reduce or eliminate any potential adverse environmental impacts of projects initiated or funded by the State.	National Environmental Policy Act (NEPA) and New Jersey Executive Order No. 215 of 1989 (EO#215)
Air Permits	New Jersey State Department of Environmental Protection Division of Air Quality	No above ground storage of VOCs in a 2,000 – 10,000 gallon tank unless the tank is painted white or has an equivalent method of emission control No above ground storage of VOCs in a 10,000 gallon or greater unless the tank is equipped with the one of the following controls: Range I – no controls necessary Range II – Conservation vent required Range III – Floating roof required Ranges are determined by vapor pressure and tank capacity	New Jersey Administrative Code Title 7, Chapter 27, Subchapter 16 Control And Prohibition of Air Pollution by Volatile Organic Compounds The Air Quality Permitting Program (AQPP) is Responsible for implementing the Federal Clean Air Amendments of 1990 and the New Jersey Air Pollution Control Act with respect to permitting, testing and monitoring emissions of air contaminants from stationary sources.

PERMIT TYPE	AGENCY	DESCRIPTION	STATUTORY AUTHORITY/ APPLICABLE REGULATIONS
New Jersey Pollutant Discharge Elimination System (NJPDES) permit	New Jersey Department of Environmental Protection Division of Water Quality	Any tank in Range III must have a double seal floating roof or equivalent control. External floating roof tanks can only be used for storing VOCs with a vapor pressure of 1.0 psia and a capacity of 20,000 gal or more and all openings must be covered when not in use. Hydrostatic Test Water Discharges permit, covers discharges occurring during the hydrostatic testing of storage tanks and pipelines that have been cleaned pursuant to recognized federal, state or general industry documented procedures. Includes Tank and Vessel Cleaning Requirements.	The state and federal laws require two types of permits: preconstruction permits for new and modified sources and operating permits for existing major facilities. Conditions for Authorization Under The NJPDES Discharge To Surface Water General Permit For Short-Term Discharges (NJ0132993)
Land Use Permits	New Jersey Department of Environmental Protection Land Use Regulation Program	These permit authorizations are typically required in order for individuals to undertake land development or other applicable activities throughout the state.	Waterfront Development, Coastal Area Facilities Review (CAFRA), Flood Hazard Area Control (Stream Encroachment), Wetlands of 1970 and Freshwater Wetlands Protection Acts (FWPA).

2. Underground storage tanks

PERMIT TYPE	AGENCY	DESCRIPTION	STATUTORY AUTHORITY/ APPLICABLE REGULATIONS
Construction permit and permit prior to the repair, installation, substantial modification or upgrade of	New Jersey State Department of Environmental Protection Bureau of Underground Storage Tanks	New Jersey's program covers all federally regulated USTs, as well as commercial heating oil tanks and nonresidential heating oil tanks with	New Jersey Administrative Code Title 7, Chapter 14B Underground Storage Tanks

the underground storage tank system.

Fire Department Permits

Local Fire Departments

capacities of more than 2,000 gallons used for onsite consumption. Regulates the installation and closure of USTs at the local level. The reference standard is National Fire Protection Association (NFPA) Code 30. The UCC has been amended to include the UST program.

The Uniform Construction Code (UCC, N.J.S.A. 52:27D-119

NFPA 30 :Flammable and Combustible Liquids Code

APPENDIX E: SURVEY INSTRUMENTS

ICF originally proposed to conduct the study using publicly available data. However, many of the interruptions are of short duration, one to two days. While price and weather data are available on a daily basis, consumption data is estimated on a weekly basis, and only fully reported on a monthly basis. Therefore to fully answer the questions posed by the Public Service Commission and the New York State Energy, Research and Development Authority, ICF required cooperation from industry in accessing private data. At the kick-off meeting for the project in Albany with the agreement of the industry associations it was decided that a survey would be sent out.

