1 EXECUTIVE SUMMARY

Proposers are required to provide an executive summary of the Proposal that documents the eligibility of the proposed Offshore Wind Generation Facility, the proposed Contract Tenor, the overall Project schedule including expected Commercial Operation Date, any contingencies specific to the Proposal or to other Proposals, and other factors Proposers deem to be important.

Equinor Wind US LLC ("Equinor Wind") welcomes the opportunity to submit this proposal to supply offshore wind renewable energy certificates ("ORECs") to the New York State Energy Research and Development Authority ("NYSERDA"). Equinor Wind believes that NYSERDA's procurement of ORECs through this solicitation process has the potential to set New York on the path towards achieving the objectives set out in Governor Cuomo's Green New Deal, including supporting the development of 9 gigawatts ("GW") of offshore wind resources by 2035, creating thousands of high-quality, green energy jobs for New York workers, and positioning New York to take a leading role in driving this dynamic new industry forward throughout the region.

As a leading developer of offshore wind resources, Equinor Wind is excited about the prospect of partnering with New York to bring affordable, low-carbon energy to New York consumers and to help establish New York as a national leader in the offshore wind industry. As discussed further below, Equinor Wind is currently pursuing the development of the Empire Wind offshore wind project in the New York Offshore Wind Area pursuant to a lease issued by the U.S. Department of the Interior, Bureau of Ocean Energy Management ("BOEM"). Located south of Long Island and near the entrance of New York harbor, the lease area is expected to be able to support the development of up to 2 GW of installed generation capacity.

Leveraging over four decades of experience developing complex offshore energy projects and the close proximity of its lease area to New York, Equinor Wind is pleased to submit four offers to supply ORECs to NYSERDA. Equinor Wind's offers in this proceeding are the culmination of almost two years of work by a dedicated and experienced team focused on developing offshore wind resources off the New York coast. As described further herein, Equinor Wind has conducted extensive analyses of the project site, potential layouts and project design, market conditions, and other factors, all with the goal of designing a facility that provides significant value to New York by ensuring that the state's environmental and economic development objectives are met as efficiently and cost-effectively as possible. Figure 1 provides an overview of key elements of Equinor Wind's offers.

Figure 1: Summary of Offers

[redacted]

[redacted]

Each of Equinor Wind's offers has been tailored to allow New York to take a substantial step towards achieving the State's offshore wind development objectives while fostering the growth and development of a supply chain and workforce that has the potential to make New York the hub of the offshore wind industry on the east coast. [redacted]

[1] Throughout this proposal Equinor Wind has highlighted in yellow text that contains confidential information or trade secrets that are exempt from public disclosure. A statement supporting these claims of confidentiality is provided under separate cover.

[redacted]

In short, Equinor Wind believes that the development of the Empire Wind Project has the unique potential to support New York's renewable development goals while generating significant economic and environmental benefits and giving New York workers and businesses the skills and support necessary to position New York as a hub for the growing offshore wind industry on the east coast.

1.1 Equinor: An Experienced and Dependable Partner

Equinor Wind is a direct, wholly owned subsidiary of Equinor US Holdings Inc. ("Equinor US") and an indirect, wholly owned subsidiary of Equinor ASA (collectively, "Equinor"). Equinor is an international energy company, headquartered in Norway, with operations in 37 countries. Equinor has approximately 22,000 employees worldwide, is listed on the New York and Oslo stock exchanges (NYSE: EQNR, OSE: EQNR), and has a current market capital valuation in excess of $65 billion. With an extensive portfolio of offshore wind, oil, and gas facilities developed over its 40 year history, Equinor has a proven track record of successfully developing large-scale energy projects in some of the most challenging ocean environments around the world.

Recognizing the changing landscape for energy production, Equinor is committed to complementing its existing oil and gas portfolio with an expanding fleet of renewable energy and other low-carbon energy solutions.

With significant in-house capabilities and resources focused specifically on meeting the challenges of offshore energy development, backed by ample financial resources, Equinor is quickly becoming a leader in the development of offshore wind throughout the world:

- Equinor has developed, constructed, and operates two major bottom-fixed offshore wind farms in the United Kingdom ("UK"): (1) the 317 MW Sheringham Shoal offshore wind farm and (2) the 402 MW Dudgeon offshore wind farm.

- Equinor also is the developer, owner, and operator of the 30 MW Hywind Scotland wind farm, the world's first floating offshore wind farm.

- Equinor is a partner in the Arkona project, a 385 MW wind farm located in the Baltic Sea approximately 22 miles from the German coastline, which is in the final stages of development and has started delivering power to the grid.

- Equinor also owns an interest in the Dogger Bank offshore wind farms, a series of proposed projects currently under development in the UK with a projected nameplate capacity of 3.6 GW, as well as the Baltyk projects, a series of projects located in the Baltic Sea with an estimated combined capacity of approximately 3 GW.

Consistent with Equinor's commitment to renewable and low-carbon energy solutions, Equinor also is pursuing the development of offshore wind projects on the east and west coasts of the United States, and is quickly becoming a leader in the growing offshore wind industry in the United States. For example, Equinor recently invested $135 million in acquiring one of three offshore wind lease areas off the coast of Massachusetts.

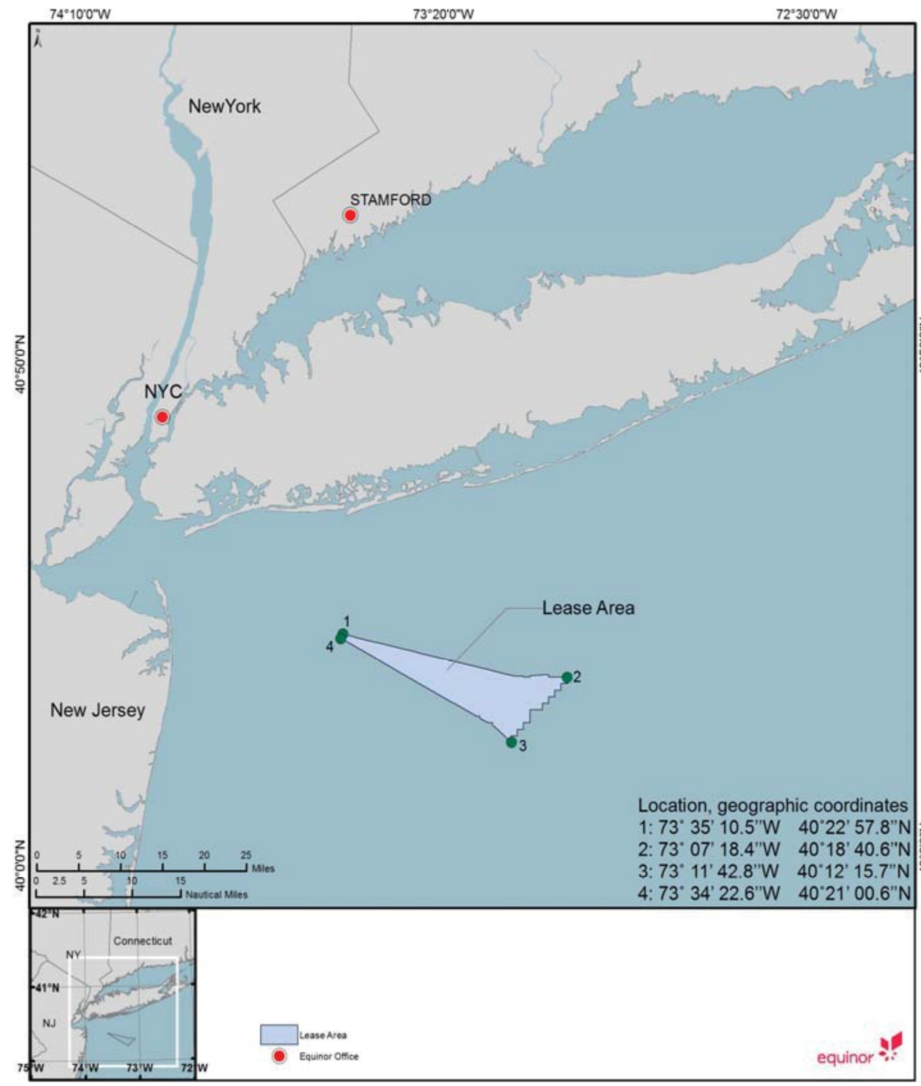
Equinor's history of successfully developing offshore wind projects and its ample financial resources give Equinor Wind several advantages that will allow it to supply offshore wind to New York at an attractive price that provides value to New York ratepayers. These advantages include:

- [redacted]
- [redacted]
- [redacted]

1.2 The Empire Wind Project: Made for New York

The Empire Wind Project is uniquely positioned to help New York efficiently and cost-effectively meet its environmental and economic objectives. As depicted in Figure 2 below, the Empire Wind Project is being developed in an offshore wind lease area located south of Long Island and near the entrance of New York harbor, pursuant to a lease signed and executed by the BOEM on March 15, 2017.

Figure 2: Project Lease Area



The lease area covers approximately 80,000 acres and is expected to support the development of up to 2 GW of installed generation capacity, enough to power more than one million homes.

Since executing its lease, Equinor Wind has been evaluating the potential of the lease area to support the development of offshore wind resources. Equinor Wind has conducted a range of analyses and studies concerning wind resources, metocean conditions, environmental and maritime conditions and constraints, potential submarine cable routes, landfall locations, and interconnection points. Equinor Wind also has had extensive discussions with numerous wind turbine, foundation, and other equipment suppliers in an effort to identify the optimal combination of equipment capable of most efficiently and cost-effectively generating renewable energy while operating reliably in the harsh ocean environment. The proposals set out in this application are the culmination of Equinor Wind's efforts to develop a project that supports New

York's ambitious offshore wind development and environmental objectives, promotes the development of a robust supply chain for offshore wind within New York, and maximizes the value of the Empire Wind Project to New York workers and ratepayers alike.

[redacted]

- [redacted]
- [redacted]
- [redacted]
- [redacted]

At the same time, the Empire Wind Project will use technologies and equipment that have been shown to operate reliably and safely even under the harshest operating conditions. [redacted]

[redacted]

[redacted]

[redacted]

In addition to the extensive efforts made by Equinor Wind to optimize the design of the Empire Wind Project, Equinor Wind is on track to achieve commercial operation on a commercially reasonable timeframe that aligns with New York's environmental objectives. [redacted], including securing approval of Equinor Wind's Site Assessment Plan ("SAP") by BOEM on November 21, 2018, and is actively engaging with relevant federal, state, and local agencies and governments to ensure the timely receipt of necessary permits and approvals.

Equinor Wind also has engaged in extensive dialogue with potentially affected stakeholder groups, including coastal communities, environmental organizations, commercial and recreational fisheries organizations, labor organizations, and local businesses, to promote public understanding and support for the development of the Empire Wind Project. Through these efforts, Equinor Wind has solicited the views of relevant stakeholder groups and the public to ensure that their views are reflected in the design and development of the Empire Wind Project and to allow Equinor Wind to proactively address issues of concern as they arise. As a result of these efforts, the Empire Wind Project has received substantial support from relevant communities and stakeholder groups, including representatives of local communities, trade groups, environmental groups, and local businesses and ports.

1.3 Summary

New York's decision to proceed with this initial solicitation process represents a critical first step towards achieving New York's ambitious environmental and economic objectives. As a company deeply committed to the growth of offshore wind resources in the United States and around the world, Equinor Wind welcomes the opportunity to partner with New York to foster the development of renewable resources off the New York coast and to accelerate New York's emergence as a leader in the offshore wind industry.

2 PROPOSER EXPERIENCE

Proposers are required to demonstrate project experience and management capability to successfully develop and operate the Project proposed. NYSERDA is interested in project teams that have demonstrated success in developing generating facilities of similar size and complexity and can demonstrate an ability to work together effectively to bring the Project to commercial operation in a timely fashion.

2.1 Organizational Chart

An organizational chart for the Project that lists the Project participants and identifies the corporate structure, including general and limited partners.

As shown in Figure 3, Equinor Wind is a direct wholly owned subsidiary of Equinor US, and an indirect wholly owned subsidiary of Equinor ASA. Equinor ASA is an international energy company, headquartered in Norway, that has operations in over 37 countries and approximately 22,000 employees worldwide. Equinor ASA is listed on the New York and Oslo stock exchanges and has a current market capital valuation in excess of $65 billion.

Figure 3: Equinor Wind US LLC Corporate Structure

[redacted]

2.2 Specific Experience

Statements that list the specific experience of Proposers and each of the Project participants (including, when applicable, Proposers, partners, and proposed contractors), in developing, financing, owning, and operating generating and transmission facilities, other projects of similar type, size and technology, and any evidence that the Project participants have worked jointly on other projects.

Equinor has over 40 years of experience developing, owning, and operating large scale, offshore energy projects. Equinor is the largest operator on the Norwegian continental shelf—operating over 40 fixed and floating offshore oil and gas assets—and is a license holder in numerous oil and gas fields worldwide. Through its experience developing, owning, and operating large-scale energy assets, Equinor ASA and its subsidiaries have built up extensive technical and commercial resources and expertise focused on every stage of offshore project development, including engineering, procurement, project and contract management, permitting, finance, health, and safety.

The resources, experience, and technical capabilities that Equinor has acquired from developing large scale, offshore oil and gas facilities are allowing Equinor to quickly become a global leader in the development and operation of offshore renewable resources. Notably, Equinor has a demonstrated record of successfully developing, financing, constructing, operating, and maintaining offshore wind facilities. Specifically, Equinor currently owns, operates, and markets the output of three operating offshore wind facilities in the UK, including the world's first floating offshore wind farm. Equinor also is a partner in the Arkona offshore wind facility, a 385 MW project located off the coast of Germany that recently commenced operation and is expected to be complete in 2019. Equinor also is actively pursuing the development of offshore wind projects throughout Europe and the United States. In particular, Equinor is part of a consortium developing the 3.6 GW Dogger Bank offshore wind generation facility located off the coast of the UK and has acquired a 50% interest in a series of offshore wind facilities currently under development off the coast of Poland in the Baltic Sea.

Equinor's seamless transition from a leading oil and gas developer into a leading developer of offshore renewable resources is a product of the company's commitment to renewable energy development and the product of a project execution model that has been refined over decades operating in harsh ocean environments and that can be readily applied to the development of offshore wind resources. Importantly, the development of offshore wind projects present challenges, and requires technical capabilities, similar to those associated with the development and operation of large-scale, offshore oil and gas projects. These include project management, environmental analysis, marine engineering, coordination of marine/vessel operations, lifting operations, coordination of personnel, equipment transport, and the selection and management of contractors. As a result, the extensive technical and commercial capabilities that Equinor has acquired over its 40-year history allow it to effectively develop and manage offshore wind facilities through every stage of project development, from initial site assessment through commercial operation and management of the asset. Equinor's relevant experience and capabilities include:

- **Project Design**: Equinor has extensive experience designing complex offshore structures and facilities that can operate reliably in the ocean environment. This includes designing and selecting each component of an offshore wind facility's electrical system and interconnection facilities, including turbine design and layout, sub-sea support structures, and submarine cables. The insights gained from operating offshore energy assets for decades allow Equinor to design offshore wind projects that are optimized to maximize production and facility availability and minimize downtime.

- **Sub-Sea Installation**: Equinor has a long track record of successfully installing, maintaining, and retrieving bottom fixed sub-sea installations. In connection with its oil and gas business and growing offshore wind portfolio, Equinor has successfully installed and constructed facilities employing the full range of substructure concepts, including monopiles, gravity-based structures, and jackets. Equinor's experience gives it a deep understanding of the risks, challenges, costs, and benefits associated with different technologies.

- **Marine Vessel Coordination and Deployment**: Equinor has demonstrated experience successfully coordinating maritime and vessel operations around the world. Equinor employs industry best practices to seamlessly coordinate maritime vessels transporting equipment, personnel, and other cargo in order to ensure the efficient and timely construction of its offshore projects while minimizing disruption to maritime and fisheries resources.

- **Environmental Assessment**: Environmental impact assessments are an integral part of successfully developing all offshore projects and Equinor has vast experience working with marine life, environmental baseline data collection and monitoring, and protecting the environment through responsible development and mitigation. Equinor is participating in joint industry projects investigating the impacts from offshore wind projects on wildlife, including on seabirds and marine mammals, and sits on numerous stakeholder groups including, the Fishing Liaison for Offshore Wind and Wet Renewables, the Sound and Marine Life Program, the Fisheries Technical Working Group, and the Environmental Technical Working Group. These groups are focused on promoting best practices to minimize the impact of the development of offshore renewable generation on commercial fisheries and marine ecology.

- **Operations and Maintenance**: Equinor operates 24-hour, 7-day a week operations and maintenance centers to monitor each of its operating offshore wind facilities and to ensure that any issues that may arise are timely identified and remedied. Composed of a multi-disciplinary team of experts, including engineers, marine coordinators, planners, and wind farm technicians, Equinor's operations and maintenance team works in close coordination to minimize outages and ensure that each of Equinor's projects operates reliably and safely.

- **Interconnection**: Equinor has experience with every phase of interconnecting offshore wind projects to the grid, including evaluating potential interconnection points and installing and constructing onshore and offshore interconnection facilities and substations. Equinor has experience working closely with transmission providers and local utilities to facilitate the timely and cost-effective interconnection of its projects to the grid.

- **Energy Marketing**: Equinor's marketing and trading group has a long history of maximizing the value of Equinor's portfolio of oil, gas, and electric generation assets, including evaluating and hedging market risk and negotiating offtake agreements with customers.

- **Financing**: Equinor has extensive experience financing complex offshore energy projects, including numerous offshore wind projects of similar size and scope to the Empire Wind Project. [redacted]

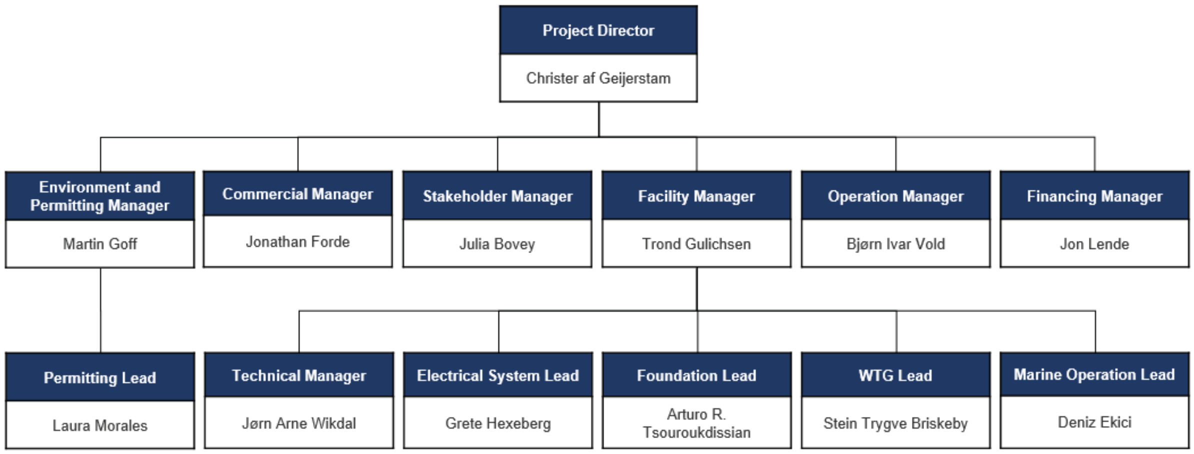
Equinor's expertise, technical capabilities, and financial strength make Equinor Wind uniquely well-suited to help New York meet its offshore wind development goals. Equinor Wind plans to continue to draw upon the extensive capabilities of its parent and affiliates to operate and maintain the Empire Wind Project, employing the same methodologies and approaches that have been used by Equinor to successfully and reliably operate utility-scale offshore wind projects in Europe.

2.3 Key Personnel

A management chart that lists the key personnel dedicated to this Project and resumes of the key personnel. Key personnel of Proposer's development team having substantial Project management responsibilities must have:
a. Successfully developed and/or operated one or more projects of similar size or complexity or requiring similar skill sets; and
b. Experience in financing power generation projects (or have the financial means to finance the Project on Proposer's balance sheet).

Leveraging the extensive experience and technical capabilities of Equinor and its affiliates, Equinor Wind has assembled a highly qualified and experienced team focused on the design, development, construction, and operation of the Empire Wind Project. Figure 4 below provides a management chart depicting key team members and their respective titles.

Figure 4: Empire Wind Management Chart



A brief description of the experience of each of these key employees is provided below and copies of these employees' resumes are provided as Attachment 1. In addition to the individuals listed below, as a subsidiary of Equinor, Equinor Wind can seamlessly leverage the expertise of over 4,500 additional employees with expertise covering a wide range of subjects and technical skills relevant to the development of offshore wind resources.

Christer af Geijerstam – *Project Director*

Mr. af Geijerstam is the Empire Wind Project Director and President of Equinor Wind. Since joining Equinor in 2008, Mr. af Geijerstam has held positions in strategy, business development, project development, and asset management for Equinor's oil, gas and offshore wind assets. Prior to joining Equinor, Mr. af Geijerstam worked in Norway's Ministry of Petroleum and Energy in the agency's Exploration Unit, where he was responsible for administering license rounds for the Norwegian Continental Shelf. Mr. af Geijerstam holds a master's degree in economics from the University of Oslo.

Martin Goff – *Environment and Permitting Manager*

Mr. Goff has worked in Environmental Impacts and permitting of offshore wind projects for Equinor Wind since 2012. As a Chartered Marine Scientist, Mr. Goff has a B.Sc. in Ocean Science from the University of Plymouth, England, and an M.Sc. in Applied Physical Oceanography from the University of Wales, Bangor, with over 10 years of experience in the metocean field prior to joining Equinor. Mr. Goff was responsible for the environmental assessments and permitting of the Dogger Bank Teesside A&B offshore wind farms, U.K., which included managing relationships with the maritime community and landowners. He also held the role of Landowner Manager during the construction of the now fully operational 402 MW Dudgeon Offshore Wind Farm, as well as advising on environmental impacts and permitting in support of business development opportunities for new projects. Mr. Goff has worked in the U.S. offshore wind sector for the past two years as the Head of Environment and Permitting Manager for the Empire Wind offshore wind energy area, New York.

