

strategy will be implemented on a sitespecific basis and finalized during the permitting process. As the Project design is still preliminary, detailed mitigation strategies will be developed as part of the final design and conform to the requirements of state and federal permitting respective to wetlands and waterbody resources.

- During operations, Beacon Wind will commit to the following avoidance, minimization, and mitigation measures to mitigate impacts:
  - Protective measures will be installed around Project-components to restrict access to wetlands, naturally vegetated areas, and wildlife resources during operation and maintenance activities;
  - Revegetation monitoring will be conducted consistent with a Landscaping Restoration Plan and Invasive Species Control Plan, which will be provided for agency review and approval,
  - Mitigation monitoring, as required and defined during the regulatory process for any areas identified as mitigation sites as a result of long-term unavoidable impacts to freshwater and tidal wetlands, naturally vegetated areas, and wildlife resources; and •
  - The implementation of lighting reduction measures such as downward projecting lights, lights triggered by motion sensors, and limiting artificial light to the extent practicable, where safe.
- Avoidance, minimization, and mitigation measures proposed to be implemented during conceptual decommissioning are expected to be similar to those experienced during construction and operations,. A full decommissioning plan will be approved by BOEM prior to any decommissioning activities, and avoidance, minimization, and mitigation measures for decommissioning activities will be proposed at that time.