A package containing a introductory letter from ICF, a confidentiality agreement and the following survey instruments was mailed to fuel oil distributors, local distribution companies and terminals. The survey tried to capture data related to interruptible gas contracts, and a detailed quantification of the infrastructure. While there is substantial public data available on terminals, pipelines, barges, and tankers, the finer details are missing. Data on individual products stored, demand, and product transported is not publicly available.

Survey for New York State Energy Development Authority's (NYSERDA) Petroleum Infrastructure Study

This survey consists of three parts:

1. Questions for fuel oil distributors (pages 2-9);
2. Questions for Local Distribution Companies (LDCs) (pages 10-11); and
3. Questions for terminals (pages 12-40).

In many cases more than one business category may apply to your company. Please fill in all appropriate sections.

Please note that the terminal questions have one cover sheet, then multiple sets of three sheets by type of fuel. In many cases, you will not need to provide information for the fuel types that are not applicable to your business.

Also, please keep in mind that we will take data in any form you have. If you do not have time to compile or manipulate the data to give us the answer we are requesting, you can send us the data and we will put it into the appropriate form. Data can be sent to us electronically, on disk, or in hard format: whichever way places the least burden on you.

Questions for
FUEL OIL DISTRIBUTORS

Fuel Oil Dealer Survey Questions

Fuel Oil Distributor Name and Location

Owner:

Address:

1. We would like to know where, geographically, your customers are located. Information like zip codes, cities, towns, and counties is acceptable information. If this is not acceptable, you could provide a distance radius that you do not or very rarely exceed and describe why and when you would exceed this delivery radius.

What areas do you serve?

2. Given your answer to question 1, please give the physical amount of each distillate and residual product you sold in thousand gallons during the June 2002 to May 2004 period which includes two full heating seasons. If you have data from previous heating oil seasons readily available, we would gladly receive that information as one of our goals is to understand trends in the fuel oil business.

The second part of the question is: which sector do you sell these products to? Please describe, as best you can, what distillate and residual products you sell to the sectors listed below. Responses may be either in volumes or percentages.

	Kerosene	Diesel ≤ 15 ppm (ULSD)	Onroad Diesel > 15 ppm and ≤ 500 ppm	Offroad No. 2 Fuel Oil ≤ 0.37% S	Offroad No. 2 Fuel Oil > 0.37% and ≤ 1.00% S	Offroad No. 2 Fuel Oil > 1.00% S	No. 4 Fuel Oil	No. 6 Residual Oil ≤ 0.37% S	No. 6 Residual Oil > 0.37% and ≤ 1.00% S	No. 6 Residual Oil > 1.00% S
Total Amount June 2002 - May 2004 (thousand gallons)										
Residential										
Industrial										
Commercial										
Farm										
Military										
Railroad										
Vessel Bunkering										
Electric Utilities										
Other										
Other										

3. Do you currently have any customers that use fuel oil as back-up for interruptible gas service? How many? During the period under review (June 2002 to May 2004) what was the volume of fuel oil purchased by these customers?

4. We would also like to know how much you sell on a monthly basis. We will accept actual data or average data or even your estimate by month using percentages. Again, we will gladly accept data from previous years if you have it readily available. Please let us know what the time period is for the data you provide. Multiple years' data, in any format, would be extremely beneficial. How much of each product do you sell per month by type?

	Kerosene	Diesel ≤ 15 ppm (ULSD)	Onroad Diesel > 15 ppm and ≤ 500 ppm	Offroad No. 2 Fuel Oil ≤ 0.37% S	Offroad No. 2 Fuel Oil > 0.37% and ≤ 1.00% S	Offroad No. 2 Fuel Oil > 1.00% S	No. 4 Fuel Oil	No. 6 Residual Oil ≤ 0.37% S	No. 6 Residual Oil > 0.37% and ≤ 1.00% S	No. 6 Residual Oil > 1.00% S

5. The following question relates to tankage capacity and the utilization of this capacity by product type within a given year.