Jonathan Forde – *Commercial Manager*

Since joining Equinor in 2010, Mr. Forde has been active in developing Equinor's growing presence in the United States and has held a variety of roles supporting commercial evaluation, strategy, and business development of Equinor's oil, gas, and offshore wind resources. Mr. Forde currently serves as the Commercial Manager for Equinor Wind US, where he is responsible for securing the commercial agreements necessary for development and growth of Equinor's offshore wind portfolio in the United States.

Prior to joining Equinor, Jonathan completed his M.Sc. in Energy Economics at the Colorado School of Mines, an M.Sc. in Petroleum Economics and Management at the Institut Francais du Petrole, and a Bachelor of Arts in Chemistry and International Relations at Claremont McKenna College.

Julia Bovey – *Stakeholder Manager*

Ms. Bovey directs external affairs for Empire Wind. She first worked on offshore wind in 2004, when she left a 15-year career in journalism to join the Conservation Law Foundation ("CLF") in Boston, Massachusetts. At CLF, she helped advance public support and regulatory policy for New England's first proposed wind projects. Her work expanded to federal energy and climate policy when she moved to Washington, D.C., to join the Natural Resources Defense Council. She then joined the Obama Administration as the Federal Energy Regulatory Commission's ("FERC") Director of External Affairs. Following her time at FERC, she joined First Wind, then a leading independent developer of wind energy projects across the U.S., as Vice President, Federal Policy. She was subsequently appointed the first-ever Long Island Director of the New York State Department of Public Service. Ms. Bovey holds a B.A. from Columbia University, Barnard College, and an M.S. from Columbia University, School of Journalism.

Trond Gulichsen – *Facility Manager*

Mr. Gulichsen has worked with Project Development for Equinor since 2012. Mr. Gulichsen has an M.Sc. in Civil Engineering from the Norwegian University of Science and Technology in Trondheim, and a Master of Management from the BI Norwegian School of Management with 15 years of experience from both onshore and offshore projects prior to joining Equinor.

Mr. Gulichsen has held a wide range of positions in both the early phases and execution phases of projects, such as Project Director for the Peregrino Clean Energy project, Drilling Facility Manager in the Peregrino Phase II project, Construction and Site Manager for the Peregrino Main

FPSO project, Civil Construction Manager at the Ormen Lange Onshore Plant and Civil Engineering and Construction Manager at the Sunndal 4 Expansion Project.

Bjørn Ivar Vold – *Operation Manager*

Mr. Vold has worked with renewables and wind energy since 2010 and has extensive offshore wind experience from Statkraft, DNV GL, and Equinor. He currently works as operations manager for Empire Wind. Mr. Vold's relevant experience includes acting as Project Manager for the Lender Technical Due Diligence report produced for the world's largest offshore wind farm, Hornsea One (DNV GL) and acting as operation manager for one of the projects at the Dogger Bank development while with Statkraft. With comprehensive experience managing multi-disciplined international projects, offshore maintenance work in the North Sea, financial modeling and operational offshore wind concept selection, Mr. Vold brings a wide range of expertise to the Equinor team. Mr. Vold holds an M.Sc. in Industrial Economics from the Norwegian University of Life Science in Aas, Norway.

Jon Lende – *Financing Manager*

Mr. Lende is the Finance Manager for the Empire Wind Project and is responsible for all aspects related to financing and credit. Mr. Lende has been a senior member of Equinor's central Structured Finance team since 2008 and has been responsible for determining the ownership structure and financing solutions for a large number of projects. More specifically, Mr. Lende was responsible for approving and implementing the initial construction and long term financing of Equinor's investment in Sheringham Shoal together with the initial partner on the project, Statkraft. He had a similar role for the initial balance sheet financing of the Dudgeon Offshore Wind Project, including leading the subsequent project financing process in cooperation with partners, financial advisors, and other advisors. Furthermore, he led the refinancing of Dudgeon (£ 1.4 billion) which successfully closed in December 2018. Mr. Lende holds a degree in economics from Norwegian Business School.

Laura Morales - *Permitting Lead*

Ms. Morales has over 15 years of professional experience with expertise in both development and operational permitting, including, but not limited to the following programs: federal, state (NJ, NY, CT) and local land use (wetlands, riverine and coastal areas), National Marine Fisheries Service Incidental Take Permits, stormwater management, soil erosion and sediment control, National Pollutant Discharge Elimination System permitting and compliance, and spill prevention and response. She holds a Master's in Environmental Management and a BS in Zoology. She currently serves as Permitting Lead for State permitting on the Empire Wind offshore wind energy development area.

Jørn Arne Wikdal – *Technical Manager*

Mr. Wikdal's professional history comprises over 35 years in the offshore oil, gas, and wind industries focusing on structural engineering, marine operations, new-build and modification projects, engineering management, and project completion activities, covering both concrete and steel structures. Mr. Wikdal has an M.Sc. in Structural Engineering from the Norwegian University of Science and Technology in Trondheim, Norway. He currently works as Technical Manager for Equinor's Empire Wind Project in NY. Prior to that, he worked for Equinor as Technical Manager for the Dudgeon offshore wind farm, which was successfully completed and commissioned in October 2017.

Grete Hexeberg – *Electrical System Lead*

Ms. Hexeberg's professional history comprises over 25 years in the offshore wind, oil and gas industries and within the electrical power transmission area. For the last 10 years, Ms. Hexeberg has been part of the leadership team responsible for several offshore wind projects, including the Sheringham Shoal, Dudgeon, and Doggerbank offshore wind farms. During this period, she has held different management positions, including Technical Manager, Area Manager for Wind Turbine Generator Foundations, Area Manager for Electrical System Infrastructure and Consent and Stakeholder Manager. She has an M.Sc. degree in electrical engineering from the Norwegian University of Science and Technology with a focus on electrical power system analysis and design. She currently works as Electrical System Lead for Equinor Wind's Empire Wind Project.

Dr. Arturo Rodríguez Tsouroukdissian – *Foundation Lead*

Dr. Tsouroukdissian's professional history comprises over 15 years in the wind industry (onshore and offshore), focusing on civil structural dynamics, earthquake engineering, structural damping control, and research and development. He holds a B.S. and M.Sc. from SUNY Buffalo Civil Engineering Department and has a joint Ph.D. between Polytechnic Catalonia University and Kobe/Osaka University. He currently works as Wind Turbine Generator and Offshore Substation Topside Foundations Package Manager and Ports & Infrastructure Leader for Foundation and Wind Turbine Staging for Equinor's Empire Wind Project. Prior to that, he worked for GE as a foundation package manager of two 6 MW turbine prototype jacket substructures, Technical Interface Manager for Project Execution in Europe and the U.S., and as GE 12 MW Offshore Wind Technologies Program Manager. He is an author and co-author of over 30 conference and journal publications and holds 9 patents related to onshore and offshore wind technology.

Dr. Stein Trygve Briskeby – *Wind Turbine Generator Lead*

Dr. Briskeby has worked with renewables and wind energy since 2008 and has extensive offshore wind experience from numerous projects and roles with Equinor. He currently works as Wind Turbine Generator package manager for the Empire Wind Project and has responsibility for the wind turbine delivery. Other relevant experience includes acting as Engineering Manager and Wind Turbine Generator lead for Hollandse Kust Zuid I and II offshore wind bid project in the Netherlands; Wind Resource Assessment lead and Wind Turbine Generator package for Kriegers

Flak offshore wind bid project in Denmark; Engineering manager for Borssele I & II offshore wind bid project in the Netherlands; and Wind Resource Assessment lead for the Dudgeon offshore wind project in the U.K. With comprehensive multi-disciplinary experience, Dr. Briskeby brings a wide range of experience to the Renewable Energy Technology team in Equinor. Dr. Briskeby holds an M.Sc. in Materials Science and Engineering and a Ph.D. in Electrochemistry, both from the Norwegian University of Science and Technology in Trondheim, Norway.

Deniz Ekici – *Marine Operation Lead*

Mr. Ekici is a California and Rhode Island licensed Professional Engineer as well as a Project Management Institute certified Project Manager. He has over fifteen years of structural engineering and management experience in large capital projects. He has participated in offshore wind development projects in Northern Europe and Asia-PAC during the planning, execution and operation stages. He has overseen marine operations for major offshore wind component load-out, marine transport and installation phases such as foundations, jacket, transformer topside and WTG components (tower, nacelle, blades). Mr. Ekici has also presented multiple oil and gas and offshore wind related technical papers at various conferences around the world, including AWEA Offshore Wind, OTC Houston, OTC Asia, SNAME, SIEW Singapore Energy Week and Thailand Renewable Energy and Expo Conference.

In addition to the key team of individuals set out above and the in-house capabilities of the broader Equinor group, Equinor Wind has retained numerous consultants with significant experience to support the development of the Empire Wind Project. Key consultants include:

- **Tetra Tech**: Equinor Wind has retained Tetra Tech to serve as lead environmental consultant for the project team. Tetra Tech is responsible for the permitting scope, inclusive of environmental assessments, stakeholder engagement, and preparation of federal and state permit applications. Tetra Tech is one of the largest full-service environmental consulting firms in the United States, with a core competency of over 17,000 environmental engineers, scientists, and planners in over 400 offices worldwide, working in more than 100 countries around the globe. As an industry leader, Tetra Tech has served as the lead consultant on the development of more than 50 offshore facilities, including deepwater ports, oil and gas platforms, subsea pipelines and transmission cables, and renewable energy projects, including wind, wave, and hydrokinetic projects across the United States. In support of these projects, Tetra Tech has conducted detailed impact assessments for various resources, including aquatic and terrestrial wildlife, wetlands/water bodies, threatened and endangered species, archaeological/historic resources, scenic resources, and land use. Tetra Tech has also led the design and execution of complex offshore marine studies (*e.g.*, geophysical, geotechnical, marine cultural, offshore avian and bat, and marine species and habitat evaluations) and completed hundreds of National Environmental Policy Act-compliant environmental impact assessment reports.

- **Sea Risk Solutions**: Sea Risk Solutions is supporting the development of the Empire Wind Project by providing information and strategies to mitigate risks to maritime interests and resources. Sea Risk is acting as Fisheries Liaison Officer for the Empire Wind Project, including coordinating a substantial fisheries outreach effort. The founding partner of Sea Risk, Stephen Drew, spent 15 years developing and managing the Marine Liaison group for a major subsea cable supplier. He managed marine relations and risk mitigation at cable landings in 25 countries and served five years on the International Cable Protection Committee Board of Directors. He has negotiated and served as liaison officer in cable/fishing agreements on the US West Coast. His partner, Wolfgang Rain, joined Sea Risk Solutions as a Partner after nine years managing the Marine Liaison program for a major cable supplier and ship operator and brings similar professional experience to the team. Mr. Drew previously supported NYSERDA as Fisheries Liaison Officer for the New York Offshore Wind Master Plan, where Stephen gained further experience with the northeast fisheries, especially the interaction between fisheries and offshore wind development in the New York Bight. More details regarding Sea Risk's efforts as Fisheries Liaison Officer are provided in Section 12.

- **Anatec Limited**: Anatec Limited is supporting the development of the Empire Wind Project by evaluating potential impacts and identifying mitigation measures associated with maritime navigation, including preparation of the Navigational Safety Risk Assessment. Anatec has extensive experience in carrying out navigation risk assessments for offshore renewable projects and for other marine users, including oil and gas developers, ports, marinas, and cable and dredging companies. Anatec's senior leadership team has over 20 years of experience working in marine and offshore environments safely and has received international recognition for its research studies concerning risk-based decision-making.

- **Mott MacDonald**: Equinor Wind has retained Mott MacDonald to provide technical and engineering services related to the proposed interconnection of the Empire Wind Project to New York, including evaluating potential interconnection points. Mott MacDonald has provided a multi-disciplinary team including engineers, environmental scientists, project managers, and land acquisition experts with decades of experience developing large-scale energy and infrastructure projects in New York and throughout the world. The team supporting the development of the Empire Wind Project has deep knowledge of New York and have been involved in large infrastructure projects throughout the state, including large independent power production facilities, interconnection facilities, substations, ports, tunnels, bridges, highways, and other civil construction projects.

- **SEARCH, Inc.**: Equinor Wind has retained SEARCH, Inc., the largest archaeology and cultural resources management company in the world, to assist with evaluating potential impacts to marine archaeological resources, including serving as the Qualified Marine Archaeologist for the project. SEARCH has completed more than 3,500 projects across 40 U.S. states and 36 countries, spanning five continents and three oceans. SEARCH specializes in the full spectrum of cultural services related to Archaeology, Maritime Archaeology, Architectural History, History, Archives, Collections Management, Museum Services, Documentary Media, and Public Affairs.

- **ICF International, Inc.**: Equinor Wind has retained ICF, a global consulting services company, to assist in developing price forecasts and evaluating the economic and social impacts of the Empire Wind Project. ICF has over 40 years of experience consulting in the energy industry providing engineering consultation, economic analysis, and policy guidance to utilities, renewable energy projects, and governments around the world. ICF's team includes over 5,000 employees across more than 65 offices worldwide.

- **Kjeller Vindteknikk:** Equinor Wind has retained Kjeller Vindteknikk, a leader in wind measurement and analysis, to confirm the wind resource and projected output of the Empire Wind Project. Kjeller Vindteknikk has 20 years of experience performing wind assessments for wind projects in Sweden, Norway, Iceland, Bulgaria, Macedonia, and the United States. Its team of meteorologists, physicists, engineers, and technicians have installed more than 200 measurement stations and performed a full suite of analyses on those data sets to support wind development.

[redacted]

- **Sargent & Lundy**: Equinor Wind has engaged Sargent & Lundy to evaluate the impact of interconnecting the Empire Wind Project to the NYISO grid. Sargent & Lundy is a power engineering consulting company that provides a comprehensive suite of consulting, engineering, design, analysis, and project services for power projects worldwide.

2.4 Successful Projects

A listing of projects the Project sponsor has successfully developed or that are currently under construction. Provide the following information for each project as part of the response:
a. Name of the project
b. Location of the project
c. Project type, size, and technology
d. Commercial Operation Date
e. Estimated and actual capacity factor of the project for the past three years
f. Availability factor of the project for the past three years
g. References, including the names and current addresses and telephone numbers of individuals to contact for each reference.

Equinor has a proven track record of successfully developing, constructing, and operating offshore wind projects. As described further, Equinor currently operates numerous projects in Europe and has a number of significant projects currently under development in Europe and the United States. The following sections provide an overview of Equinor's existing projects as well as projects in development.

2.4.1 Sheringham Shoal

The Sheringham Shoal Offshore Wind Farm, located north of Sheringham, UK, was completed in 2012. Equinor is the operator of the joint venture company Scira, which owns Sheringham Shoal. The wind farm is located 11 miles from shore and consists of 88 turbines on monopile foundations with a total nameplate capacity of 317 MW. The project is connected to the grid through two offshore substations, two offshore cables, and an onshore cable.

Figure 5: Sheringham Shoal

2.4.2 Dudgeon

The Dudgeon Offshore Wind Farm, located north of Cromer, UK, was completed in 2017. Equinor is the operator of the joint venture company that owns Dudgeon. The wind farm is located 20 miles from shore and consists of 67 turbines on monopile foundations with a total nameplate capacity of 402 MW. The project is connected to the grid through an offshore substation and two export cables consisting of both onshore and offshore facilities. On December 14, 2018, Equinor, along with the joint owners of Dudgeon, completed a hybrid refinancing of the project totaling more than $1.7 Billion (£1.4 Billion).

Figure 6: Dudgeon

2.4.3 Arkona

The Arkona Offshore Wind Farm, located northeast of Sassnitz, Germany, has started delivering power to the grid, and will be completed in early 2019. Equinor holds a 50% stake in the project. E.ON owns 50% and is operating the project on behalf of the consortium. The wind farm is located 22 miles from shore and consists of 60 turbines with a nameplate capacity of 385 MW. The turbines are secured to the seabed using a monopile design and are connected to the grid through an offshore substation and cables running to shore.

Figure 7: Arkona

2.4.4 Hywind Demo

The Hywind Demo project, located west of Karmøy, Norway was completed in 2009 and is the world's first floating wind turbine. Equinor designed and developed the project which consists of a single turbine on a floating spar foundation anchored to the seafloor. The project has produced electricity for more than eleven years without any major component failures and continues to generate electricity. Over that time period, it has withstood wind speeds reaching 89 mph and waves in excess of 60 feet. Equinor operated the project until February 1, 2019, when ownership of the facility was transferred to Unitech Offshore. Unitech plans to use the project as a platform for teaching and training as well as research and development of new offshore wind technologies.

Figure 8: Hywind Demo

2.4.5 Hywind Scotland

The Hywind Scotland wind farm, located east of Peterhead, Scotland was completed in 2017. Equinor designed, developed and operates the project, which incorporates experience gained from the Hywind Demo Project. With a total installed capacity of 30 MW, the project consists of five 6 MW turbines on floating spar foundations anchored 328 feet down to the sea floor. The project consists of a mixture of available technology and new patents developed and owned by Equinor. Through this experience, Equinor continues to expand its expertise in this new model of offshore wind development. The project is owned by Equinor and Masdar.

Figure 9: Hywind Scotland

2.4.6 Projects Under Development

Dogger Bank

The Dogger Bank Offshore Wind Farm is a series of three proposed projects currently under development east of Yorkshire, UK. Alongside the other members of the Forewind consortium, Equinor secured all the necessary consents and owns a 50% interest in all 3 proposed projects in a consortium with SSE plc. The 400,000 acre development is located 80–120 miles offshore, with a projected nameplate capacity of 3.6 GW. The current plan contemplates connecting the projects to the grid in Creycke Beck and Teesside.

Massachusetts Wind Lease

Consistent with its strong commitment to offshore wind development in the United States, on December 14, 2018, Equinor submitted a winning bid of $135 million for one of three lease areas off the coast of Massachusetts auctioned off by BOEM. Upon execution of the lease, Equinor will have the opportunity to explore the potential development of offshore wind resources in the lease area, which covers 128,811 acres.

Baltyk

Equinor is in a 50/50 joint venture with the polish utility Polenergia in the Baltyk II and Baltyk III Offshore Wind Farms, located off the coast of Poland in the Baltic Sea. The farms have a planned capacity of 1,440 MW with the potential to power more than two million Polish households. First power for Baltyk II and Baltyk III is planned for mid-2020. Also, Equinor has signed an agreement to acquire a 50% interest in the Baltyk I license, which allows for the development of a wind farm with a capacity up to 1,560 MW. This project is in the early stage of development and will be further matured in a joint venture with Equinor and Polenergia.

2.4.7 Operating Project Details

Figure 10 below provides detailed information for each of Equinor’s operating projects including the location, technology used, and key performance metrics.

Figure 10: Summary of Operating Projects

[redacted]

2.5 Partners

With regard to Proposer's Project team, identify and describe the entity responsible for the following, as applicable:
a. Construction Period Lender, if any
b. Operating Period Lender and/or Tax Equity Provider, as applicable
c. Financial Advisor
d. Environmental Consultant
e. Facility Operator and Manager
f. Owner's Engineer
g. EPC Contractor (if selected)
h. Transmission Consultant
i. Legal Counsel

As a result of its long history of offshore development, Equinor has extensive in-house capabilities and resources devoted to offshore wind development and has strong relationships with outside consultants and companies focused on supporting the development of offshore wind resources. Leveraging these relationships, Equinor Wind has retained numerous consultants with significant experience relevant to the development of the Empire Wind Project. Key consultants include:

a. **Construction Period Lender**: [redacted]
b. **Operating Period Lender and/or Tax Equity Provider:** [redacted].
c. **Financial Advisor**: [redacted]
d. **Environmental Consultant:** Equinor Wind has engaged Tetra Tech, SeaRisk Solutions, and SEARCH Inc. to provide environmental consulting services.
e. **Facility Operator and Manager:** Equinor Wind will be responsible for managing and operating the Empire Wind Project, leveraging the expertise of its parent and affiliates in operating offshore projects around the world.
f. **Owner's Engineer/EPC Contractor:** The Empire Wind Project does not plan to engage any single Owner's Engineer or EPC Contractor. Instead, the procurement and development strategy for the Empire Wind Project will consist of multiple contracts with qualified contractors chosen through a rigorous vetting and selection process, as described further in Section 9.1.2. Equinor has successfully used this approach when constructing other offshore wind projects in Europe.

g. **Transmission Consultant:** Equinor Wind has engaged Sargent & Lundy, Mott MacDonald, and Tetra Tech to advise Equinor on matters concerning the interconnection of the Empire Wind Project to the grid and its impact on the New York transmission system.

h. **Legal Counsel:** Legal advice to the Empire Wind Project has been provided by Bracewell LLP.

i. **Tax Advisor:** Empire Wind has engaged Deloitte Touche Tohmatsu Limited, which has provided advice concerning federal tax laws related to the Empire Wind Project.

2.6 Experience with NYISO Market

Details of Proposer's experience in NYISO markets. With regard to Proposer's experience with NYISO markets, please indicate the entity that will assume the duties of Market Participant for your proposed Offshore Wind Generating Facility. Please provide a summary of Proposer's or Market Participant's experience with the wholesale market administered by NYISO as well as transmission services performed by Con Edison, NYPA, and PSEG-LI/LIPA.

Equinor Wind currently anticipates leveraging the expertise of Equinor's Marketing & Trading division to optimize the value of the Empire Wind Project. More specifically, Equinor Wind plans to enter into a power purchase agreement ("PPA") with Equinor Marketing & Trading, who will act as market participant for the asset and be responsible for marketing the output and capacity of the Empire Wind Project. As discussed further below, Equinor's Marketing & Trading Division already has extensive experience with wholesale markets for electricity and is currently responsible for marketing the output of Equinor's operating offshore wind facilities. This expertise promises to be further enhanced by Equinor's acquisition of Danske Commodities ("Danske"), one of the largest short-term traders of electricity in Europe.