Fuel	Tank Capacity Owned (thousand gallons)	Tank Capacity Rented (thousand gallons)	Total Across all Tank Capacity for a Fuel		
			Total Capacity (thousand gallons)	Minimum Inventory Level (thousand gallons)	Safety Inventory Level (thousand gallons)
Kerosene					
Diesel \leq 15 ppm (ULSD)					
Onroad Diesel > 15 ppm and \leq 500 ppm					
Offroad No. 2 Fuel Oil \leq 0.37% S					
Offroad No. 2 Fuel Oil > 0.37 % and \leq 1.00% S					
Offroad No. 2 Fuel Oil > 1.00% S					
No. 4 Fuel Oil					
No. 6 Residual Oil \leq 0.37% S					
No. 6 Residual Oil > 0.37 % and \leq 1.00% S					
No. 6 Residual Oil > 1.00% S					

6. How many trucks and barges are needed to sell the amount of product you sell to your market from June 2002 to May 2004?

	Common Carriers	Proprietary Fleet Tankers	Proprietary Fleet Tank Wagons	Commercial Barge	Other
Total Trucks				N/A	
Average Size of Truck				N/A	
Total Shipped June 2002 to May 2004 (thousand gallons)					
Kerosene					
Diesel ≤ 15 ppm (ULSD)					
Onroad Diesel > 15 ppm and ≤ 500 ppm					
Offroad No. 2 Fuel Oil ≤ 0.37% S					
Offroad No. 2 Fuel Oil > 0.37 % and ≤ 1.00% S					
Offroad No. 2 Fuel Oil > 1.00% S					
No. 4 Fuel Oil					
No. 6 Residual Oil ≤ 0.37% S					
No. 6 Residual Oil > 0.37 % and ≤ 1.00% S					
No. 6 Residual Oil > 1.00% S					

7. What is the typical maximum delivery capacity for an 8 hour shift in "normal" and "inclement" winter weather for your proprietary truck fleet?

Tank Wagons:

Tanker Trucks:

8. What is the level of competition in your market? Who are your competitors in your market area and how much of your market do they sell to?

9. And, finally, we would like to know what types of financial processes you use to purchase and sell your fuel. A few examples are Guaranteed Maximum Price, Spot, Long-Term Contracts, and Harbor Price.

What types of transactions do you use to buy and sell your petroleum products? Does it differ by type of product? By type of buyer? Does it differ by season? Please explain how the contracts work.

Questions for

**LOCAL DISTRIBUTION
COMPANIES
(LDCs)**

LDC Survey Questions

LDC Name and Location

Owner:

Address:

We will be trying to quantify how much demand there is for the different fuel oils when interruptible gas customers swing from gas to petroleum during an interruption. We want to understand the following issues.

1. What is the interruptible load by rate class – for example, residential, industrial, commercial, power? Is there any information on their installed alternative fuel?
2. Do you have an estimate by rate class or customer type of the economic switchability between gas and fuel oils? Do you have data for when customers went from gas to oil for economic reasons?
3. How does interruption occur? We understand that some of the interruptibles are cut off when the temperature reaches a certain point; others are interrupted as needed. How much load is represented by each type of interruption?
4. As each type of interruption occurs, how much gas is cut off (Dth/hour or day)? Has anyone ever estimated how much gas would have been consumed by the interruptibles if they had not been cut off? If this information exists, we may be able to estimate the fuel consumed when these customers switch to oil?
5. Do you know how the interruptibles use the gas (e.g., boilers, heaters, hot water, feedstock)?
6. What information do you have about the on-site fuel oil storage capacity of interruptible customers?
7. Can we see some historical data on interruptions, sendout, temperature and the other conditions that surrounded the interruption days? For the last five years.

What do LDCs know about direct purchase customers behind the citygate? We would like to obtain any such market information you may have on these customers to allow us to answer the same questions raised above. .

What does LDC marketing staff know about any large switchable loads outside the LDC? How big is it; is it interruptible (I would presume it is)? These loads may be using LDC released capacity.

An issue not raised is how do nearby interruptible loads outside the study area affect the demand for fuel oil when they are interrupted? (Connecticut, northern NJ for example). Do the NY LDCs have any insights into these loads?

Questions for

PETROLEUM TERMINALS

Petroleum Terminal Name and Location

Terminal Owner:

Address:

Storage Capacity and Utilization

Please provide information about your normal storage levels during the heating oil season (September to March) for each of the products listed in the table below. The questions that follow all relate specifically to this "List of Products".

Storage Capacity by Refined Product

Fuel	No. of Tanks	Total Across all Tanks for a Product			
		Total Capacity (barrels)	Minimum Inventory Level (barrels)	Typical Safety Inventory (barrels)*	Average Drop or Receipt Size (barrels)
Kerosene					
Diesel ≤ 15 ppm (ULSD)					
Onroad Diesel > 15 ppm and ≤ 500 ppm					
Offroad No. 2 Fuel Oil ≤ 0.37% S					
Offroad No. 2 Fuel Oil > 0.37 % and ≤ 1.00% S					
Offroad No. 2 Fuel Oil > 1.00% S					
No. 4 Fuel Oil					
No. 6 Residual Oil ≤ 0.37% S					
No. 6 Residual Oil > 0.37 % and ≤ 1.00% S					
No. 6 Residual Oil > 1.00% S					

*Safety Inventory is defined as volume above suction that is typically held constant

[The following set of questions is repeated for every fuel type as listed in the table above. There are three pages to fill out for each type of fuel. PLEASE FILL IN THE TABLES THAT COVER FUELS THAT YOUR COMPANY DEALS WITH.]

Please feel free to attach any additional documents or explanation to provide details.]

Diesel \leq 15 ppm Sulfur (ULSD)

Inventory

- a. We would also like monthly Diesel \leq 15 ppm inventory levels for the period June 2002 till May 2004. We will gladly accept the data in any format (papers attached to this survey, or electronic) that you already have.

- b. For the period June 2002 to May 2004, we would like daily inventory levels for Diesel \leq 15 ppm during any period of gas interruption. Please provide date and inventory level data from 5 days before the start of the interruption till 5 days after the end of the interruption. We will gladly accept the data in any format (papers attached to this survey, or electronic) that you already have.

- c. Please provide information on the total capacity and throughput (or sales) for **Diesel \leq 15 ppm** over the last twenty years.

Year	Storage Capacity (barrels)	Actual Throughput (barrels)
1985		
1990		
1995		
2000		

Facility Expansion

- a. What are the planned capacity-changes involving Diesel \leq 15 ppm within the next five years?

- b. Is there additional land available at your specific location that can be used to build terminals? Do you own or lease this land? How much additional storage capacity (tanks or barrels) could you build on this land? What product are you likely to use this extra storage capacity for?

- c. Are there plans to relocate to another terminal site? If yes, what will happen to the vacated terminal? If the location is new to the industry, where will it be and what will its capacities be for listed products?

Incoming Product Supply

- a. What volume of Diesel \leq 15 ppm do you receive by different modes of transportation?

Transport Mode	Vol. of Product (bbl/day)	% of total product
Pipeline		
Rail		
Trucks		
Marine Tankers		
Barges		

- b. What is the average incoming Diesel \leq 15 ppm loading capacity during the heating oil season?

Loading Method	Capacity (bbl/day)	Actual Receipt Volume (bbl/day)
Wharf		
Truck Rack		
Rail		
Pipeline Transfer		

- c. What type of contracts do you buy Diesel \leq 15 ppm under?

Contract type	Average Contract Size (bbl/contract)	% of product purchase
Fixed contract for the entire heating oil season (September to March)		
Spot Purchase (0-14 days in advance)		
Spot Purchase (15-30 days in advance)		
Spot Purchase (31-60 days in advance)		
Spot Purchase (more than 60 days in advance)		
Any other contract type (please specify)		
a.		
b.		