2.6.1 Experience with Electricity Markets

Equinor Marketing & Trading

Developed over the 40-year life of the company, Equinor's Marketing & Trading division has a long history of analyzing market conditions and identifying opportunities to maximize the value of Equinor's portfolio of assets. [redacted]

[redacted]

[redacted]

[redacted]

Equinor's Marketing & Trading division has accumulated a wealth of experience marketing and optimizing the value of energy, capacity, and ancillary services from offshore wind resources in wholesale markets. Currently, Equinor's Marketing & Trading division is responsible for marketing electricity and associated products from Equinor's existing offshore wind projects, all of which are located in the UK: Sheringham Shoal, Dudgeon, and the Hywind Scotland floating offshore wind park. [redacted] As a result of this experience, Equinor's Marketing & Trading division has built up substantial capabilities focused exclusively on marketing the output of offshore wind resources, including trading, market analysis, and technical support. Equinor's Marketing & Trading division also has significant experience and resources focused on wind production forecasting, [redacted]

Equinor Marketing & Trading has spent significant resources evaluating the NYISO market, including evaluating potential risks and opportunities associated with the development of the Empire Wind Project. In addition to leveraging the insights gained from its management of Equinor's existing offshore wind facilities, Equinor engaged ICF to provide detailed price forecasting and modeling information and to provide guidance regarding market participation. Combining ICF's modeling with Equinor's proprietary modeling and short-term and long-term assumptions, Equinor's Marketing & Trading division has conducted market simulations to project expected electricity and capacity income over the life of the Empire Wind Project considering a range of potential scenarios and uncertainties, including price formation in adjacent markets, import/export balances within the region, new builds and retirements and long-term fuel and emissions costs.

Based on these analyses, Equinor has concluded that the Empire Wind Project is well-suited to generate significant energy and capacity revenues over the life of the asset. [redacted]

- [redacted]
- [redacted]
- [redacted]

[redacted]

Acquisition of Danske Commodities

On July 6, 2018, Equinor announced that it had reached an agreement to buy 100% of the shares of Danske. After approval by relevant regulatory authorities, the transaction was consummated on February 1, 2019. Equinor's acquisition of Danske only promises to further enhance the capabilities of Equinor's Marketing & Trading division. Founded in 2004, Danske is one of Europe's largest short-term electricity traders and has extensive experience trading electricity and associated products in markets around the world. For instance, in 2017, Danske traded 318 terawatt hours of electricity across 37 countries. The acquisition of Danske will further strengthen Equinor's ability to optimize the value of its portfolio of assets, including the Empire Wind Project.

An overview of Danske's experience managing electricity market positions in several sectors is provided below.

Renewables

With over 10 years of experience and a portfolio of more than 6,000 MW under management, Danske is among the leading players in renewable generation offtake contracts in Europe. Danske specializes in maximizing the value of renewable energy. Danske pioneered the market for direct marketing contracts in Germany and has significant experience with the optimization of renewable energy generation, including standard and non-standard PPAs. Over the course of a decade, Danske has developed and refined how renewable energy is traded in Europe. To balance and optimize the variable production output from these sources, they rely on in-house meteorologists, market analysts, and advanced forecasting models. Superior market access and around-the-clock availability enables customers to extract the full value of renewable assets. Products offered include:

- PPAs on both standard and individually structured terms
- Production management and balancing
- Production hedging from the day-ahead timeframe up to 10 years
- Trading of all relevant renewable energy certificates
- Participation in relevant reserve markets to support the balancing of the grid
- 24/7/365 market monitoring, trading, and operations

Risk Management

Danske provides utilities, energy supply companies and large industrial consumers with trading and risk management solutions. They deliver consumption forecasting, procurement of fixed or variable volumes as well as individual hedging strategies that protect customers from adverse price developments in the volatile electricity markets.

Danske enables wholesale and industrial customers to structure their energy procurement in a cost-effective way and manage their volume and balancing risk. With extensive experience and an advanced forecasting model, they optimize customer portfolios. Danske builds long-term relationships and provides utilities and wholesale energy suppliers with flexible, bespoke solutions. This enables them to offer competitive products and prices to their customers. Products offered include:

- Market access, enabling customers to trade standard products in power markets
- Consumption management and balancing, based on individual portfolio analysis
- Consumption optimization, capturing opportunities in the volatile short-term markets
- Hedging solutions tailored to the specific consumption profile and end-user needs
- Trading of all relevant certificates, either in the market or directly from the renewable assets

[redacted]

2.6.2 Experience with Transmission and Interconnection

Equinor Wind is actively working with NYISO and the relevant transmission owners to ensure timely interconnection of the Empire Wind Project. [redacted] Since submitting this request, Equinor Wind has engaged in regular meetings with NYISO to discuss the interconnection request and monitor the interconnection process.

[redacted]

Equinor also has extensive experience with successfully interconnecting its projects to the wholesale transmission grid. Notably, in the UK, Equinor has successfully developed and operates three offshore wind farm, including the associated interconnection facilities. Equinor has secured grid connection agreements for these wind farms and has also conducted tests and studies to verify the performance of the wind farm to ensure compliance with the technical and operational requirements established by the grid operator/owners.

3 PROJECT DESCRIPTION AND SITE CONTROL

Identify the BOEM wind energy area where the proposed Offshore Wind Generation Facility will be located. Provide documentation that Proposer has a valid lease or irrevocable lease option to develop the leased area within this wind energy area over the entire Contract Tenor.

Provide a site plan (or plans) including a map (or maps) that clearly identifies the location of the proposed Offshore Wind Generation Facility, collection facilities, offshore and onshore route of the generator lead line to the interconnection point, converter station(s), and the assumed right-of-way width. Identify the anticipated interconnection point, support facilities, and the relationship of the interconnection point to other local infrastructure, including transmission facilities, roadways, and waterways.

Identify any rights that Proposer or its development partner has at the interconnection point and for the generator lead line right of way. Provide a detailed plan and timeline for the acquisition of any additional rights necessary for interconnection and for the generator lead line right-of-way. Include these plans and the timeline in the overall Project schedule in Section 6.4.10.

In addition to providing the required map(s), provide a site layout plan that illustrates the location of all on-shore and offshore equipment and facilities and clearly delineates the perimeter of the area in which offshore wind turbines will be placed. Identify the distance in statute miles between the nearest shoreline point and the nearest Offshore Wind Generation Facility turbines.

3.1 Project Location and Description

3.1.1 Lease Area and Project Overview

Equinor Wind is pursuing the development of the Empire Wind Project in the New York Wind Energy Area, a federal offshore wind lease area located south of Long Island. Equinor Wind has been granted the right to pursue development of offshore wind resources within the New York Wind Energy Area pursuant to renewable energy lease number OCS-A 0512, a copy of which is provided as Attachment 2. The lease area spans approximately 123 square miles ("mi^2") and is located approximately 14 miles south of Long Island at its nearest point. Figure 11 provides a map depicting the location of the lease area and its distance from shore.

Figure 11: Lease Area Distance from New York Shore

[redacted]

The New York Wind Energy Area represents the closest offshore wind lease area to New York and has been designated as suitable for the potential development of offshore wind resources through a multi-step process that included solicitations of commercial interest in the area, environmental assessments and analyses, and extensive dialogue with potential lessees, stakeholders, states, and local governments. Based on preliminary navigational safety and risk assessments, Equinor Wind currently estimates that the lease area is capable of supporting the development of up to 2 GW of installed generation capacity, enough to power more than 1 million homes.

[redacted]

[redacted]

Figure 12: Schematic of the Project Showing Arrangement of All Major Elements

[redacted]

[redacted]

Figure 13: Empire Wind Site Layout

[redacted]

Each element of the Empire Wind Project has been calibrated to optimize production from the facility and ensure that New York's environmental objectives are met as efficiently and cost-effectively as possible. [redacted]

[redacted] At the same time, the Empire Wind Project will use technologies and equipment that have been shown to operate reliably and safely under even the harshest ocean conditions. [redacted]

A more detailed overview of the location of major Empire Wind Project components is included in the following sections.

Wind Turbine Generators and Offshore Collection Facilities

The proposed layout of the Empire Wind Project has been optimized to maximize production from the facility while respecting existing uses of fisheries, maritime navigation, and ocean resources. Since executing the offshore lease, Equinor Wind has been evaluating a wealth of information concerning wind conditions and other metocean data to determine the optimal turbine array that maximizes production, minimizes wake effects, and leaves sufficient space and layout considerations to accommodate existing uses of the outer continental shelf, including commercial fishing. [redacted]

Figure 14: Anticipated WTG Layout and Offshore Substation

[redacted]

Offshore Cable Route

Equinor Wind has evaluated a variety of potential submarine cable routes to determine the best cable route to various landfall locations. These efforts have included extensive consultation with New York state and federal agencies as well as a detailed study of potential cable routes performed by Tetra Tech. [redacted] These paths were developed to respect existing uses by avoiding known conflict areas and mitigating any potential impacts that could not be avoided, and takes into account information received through stakeholder discussions and 2018 surveys. The final path will be determined based on the additional data received from surveys being performed in 2019 and 2020. [redacted]

Interconnection Point and Landfall Location

Equinor Wind engaged Mott MacDonald to evaluate potential landfall locations and interconnection points in New York. [redacted]

[redacted]

[redacted]

Land Acquisition

Equinor Wind already has taken substantial steps towards acquiring the property rights necessary for the construction of the Empire Wind Project.

- **Federal Waters**: As a condition of the executed lease agreement for Lease Area OCS-A-512, Equinor Wind will receive easements necessary for the full enjoyment of the lease, including easements necessary for the purpose of installing transmission and distribution cables associated with the Empire Wind Project.[4] These easements will be granted upon approval of Equinor Wind's Construction and Operations Plan ("COP"). A detailed timeline for the submission of Equinor Wind's COP is provided in Section 8.
- **State Waters**: For the portion of the export cables within state waters, Equinor Wind will need to obtain an easement from the New York State Office of General Services, Bureau of Land Management. A complete description of state permitting requirements is provided in Section 8.
- **Onshore Export Cables and Substation**: Upon landfall, easements and access agreements will be required for several project facilities, including onshore export cables and interconnection facilities, the new onshore substation, and any required substation upgrades. In support of permit applications, Equinor will initially need to secure rights of access with landowners to perform field surveys (*e.g.*, wetland delineation, cultural resources, geotechnical, and land surveys). Equinor has begun discussions with property owners that may be impacted by the Empire Wind Project. [redacted]

[4] 30 C.F.R. § 585.200(b)

4 ENERGY RESOURCE ASSESSMENT AND PLAN

Provide a summary of all collected wind data for the proposed Offshore Wind Generation Facility site. Identify when and how (e.g., meteorological mast or LiDAR – for "Light Detection and Ranging") the data was collected and by whom.
Indicate where the data was collected and its proximity to the proposed Offshore Wind Generation Facility site. Include an identification of the location and height for the anemometers and/or "range gate" heights for sensing by LiDAR that were used to arrive at an assessment of the site generation capability. Describe any additional wind data collection efforts that are planned or ongoing. Provide at least one year of hourly wind resource data. Data collected from the site is preferred, though projected data is permissible. The method of data collection must also be included.
Provide a wind resource assessment report for the Proposed Offshore Wind Generation Facility site. Include an analysis of the available wind data which addresses the relationship between wind conditions and electrical output. Provide a site-adjusted power curve. Each curve should list the elevation, temperature and air density used.

4.1 Introduction

Equinor has acquired extensive technical expertise in collecting, analyzing, and modeling wind data through its experience developing and operating offshore energy projects in Europe. In particular, Equinor's Metocean Department is responsible for analyzing an array of metocean data in order to determine the optimal design and layout for Equinor's oil, gas, and offshore wind projects, including wind speed and direction, wave height and direction, temperature, salinity, extreme weather events, and other factors that can have a significant impact on the design, operation, maintenance, and life of offshore energy projects. Through this experience, Equinor's Metocean Department has developed a set of best practices and models that it employs to evaluate and analyze every aspect of developing, operating, and maintaining offshore energy projects. In fact, Equinor's Metocean Department took the lead in developing the publicly available Metocean Reference Extreme Software, which is widely used within the Metocean community for analysis of extreme conditions and as a benchmark for verifying the accuracy of Metocean software.

Equinor's Metocean Department has analyzed a range of wind resource and metocean data in order to provide a foundation for the design of the Empire Wind Project and estimating the likely output from the facility over the contract term. Among other things, Equinor has prepared a wind assessment report detailing the net yearly energy output for the Empire Wind Project. As detailed in the wind resource assessment performed by Equinor provided as Attachment 4, Equinor's analysis of metocean data concerning the project site demonstrate that the Empire Wind Project has the potential to reliably deliver significant quantities of renewable energy, both on an annual basis and over the life of the project. Additionally, Equinor retained Kjeller Vindteknikk to provide a third-party analysis wind resource assessment, which is provided as Attachment 5. Their assessment closely corresponds to Equinor's own assessment. Equinor believes that these estimates of production provide a sound basis for moving forward with the development of the Empire Wind Project.

4.2 Data Sources

4.2.1 Existing Data Sources

[redacted]

[redacted]

[redacted]

[redacted]

[redacted]

Figure 17: Stations and Buoys Used for the Hindcast Validation Relative to the Lease Area

[redacted]

[redacted]

[redacted]

4.2.2 Ongoing Data Collection Efforts

[redacted] Equinor Wind is in the process of implementing a comprehensive program to collect and analyze meteorological data for the New York Wind Area, including wind speed and direction at multiple heights and information on other meteorological and metocean conditions. Specifically, on December 2, 2018, Equinor Wind installed one floating light detection and ranging buoy (“FLiDAR 1”), one metocean buoy, and one subsurface current meter mooring within the lease area. An additional FLiDAR will be installed in “Buoy Deployment Area 2” (“FLiDAR 2”) during the first scheduled service visit in spring 2019. The location of these buoys are depicted in Figure 18, below. The proposed facilities and devices represent state-of-the-art equipment that incorporates the best available technologies, mooring components, and mooring design to ensure reliability and quality data collection.

[redacted]

4.3.3 Power Curve and Wind Data

A detailed overview of the power curves for the Empire Wind Project is provided in the Wind Resource Assessment report. In addition, one year of wind data is provided as an exhibit to the Wind Resource Assessment Report.

5 OPERATIONAL PARAMETERS

Provide partial and complete planned outage requirements in weeks or days for the Offshore Wind Generation Facility. Also, list the number of months required for the cycle to repeat (e.g., list time interval of minor and major overhauls, and the duration of overhauls).
Provide all the expected operating constraints and operational restrictions for the Project, the reason for the limitation, and characterize any applicable range of uncertainty.

Equinor Wind is designing, and plans to operate, the Empire Wind Project to safely and reliably deliver offshore wind to New York over the contract term and the operational life of the project. Equinor Wind plans to achieve this objective both by designing the Empire Wind Project using best in class technologies that have been shown to operate reliably in the unforgiving ocean environment and by employing operational and maintenance practices that have been refined over decades operating large and complex offshore energy projects, including Equinor's existing offshore wind facilities. As described in the following sections, these operational and maintenance activities are motivated by an unwavering commitment to ensuring that Equinor's projects are operated safely and in a manner that maximizes project availability, reduces costs, is environmentally responsible, and is backed by the financial and logistical resources of the broader Equinor group.

5.1 Equinor's Operations and Maintenance Experience and Approach

Equinor has been operating offshore wind farms since 2009 and has built up a demonstrated track record of successfully operating and maintaining offshore wind farms. Currently, Equinor is responsible for operation and maintenance activities at its Sheringham Shoal, Dudgeon, and Hywind Scotland projects. Employing insights and expertise that have been developed over the course of four decades operating and maintaining large and complex offshore energy projects, Equinor has been able to achieve a high level of availability and reliability at its existing wind farms. [redacted]

Equinor's approach to Operations and Maintenance ("O&M") is driven by a commitment to ensuring the safe and reliable operation of its projects under a full range of operational conditions and is informed by decades of experience operating and maintaining large-scale offshore energy projects. The objective of ensuring safe and reliable operations is reflected in every stage of the project lifecycle, from initial design and construction through the operational life of the facility. Equinor is focused on designing a project that minimizes operational and maintenance risk and integrates remote control and monitoring of each project, allowing Equinor to proactively identify and resolve potential issues before they occur. Equinor employs industry best practices to safely operate and optimize the value of its facilities, reduce life cycle costs, and extend the operational life of its assets.

[redacted]

[redacted]

- [redacted]
- [redacted]
- [redacted]

[redacted]

[redacted]

[redacted]

[redacted]

[redacted]

5.2 Operations and Maintenance Protocols

5.2.1 Monitoring and Staffing

Continuous monitoring of Empire Wind's performance is a foundational principle of Equinor's approach to O&M and has been successfully employed at Equinor's existing offshore wind projects. For instance, Equinor currently operates a 24/7 control room responsible for monitoring the performance and operations of its existing offshore wind generation facilities. Equinor also has extensive experience operating 24/7 control rooms in connection with its offshore oil and gas facilities. Typically, an offshore wind farm control room includes sophisticated supervisory control and data acquisition ("SCADA") systems, high voltage switching, marine communication and monitoring systems, and other systems that ensure that Equinor is able to continuously monitor projects and support personnel and vessels.

- [redacted]
- [redacted]
- [redacted]
- [redacted]

[redacted]

[redacted]

[redacted]

- [redacted]
- [redacted]
- [redacted]
- [redacted]

[redacted]

5.2.2 Emergency Preparedness

Equinor is committed to providing a safe and secure environment for everyone working at Empire Wind. Equinor's approach to O&M is founded upon the goal of ensuring "zero harm" and Equinor continuously works to foster a culture of safety and security in everything the company does. The Empire Wind Project and supporting personnel will be well-equipped to deal with any emergency situations that may arise during project operation and will employ emergency response procedures based on industry best practices and Equinor's experience with onshore and offshore energy projects around the world.

[redacted]

[redacted]

[redacted]

[redacted]

In addition, the Empire Wind Project will be fully integrated within, and be able to draw upon, Equinor's broader emergency and crisis response organization. Equinor has a robust emergency and crisis management team that is well-versed in carrying out emergency operations. This includes a Global Management Assist Team ("GIMAT") consisting of personnel that are trained in effectively responding to emergency situations and that can be deployed across the globe to assist Equinor project sites. The GIMAT's approach to emergency response builds upon the Incident Command System, a U.S.-developed approach to command, control, and coordination of emergency response. The GIMAT can be called upon by the Empire Wind Project to provide additional resources when necessary to support emergency operations.

5.3 Maintenance Schedule and Duration

5.3.1 Planned Outages

Planned maintenance outages will be scheduled in a manner designed to both maximize the safety of maintenance operations and minimize the disruption to the output of the facility. In order to maximize the output of the facility, planned outages will be scheduled during periods in which potential production is at its lowest (typically summer season/low wind seasons) and will be coordinated with NYISO in accordance with its tariff to minimize the potential reliability impacts of outages.

[redacted]

[redacted]

[redacted]

[redacted]

To ensure maximum availability and reliable production for all project components, a number of maintenance tasks are scheduled and completed over several years. These tasks have been summarized below. Notably, when planning maintenance operations, Equinor conducts simultaneous work when feasible, in order to reduce downtime. Therefore, the total downtime for each component is not the sum of the individual maintenance tasks. [redacted]

Figure 22: Typical Maintenance Downtimes

[redacted]

[redacted]

[redacted]

5.3.2 Forced Outages

As a general matter, forced outages can occur at any time of the year in response to unexpected equipment failures, physical damage to the facility, and other factors creating a need for unplanned maintenance or repairs. [redacted]

6 BUSINESS ENTITY AND FINANCING PLAN

6.1 Financial Outlook

Submit information and documentation that demonstrates that a long-term contract resulting from this RFP process would either permit Proposers to finance Proposals that would otherwise not be financeable or assist Proposers in obtaining financing of its Proposal.

As described further below, Equinor plans to [redacted] and Equinor has already demonstrated a major commitment to offshore wind by financing its existing projects. However, the willingness of Equinor to fund and develop the Empire Wind Project depends upon its ability to obtain long-term contracts to de-risk the project and provide revenue certainty over the life of the project. As a result, obtaining a long-term contract to supply ORECs through this RFP process is critical to the future development of the Empire Wind Project.

6.2 Organizational Structure

Describe the business entity structure of Proposers' organization from a financial and legal perspective, including all general and limited partners, officers, directors, managers, members and shareholders, and involvement of any subsidiaries supporting the Project. Provide an organization chart showing the relationship among the different Project participants. For joint ventures, identify all owners and their respective interests, and document Proposers' right to submit a binding Proposal.

As noted above, this bid is being submitted by Equinor Wind, which is a Delaware limited liability company. Equinor Wind is a wholly owned subsidiary of Equinor US, which, in turn, is an indirect wholly owned subsidiary of Equinor ASA. Figure 23 depicts the organizational structure of Equinor Wind.

Figure 23: Equinor Organization

[redacted]

As described further below in Section 6.3, Equinor Wind currently anticipates funding the development and operation of the Empire Wind Project [redacted]

The leadership of Equinor Wind consists of individuals with significant experience with the development of complex offshore energy resources. An overview of the officers and directors of Equinor Wind is provided below.

6.2.1 Equinor Wind US LLC

Officers

Christer af Geijerstam - *President*

Christer af Geijerstam has held his current position since August 31, 2018 after serving as Manager of Business Development. Mr. af Geijerstam brings a wealth of experience from a range of business areas including strategy, business development, project development, and asset management for oil, gas and offshore wind assets. Prior to joining Equinor in 2008, he worked in Norway's Ministry of Petroleum and Energy in the agency's Exploration Unit.

Michael Olsen – *Leader (Business Development)*

Michael Olsen has held his current position since August 31, 2018. In this role, Mr. Olsen is responsible for business development, public policy, and regulatory issues that impact the company's offshore wind activities in the United States. He was previously Senior Counsel in the Washington, D.C. office of Bracewell LLP. Prior to that, Mr. Olsen served for almost six years in the Bush Administration at the U.S. Department of the Interior, most recently as Deputy Assistant Secretary for Land and Minerals Management. During his time with the U.S. Department of the

Interior, he oversaw a wide range of energy and environmental issues, including the development of offshore renewable energy.