Outgoing Fuel Delivery

- a. What volume of Diesel \leq 15 ppm do you send-out by different modes of transportation?

Transport Mode	Vol. of Product (bbl/day)	% of total product
Pipeline		
Trucks		
Rail		
Marine Tankers		
Barges		

- b. What is the average and maximum Diesel \leq 15 ppm send-out capacity during the heating oil season?

Outbound handling Method	Capacity (bbl/day)	Actual Throughput Volume (bbl/day)
Wharf		
Truck Rack		
Rail Rack		
Pipeline Transfer		

- c. What type of customers do you have for Diesel \leq 15 ppm?

Customer type	Volume of Product (bbl/day)	% of total supply
Electric Generation		
Industrial		
Vessel Bunkering		
Fuel Oil Distributor		
Other (please specify)		
a.		
b.		

- d. What type of contracts do you sell your products under?

Contract type	Volume of Fuel (gal/ contract)	% of product purchase
Fixed contract for the entire heating oil season (September to March)		
Spot Sale		
Other (Please Specify)		
a.		
b.		

Costs

- a. What are your average operating and maintenance costs for Diesel ≤ 15 ppm during the heating oil season in \$ per barrel of throughput? If you cannot isolate the operating cost for Diesel ≤ 15 ppm, please indicate so and provide the overall operating cost per barrel of throughput.

Onroad Diesel > 15 ppm and ≤ 500 ppm Sulfur

Inventory

- a. We would also like monthly Onroad Diesel > 15 ppm and ≤ 500 ppm inventory levels for the period June 2002 till May 2004. We will gladly accept the data in any format (papers attached to this survey, or electronic) that you already have.

- b. For the period June 2002 to May 2004, we would like daily inventory levels for Onroad Diesel > 15 ppm and ≤ 500 ppm during any period of gas interruption. Please provide date and inventory level data from 5 days before the start of the interruption till 5 days after the end of the interruption. We will gladly accept the data in any format (papers attached to this survey, or electronic) that you already have.

- c. Please provide information on the total capacity and throughput (or sales) for Onroad Diesel > 15 ppm and ≤ 500 ppm over the last twenty years.

Rail Rack		
Pipeline Transfer		

c. What type of customers do you have for No. 4 Fuel Oil?

Customer type	Volume of Product (bbl/day)	% of total supply
Electric Generation		
Industrial		
Vessel Bunkering		
Fuel Oil Distributor		
Other (please specify)		
a.		
b.		

d. What type of contracts do you sell your products under?

Contract type	Volume of Fuel (gal/ contract)	% of product purchase
Fixed contract for the entire heating oil season (September to March)		
Spot Sale		
Other (Please Specify)		
a.		
b.		

Costs

- a. What are your average operating and maintenance costs for No. 4 Fuel Oil during the heating oil season in \$ per barrel of throughput? If you cannot isolate the operating cost for No. 4 Fuel Oil, please indicate so and provide the overall operating cost per barrel of throughput.

No. 6 Residual Fuel Oil \leq 0.37% Sulfur

Inventory

- a. We would also like monthly No. 6 Residual Fuel Oil \leq 0.37% inventory levels for the period June 2002 till May 2004. We will gladly accept the data in any format (papers attached to this survey, or electronic) that you already have.

- b. For the period June 2002 to May 2004, we would like daily inventory levels for No. 6 Residual Fuel Oil \leq 0.37% during any period of gas interruption. Please provide date and inventory level data from 5 days before the start of the interruption till 5 days after the end of the interruption. We will gladly accept the data in any format (papers attached to this survey, or electronic) that you already have.

- c. Please provide information on the total capacity and throughput (or sales) for No. 6 Residual Fuel Oil \leq 0.37% over the last twenty years.