Martin Goff – *Leader (Permitting)*

Martin Goff has held his current position since December 14, 2017. Mr. Goff brings over 10 years of experience in the metocean field prior to Equinor in 2012. As noted above, Mr. Goff was responsible for the environmental assessments and permitting of the Dogger Bank Teesside A&B offshore wind farms in the U.K. and served as Landowner Manager for the 402 MW Dudgeon Offshore Wind Farm.

Tim Thompson – *Project Lead (Business Development)*

Mr. Thompson joined Equinor in 2007 and has served as an officer of Equinor Wind since December 2017. Mr. Thompson is currently serving as Commercial Manager for Equinor's US offshore wind projects. Prior to his work on US offshore wind, he worked primarily as a commercial negotiator and Manager for offshore oil and gas projects in the Gulf of Mexico, negotiating both with other companies and BOEM. Prior to joining Equinor in 2007, Mr. Thompson served various commercial roles across numerous oil and gas regions in the US for Conoco and ConocoPhillips over a 23-year career. Mr. Thompson holds a bachelor's degree in Petroleum Land Management from University of Texas School of Business.

Tom Geczik – *Manager (Tax)*

Mr. Geczik joined Equinor in 2016 as US Tax Manager and has served as an officer of Equinor Wind since 2017. In his current role, Mr. Geczik provides tax related services to Equinor Wind and ensures that US federal income tax compliance as well as state income tax compliance are completed for this entity. Mr. Geczik has worked in tax since 1992, previously in the tax departments of national accounting firms and for the past 18 years in the tax departments of large corporations. Mr. Geczik has a Bachelor of Science in Accounting from Boston College, a Juris Doctor from Case Western Reserve University and a LL.M in Taxation from New York University.

Kathleen Parchinski – *Leader (Tax)*

Ms. Parchinski has worked in Equinor's Tax Department since 2009 and has served as Leader of Tax for Equinor Wind since August 2017. Her current responsibilities include providing tax support to Equinor's US operations, including the New Energy Solutions business, as well as Equinor's International affiliates' activities in the US. Prior to joining Equinor, Ms. Parchinski was a Tax Manager at Ernst & Young. Ms. Parchinski has a Bachelor of Business Administration in Accounting from Pace University and is a Certified Public Accountant.

Miguel Estrada – *Leader (Tax)*

Mr. Estrada has been a tax professional with Equinor since 2017 and has served as the Leader-Tax of Equinor Wind since August 2017. His current responsibilities include supporting the US Equinor group with federal and state income tax compliance and reporting. Prior to joining Equinor, Mr. Estrada was an International Tax Director with a multinational oil and gas service provider in Houston, TX. Mr. Estrada has a Bachelor of Business Administration (Accounting) from the University of Houston and is a Certified Public Accountant licensed by the state of Texas.

Josh Kaplan – *Assistant Secretary*

Mr. Kaplan has been legal counsel with Equinor since July 2017 and has served as assistant secretary of Equinor Wind since August 2017. His current responsibilities include providing counsel on all energy transactional and regulatory matters with a focus on crude oil and associated products in North, Central and South America. Prior to joining Equinor, Mr. Kaplan was assistant general counsel at Noble Americas Corp. where his practice included in addition to the aforementioned energy products, significant work on ethanol, biodiesel, RINs, RECs and related renewable energy credit related matters. Mr. Kaplan has a bachelor of science in Business Administration from the University at Albany, State University of New York and a Juris Doctor from New York Law School.

Christiano Salgado – *Manager (Safety, Security, and Sustainability)*

Mr. Salgado joined Equinor in 2007 and has served as Manager – Safety Security and Sustainability ("SSU") since 2017. Since joining Equinor, Mr. Salgado has held a number of positions within the Company's SSU division. Currently, Mr. Salgado is the SSU Manager for North America in Equinor's Marketing, Midstream and Processing business unit. In this role, he has responsibility for a broad range of SSU functions, including the identification and implementation of SSU best practices, engagement with suppliers to perform supplier verifications and training on Equinor's safety standards, and general emergency response readiness for Equinor's MMP activities in North America. Mr. Salgado has a bachelor of science in Biology and Ecology from the Federal University of Rio de Janeiro – Brazil and a master of science in Biology (Ecology and Evolution) from the University of Houston.

Todd Walls – *Chief Financial Officer*

Todd Walls has been working in Equinor's Finance & Control division since 2013 and has served as Equinor Wind CFO since February 2015. His current responsibilities include accounting and financial service support to Equinor US Mid, Downstream, and Alternative Energy companies. Prior to joining Equinor, Mr. Walls held Controllership positions at LouisDreyfus, Noble, and FCStone. Mr. Walls holds Bachelor of Science degrees in Accounting and Finance from Bryant University.

Meagan Keiser – *Secretary*

Ms. Keiser has been legal counsel with Equinor since 2010 and has served as the Secretary of Equinor Wind since 2013. Her current responsibilities include providing legal support to Equinor's

New Energy Solutions business unit, with a focus on the company's North and South American offshore wind and solar energy activities. Ms. Keiser is lead counsel for the Empire Wind and Boardwalk Wind projects. Prior to joining Equinor, Ms. Keiser was an associate in the energy group at a Washington DC law firm. Ms. Keiser has a Bachelor of Science in Biology and Environmental Sciences from Duke University and a Juris Doctor from the Washington University School of Law.

Knut Aanstad – *President (Former)*

Knut Aanstad served as President from February 7, 2017 through August 31, 2018.

Heidi Aakre – *President (Former)*

Heidi Aakre served as President from June 20, 2016 through February 7, 2017.

Bent Pendersen – *President (Former)*

Brent Pendersen served as President from March 19, 2013 through June 20, 2016.

Gary Aucoin – *Manager (Safety, Security, and Sustainability) (Former)*

Gary Aucoin served as Manager of Safety, Security, and Sustainability from February 24, 2015 through June 30, 2017.

Martin Pastore – *Assistant Secretary and Vice President (Tax) (Former)*

Martin Pastore served as Assistant Secretary and Vice President of Tax from March 19, 2013 through June 30, 2017.

Directors

Trine Ingebjørg Ulla - *Chairman*

Trine Ingebjørg Ulla has served as Director of Equinor Wind since March 19, 2013. Ms. Ulla has held leading positions with Equinor since 2007, and in Equinor's wind business since 2009. She currently holds the position of Senior Advisor to the Senior Vice President for Equinor's Wind and Low Carbon development activities, and has previously headed up Business Development for floating wind and Asset Management for Equinor's wind business. Ms. Ulla is Bid Manager for the Empire Wind and Boardwalk Wind projects. She also serves as Director of Dudgeon Offshore Wind Limited, Wind Power AS, and Equinor New Energy AS. Prior to joining Equinor, Ms. Ulla held leading positions with Norsk Hydro and Saga Petroleum. Ms. Ulla has a Master's degree in Chemical Engineering from the Norwegian University of Science and Technology.

Heidi Aakre – *Director*

Ms. Aakre joined Equinor in 1991 and has held several management roles during this time. Ms. Aakre was the President of Equinor Wind from 2016-2017 and has served as a Director since February 2017. Currently, Ms. Aakre is the Vice President of Midstream Asset Management – North America, supporting Equinor's Marketing, Midstream and Processing business unit. Ms. Aakre is also the President of Equinor Pipelines LLC, Equinor's US midstream company, and is the location manager for the company's Stamford office. Prior to joining Equinor, Ms. Aakre worked as a chemical engineer for the Rogaland Research Institute. Ms. Aakre received a Bachelor's degree in Chemical Engineering from the Bergen School of Engineering and a Master's degree in Business Administration from the Norwegian School of Economics and Business Administration.

Olav Leivestad – *Director*

Mr. Leivestad joined Equinor in 1992 and has held several positions within the company's Finance & Control network. Since 2012, Mr. Leivestad has been employed in the Equinor New Energy Solutions business unit as a financial / business controller and he has been a Director of Equinor Wind since 2013. Mr. Leivestad's current responsibilities including advising senior management and decision makers on business proposals within New Energy Solutions unit related to offshore/onshore wind, low carbon solutions and solar activities. Mr. Leivestad has a master's degree in Finance and Internationalization from the University of Kristiansand, Norway.

Charles O'Brien - *Director*

Mr. O'Brien has been Managing Counsel with Equinor since 1999 and has served as a Director of Equinor Wind since 2013. His current responsibilities include providing legal support to Equinor's Marketing, Midstream & Processing business unit, with a focus on the company's North and South American natural gas, crude oil and refined products liquids activities. Prior to joining Equinor, Mr. O'Brien was an attorney in the Trading & Markets Division of the U.S. Commodity Futures Trading Commission in Washington DC and worked as a trading assistant for several commodity brokerage firms in Chicago. Mr. O'Brien has a Bachelor of Arts in Economics from the University of Illinois at Urbana-Champaign and a Juris Doctor from the Catholic University of America, Columbus School of Law in Washington, DC.

6.3 Financing Plan

Provide a description of the financing plan for the Project, including construction and term financing. The financing plan should address the following:
a. Who will finance the Project (or are being considered to finance the Project) and the related financing mechanism or mechanisms that will be used (i.e., convertible debenture, equity or other) including repayment schedules and conversion features
b. The Project's existing initial financial structure and projected financial structure
c. Expected sources of debt and equity financing
d. Describe how any such agreements would differ, contingency on NYERDA's selecting either the Fixed OREC or Index OREC form of pricing
e. Estimated construction costs

f. The projected capital structure
g. Describe any agreements, both pre and post Commercial Operation Date, entered into with respect to equity ownership in the proposed Project and any other financing arrangement.

6.3.1 Financing Approach

Equinor's strong financial position and access to global capital markets gives Equinor the flexibility and freedom to fund development of the Empire Wind Project in a manner that reduces total costs and optimizes the value of the project for New York. [redacted]

[redacted]

[redacted]

- [redacted]
- [redacted]
- [redacted]
- [redacted]

[redacted]

[redacted]

[redacted]

6.4 Similar Financing

Provide documentation illustrating the experience of Proposer in securing financing for projects of similar size and technology. For each project previously financed provide the following information:
a. Project name and location
b. Project type and size
c. Date of construction and permanent financing
d. Form of debt and equity financing
e. Current status of the project

Equinor has extensive experience financing complex offshore energy projects and has demonstrated the ability to successfully finance offshore wind energy projects of size and scope similar to the proposed Empire Wind Project. As detailed further below in Figure 24, Equinor has funded these projects using a combination of balance sheet and external financing. In total, Equinor has invested over $1.4 billion in the development of its existing offshore wind fleet.

Figure 24: Similar Financings

[redacted]

6.5 Financial Resources and Strength

Provide evidence that Proposer has the financial resources and financial strength to complete and operate the Project as planned.

Equinor Wind, through its U.S. parent, Equinor US, and ultimate parent, Equinor ASA brings with it an unparalleled capability to finance development of the Empire Wind Project. Equinor ASA is an international energy company, headquartered in Norway, that has operations in over 37 countries and approximately 22,000 employees worldwide. Equinor ASA is listed on the New York and Oslo stock exchanges and has a current market capital valuation in excess of $65 billion. Equinor ASA is the largest operator on the Norwegian continental shelf, and a license holder in numerous oil and gas fields worldwide.

Recognizing the changing landscape for energy production, the development of the Empire Wind Project reflects Equinor ASA's strong commitment to complementing its existing oil and gas portfolio with profitable renewable energy and other low-carbon energy solutions. Equinor ASA currently expects that approximately 15% to 20% of its investments will be directed towards renewable and low-carbon energy solutions by 2030. Equinor ASA already has demonstrated a major financial commitment to the development, construction, and operation of offshore wind resources with the development of its existing offshore wind fleet.

Equinor ASA's and Equinor US's ample financial resources and strong credit ratings ensure that these companies have access to the capital markets. In addition, Equinor has access to the global debt markets through the following programs and mechanisms:

- **US Shelf Registration Statement**: Equinor ASA has filed a shelf registration with the U.S. Securities and Exchange Commission. This filing permits Equinor ASA to engage in multiple public offerings without developing a separate prospectus for each offering.

- **Euro Medium Term Note Programme**: Established in 1997 and listed on the London Stock Exchange, the program ensures Equinor ASA access to non-US markets.

Equinor ASA also has access to a $5 billion revolving credit facility supported by twenty-one leading global banks, including Bank of America, Merril Lynch, Citi, Goldman Sachs, JP Morgan, and Morgan Stanley. [redacted] Letters of support from creditors attesting to the strong financial position of Equinor can be found in Attachment 7.

[redacted]

[redacted]

6.6 Role of PTC or ITC

Describe the role of the Federal Production Tax Credit or Investment Tax Credit (or other incentives) on the financing of the Project, including presumed qualification year and percentage. The Proposal may not be contingent on receipt of the Production Tax Credit or Investment Tax Credit.

6.7 Financial Statements and Annual Report

Provide complete copies of the most recent audited financial statement and annual report for each Proposer for each of the past three years; including affiliates of Proposer (if audited statements are not available, reviewed or compiled statements are to be provided). Also, provide the credit ratings from Standard & Poor's and Moody's (the senior unsecured long-term debt rating or if not available, the corporate rating) of Proposer and any affiliates and partners.

Because Equinor Wind is a private company, Equinor Wind does not have any credit ratings or financial statements. However, copies of the financial statements of Equinor ASA for the past three years are provided as Attachment 9. In addition, the unconsolidated financial statements of Equinor US for the past three years are provided as Attachment 10.

The current credit ratings of Equinor ASA and Equinor US with Moody's and Standard and Poor's are set forth below in Figure 25[6]:

Figure 25: Credit Ratings

	Equinor ASA		Equinor US
	Moody's	Standard & Poor's	Standard & Poor's
Long-term rating	Aa3	AA-	A
Short-term rating	P-1	A-1+	A-1
Outlook	Stable	Stable	Stable

[6] Currently, Equinor US is only rated by Standard & Poor's.

6.8 Board of Directors

List the board of directors, officers and trustees for the past three years and any persons who Proposer knows will become officers, board members or trustees.

An overview of the officers and directors of Equinor Wind is provided in Section 6.2.

Additionally, as a wholly owned subsidiary of Equinor ASA, Equinor Wind has the ability to draw upon significant resources from its parent company. An overview of the officers and directors of Equinor ASA is provided below.

6.8.1 Equinor ASA Officers and Directors

Officers

Eldar Stære – *President and Chief Executive Officer*

Eldar Sætre has held his current position since October 15, 2014. Mr. Sætre joined Equinor in 1980. He served as Executive Vice President and CFO from October 2003 until December 2010 and as Executive Vice President for Marketing, Processing & Renewable Energy from 2011 until 2014. Mr. Sætre holds a MA in Business Economics from the Norwegian School of Economics and Business Administration in Bergen.

Jannicke Nilsson – *Chief Operating Officer*

Jannicke Nilsson has held her current position since December 1, 2016. Ms. Nilsson joined Equinor in 1999 and has held a number of central management positions within Upstream Operations Norway, including Senior Vice President for Technical Excellence in Technology, Projects & Drilling, Senior Vice President for Operations North Sea, Vice President for Modifications and Project Portfolio Bergen, and Platform Manager at Oseberg South. In August 2013 she was appointed Programme Leader for the Equinor Technical Efficiency Programme, responsible for a project portfolio delivering yearly efficiency gains of 3.2 billion USD from 2016. She holds a M.Sc. in Cybernetics and Process Automation and a B.Sc. in Automation from the Rogaland Regional College/University of Stavanger.

Lars Christian Bacher – *Chief Financial Officer*

Lars Christian Bacher has held his current position since August 1, 2018. Mr. Bacher joined Equinor in 1991 and has held a number of leading positions in Equinor, including that of Platform Manager on the Norne and Statfjord fields on the Norwegian continental shelf. He was in charge of the merger process involving the offshore installations of Norsk Hydro and Equinor. He has also been Senior Vice President for Gullfaks operations and subsequently for the Tampen area, and Equinor's Canadian operations within Development & Production International. He most recently served as Executive Vice President of Development & Production International before moving to his current position. Mr. Bacher holds M.Sc. in Chemical Engineering from the

Norwegian Institute of Technology and a business degree in Finance from the Norwegian School of Economics and Business Administration.

Hans Henrik Klouman – *General Counsel and Senior Vice President (Legal)*

Hans Henrik Klouman has held his current position since August 1, 2011. Mr. Klouman combines a broad legal background and business knowledge with international experience. He has held various executive and board positions in different industries since he began practicing law in 1987. He joined Equinor in 2011, after serving as CEO of SEB Enskilda in Norway for four years. Prior to joining SEB Enskilda in 2007, he was Executive Vice President and General Counsel with the leading Norwegian insurance, pension and banking group Storebrand from 1994 to 2007. From 1987 and until joining Storebrand in 1994 Mr. Klouman worked in the Financial Supervisory Authority, as a Deputy Judge in Sandefjord District Court, in the Norwegian law firm Thommessen, for the Ministry of Finance and at the Oslo Stock Exchange. He holds a Cand. Jur. from the University of Oslo, LLM (Master of Law) from the University of Southampton, UK and a degree from Harvard Business School's Advanced Management Program.

Reidar Gjærum – *Senior Vice President (Corporate Communication)*

Reidar Gjærum has held his current position since May 1, 2005. Mr. Gjærum combines broad communication experience from Norwegian business, journalism, and politics. He joined Equinor as Senior Vice President in 2005 after serving as Executive Vice President for Communications at EDB Business Partners. Prior to EDB Business Partners, Mr. Gjærum held executive positions at JKL Oslo, Telenor, and the Confederation of Norwegian Enterprise. He holds a degree from Harvard Business School's Program for Management Development.

Jon Arnt Jacobsen – Senior Vice President (Audit)

Jon Arnt Jacobsen has held his current position since April 1, 2017. Mr. Jacobsen joined Equinor in 1998 as Senior Vice President for Group Finance. From 2004, he served six years on Equinor's Corporate Executive Committee as Executive Vice President for Manufacturing & Marketing. From 2011 to 2017 he was Equinor's Chief Procurement Officer. Prior to joining Equinor, he worked for Den norske Bank in several capacities within corporate banking, including General Manager at the Singapore branch from 1995 to 1998. Mr. Jacobsen also worked as an analyst at Esso Norge. He holds various degrees from Agder Regional College and the Norwegian Business School, as well as an MBA from the University of Wisconsin.

Magne André Hovden – *Senior Vice President (Corporate People and Leadership)*

Magne André Hovden has held his current position since September 1, 2011. Mr. Hovden joined Equinor in 2009 as VP HR for Projects & Procurement. He has also held executive positions within the oil service and shipbuilding industry. Prior to joining Equinor he was Chief of Staff in STX Europe, previously known as Aker Yards. He also has more than 10 years leadership experience from various roles in the Aker group. He was Senior Vice President of Corporate Human Resources & Health, Safety and the Environment at Aker Solutions, and Senior Vice President of

Human Resources in Engineering & Construction at Aker Kværner. He holds a Cand. Psychol. from the University of Oslo.

Irene Rummelhoff – *Executive Vice President (Marketing, Midstream, and Processing)*

Irene Rummelhoff has held her current position since August 17, 2018. Ms. Rummelhoff joined Equinor in 1991. She has held a number of management positions within international business development, exploration, and the downstream business in Equinor. Her most recent position, which she held from June 2015, was an Executive Vice President New Energy Solutions. She holds a Master’s degree in Petroleum geosciences from the Norwegian Institute of Technology.

Arne Sigve Nylund – *Executive Vice President (Development and Production Norway)*

Arne Sigve Nylund has held his current position since January 1, 2014. Mr. Nylund was employed by Mobil Exploration Inc. from 1983 to 1987. Since 1987, he has held several central management positions in Equinor. He holds a degree in mechanical engineering from Stavanger College of Engineering with further qualifications in Operational Technology from Rogaland Regional College/University of Stavanger. He is also a business graduate of the Norwegian School of Business and Management.

Torgrim Reitan – *Executive Vice President (Development and Production International*

Torgrim Reitan has held his current position since August, 17 2018. Prior to his current role, Mr. Reitan served as Executive Vice President of Development and Production USA as well as Executive Vice President and Chief Financial officer of Equinor. He has held several managerial positions in Equinor, including Senior Vice President of trading and operations for Natural Gas, Senior Vice President in Performance Management and Analysis, and Senior Vice President of Performance Management, Tax, and M&A. From 1995 to 2004, he held various positions in the Natural Gas business area and corporate functions in Equinor. He holds a M.Sc. from the Norwegian School of Economics and Business Administration.

Margareth Øvrum – *Executive Vice President (Development and Production Brazil)*

Margareth Øvrum has held her current position since October 15, 2018. Ms. Øvrum has worked for Equinor since 1982 and has held central management positions in the company, including the position of Executive Vice President for Health, Safety and the Environment and Executive Vice President for Technology & Projects. She was the company's first female platform manager, on the Gullfaks field. She was Senior Vice President for operations for Veslefrikk and Vice President of Operations Support for the Norwegian continental shelf. She joined the Corporate Executive Committee in 2004. Her most recent position was Executive Vice President for Technology, Projects, and Drilling, which she held from September 2011. She holds a Master's degree in Engineering from the Norwegian Institute of Technology in Trondheim, specializing in technical physics.

Anders Opedal – *Executive Vice President (Technology, Projects, and Drilling)*

Anders Opedal has held his current position since October 15, 2018. Mr. Opedal joined Equinor in 1997 as a petroleum engineer in the Statfjord operations. Previously, he worked for Schlumberger and Baker Hughes. He has held a range of positions in Equinor in Drilling and well, Procurement and projects. He served as Chief Procurement Officer in Equinor from 2007-2010. In 2011, he took on the role as Senior Vice President for Projects in Technology, Projects and Drilling responsible for Equinor's approximately NOK 300 billion project portfolio. He served as Equinor's Executive Vice President and Chief Operating Officer before taking the role as Senior Vice President for Development & Production International, Brazil. His most recent position, which he held from August 2018, was Executive Vice President for Development & Production Brazil. He holds an MBA from Heriot-Watt University and Master's degree in Engineering from the Norwegian Institute of Technology in Trondheim.

Tim Dodson – *Executive Vice President (Exploration)*

Tim Dodson has held his current position since January 1, 2011. Mr. Dodson has worked in Equinor since 1985 and held central management positions in the company, including the positions of Senior Vice President for Global Exploration, Exploration Norway and the Technology Arena. He holds a Bachelor's degree of Science in Geology and Geography from the University of Keele.

Al Cook – *Executive Vice President (Global Strategy and Business Development)*

Al Cook has held his current position since May 1, 2018. Mr. Cook joined Equinor in 2016 as the Senior Vice President in Development & Production International overseeing operations in Angola, Argentina, Azerbaijan, Libya, Nigeria, Russia and Venezuela. He joined from BP, where he was Chief of Staff to the CEO. Cook joined BP in 1996, taking on a series of project development and commercial roles in the North Sea and Gulf of Mexico. He then worked in field operations in the North Sea from 2002 to 2005, becoming Offshore Installation Manager. From 2005, he led the IGB2 Project in Vietnam and acted as President for BP Vietnam. Cook worked from 2009 to 2014 as BP's Vice President leading the development of the Shah Deniz field in Azerbaijan and construction of the Southern Gas Corridor. He holds a Masters in Natural Sciences from St. John's College, Cambridge University and International Executive Programme at INSEAD.

Pål Eitrheim – *Executive Vice President (New Energy Solutions)*

Pål Eitrheim has held his current position since August 17, 2018. Mr. Eitrheim joined Equinor in 1998. He has held a range of positions in Equinor in Azerbaijan, Washington DC, the CEO office, and Brazil. In 2013, he led the Secretariat for the investigation into the terrorist attack on the In Amenas gas processing facility in Algeria. His most recent position, which he held from February 2017, was Senior Vice President and Chief Procurement Officer. He holds a Master's Degree in Comparative Politics from the University of Bergen, Norway and University College Dublin, Ireland.

Directors

Jon Erik Reinhardsen – *Chair*

Jon Erik Reinhardsen has served as a member of the board since September 1, 2017 and also serves a chair of the Compensation and Executive Development Committee. Mr. Reinhardsen was the Chief Executive Officer of Petroleum Geo-Services from 2008 to August 2017. PGS delivers global geophysical and reservoir services. The company has its headquarters in Oslo, Norway and offices in 17 countries with approximately 1,800 employees. In the period 2005 to 2008 Reinhardsen was President of Growth for Primary Products in the international aluminum company Alcoa Inc.. From 1983 to 2005, Reinhardsen held various positions in the Aker Kværner group, including Group Executive Vice President of Aker Kværner ASA, Deputy Chief Executive Officer and Executive Vice President of Aker Kværner Oil & Gas AS in Houston, and Executive Vice President in Aker Maritime ASA. He holds a Master's Degree in Applied Mathematics and Geophysics from the University of Bergen. He has also attended the International Executive Program at the Institute for Management Development in Lausanne, Switzerland.

Roy Franklin – *Deputy Chair*

Roy Franklin has served as a member of the board since July 1, 2015. Mr. Franklin previously served as a member of the board from October 2007 to June 2013. He serves as the Chair of the Board's Safety, Sustainability, and Ethics Committee and is a member of the Board's Audit Committee. He has broad oil and gas experience from management positions in several countries, including positions with BP, Paladin Resources plc and Clyde Petroleum plc and holds a Bachelor of Science in Geology from the University of Southampton, UK.

Bjørn Tore Godal

Bjørn Tore Godal has served as a member of the board since September 1, 2010 and is a member of the Board's Compensation and Executive Development Committee and the Board's safety, Sustainability and Ethics Committee. Mr. Godal was a member of the Norwegian parliament for 15 years from 1986 to 2001. At various times he served as Minister for Trade and Shipping, Minister for Defense and Minister of Foreign Affairs for a total of eight years between 1991 and 2001. From 2007 to 2010, he was Special Adviser for international energy and climate issues at the Ministry of Foreign Affairs. From 2003 to 2007, he was Norway's ambassador to Germany and from 2002 to 2003 he was senior adviser at the Department of Political Science at the University of Oslo. From 2014 to 2016, Mr. Godal led a government-appointed committee responsible for the evaluation of the civil and military contribution from Norway in Afghanistan in the period 2001 to 2014. He holds a Bachelor of Arts degree in Political science, History and Sociology from the University of Oslo.

Ingrid Elisabeth di Valerio

Ingrid Elisabeth di Valerio has served as a member of the board since July 1, 2013. Ms. Di Valerio is also the employee-elected member of the board and serves on the Board's Audit Committee.

She has been employed by Equinor since 2005 and works in materials discipline for Technology, Projects & Drilling. Di Valerio was Tekna's main representative in Equinor from 2008 to 2013. She also sat on Tekna's central committee from 2005 to 2013. Ms. Di Valerio is a Chartered engineer (mathematics and physics) who studied at the Norwegian University of Science and Technology in Trondheim.

Per Martin Labråten

Per Martin Labråten has served as a member of the board since June 8, 2017 and is a member of the Safety, Sustainability and Ethics Committee. Mr. Labråthen has worked as a process technician at the petrochemical plant on Oseberg field in the North Sea. Labråthen is now a full-time employee representative as the leader of IE Equinor branch. He holds a craft certificate as a process/chemistry worker.

Wenche Agerup

Wenche Agerup has served as a member of the board since August 21, 2015 and is a member of the Board's Compensation and Executive Development Committee. Ms. Agerup is Senior Vice President Group Holdings in Telenor ASA. She was previously Executive Vice President (Corporate Affairs) and General Counsel in Telenor from 2014 to 2018 and Executive Vice President for Corporate Staffs and General Counsel of Norsk Hydro ASA from 2010 to 2014. She has held various executive roles in Hydro since 1997, including within the company's M&A-activities, the business area Alumina, Bauxite, and Energy, as a plant manager at Hydro's metal plant in Årdal and as a project director for a Joint Venture in Australia where Hydro cooperated with the Australian listed company UMC. She holds a MA in Law from the University of Oslo, Norway and a Master of Business Administration from Babson College.

Rebekka Glasser Herlofsen

Rebekka Glasser Herlofsen has served as a member of the board since March 19, 2015 and is a member of the Board's Audit Committee. In April 2017, Ms. Herlofsen took on a new position as Chief Financial Officer in Wallenius Wilhelmsen Logistics ASA, an international shipping company. Before joining WWL ASA, she was the Chief Financial Officer in the shipping company Thorvald Klaveness. She has broad financial and strategic experience from several corporations and board directorships. Ms. Herlofsen's professional career began in the Nordic Investment Bank, Enskilda Securities, where she worked in corporate finance from 1995 to 1999 in Oslo and London. During the next ten years she worked in the Norwegian shipping company Bergesen d.y. ASA (later BW Group). During her period with Bergesen d.y. ASA/BW Group she held leading positions within M&A, strategy and corporate planning and was part of the group management team. She holds a M.Sc. in Economics and Business Administration and Certified Financial Analyst Program from the Norwegian School of Economics.

Jeroen van der Veer

Jeroen van der Veer has served as a member of the board since March 18, 2016 and is the chair of the Board's Audit Committee. Mr. Van der Veer was the Chief Executive Officer in the international oil and gas company Royal Dutch Shell Plc (Shell) from 2004 to 2009, when he retired. Van der Veer thereafter continued as a non-executive director on the Board of Shell until 2013. He started with Shell in 1971 and has experience within all sectors of the business and has significant competence within corporate governance. He holds an M.Sc. Mechanical Engineering from Delft University of Technology, Netherlands and an M.Sc. in Economics from Erasmus University, Rotterdam, Netherlands. He also holds an honorary doctorate from the University of Port Harcourt, Nigeria.

Stig Lægreid

Stig Lægreid has served as a member of the board since July 1, 2013. Mr Lægreid has been employed in ÅSV and Norsk Hydro since 1985 as project engineer and constructor for production of primary metals and as a weight estimator for platform design. He is now a full-time employee representative as the leader of NITO, Equinor. He holds a Bachelor degree in Mechanical Construction from OIH.

Anne Drinkwater

Anne Drinkwater has served as a member of the board since July 1, 2018 and is a member of the Board's Audit Committee and the Board's Safety, Sustainability, and Ethics Committee. Ms. Drinkwater was employed with BP in the period 1978 to 2012, holding a number of different leadership positions in the company. In the period 2009 to 2012 she was chief executive officer of BP Canada. A British citizen, she has extensive international experience, including being responsible for operations in the US, Norway, Indonesia, the Middle East and Africa. Through her career Ms. Drinkwater has acquired a deep understanding of the oil and gas sector, holding both operational roles, and more distinct business responsibilities. She holds a Bachelor of Science in Applied Mathematics and Statistics from Brunel University London.

Jonathan Lewis

Jonathan Lewis has served as a member of the board since July 1, 2018 and is a member of the Board's Compensation and Executive Development Committee and the Board's Safety, Sustainability, and Ethics Committee. Mr. Lewis joined as Chief Executive Officer to Capita in December 2017; having previously spent 30 years working for large multi-national companies in technology-enabled industries. Lewis came to Capita from Amec Foster Wheeler plc, a global consulting, engineering and construction company, where he was CEO from 2016 to 2017. Prior to this, he held a number of senior leadership positions at Halliburton from 1996 to 2016. He has previously held several directorships within technology and the oil and gas industry. He has an education from the Stanford Executive Program at the Stanford University Graduate School of Business, a PhD in Reservoir Characterization, Geology/Sedimentology from University of Reading and a Bachelor of Science Degree in Geology from Kingston University.

6.9 Security Capability/Plan

Demonstrate Proposer's ability (and/or the ability of its credit support provider) to provide the required security, including its plan for doing so.

Equinor strong financial rating and assets will ensure that Equinor Wind has ready access to letters of credit, parental guarantees, and other forms of security necessary to meet its contractual obligations. In particular, Equinor has ready access to letters of credit or bank guarantees through bilateral agreements with a number of reputable, international banks. A bank issuing a letter of credit or bank guarantee on behalf of Equinor ASA or an affiliated company will normally also be a participant in the Equinor group multicurrency revolving credit facility described above. [redacted]

6.10 Credit Events

Provide a description of any current or recent credit issues/ credit rating downgrade events regarding Proposer or affiliate entities raised by rating agencies, banks, or accounting firms.

None.

6.11 Litigation Events (Project)

Disclose any pending (currently or in the past three years) litigation or disputes related to projects planned, developed, owned or managed by Proposer or any of its affiliates in the United States, or related to any energy product sale agreement.

On September 30, 2018, the United States District Court for the District of Columbia issued an opinion granting motions for summary judgment against a coalition of parties that sought to challenge BOEM's sale of a lease area for the development of offshore wind projects off of the coast of New York. A copy of the opinion is provided as Attachment 11. Shortly thereafter, Fisheries Survival Fund ("Fisheries") filed a motion asking the district court to alter or amend the judgment based on new evidence, namely the issuance of several power purchases agreements for offshore wind facilities proposed for areas other than off New York. Both BOEM and Equinor Wind have opposed Fisheries' motion. The court has yet to act on Fisheries' motion and is under no deadline to do so. Fisheries still retains the opportunity to appeal the September 30, 2018 decision.

Other than this action, there have not been any litigation or disputes related to projects, planned, developed, owned or managed by Equinor Wind or any of its affiliates in the United States or related to any energy product sale agreement.

6.12 Project Lifetime Expectations

Provide the expected operating life of the proposed Project and the depreciation period for all substantial physical aspects of the offer, including generation facilities, generator lead lines to move power to the grid, and transmission system upgrades.

Equinor Wind currently anticipates that the Empire Wind Project and its components will have a [redacted]

Each of the facilities described above will be depreciated in accordance with applicable IRS requirements.

6.13 Affiliated Entities and Joint Ventures

List all of Proposers' affiliated entities and joint ventures transacting business in the energy sector.

As noted above, Equinor Wind is a wholly owned subsidiary of Equinor ASA, an international energy company headquartered in Norway. Through its subsidiaries, Equinor ASA engages in the development of offshore wind facilities as well as the exploration, development, and production of oil and gas around the world. Equinor ASA is the leading operator on the Norwegian continental shelf and has substantial international operations. A full overview of the Equinor ASA and its subsidiaries' business activities are provided in the annual report provided as Attachment 9.

6.14 Litigation Events (General)

Describe any litigation, disputes, claims or complaints, or events of default or other failure to satisfy contract obligations, or failure to deliver products, involving Proposer or an affiliate, and relating to the purchase or sale of energy, capacity or RECs or other electricity products.

Equinor Wind, its parents, and affiliates have not been the subject of any significant, relevant, and adverse litigation, disputes, claims, or complaints, events of default or failure to satisfy contract obligations, or failure to deliver products relating to the purchase or sale of energy, capacity, or RECs or other electricity products.

6.15 Investigation Disclosure

Confirm that Proposer, and the directors, employees and agents of Proposer and any affiliate of Proposer are not currently under investigation by any governmental agency and have not in the last four years been convicted or found liable for any act prohibited by State or Federal law in any jurisdiction involving conspiracy, collusion or other impropriety with respect to offering on any contract, or have been the subject of any debarment action (detail any exceptions).

Equinor Wind, its parents, affiliates, directors, the key employees described above, and agents listed above are not the subject of any significant, relevant, and adverse investigation by any governmental agency and have not in the last four years been convicted or found liable for any act prohibited by state or federal law in any jurisdiction involving conspiracy, collusion, or other impropriety with respect to offering on any contract and have not been the subject of any disbarment action.

7 INTERCONNECTION AND DELIVERABILITY

7.1 Interconnection Request Documentation

Provide documentation to show evidence of the interconnection request to NYISO or any neighboring control areas for Capacity Resource Interconnection Service ("CRIS") or for Energy Resource Interconnection Service, or similar interconnection standards in neighboring control areas. For Proposals where capacity is to be delivered to NYCA, Proposers should describe any required transmission system upgrades and provide an estimate of the required transmission system upgrade costs under NYISO CRIS to meet deliverability requirements in NYISO. Evidence that Proposer has a pending, valid interconnection request is sufficient. Describe the status of any planned interconnection to the grid. Any interconnection studies undertaken by the applicable control area or third parties on behalf of Proposer must be provided.

As noted above, Equinor Wind is proposing to interconnect the Empire Wind Project at the [redacted] As described in detail in the Interconnection Evaluation Study provided as Attachment 12, as starting point for its analysis, Mott MacDonald [redacted]

- [redacted]
- [redacted]
- [redacted]
- [redacted]

Based on the results of these analyses, and extensive dialogue with Equinor Wind, [redacted]

[redacted]

[redacted]

[redacted]

[redacted]

[redacted]

[redacted]

7.2 Interconnection Facilities Diagram

Provide a copy of an electrical one-line diagram showing the interconnection facilities and the relevant facilities of the transmission provider.

A copy of the electrical one-line diagram showing the interconnection facilities and the relevant transmission facilities of the transmission provider are provided as Attachment 14.

7.3 Proposed and Anticipated Interconnection Upgrades

Identify and provide an estimate of cost, supported by an independent third party, for all proposed or anticipated interconnection and transmission upgrades, including any transmission upgrades beyond the point of interconnection that are needed to ensure delivery of energy from the Offshore Wind Generation Facility into NYCA. Describe measures to identify and control the regulatory and operational risks related to the delivery of energy from the Offshore Wind Generation Facility.

7.3.1 Estimate of System Upgrade Costs

In order to provide a basis for estimating the costs associated with interconnecting the Empire Wind Project to the NYISO system, Equinor Wind engaged Sargent & Lundy Consulting to perform an interconnection study of the Empire Wind Project. As detailed in the System Reliability Impact Study for the Empire Wind Project provided as Attachment 15, Sargent & Lundy performed an [redacted] Sargent & Lundy currently estimates that the interconnection of the Empire Wind Project will [redacted]

7.3.2 Estimate of Interconnection Facilities Cost

Equinor Wind plans to construct interconnection facilities that will deliver energy produced by the Empire Wind Project directly into the New York Control Area. These facilities will include an offshore substation, export cables, a new onshore substation, and related interconnection facilities. The design of this system is based on the design of the electrical system of the Dudgeon offshore wind project, which has allowed Dudgeon to achieve an unparalleled level of reliability and availability since commencing commercial operations. Based on Equinor Wind's experience

[redacted]

7.4 Energy Delivery into NYCA

Demonstrate that energy and associated ORECs generated by the facility can be delivered into the NYCA. For an Offshore Wind Generation Facility interconnecting in an adjacent Control Area, describe how Proposer intends to fulfill the External Project Delivery Requirement.

As noted above, the Empire Wind Project will interconnect directly to the New York Control Area.

7.5 Available Capacity

Provide detail regarding the available capacity, at the time of submission, of the proposed Injection Point.

[redacted]

8 ENVIRONMENTAL ASSESSMENT AND PERMIT ACQUISITION PLAN

8.1 Permits, Licenses, and Environmental Documentation List

Provide a comprehensive list of all the permits, licenses, and environmental assessments and/or environmental impact statements required to construct and operate the Project. Along with this list, identify the governmental agencies that are responsible for issuing approval of all the permits, licenses, and environmental assessments and/or environmental impact statements. If a Proposer has secured any permit or has applied for a permit, please indicate this in the response. Provide the anticipated timeline for seeking and receiving the required permits, licenses, and environmental assessments and/or environmental impact statements. Include a Project approval assessment which describes, in narrative form, each segment of the process, the required permit or approval, the status of the request or application and the basis for projection of success by the milestone date. All requirements should be included on the Project schedule.

Equinor Wind has reviewed federal and state permitting requirements in detail in order to identify the regulatory frameworks governing the construction and operation of the Empire Wind Project. As noted in Section 3 of this application, the Empire Wind Project will be located in federal waters off the coast of New York and interconnected to the New York Control Area.

This Environmental Assessment and Permit Acquisition Plan (for the purpose of this section, the “Plan”) provides a summary of the information required for each applicable regulatory approval, as well as a strategy for obtaining these approvals, including efficient coordination among agencies to facilitate a more streamlined permitting timeline. The Plan is supported by comprehensive environmental and technical assessments that are either in process or planned. Additional details are provided in the permitting matrix provided as Attachment 16. Details on the timeline and associated milestones for this Plan have also been incorporated into Section 10 of this application.

The following sections provide a narrative overview of the federal, state, and local approvals that will be required for the Project to initiate construction. As discussed further below, Equinor Wind already has taken significant steps towards obtaining the permits and approvals necessary for the development of the Empire Wind Project. Notably, Equinor Wind has obtained approval of its SAP from BOEM and is actively preparing its COP.

Equinor Wind also has been actively engaged with relevant stakeholders, including state and federal agencies about the Empire Wind Project and required permits and approvals. These include: the New York State Department of State (“NYSDOS”), New York State Department of Environmental Conservation (“NYSDEC”), New York State Office of Parks, Recreation and Historic Preservation (“NYSOPRHP”) , New York State Department of Public Services (“NYDPS”), New York State Office of General Services (“NYSOGS”) and NYSERDA, including ongoing participation in New York State’s Environmental Technical Working Group (“E-TWG”) and Fisheries Technical Working Group (“F-TWG”). Additional details describing when and how state agencies are and will be involved are provided below, summarized in the permitting matrix provided as Attachment 16 and tracked in the Stakeholder Tracking Matrix, see Attachment 17.

8.1.1 Federal Permits

U.S. Dept. of Interior, Bureau of Ocean Energy Mgmt.

The federal permitting process will be largely coordinated by BOEM and will include a review of environmental impacts under the National Environmental Policy Act of 1969 ("NEPA").[8] Under NEPA, federal agencies evaluate the potential impacts of any proposed major federal action with the potential to significantly affect the quality of the human environment. Through this process, federal agencies will also consider alternatives to the proposed action. BOEM serves as the lead federal agency for NEPA review and compliance with respect to the Empire Wind Project.

BOEM's jurisdictional obligations are defined under the Outer Continental Shelf Lands Act ("OCSLA") as implemented through regulations governing Renewable Energy and Alternate Uses of Existing Facilities on the Outer Continental Shelf. Under OCSLA, as amended by the Energy Policy Act of 2005, the Secretary of the Interior is authorized to issue leases for wind and other alternative energy development on the outer continental shelf ("OCS"). The OCS is defined as all submerged lands and seabeds within U.S. navigable waters, seaward and outside of the state jurisdiction or 3 nm.[9] Under delegated authority from the Department of the Interior, BOEM issued Lease OCS-A-0512 to Equinor Wind. This lease is the primary mechanism by which BOEM regulates the use of the submerged lands for the Empire Wind Project.

Detailed information about proposed activities and schedule requirements for the BOEM process are defined in both the Lease and in applicable regulatory guidelines. A summary of these requirements and timelines is provided in Figure 26.

[8] 42 U.S.C. § 4321 *et seq*.
[9] *See* 43 U.S.C. § 1301.