Year	Storage Capacity (barrels)	Actual Throughput (barrels)
1985		
1990		
1995		
2000		

Facility Expansion

- a. What are the planned capacity-changes involving No. 6 Residual Fuel Oil \leq 0.37% within the next five years?

- b. Is there additional land available at your specific location that can be used to build terminals? Do you own or lease this land? How much additional storage capacity (tanks or barrels) could you build on this land? What product are you likely to use this extra storage capacity for?

- c. Are there plans to relocate to another terminal site? If yes, what will happen to the vacated terminal? If the location is new to the industry, where will it be and what will its capacities be for listed products?

Incoming Product Supply

- a. What volume of No. 6 Residual Fuel Oil $\leq 0.37\%$ do you receive by different modes of transportation?

Transport Mode	Vol. of Product (bbl/day)	% of total product
Pipeline		
Rail		
Trucks		
Marine Tankers		
Barges		

- b. What is the average incoming No. 6 Residual Fuel Oil $\leq 0.37\%$ loading capacity during the heating oil season?

Loading Method	Capacity (bbl/day)	Actual Receipt Volume (bbl/day)
Wharf		
Truck Rack		
Rail		
Pipeline Transfer		

- c. What type of contracts do you buy No. 6 Residual Fuel Oil $\leq 0.37\%$ under?

Contract type	Average Contract Size (bbl/contract)	% of product purchase
Fixed contract for the entire heating oil season (September to March)		
Spot Purchase (0-14 days in advance)		
Spot Purchase (15-30 days in advance)		
Spot Purchase (31-60 days in advance)		
Spot Purchase (more than 60 days in advance)		
Any other contract type (please specify)		
a.		
b.		

Outgoing Fuel Delivery

a. What volume of No. 6 Residual Fuel Oil $\leq 0.37\%$ do you send-out by different modes of transportation?

Transport Mode	Vol. of Product (bbl/day)	% of total product
Pipeline		
Trucks		
Rail		
Marine Tankers		
Barges		

b. What is the average and maximum No. 6 Residual Fuel Oil $\leq 0.37\%$ send-out capacity during the heating oil season?

Outbound handling Method	Capacity (bbl/day)	Actual Throughput Volume (bbl/day)
Wharf		
Truck Rack		
Rail Rack		
Pipeline Transfer		

c. What type of customers do you have for No. 6 Residual Fuel Oil $\leq 0.37\%$?

Customer type	Volume of Product (bbl/day)	% of total supply
Electric Generation		
Industrial		
Vessel Bunkering		
Fuel Oil Distributor		
Other (please specify)		
a.		
b.		

d. What type of contracts do you sell your products under?

Contract type	Volume of Fuel (gal/ contract)	% of product purchase
Fixed contract for the entire heating oil season (September to March)		
Spot Sale		
Other (Please Specify)		
a.		
b.		

Costs

- a. What are your average operating and maintenance costs for No. 6 Residual Fuel Oil \leq 0.37% during the heating oil season in \$ per barrel of throughput? If you cannot isolate the operating cost for No. 6 Residual Fuel Oil \leq 0.37%, please indicate so and provide the overall operating cost per barrel of throughput.

No. 6 Residual Fuel Oil > 0.37% and ≤ 1.00% Sulfur

Inventory

- a. We would also like monthly No. 6 Residual Fuel Oil > 0.37 and ≤ 1.00% inventory levels for the period June 2002 till May 2004. We will gladly accept the data in any format (papers attached to this survey, or electronic) that you already have.

- b. For the period June 2002 to May 2004, we would like daily inventory levels for No. 6 Residual Fuel Oil > 0.37 and ≤ 1.00% during any period of gas interruption. Please provide date and inventory level data from 5 days before the start of the interruption till 5 days after the end of the interruption. We will gladly accept the data in any format (papers attached to this survey, or electronic) that you already have.

- c. Please provide information on the total capacity and throughput (or sales) for **No. 6 Residual Fuel Oil > 0.37 and ≤ 1.00%** over the last twenty years.