Figure 26: BOEM Requirements and Lease OCS-A-0512 Stipulations

Filing/Milestone	Description	Required by	Date
SAP Survey Plan	A description of methods and timing of surveys necessary to meet the information requirements of 30 C.F.R. § 585.610-611, including shallow hazards, geological, biological, geotechnical, and archaeological surveys. Plan submitted to BOEM for review and comment.	Lease Addendum C, Section 2.1.1 Survey Plan(s)	At least 30 calendar days prior to the date of the pre-survey meeting At least 90 days prior to start of marine surveys
Pre-Survey Meeting for the SAP surveys	Hold a pre-survey meeting with BOEM at which a qualified marine archaeologist must be present to discuss the SAP Survey Plan.	Lease Add. C, Stipulation 2.1.2 Pre-Survey Meeting(s) with the Lessor	At least 60 days prior to start of SAP surveys
SAP	Plan due at the end of the Preliminary Term (*i.e.*, 12 months after the Effective Date) describing the activities to collect wind resource and metocean measurements using buoys or fixed-platform meteorological towers.	30 C.F.R. §§ 585.235(a)(1) and 585.601(a)	Prior to the end of the Preliminary Term
Semi-Annual Progress Report	A semi-annual progress report throughout the duration of the site assessment term providing a brief narrative of the overall progress since the last progress report.	Lease Add. C, Stipulation 2.2.1 Semi-Annual Progress Report	Every 6 months after SAP approval
Construction and Operation Survey Plan	A plan describing the methods and timing of surveys necessary to meet the information requirements of a COP (§ 585.626 and 627). These surveys include shallow hazards, geological,	Lease Add. C, Stipulation 2.1.1 Survey Plan(s)	At least 30 calendar days prior to pre-survey meeting

Filing/Milestone	Description	Required by	Date
	biological, geotechnical, and archaeological.		At least 90 days prior to start of marine surveys
Pre-Survey Meeting for the COP surveys	Hold a Pre-Survey Meeting with BOEM at which a Qualified Marine Archaeologist must be present, to discuss the COP Survey Plan.	Lease Add. C, Stipulation 2.1.2	At least 60 days prior to start of COP surveys
Construction and Operation Plan	A plan describing the activities for constructing and operating an offshore wind project that includes the requirements of § 585.601, 626, and 627.	30 C.F.R. § 585.601(b)	6 months prior to the end of the 5-year Site Assessment Term
Facility Design Report	A report that provides specific details of the design of any facilities, including cables and pipelines that are outlined in the approved SAP and/or COP, which demonstrates that the design conforms to the responsibilities listed in §585.105(a).	30 C.F.R. § 585.701	May be submitted with COP or following COP approval.
Fabrication and Installation Report	A report that describes how the facilities will be fabricated and installed in accordance with the design criteria identified in the FDR; the approved SAP and/or COP, and generally accepted industry standards and practices.	30 C.F.R. § 585.702	May be submitted with COP or following COP approval.

Equinor Wind already has taken significant steps towards obtaining the approvals necessary to develop the lease area. In accordance with BOEM's requirements, on June 18, 2018, Equinor Wind submitted a SAP to BOEM setting out its plan for the installation of metocean facilities at the Empire Wind Project site. On August 22, 2018, BOEM notified Equinor Wind that its SAP was complete. Equinor Wind amended the SAP in July 2018, August 2018, and October 2018. A copy of the SAP is provided as Attachment 18.

On November 21, 2018, after appropriate consultations with relevant federal, state and tribal entities, local governments, and potentially affected stakeholders, BOEM approved the SAP, clearing the way for the subsequent installation of the metocean facilities in the lease area. A copy of BOEM's approval of the SAP is provided as Attachment 19. On December 2, 2018, Equinor Wind installed the metocean facilities in the lease area.[10]

The next step in the process is for Equinor Wind to continue with site assessment and proceed with development of its COP. [redacted]

In addition to the environmental assessments that will be presented in the COP, Equinor Wind is required to prepare a preliminary Oil Spill Response Plans ("OSRP") and a Safety Management System ("SMS") associated with *operations* of the wind farm. The OSRP will be prepared in accordance with 30 CFR 254 "*Oil Spill Response Requirements for Facilities Located Seaward of the Coastline*," and will document the types and quantities of oil-filled equipment associated with the WTGs and offshore substation(s), as well as spill response capabilities and procedures. The SMS will be prepared in accordance with the BOEM and Bureau of Safety and Environmental Enforcement ("BSEE") Technology Assessment Program #633- "*Wind Farm/Turbine Accidents and the Applicability to Risks to Personnel and Property on the OCS, and Design Standards to Ensure Structural Safety, Reliability, Survivability of Offshore Wind Farms on the OCS*," and the applicable guidelines, while also considering relevant standards set forth in USCG regulations for unmanned facilities or other safety regulations under 33 CFR 142 through 33 CFR 146. Additionally, Equinor Wind will draw upon its experience in offshore wind operations in Europe to support the development of these documents. Both the OSRP and SMS documents will be subject to the review and approval of BSEE.

---

[10] Prior to deployment of the metocean facilities, Equinor Wind submitted and received approval for a private aid to navigation ("PATON") from the U.S. Coast Guard ("USCG"). In addition, the metocean facilities are covered under Nationwide Permit #5, "Scientific Measurement Devices," which does not require pre-construction notification to the U.S. Army Corps of Engineers ("USACE"). *See* Section 8.1.1 for additional details on USACE permitting anticipated for the Project.

[11] Per Secretarial Order 3355, BOEM is obligated to undertake a page-limited Environmental Impact Statement ("EIS") and target completion of its NEPA review (*i.e.*, publication of a final EIS) within 12 months of the publication of a Notice of Intent to prepare an EIS. Additionally, per Executive Order 13807, a Memorandum of Understanding was signed by federal regulatory agencies to agree to a single timeline of environmental reviews and authorization decisions for proposed major infrastructure projects, prepare a single EIS, sign one ROD, and issue all necessary authorization decisions within 90 days of issuance of the ROD.

Following COP approval, Equinor Wind will submit a Facility Design Report ("FDR") and Fabrication and Installation Report ("FIR") for BOEM approval prior to construction. In accordance with 30 C.F.R. § 585.705, Equinor Wind will be required to enlist a Certified Verification Agent ("CVA") to review and certify the FDR and FIR to ensure that the facilities are designed, fabricated and installed in conformance with accepted engineering practices and the FDR and FIR. [redacted]

U.S. Army Corps of Engineers

Equinor Wind has been in the process of conducting site investigations in federal waters (*e.g.*, geotechnical, geophysical borings) to support the design of the export cable and the wind farm. These activities meet the requirements of a Nationwide Permit #6 for Survey Activities.[12] As discussed in previous sections, activities associated with facilities associated with the SAP qualify for a Nationwide Permit #5.

Equinor Wind anticipates that an Individual Permit from the U.S. Army Corps of Engineers ("USACE"), New York District will be required for dredging and installation activities in Waters of the U.S. For dredging and excavation, Section 404 of the Clean Water Act ("CWA") (33 U.S.C. § 1344) prohibits the discharge of dredged or fill material into navigable waters of the United States without a permit from the USACE. Navigable waters are "subject to the ebb and flow of the tide and/or presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce" (33 C.F.R. § 329.4). Section 401 of the CWA requires applicants to obtain a certification or waiver from the NYSDEC for any activity that may result in a discharge of a pollutant into waters of the United States, including any dredged or fill materials. Section 10 of the Rivers and Harbors Act of 1899 (33 U.S.C. § 401 *et seq.*) requires a permit from the USACE for construction of any structure, such as wind turbine generators and/or a submarine transmission cable, in or over any navigable waters of the United States. USACE also regulates dredging activities pursuant to Section 10 of the Rivers and Harbors Act. USACE is expected to be a cooperating agency under NEPA to satisfy the NEPA requirements for the Individual Permit. The CWA application package will include: ENG Form 4345, project drawings, and other supporting information. In the event that activities propose impacts to wetlands subject to USACE jurisdiction (*e.g.*, tidal wetlands), Equinor Wind will be required to complete field delineations to define the wetland boundary and corresponding buffer. The delineation is subject to review and approval by USACE through the permitting process. Depending on the nature and extent of dredging activities, USACE may require sampling and analysis of proposed dredge material to characterize this material within the permit application. Any characterization of proposed dredge material will also be coordinated with NYSDEC within state jurisdictional

[12] Any activities located in state waters will require the state water quality certificate and coastal zone consistency determination. This is predicated on proposed activities meeting NY-regional specific conditions. Equinor Wind is consulting with both NYSDEC and NYSOGS for work proposed within the 3 nm jurisdictional boundary and preparing the required documentation in support of this work.

waters see Section 8.2 below. Depending on the nature of these impacts, mitigation may be required.

USACE also regulates occupancy for any project that would be located within a federally sponsored project (*e.g.*, navigational channels, anchorages, beach replenishment), regardless of whether the sponsorship is partial or whole under Section 408 of the CWA. Equinor Wind will review the project details with USACE to determine the applicability of these requirements to the Project.

U.S. Coast Guard

The USCG, Sector New York will issue a PATON approval for navigational lighting on structures above the waterline (*e.g.*, FLiDAR buoys, WTGs, and offshore substation platforms) once the USACE permit is obtained. Approximately two weeks prior to the initiation of construction activities, the USCG will publish a Local Notice to Mariners ("Notice"), which will remain in effect throughout the construction period. USCG will also be a cooperating agency under NEPA and will review the Navigation Safety Risk Assessment associated with the proposed facilities. A separate PATON application and corresponding Notice will be required for the wind farm operations.

U.S. Environmental Protection Agency

The United States Environmental Protection Agency ("EPA"), Region 2 will review the Empire Wind Project for potential air emissions associated with construction and operation and maintenance vessels with respect to state non-attainment areas for criteria pollutants. The EPA will require an air quality permit for project-related activities on the OCS under the Clean Air Act ("CAA"), including emergency generators, should they be installed in the turbine towers, and marine vessels used for construction and/or operation while such vessels are physically attached to the seafloor.

As part of the OCS air permit process, a Corresponding Onshore Area ("COA") will be identified by the EPA in order to determine what federal and state air quality regulations may apply to the project. In most cases, the COA will be the nearest point of land to a proposed project. In this case, New York is geographically closest to the lease area and it will likely be designated the COA by default.

To protect human health, the EPA establishes National Ambient Air Quality Standards ("NAAQS") pursuant to the CAA that apply to outdoor air throughout the country. For each NAAQS pollutant and averaging period, the EPA may designate a specified geographic area as being in attainment of the standard, as being in nonattainment of the standard, or as being a maintenance area (*i.e.*, an area that was previously in nonattainment but has since been redesignated as attaining the standard due to ongoing improvements in local air quality). Because the COA for the lease area will be a nonattainment or maintenance area for several pollutants, a General Conformity analysis pursuant to 40 C.F.R. pt. 93 will be required for air emissions occurring within 3 nm from shore (and potentially as far as 25 nm from the state seaward boundary), both for construction of the project and for any operational air emissions that will not be included in the OCS air permit. If calendar year emissions of any pollutant exceed the applicable General Conformity threshold, then a formal determination of General Conformity will be required.

The OCS air permit and General Conformity determination will cover offshore construction and operation, as well as onshore and offshore construction, but will not cover onshore operation (*i.e.*, stationary sources). If an onshore substation is built with an emergency generator engine for operations, that engine could require state-only minor source air permitting in New York. As Equinor Wind refines the design of the Empire Wind Project, Equinor Wind will engage with NYSDEC to determine applicable requirements.

Under Section 402 of the CWA, the EPA will issue a National Pollutant Discharge Elimination System ("NPDES") Vessel General Permit for the discharge of any pollutant into navigable waters outside of the New York State jurisdictional boundary. EPA has delegated authority to NYSDEC for any State Pollutant Discharge Elimination System ("SPDES") permits that may be required within state jurisdiction, see Section 8.2 below.

Other Federal Agencies

Because the Empire Wind Project is outside of the federal territorial seas (defined as 3 nm to 12 nm), the Federal Aviation Administration ("FAA") review of structures over 200 feet will not apply to the project. However, BOEM has incorporated FAA guidance on marking and lighting in its own guidance. See Section 9.2 of this proposal for a discussion on lighting.

The Department of Defense ("DoD") will be consulted to ensure that the location of the wind turbines, offshore substation platforms, and submarine transmission cable will not interfere with military practice areas, firing ranges, submarine routes, military radar and/or other features of concern.

Environmental resource protection agencies, including the National Oceanic and Atmospheric Administration, National Marine Fisheries Service ("NOAA NMFS") and the U.S. Fish and Wildlife Service ("USFWS"), Northeast Region (Region 5), will be responsible for reviewing project impacts to protected resources and evaluating the need for mitigation through prescribed best management practices. These agencies will have the opportunity to review environmental documents and comment through inter-agency consultations required pursuant to NEPA. NOAA NMFS and USFWS will review impacts to marine, coastal, and terrestrial threatened and endangered species protected by the federal Endangered Species Act ("ESA"). Impacts to non-listed species and habitats will also be evaluated under several other wildlife protection laws, including the Migratory Bird Treaty Act of 1918 ("MBTA"), the Bald and Golden Eagle Protection Act ("BGEPA"), the Marine Mammal Protection Act of 1972 ("MMPA"), and the Magnuson-Stevens Fishery Conservation and Management Act ("MSFCMA"). Additionally, in accordance with 50 C.F.R § 600.920(e)(1), BOEM and NOAA NMFS will assess impacts to Essential Fish Habitat.

Under the MMPA and ESA, NOAA NMFS and USFWS are required to review any activity that may result in the unintentional "taking" of marine mammals and of sea turtles and fish incidental to activities including construction projects. Incidental take is authorized if it is determined that the taking would: (a) be a small number; (b) have no more than a negligible impact; and (c) not have an unmitigable adverse impact. Incidental Take Authorizations can be provided in the form of an Incidental Harassment Authorization or a Letter of Authorization, depending on the nature and duration of the activity.

Implementation of the following federal statutes has been delegated to the State of New York:

- The Coastal Zone Management Act ("CZMA") requires that the NYSDEC, the agency responsible for administering the New York Coastal Management Program, provide a determination that construction and operation of the proposed Empire Wind Project is consistent with New York coastal protection policies.
- The CWA Section 401 permit ("State Water Quality Certificate") must be issued as a pre-requisite to the USACE permit.
- NYSDEC has delegated authority for CWA Section 404. In some locations, USACE Section 404 and NYSDEC permits will be required, see Section 8.2 below.
- NYSDEC has the delegated authority to implement Section 402 of the CWA and thus enforces the NYSDEC under its NYSDEC program and will issue permits required for the installation of the transmission cable to shore and substation upgrades see Section 8.2.

Additionally, the National Historic Preservation Act of 1966 ("NHPA") requires consultation with the State Historic Preservation Office and with the Tribal Historic Preservation Office of any Native American Tribes which may be affected by the Empire Wind Project. Section 106 of the NHPA requires federal agencies to take into account the effects of a proposed action on properties eligible for inclusion in the National Register of Historic Places ("NRHP") and, if applicable, develop plans to avoid, minimize, or mitigate adverse effects to the historic properties. "Properties" are defined as "cultural resources," which include prehistoric and historic sites, buildings, and structures that are listed on or eligible for listing in the NRHP.

8.1.2 State Permits

NY Public Service Commission and Department of Public Service Commission

The primary state environmental review and approval for the Empire Wind Project is defined by Article VII of the Public Service Law. At the conclusion of the Article VII process, Equinor Wind will be issued a Certificate of Environmental Compatibility and Public Need ("ECPN"), which is required for the siting of major utility infrastructure[13] in the state of New York. The Article VII application will address the proposed transmission system connecting the offshore wind farm to the interconnecting substation including any associated infrastructure upgrades (*e.g*. switching station) that may be required for deliverability at the interconnection point. Applications for major electric transmission lines, like the one to be proposed by Equinor Wind, are governed by 16 NYCRR Part 86 and 88. The Article VII process supersedes other State and local permits except for federally authorized permits, such as the NYSDOT Accommodation Permit subject to review by the Federal Highway Authority ("FHWA").

The Public Service Commission ("PSC") regulates investor-owned electric, natural gas, steam, telecommunications, and water utilities in New York State and issues the ECPN. The PSC decides any application filed under Article VII, the certification review process for major electric and gas transmission facilities. The Department of Public Service ("DPS"), who serve as staff to the PSC, is the State agency that carries out the PSC's legal mandates. Namely, one of DPS's responsibilities is to participate in all Article VII proceedings to represent the public interest.

The Article VII Application will be prepared based on the results of various technical studies. The application will include a description of the preferred alternative, presentation of the technical studies and potential impacts, a discussion of project need and an evaluation of alternatives. The application will also identify pertinent local regulations in the towns and counties traversed by the transmission line and will indicate those regulations that are considered unduly restrictive. The application will also include supporting direct testimony from the technical experts who will serve as potential witnesses during evidentiary hearings. Consultation with the PSC staff prior to completion of the Application will be used to provide guidance regarding the scope of the technical studies to be included in the Application.

Statutory parties to the Article VII process must be provided copies of the Article VII Application. These parties include: each municipality in which any portion of the facility is to be located, various state agencies, and each member of the state legislature through whose district the facility is to be located. Once the Article VII application is filed with the PSC, staff will conduct a completeness determination review of the application and initiate the review process.

New York State Department of Environmental Conservation

NYSDEC is primarily a cooperating agency in the Article VII review process. Subject matter experts in wetlands, wildlife, contaminated soils, fisheries etc. will participate in the discovery process during the Article VII review, however the ultimate approval of the Empire Wind Project rests with the PSC for wetlands permitting and other environmental approvals.

[13] Major electric transmission facilities are lines with a design capacity of 100 kV or more extending for at least 10 miles, or 125 kV and over, extending a distance of one mile or more.

NYSDEC has the delegated authority to implement Section 402 of the Clean Water Act and thus enforces the SPDES and will issue permit(s) for the installation of the transmission cable to shore (e.g., construction stormwater permit and/or discharge permit for construction dewatering).

New York State Department of State

NYSDOS, is responsible for administering the New York State Coastal Management Program ("NYS CMP"). Consistency review is the tool which enables the NYSDOS to manage coastal uses and resources while facilitating cooperation and coordination with involved state, federal and local agencies. The "consistency" of a proposed activity with the NYS CMP is determined through a set of coastal policies and procedures designed to enable appropriate economic development while advancing the protection and preservation of ecological, cultural, historic, recreational, and esthetic values.

New York State Office of General Services

NYSOGS holds title to the seabed within 3 nm of the coastline "in trust" for the people of the State of New York. Structures located in, on, or above submerged state-owned lands are regulated under the Public Lands Law and may require authorization from the state. A submerged lands lease will be required by the NYSOGS for the export cable to shore.

New York State Energy Research and Development Authority

NYSERDA is the lead agency coordinating offshore wind opportunities in New York State. In support of the Governor's proposal to meet 100 percent of New York's electricity needs with carbon-free sources by 2040, NYSERDA continues to work closely with coastal communities and the fishing and maritime industries to identify offshore wind sites to be included in New York State's Offshore Wind Master Plan ("Master Plan"). Although it has no permitting authority, it may impose certain conditions via issuance of the bid award in order to support meeting objectives described in the Master Plan. In addition, the assessments and surveys conducted by NYSERDA to inform the Offshore Wind Master Plan will be of significant value towards informing Equinor's development plans, permitting, and stakeholder outreach.

New York State Department of Transportation

As the onshore route may be located in state highways, parkways, and expressway rights-of-way, authorization may be required from the New York State Department of Transportation ("NYSDOT"), including a Highway Access Permit and a Permit for Use and Occupancy within State Rights-of-Way.

NYSDOT has an agreement with the FHWA regarding how utilities are accommodated on controlled access highways (Accommodation Plan for Longitudinal Use of Freeway Right-of-Way By Utilities); however, only communication utilities are permitted. Therefore, any request for a non-highway use of a controlled access highway (*i.e.*, for construction and operation of the

Empire Wind Project) is considered an exception to the Accommodation Plan and would require approval by the Federal Highway Administration. Unlike the other approvals described in this plan, the FHWA approval is issued to NYSDOT and not Equinor Wind.

State Coordination

The environmental assessment activity for the Empire Wind Project through the Article VII process, as described above, and will rely on input from NYSDEC, OPRHP, and NYSDOS to inform the review. These agencies will similarly play a significant role in the NEPA process and will be asked to coordinate with BOEM.

8.1.3 Local Permits

Since the Article VII process supersedes local permitting, the PSC has the authority to grant waivers from local ordinance requirements that are determined to be unreasonable or prohibitive to construction and operation of a transmission project determined to be in the public interest of New York residents. The threshold to obtain a waiver for local ordinances is high. Accordingly, this pathway will only be taken if there are no other commercial or technically viable alternatives. In the event that zoning variances may be required from local planning boards, the PSC will expect a good faith effort to have been made by Equinor Wind to reach an agreement between the municipalities, prior to seeking a waiver. Compliance with applicable ordinances and any requests for waivers (if needed) will be prepared as part of the initial Article VII application.

8.1.4 Federal and State Agency Coordination

As discussed above, as the lead federal agency under NEPA, BOEM is responsible for reviewing and approving the SAP Survey Plan, SAP, COP Survey Plan, and COP, as well as the FDR/FIR. BOEM will prepare an EIS upon the completeness determination of the COP. After public comment and formal review of the EIS, BOEM will issue an ROD for the Empire Wind Project. The ROD will explain BOEM’s decision, describe the alternatives BOEM considered, and discuss mitigation and monitoring to be undertaken by the project proponent, if necessary.

During its technical review of the abovementioned documents, BOEM will engage in formal consultation with the cooperating federal agencies (*e.g.*, USACE, USFWS, NOAA NMFS, EPA, etc.) under the CZMA, ESA, MBTA, BGEPA, MMPA, MSFCMA, CWA, and CAA. Additionally, state agencies, particularly those delegated authority as discussed in Section 8.2 above, will be engaged in review of the COP and other permit applications, in coordination with the federal NEPA review.

Similar to the federal review process, several consultations will be required prior to approval of permits, including the Division of Parks and Forestry, Natural Heritage Program for impacts to threatened and endangered species; and the Historic Preservation Office for consultation under the New York Register of Historic Places Act and Section 106 of the NHPA.

Equinor Wind has been actively engaged with these agencies and other stakeholders to share results and discuss potential impacts from the Empire Wind Project.

8.2 Pending Permits, Licenses, and Environmental Documentation Timing

Provide the anticipated timeline for seeking and receiving the required permits, licenses, and environmental assessments and/or environmental impact statements. Include a Project approval assessment which describes, in narrative form, each segment of the process, the required permit or approval, the status of the request or application and the basis for projection of success by the milestone date. All requirements should be included on the Project schedule in as described in Section 6.4.10.

This section describes the sequence for seeking and receiving the required permits, licenses, and environmental assessments and/or environmental impact statements. At the time that this proposal was prepared, Equinor Wind has completed activities associated with the SAP and certain COP surveys; therefore, the information presented is on a going forward basis. As the Empire Wind Project proceeds, a variety of tasks will be moving in parallel path. From study planning to survey execution and stakeholder outreach, the number of ongoing activities that must be tracked diligently in order to maintain consistency and quality will demand careful attention and thorough record keeping. Given the complexity of a proposed offshore wind farm and the number of technical details that must be managed, it is critical for the project team to have a well-developed process for keeping track of commitments and environmental requirements either offered by Equinor Wind or required through permitting. A Commitments Register has been developed that includes information about the origin of the commitments and/or environmental requirements (when they were made and who they were made to), what aspect of the facility the requirements apply to (*e.g.*, installation of the submarine cable, pre-construction notification, etc.), and estimated start/end of that commitment to ensure a successful project.

Equinor Wind believes in early and frequent engagement with relevant regulatory agencies. Public involvement in both the federal and state regulatory process is important and has and will continue to be managed proactively. Stakeholders include, but are not limited to: Congressional delegations; federal, state, and local regulatory agencies; citizen groups; environmental/nongovernmental groups; coastal states; Native American tribes; fishermen's organizations; recreation and tourism interests; marine trades; commercial interests; and the general public or other groups with broad interest in the Empire Wind Project. Details on outreach to these entities and others are further described in other sections of this RFP (*see e.g.*, Community Outreach Plan; Environmental Mitigation Plan, and Fisheries Mitigation Plan).

8.2.1 Phase I: COP, Article VII, Coastal Consistency and NYSDOT Submittals

Status: Under preparation

Anticipated Submittal: [redacted]

Anticipated Completion: [redacted]

In general, the COP and Article VII application are the two primary environmental and siting approvals that have the longest durations and require the most detailed impact assessments. Public involvement is a critical aspect of both review processes and therefore it is preferable to file both applications close together. Several environmental assessments are needed to support the characterization of baseline conditions and potential impacts, which are further detailed in [redacted]. These assessments are either in progress or will be initiated so that information can be incorporated into the COP and the Article VII applications, including but not limited to:

- Offshore site characterization surveys, including benthic, geophysical, metocean, geotechnical, and marine archeological assessments
- Offshore avian surveys
- Marine mammals and sea turtles monitoring
- Bat Monitoring
- Essential Fish Habitat Assessment
- Wetlands delineation
- Terrestrial cultural surveys
- Visual surveys
- Historic properties surveys
- Navigational risk safety assessment
- In-air noise
- Cable burial risk assessment
- Aviation risk assessment
- Underwater noise acoustic modeling
- Air quality modeling
- Sediment transport analysis
- Electromagnetic Field (“EMF”) modeling

Consultations with various agencies will be completed to support the assessments. As information becomes available, Equinor has been, and will be, proactive with sharing results with the appropriate authorities.

An additional requirement for the Article VII application is the SRIS, prepared by NYISO as a result of the interconnection requests filed by Equinor. It is anticipated that this will be received in advance of the submission of Equinor Wind’s application submittal to NYSDPS.

At the time Equinor Wind submits the COP to BOEM, a copy will be provided to NYSDOS, NYSDEC, NYSOPRHP, NYDPS, NYSOGS and NYSERDA, so that each agency may provide input on the COP concurrently with BOEM’s review. Equinor Wind has and will continue to consult with each of these agencies up to COP submissions in order to seek, and where required, apply any feedback. Upon receipt of comments from any of these agencies, Equinor will request a meeting to review and resolve any concerns that are expressed. A copy of all federal application materials will also be submitted to NYSDOS at the same time they are sent to the federal permitting agency to support the Coastal Consistency Determination. Equinor will certify to the federal agency and the NYSDOS that the Empire Wind Project complies and is consistent with the New York State Coastal Management Program. No federal agency can issue a permit for a project affecting New York's coastal area until the NYSDOS concurs with the consistency certification. By federal regulation, NYSDOS has six months to complete its review of a consistency certification and make a decision. Typically, most consistency reviews can be completed within one or two months. To date, Equinor has consulted with, and will continue to consult with the abovementioned agencies on development of the COP, and therefore those agencies have had and will have opportunities to input into and comment on the process prior to final COP submission.

Approval of the Article VII application will be contingent on NYSDOT and FHWA approving the proposal for certain portions of the export cable within NYSDOT rights of ways ("ROWs"). As such, Equinor intends to submit its application to NYSDOT at the same time as the Article VII application.

Under Secretarial Order 3355 and Executive Order 13807[14], [redacted]

8.2.2 Phase II: USACE, EPA, NYSOGS, NOAA NMFS Application Submittals

- *Status: Planning*
- *Anticipated Submittal:* [redacted]
- *Anticipated Completion:* [redacted]

The Atlantic seaboard has certain areas that are identified as hazard areas, as reflected on the NOAA Navigational Charts. These hazard areas can be associated with Unexploded Ordinance ("UXO"). To support micro-siting of offshore facilities, Equinor Wind will be completing a UXO survey to characterize and identify mitigation procedures of these hazards. The UXO survey would be designed based on the findings of a UXO desktop study and consultation with the DOD. The desktop study will include the following:

- UXO Hazard identification
- Empire Wind Project Operations Risk Analysis

[14] Per Secretarial Order 3355, BOEM is obligated to undertake a page-limited EIS and target completion of its NEPA review (i.e., publication of a final EIS) within 12 months of the publication of a Notice of Intent to prepare an EIS. Additionally, per Executive Order 13807, a Memorandum of Understanding was signed by federal regulatory agencies to agree to a single timeline of environmental reviews and authorization decisions for proposed major infrastructure projects, prepare a single EIS, sign one record of decision ("ROD"), and issue all necessary authorization decisions within 90 days of issuance of the ROD ("One Federal Decision").

- Risk Mitigation Recommendations

The UXO desktop study will serve as the basis for UXO field surveys, where survey methods will likely require Equinor Wind to apply for an IHA through the NOAA NMFS. Survey activities will also likely meet the conditions of the USACE NWP #6 (Survey Activities), but this will be confirmed as the scope is developed.

The lead agencies responsible for the COP and Article VII review will rely on other federal and state agencies to comment and coordinate the environmental reviews of the Empire Wind Project. Therefore, it will be necessary to prepare and submit the USACE, EPA OCS Air Permit and NYSOGS Underwater Utility Easement application packages soon after the COP and Article VII applications are submitted. Information gathered during the studies outlined and completed for Phase I permitting will support these applications. Additional site-specific data will be collected as well, including, but not limited more thorough geotechnical information and land survey. Detailed design drawings will also be prepared as part of the application packages.

8.2.3 Phase III: Supplemental Requirements for BOEM and PSC

- *Status: Planning*
- *Anticipated Submittal:* [redacted]
- *Anticipated Completion:* [redacted]

Upon COP approval, Equinor Wind will submit the FDR and the FIR for BOEM approval prior to construction (submittal is not contingent on the COP approval). Per §585.705, Equinor Wind will be required to enlist a CVA who will review and certify the FDR and FIR to ensure that the facilities are designed, fabricated and installed in conformance with accepted engineering practices. (Equinor Wind will nominate their CVA for BOEM approval as part of the COP submittal.)

Following issuance of the Article VII ECPN, Equinor Wind will prepare the various additional documents to verify its compliance with the certification order, including the Environmental Management & Construction Plan ("EM&CP"). This document must be formally filed with and approved by the PSC before construction can proceed. The EM&CP will detail the precise location of the proposed facilities and the special precautions that will be taken during construction to ensure environmental compatibility. It is important to note that the Article VII authorization does not include property rights. As such, the EM&CP cannot be issued until all property right are obtained, including the NYSDOT Accommodation Permit.

Both of these documents will rely on the additional design details that will have been developed as the project matures.

8.2.4 Phase IV: Remaining Permit Applications

- *Status: Planning*
- *Anticipated Submittal:* [redacted]

- *Anticipated Completion:* [redacted]

During this time frame, Equinor will submit the remaining permit applications required for project construction:

- The PATON to USCG for wind farm development;
- The IHA or LOA request to NOAA Fisheries for wind farm development;
- The Vessel Discharge Permit to EPA for wind farm development and operations; and
- The Notice of Intent and Stormwater Pollution Prevention Plan and SPDES permit applications to NYSDEC for export cable landing and routing and substation construction.

8.3 Construction Permit Close-out and Operations Turnover

As the construction phase of the Empire Project comes to a close, it may be necessary to complete certain obligations or commitments associated with permits obtained for construction. For example, Equinor Wind may be required to restore vegetation temporarily removed/disturbed as part of onshore export cable installation, with documented successful vegetation establishment after a certain timeframe of planting. Equinor Wind will continue to maintain the Commitments Register referenced in Section 8.2, such that these requirements are closed out appropriately.

Similarly, in preparation for operations, Equinor Wind will be turning the project over to the dedicated Operations Team. Leading up to the turnover, Equinor Wind will prepare an "Operations Compliance Matrix," which will identify all operations permits, required monitoring/recordkeeping, regulatory submittals (if applicable), and timeframes. This information is necessary such that the dedicated Environmental Compliance Manager for operations becomes familiar with and is able to establish a compliance program for implementation throughout the operations phase. Examples of items that would be part of this matrix, include but are not limited to:

- EPA Vessel Discharge Permit monitoring and annual reports;
- OSRP spill response training; and
- OSRP biennial review and submittal.

As part of the development of Standard Operating Procedures for the wind farm, Equinor Wind will consider relevant regulatory requirements associated with environmental compliance that need to be incorporated. For example, under the OSRP, spill response equipment will need to be inspected and maintained monthly and records of such inspections must be maintained for two years. Operations Team members will be trained on these at an established, applicable interval (*e.g.*, annual or other) to ensure continued environmental compliance.

8.4 Decommissioning

In a manner similar to the operations turnover, certain things will be required to maintain compliance during decommissioning activities. These are expected to be initially identified during the current permitting phase of the Empire Project and logged in the Commitments Register. Throughout operations, the Commitments Register will be reviewed periodically to ensure any nuances associated with decommissioning requirements are captured, such that upon initiation of decommissioning activities, the appropriate oversight resources can be dedicated to see this activity to completion.

9 ENGINEERING AND TECHNOLOGY

9.1 Preliminary Engineering Plan

Provide information about the specific technology or equipment including the track record of the technology and equipment and other information as necessary to demonstrate that the technology is viable. Provide a preliminary engineering plan which includes at least the following enumerated information. If specific information is not known, identify manufacturers, vendors, and *equipment that will be considered.*

a. Type of foundation, Offer Capacity, and generator lead line transmission technology

b. Major equipment components to be used, including nacelle, hub, blade, tower, foundation, transmission structures and platforms, electrical equipment and cable)

c. Manufacturer of each of the equipment components as well as the location of where each component will be manufactured

d. Status of acquisition of the equipment components

e. Status of any contracts for the equipment Proposer has or Proposer's plan for securing equipment and the status of any pertinent commercial arrangements

f. Equipment vendors selected/considered

g. Track record of equipment operations

h. Design considerations (technology selection, layout) for climate adaptation and resiliency such as sea level rise, potential impacts from increased frequency and severity of storms (i.e. superstorms, hurricanes), seismic activity, etc.

i. In the event the equipment manufacturer has not yet been selected, identify in the equipment procurement strategy the factors under consideration for selecting the preferred equipment as well as the anticipated timing associated with the selection of the equipment manufacturer, including the timing for binding commercial agreement(s).

9.1.1 Overview of Major Project Components and Technologies

Wind Turbine Generators

The wind turbines used in an offshore wind project can have a critical impact on project cost, performance, and reliability, including the project's ability to generate energy during low wind periods, the capacity factor of the project, and the frequency and cost of preventative and unplanned maintenance required. Foundations

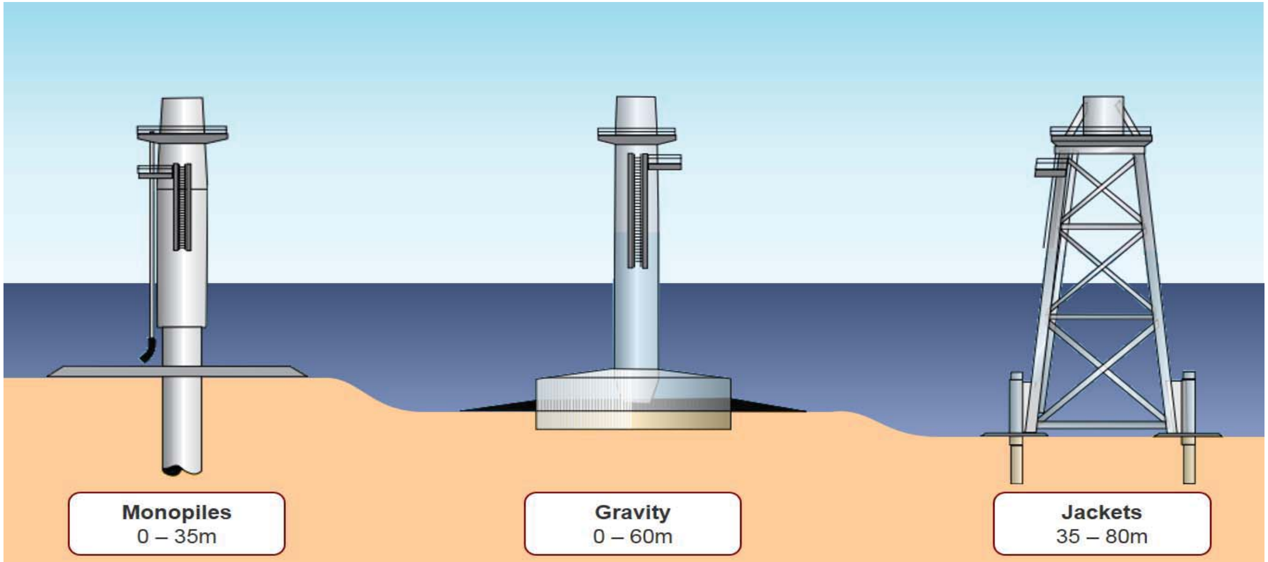
For the WTG foundations, Equinor Wind has conducted extensive studies and analysis of the costs, benefits, and feasibility of three potential foundations: gravity-based structures, monopiles, and jackets. Figure 29 shows each of these structures and the range of suitable water depths for each technology. [redacted]

Figure 29: Suitable Water Depths for Each Type of Foundation Technology



As part of these efforts, over the course of 2017 and 2018, Equinor Wind conducted a desktop study of soil conditions, gathered information regarding the Empire Wind Project site during a geophysical/geotechnical campaign, and has had discussions with numerous suppliers regarding potential foundations. [redacted] Details of both types of foundations can be found below.

9.1.2 Procurement Strategy

Since being granted rights to develop the lease area, Equinor Wind has been diligently evaluating potential design and supply options. Equinor Wind has issued requests for information to potential suppliers and has had extensive discussions regarding potential wind turbine technologies, foundations, and other major project components in order to obtain information regarding the costs, viability, and delivery timing of different technologies. Equinor Wind is committed to ensuring that the development of the Empire Wind Project fosters the growth and development of a robust offshore wind supply chain within New York that makes New York a hub of the offshore wind industry and allows the state to efficiently and cost-effectively meet its renewable energy goals. As described further in the Economic Benefits Plan provided in Section 16, Equinor Wind's proposed construction of the Empire Wind Project has been tailored to maximize the economic benefits to New York to the extent practicable while promoting the efficient and cost-effective development of the Empire Wind Project.

Equinor Wind is continuing discussions with suppliers and no equipment components have been acquired yet. Nevertheless, Equinor Wind has a well-defined procurement strategy that will both ensure that Equinor Wind is able to procure necessary components and equipment on a timeline that allows it to meet its target commercial operation date while ensuring that all project components meet Equinor Wind's rigorous quality standards and cost objectives. An overview of Equinor Wind's approach to equipment solicitation and supply chain management is provided below.

At this phase, the project is defining sourcing strategies based on scope of work and technical specifications for the different work packages and information provided by main potential suppliers through requests for information and studies. The project is in the process of pre-qualifying potential suppliers.

Equipment Solicitation and Supply Chain Management

Equipment solicitation and supply chain management are integrated into the planning, execution and operation of the Empire Wind Project. Procurement activities and the development of an overall procurement strategy start at an early stage of the project. This strategy incorporates lessons from previous offshore wind projects and is based on the Empire Wind Project's specific conditions and requirements, as well as market analysis and screening.

Equinor Wind's procurement process consists of the following main steps:

- Development of procurement strategy
- Development of a bidders list
- Contract Drafting
- Sourcing
- Contract award
- Contract management

Development of Procurement Strategy

The first step in the procurement process is to establish a defined procurement strategy in cooperation with the technical group within Equinor that will be installing and managing the procured product or equipment. This process also includes a risk assessment for the specific contract package to ensure that any potential issues are known and addressed early on.

[redacted]

[redacted]

Development of a Bidders List

Once a strategy is established, Equinor develops a bidder list. This process begins with identifying qualified suppliers. Each supplier must meet minimum requirements with regards to safety, quality, and integrity, which is confirmed through a due diligence process. Additionally, potential suppliers must sign a supplier declaration, agreeing to minimum standards for ethics, anti-corruption, security, health and safety, and respect for human rights. Furthermore, suppliers agree to promote these standards among sub-suppliers. A copy of a supplier declaration is provided as Attachment 22.

In addition, to these business requirements, suppliers must meet the project's technical requirements. Equinor uses a supplier qualification system, such as ISNetworld or Avetta, to vet and compare potential suppliers. In many cases, more potential suppliers will pass the minimum requirements than those that are selected to be added to a bidders list. Therefore, Equinor uses a prequalification process to shortlist suppliers and ensure that only qualified and capable suppliers are invited to tender a contract. This prequalification process is specifically tailored for each procurement and typically involves follow-up questions to potential suppliers, site visits, and/or audits, depending on the needs of the project.

Contract Drafting

The sourcing process starts with defining the scope of work and delivery in detail. Once settled, the contract documents are drafted, including terms and conditions, compensation format, proposed delivery milestones, payment schedules, technical requirements, and administrative requirements. This is completed by Equinor's procurement group in cooperation with other departments responsible for the project at issue. Equinor's procurement group will tailor each contract to reflect the size, scope, and complexity of a project.

[redacted]

Sourcing

Based on the results of the qualification process described above and in accordance with general requirements, Equinor will invite qualified suppliers to bid to supply the equipment or perform the work at issue. In order to guide the bid process, Equinor will develop detailed instructions that will define the information to be included in the bid, provide guidance regarding how to submit the bid, detail Equinor's evaluation criteria, and include the draft contract developed by Equinor. After a predefined period, Equinor receives the bids and starts the contract evaluation and negotiation phase.

Objective and non-discriminatory evaluation criteria are defined for the specific procurement and agreed to prior to the bid opening to ensure a fair and fact-based selection process. The evaluation is performed by a cross functional team and will cover the Health, Safety, and Environmental ("HSE"), technical, commercial, and schedule aspects of the bids. The evaluation process will continue until Equinor has identified which supplier best suits its business needs and the Empire Wind Project's specific requirements.

[redacted]

Contract Award

The Chief Procurement Officer ("CPO") holds the authority to legally commit Equinor to suppliers. All legal commitments are handled through the CPO in order to safeguard the principle of segregation of duties and ensure the appropriate involvement of both the requisitioning line and the procurement function.

As soon as the contract has been signed by both parties, unsuccessful bidders are informed in writing. Debrief meetings are proposed to assist them in improving future bids.

Figure 40 below depicts the expected contract structure for the Empire Wind Project and the expected contract award schedule. Equinor Wind reserves the right to combine or split contracts to improve project execution, mitigate risks, or reduce costs.

Figure 40: Expected Contract Structure

[redacted]

Contract Management

After the contract has been signed, a kick-off meeting with the supplier is held to ensure that the contract requirements and Equinor's expectations are well understood, and to agree on communication lines and routines during the contract period.

[redacted]

9.1.3 Manufacturer Location

Figure 41 provides an overview of the potential Tier 1 Suppliers for the main procurement packages and potential location for the manufacture of the main components and equipment. Tier 1 Suppliers are those parties that Equinor will directly contract with. Tier 2 supplier are those that may be subcontracted by Tier 1 Suppliers. Because Equinor Wind is still in the process of identifying potential Tier 1 Suppliers, the final location of the manufacturer will be finalized based on the outcome of Equinor's procurement process. As a result, the list below should not be considered final and is subject to change as Equinor Wind moves forward with development of the project.[19]

[redacted]

Figure 41: Potential Manufacturers and Locations

[redacted]

9.1.4 Design Considerations

As with any offshore installation, offshore wind projects are subject to numerous risks that have the potential to cause physical damage to the facility or otherwise disrupt operations, including extreme weather events and maritime collisions. For that reason, Equinor incorporates these risks into every aspect of project development, including project design, construction, and O&M. Figure 42 provides an overview of physical risks and mitigation measures relevant to the Empire Wind Project.

Figure 42: Overview of Physical Risks and Mitigation Measures

Risk	Potential Impact	Mitigation
Hurricanes	[redacted]	[redacted]
Lightning	[redacted]	[redacted]

		[redacted]	[redacted]
Fog	[redacted]	[redacted]	[redacted]
Rogue Waves	[redacted]	[redacted]	[redacted]

	[redacted]	[redacted]
Exposed Cabling	[redacted]	[redacted]
Climate Change	[redacted]	[redacted]

9.2 Lighting Controls Plan

Describe the lighting controls that will be utilized on the Offshore Wind Generation Facility and explain how these controls comply with the minimum contract standards and the Offshore Wind Order.

Equinor Wind is committed to minimizing the impact of the Empire Wind Project on the view from the New York coastline. As described further in Section 15 below, Equinor Wind has conducted a detailed study and simulation of the viewshed impact of the Empire Wind Project under a full range of conditions and at various times of day. This analysis demonstrates that the construction of the Empire Wind Project will not have an adverse effect on viewshed resources.

To further minimize the potential impact of the Empire Wind Project, Equinor Wind expects to install an Aircraft Detection Lighting System ("ADLS") at the Empire Wind Project. This system uses radar technology to monitor the airspace over and around the wind farm and ensures that lights will only be activated when an aircraft is in the vicinity of the wind farm. The system's detection coverage satisfies the FAA Obstruction Marking and Lighting Advisory Circular, which sets forth the requirements for lighting obstructions that may be a safety risk to air navigation. In accordance with this requirement, lighting shall be activated and illuminated prior to an aircraft penetrating the perimeter of a group of structures (*e.g.*, WTGs), which is a minimum of 3 nm horizontally and 1000 ft vertically. The system has previously been assessed by FAA Air Traffic Requirements personnel at an onshore wind resource area in US. The system was found to perform in accordance with the manufacturer's specifications and met the performance requirements identified in Advisory Circular 70/7460L.

Based on discussions with the wind turbine supplier, it is anticipated that this type of lighting system can be employed for the Empire Wind Project. If, during later stages of design, it is deemed infeasible, or a better technology becomes available, Equinor Wind will evaluate such technology for use in consultation with NYSERDA.

The installation of ADLS will minimize the potential impact of the Empire Wind Project on bird and bat species, as well as limit the impact on viewshed resources. Importantly, detailed assessments of the impact of lighting on birds, bats, and viewshed resources will be carried out as part of BOEM's NEPA process in the COP. Collectively, the measures set out herein and regulatory review process will ensure that the Empire Wind Project complies with minimum contract standards and applicable state and federal requirements.

10 PROJECT SCHEDULE

A Proposer must demonstrate that its Project can be developed, financed, and constructed within a commercially reasonable timeframe. Proposer is required to provide sufficient information and documentation showing that Proposer's resources, process, and schedule are adequate for the acquisition of all rights, permits, and approvals for the financing of the Project consistent with the proposed milestone dates that support the proposed Commercial Operation Date.

Proposers are required to provide a complete critical path schedule for the Project from the notice of award to the start of commercial operations. For each Project element listed below, provide the start and end dates:

1. Identify the elements on the critical path. The schedule should include, at a minimum, preliminary engineering, financing, acquisition of real property rights, Federal, state and/or local permits, licenses, environmental assessments and/or environmental impact statements (including anticipated permit submittal and approval dates), completion of interconnection studies and approvals culminating in the execution of the Interconnection Service Agreement, financial close, engineer/procure/construct contracts, start of construction, construction schedule, and any other requirements that could influence the Project schedule.

10.1 Critical Path Schedule

Equinor Wind has developed a detailed and standardized approach to planning and executing offshore wind projects, which has been used to successfully complete large and complex offshore projects in Europe. This approach is tailored to provide a basis for well-informed decision-making, ensure effective use of time and resources, and provide certainty for our stakeholders and partners.

The Empire Wind Project Master Schedule ("PMS") integrates the major tasks associated with the development of the project. This schedule was developed with input from manufacturers and the supply chain, as well as Equinor's past experience, to ensure that it is realistic and achievable given current conditions and main assumptions. [redacted]. As more data is gathered and concepts are further developed, the schedule will continue to be refined to accommodate this additional information. A copy of the PMS is provided as Attachment 23.

The PMS is based on a Main Activity Logic Chart, which depicts the sequence of activities from the design of the project through commissioning. A copy of the Main Activity Logic Chart is provided as Attachment 24.

The project plan is broken down into several defined work packages, some of which will be executed concurrently. A detailed timeline and discussion of each work package can be found below.

A description of Equinor Wind's plan respecting the financing of the Empire Wind Project is provided in Section 6.3. [redacted]

10.1.1 Permitting and Site Survey

As further detailed in Section 8, Equinor Wind will be required to obtain a range of local, state, and federal permits in order to construct the Empire Wind Project. Permitting is an integrated part of the project schedule and includes studies, assessments, and surveys for the COP and local permitting. Section 8 provides a detailed overview of the permits that will be required for the development of the Empire Wind Project and Equinor Wind's progress to date in obtaining the requisite approvals.

Prior to the development of the Empire Wind Project, Equinor Wind is conducting a range of surveys and assessments to further refine its understanding of the lease area and ensure that the Empire Wind Project is developed in a manner that minimizes disruption to the natural environment. [redacted] The information from these surveys will be used to further refine the design of the onshore and offshore components of the Empire Wind Project.

Attachment 25 provides a detailed permit schedule.

Information concerning Equinor Wind's plan for interconnection of the Empire Wind Project and associated land acquisition requirements is provided in Section 7 of this application.

10.1.2 Construction Schedule

Equinor Wind has developed a detailed schedule for the engineering, procurement, fabrication, and installation of major components of the Empire Wind Project. This schedule has been developed through extensive dialogue with prospective suppliers as well as Equinor's experience developing offshore wind facilities of similar size and scope. A high-level overview of the construction schedule is provided as Attachment 26. The following sections provide a more granular breakdown of the timing of the engineering, procurement, fabrication, and installation of individual components of the Empire Wind Project.

Wind Turbine Generators

[redacted]

Attachment 27 provides a detailed wind turbine generator schedule.

Foundations

[redacted]

[redacted]

Attachment 28 provides a detailed foundations schedule.

Cables

[redacted]

Attachment 29 provides a detailed cables schedule.

Electrical System

Equinor Wind has commissioned several studies covering the necessary equipment and layout of the offshore and onshore substations. [redacted] The equipment chosen for the onshore and offshore substations will provide the basis for the layouts, procurement, fabrication, and pre-commissioning of the onshore and offshore substations.

[redacted]

Based on discussions with NYISO, Equinor Wind currently anticipates that any network upgrades necessary to accommodate the interconnection of the Empire Wind Project will be completed [redacted] Civil and construction work at the onshore substation will continue after energization.

[redacted]

Attachment 30 provides a detailed electrical system schedule.

Marine Operations

Separate from the surveys discussed above, Equinor Wind will be conducting extensive marine operations to prepare the site and install equipment. [redacted]

The marine construction schedule will be further optimized to allow for simultaneous work on different aspects of the project.

Attachment 31 provides a detailed marine operations schedule.

Decommissioning

Equinor Wind is committed to responsibly developing Empire Wind, including the eventual decommissioning of the project in compliance with applicable regulations and the stipulations in

Equinor Wind's lease. Given the current stage of development, a decommissioning timeline has not been established. Prior to the end of the project lifetime, Equinor Wind will conduct an assessment of the project site employing best practices and analytical methods to determine the feasibility and potential risks associated with decommissioning of the Empire Wind Project. The results of this analysis will then be reflected in a decommissioning application, which will be submitted to BOEM for review and approval prior to the commencement of decommissioning activities. [redacted]

10.2 Offshore Construction Windows

Describe the anticipated permissible offshore construction windows, and how the construction milestones will be accommodated within these windows.

Installation windows have been established based on the metocean characteristics of the lease area in order to maximize efficiency in the project marine operations. These windows take into account the expected weather conditions and were calculated by installation contractors using their own software and verified by Equinor using its internally developed marine operations simulation software, MARSIM.

Equinor has vast experience conducting complex marine installation activities as a result of its oil, gas, and offshore wind projects. This experience has been reflected in designing a realistic installation schedule for the Empire Wind Project that takes into account the full range of factors that have the potential to impact marine operations, including environmental restrictions and regulations and expected weather conditions.

Marine Installation activities can occur year round, but the preferred windows for each task are provided below. [redacted]

Given its vast experience conducting complex marine operations, Equinor has developed a variety of procedures to ensure that project components are ready during a given installation window. These procedures include ensuring timely delivery of components, inspection for compliance with specifications, and coordinating vessel activities to allow for efficient use of resources.

11 CONSTRUCTION AND LOGISTICS

This section of the Proposal addresses necessary arrangements and processes for outfitting, assembly, storage, and deployment of major Project components such as turbine nacelles, blades, towers, foundations, and transmission support structures.

11.1 Major Tasks and Necessary Equipment

List the major tasks or steps associated with deployment of the proposed Project and the necessary specialized equipment (e.g., vessels, cranes).

The construction and deployment plan for the Empire Wind Project is based on insights gained over the course of Equinor's decades of experience constructing and deploying large scale offshore energy projects, including its existing offshore wind fleet. This construction and deployment plan has been calibrated to ensure timely completion of the Empire Wind Project given the characteristics of the lease area, permitting and regulatory requirements, the availability of necessary equipment and vessels, and offshore installation windows.

Figure 43 below provides an overview of the major tasks associated with deployment of the Empire Wind Project and the equipment necessary for each task.

Figure 43: Major Tasks and Equipment

[redacted]

[redacted]

11.2 Staging and Deployment

Describe the proposed approach for staging and deployment of major Project components to the Project site. Include a description and discussion of the laydown facility/facilities to be used for construction, assembly, staging, storage, and deployment.

Equinor has extensive experience coordinating port and maritime activities and employs industry best practices to seamlessly coordinate port and maritime operations to ensure the timely and cost-effective construction of offshore projects while minimizing disruption to maritime and fisheries resources.

The construction plan for the Empire Wind Project incorporates Equinor's insights and best practices gained over forty years of developing offshore projects. Equinor utilizes industry leading best practices in planning and executing offshore energy projects in accordance with the most rigorous health and safety standards. These best practices include stringent contractor evaluation and quality control measures, detailed planning aligned with industry and regulatory rules, and proprietary software built specifically for Equinor's needs and processes. Furthermore, Equinor utilizes KPIs to evaluate a project's development and provide insights for future improvements of these systems. Based on this experience, construction activities will be primarily divided into onshore and offshore components.

[redacted] The process of manufacturing, shipping, assembly, and in-field installation of major project components is discussed below and prospective supplier letters of support are provided in Attachment 32. Detailed information regarding the project schedule is provided in Section 10.

11.2.1 WTGs

The staging and deployment of the WTGs will consist of the following distinct tasks:

- Fabrication
- Transportation to staging port
- Transportation to site from the staging port and installation at the project site
- Commissioning

Fabrication

[redacted]

[redacted]

Transportation to Staging Port

[redacted] Additionally, the port facility will need to comply with International Ship and Port Security standards.

Since obtaining rights to the lease area, Equinor Wind has been collaborating with local ports and [redacted] Equinor Wind is working with local authorities and organizations to identify potential port facilities that can successfully service the project. A number of feasible candidate ports have been identified and discussions are ongoing with the port authorities and state agencies in the hopes of broadening the development options. Further details regarding potential ports are provided in Section 11.3 below.

Regardless of the port that is selected, [redacted] Each vessel will be equipped with specialized cranes and other equipment to facilitate the loading and unloading of equipment. An example of the types of vessels that typically are used for component transportation can be found in Figure 44 below.

[redacted]

[redacted]

[redacted], the WTG components will be unloaded from the transportation vessels. After off-loading, preservation measures will be in place at the staging port to maintain the WTG components until they are ready for load-out. Prior to load-out onto the transportation vessel for installation, Equinor Wind will conduct a "walk down" procedure to ensure the integrity of the components and compliance with specifications. Additionally, some initial component assembly and commissioning activities will occur at the quayside, in accordance with turbine manufacturer standard procedures, to reduce the commissioning time offshore.

Transportation to Site and Installation

Once pre-installation preparation and testing are complete, the wind turbines will be loaded on a transport vessel spread for transportation to the project site. [redacted] The transportation and installation process will continue year-round until construction of the project is complete. As a general matter, Equinor expects there to be some delays in the winter months due to adverse weather, but the current project schedule has been tailored to account for these delays. Equinor Wind will engage a qualified transportation and installation contractor for transportation and installation of the wind turbines components. The main contractor will be responsible for selecting the methodology that will be used to safely transport the components from the staging port to the lease area in compliance with the Jones Act. The foreign flagged MIV with appropriate crane capacity will be located offshore. [redacted]

[redacted]

[redacted]

Commissioning

Following installation, the WTGs will be prepared for operation and energization. [redacted]

[redacted]

[redacted]

11.2.3 Export Cables

Staging and deployment of the offshore export cables will consist of the following steps:

- Fabrication and transportation
- Surveys and pre-grapnel run
- Laying and burial
- Connection to offshore substation

Because the project Electrical System Design utilizes two export cables laid in parallel orientation between the Offshore Substation and the chosen landfall Interconnection Point ("ICP") for operational redundancy, the process described below will be performed twice with minor modifications to the survey and pre-grapnel run actions as noted below.

Fabrication and Transportation

Based on discussions with prospective suppliers and initial procurement efforts to date, Equinor Wind currently anticipates that the export cables will be [redacted]. Once fabricated, the cables will be loaded directly onto the CLV by the manufacturer and transported from the manufacturing facilities to the project site onboard the vessel. Figure 54 depicts a CLV in operation.

[redacted]

[redacted]

Surveys and Grapnel Run

Prior to any installation, a survey will be conducted to evaluate the seabed geology, assess the water depth, and identify any objects or conditions that would impact cable installation. Once the survey is complete, a grapnel run will be performed which involves pulling a grapnel train over the planned cable route to clear debris and ensure the seabed is ready for cable installation. Figure 13 above depicts the current export cable study area and alternative routes.

Laying and Burial

Once transported to the project site, the CLV will install the cable starting at the onshore landfall point and moving along the pre-determined cable route to the offshore substation. A simultaneous lay and burial or open trench method will be used in nearshore and offshore based on the results of the geotechnical survey campaign which commenced in 2018 and is expected to be completed in 2020. Burial depth will be determined by these studies, in consultation with regulatory authorities and existing cable operators (when crossing) [redacted]

[redacted]

Connection to Offshore Substation

Export and inter-array cable connection to the offshore substation will be executed in accordance with industry best practices. [redacted]

11.2.4 Offshore Substation

The staging and deployment of the offshore substation will consist of the following steps:

- Fabrication
- Transportation to project site
- Installation

Fabrication

[redacted] Topside fabrication will require a contractor experienced in complex interface management environments, fabrication facilities, and continuous material flow operations. Major equipment is expected to be delivered to the fabrication site from their respective manufacturing locations. Therefore, communication between the equipment manufacturer and site fabricator will need to be established in advance to ensure proper handling and installation of the equipment.

Transportation

Offshore substation transportation and installation tasks will be executed in accordance with industry best practices and compliance with the Jones Act regulations. [redacted] In the tug and barge arrangement, cargo will be loaded and secured on a barge and the barge will be towed offshore using tow tugs. Figure 55 depicts a typical tug and barge arrangement.

[redacted]

Installation

The transport marine spread with the offshore substation topside on deck will meet the Heavy Lift Vessel ("HLV") at the installation site. Prior to topside installation, the foundation of the topside interface will be prepared for installation. Once complete, the HLV will lift the topside and install onto the preinstalled foundation. Upon landing the topside onto the foundation, the steel interface between topside and foundation will be welded together. Figure 56 below depicts the Dudgeon jacket foundation on a barge and HLV installation of the offshore substation.

[redacted]

Upon completion of topside installation, offshore substation commissioning will commence. [redacted]

11.2.5 Inter-Array Cable

WTGs will be interconnected to the offshore substation through an inter-array network. The selected EPCI contractor will begin cable installation shortly after the first foundation is completed. [redacted]

[redacted]

11.2.6 Onshore Landfall and Cable Routing

Onshore landfall and cable routing will consist of the following steps

- Surveys and ground investigations
- Cable landfall
- Onshore export cable installation

Surveys and Ground Investigations

Environmental surveys and ground investigations will be performed prior to starting any construction activities at the landfall location and along the cable corridor from the landfall to the substation site. This information will inform the design and permitting of the project as appropriate.

Cable Landfall

Equinor Wind plans to use the HDD technique in order to minimize surface disturbance and environmental impacts. The HDD operation will involve vessels and divers to assist in the process. [redacted]

Equinor Wind plans to drill one borehole per cable circuit from shore to a water depth on the seabed suitable for the cable installation activities. [redacted] Figure 57 below depicts potential landfall location and cable routes.

Figure 57: Potential Cable Landfall Locations and Onshore Cable Study Area

[redacted]

Onshore Export Cable Installation

The onshore cable route will involve construction activities predominantly in the road lane and shoulder. Any necessary road closures will be done in collaboration with local authorities. [redacted] Once trenching on a section is complete, duct banks and cable surround will be installed, followed by the construction of joint bays between each section. The cable section will be installed in the ducts using a winch and connected at each joint bay. As each section is completed, it will be backfilled using sand, cement, and existing material along with protective cable covers laid above the duct bank. Once installed, the cables will be tested prior to being connected with the onshore substation and submarine export cables.

11.2.7 Onshore Substation

Construction of the new onshore substation will consist of the following main steps:

- Surveys and ground investigations
- Construction activities
- Electrical equipment installation
- Commissioning and energization

Surveys and ground investigations

Environmental surveys and ground investigations will be performed prior to any construction activities at the onshore substation site. These investigations will include activities such as boreholes, cone penetration test, groundwater control, and environmental surveys (*e.g.*, wetland delineations, tree surveys, as applicable). This process will produce full geotechnical and environmental reports for the site.

Construction Activities

The new substation that Equinor Wind plans to construct will likely require site preparation, including vegetation removal, a new access road, and site leveling. The onshore substation is expected to include the following:

- Substation building (electrical equipment HVAC room, battery room, control room, office)
- Outdoor equipment areas
- Permanent lighting, designed to minimize glare, and light spillage off-site
- Area for car parking and internal roads
- Security fencing and gates

Based on the ground investigation described above, piles will be driven to support the foundations to be installed on the site. Then, contractors will begin with the underground installations including drainage, sewer, and cable corridors followed by the foundations for the equipment and buildings. Once complete, construction will begin on the substation building for personnel and equipment. Finally, the site fencing, internal roads, and landscaping will be completed.

Electrical Equipment Installation

Once the substation site is ready, the main electrical high voltage ("HV") equipment will be installed on site.

The electrical HV equipment typically includes:
- Transformers
- Reactors
- Harmonic filters
- Switchgears

Due to the size and complexity of some of the equipment, specialized transport and installation personnel will be utilized. Utility systems, instruments, and automation systems will also be installed at this time followed by their associated instrument panels, batteries, and control equipment. The cables connecting the equipment will be installed through the preinstalled ducts and cable pull-through. The onshore export cable will be connected to the switchgear/high voltage breaker after high voltage testing is complete.

Commissioning and Energization

Prior to energizing the onshore substation all utility systems, instruments, and automation systems must be fully tested and commissioned. [redacted]

The offshore substation will be energized via the export cables, one at a time, from the onshore substation. [redacted]

11.2.8 Grid Interconnection and network upgrades

As explained in detail in Section 7, [redacted] Equinor Wind anticipates that any network upgrades necessary to accommodate the interconnection of the Empire Wind Project will be completed [redacted]

11.3 Marine Terminals and Waterfront Facilities

Identify the marine terminals and other waterfront facilities that will be used to stage, assemble, and deploy the Project for each stage of construction.
a. If available, evidence that Proposer or the equipment/service provider have right(s) to use a marine terminal and/or waterfront facility for construction of the Project (e.g., by virtue of ownership or land development rights obtained from the owner).
b. If not available, describe the status of acquisition of real property rights for necessary marine terminal and/or waterfront facilities, any options in place for the exercise of these rights and describe the plan for securing the necessary real property rights, including the proposed timeline. Include these plans and the timeline in the overall Project schedule in Section 6.4.10.
c. Identify any joint use of existing or proposed real property rights for marine terminal or waterfront facilities.

Equinor Wind has been investigating collaboration with local ports since executing its lease with BOEM. Since that time, Equinor Wind has commissioned several studies to investigate the feasibility of various ports located in New York, New Jersey, and other states along the eastern seaboard for wind turbine staging and [redacted]

[redacted]

[redacted]

[redacted] [redacted]

[redacted]

[redacted]

[redacted]

[redacted]

[redacted]

[redacted]

[redacted]

[redacted]

[redacted]

11.4 Number Type and Size of Vessels

Indicate the number, type and size of vessels that will be used, their respective uses, and how vessels will be secured for the required construction period. Explain how Proposer's deployment strategy will conform to requirements of the Merchant Marine Act of 1920 (the Jones Act).

Due to the nascent development of offshore wind farm projects in the U.S., there are a limited number of Jones Act-compliant vessels that are also feasible for offshore wind construction. Therefore, in order to develop the project safely and in a cost efficient manner, some foreign vessels will need to be used.

Equinor Wind and vessel operators will execute contractual agreements to address project marine construction activities. The marine coordination center established by Equinor Wind will track all vessels engaged in marine operations and maintain proper communications throughout the campaign in accordance with local and federal regulations.

[redacted]

Figure 60: Vessel Information

[redacted]

11.5 Responsibility Assignment

List the party or parties responsible for each deployment activity and describe the role of each party. Describe the status of Proposer's contractual agreements with third-party equipment/service providers.

An overview of the division of roles and responsibilities respecting staging and deployment activities is provided in Section 11.2. As noted in Section 9.1.2, Equinor Wind remains in discussion with potential contractors that would support staging and deployment activities and has not yet finalized contractual arrangements respecting these activities.

12 FISHERIES MITIGATION PLAN

Proposers must include in their Proposal a Fisheries Mitigation Plan in as much detail as possible that describes how Proposer will mitigate adverse impacts on the commercial fishing industry that may be caused by the Project. Elements of the Fisheries Mitigation Plan are described in detail in Appendix D. Proposers are advised to review the Fish and Fisheries Study prepared for the New York State Offshore Wind Master Plan with respect to the potential impacts of offshore wind energy development on the fishing industry, and also are advised to include in their mitigation plan the appropriate Best Management Practices described in the Master Plan and supporting studies.

Equinor Wind's Fisheries Mitigation Plan is provided under separate cover.

13 ENVIRONMENTAL MITIGATION PLAN

Proposers must include in their Proposals a detailed Environmental Mitigation Plan that describes how Proposer will mitigate adverse environmental impacts that may be caused by the Project. Elements of the Environmental Mitigation Plan are described in detail in Appendix E. Proposers are advised to review the environmental studies prepared for the New York State Offshore Wind Master Plan with respect to the potential impacts of offshore wind energy development on the environment, and also are advised to include in their mitigation plan the appropriate Best Management Practices described in the Master Plan and supporting studies.

Equinor Wind's Environmental Mitigation Plan is provided under separate cover.

14 COMMUNITY OUTREACH PLAN

Provide a community outreach plan that identifies proposed stakeholder engagement activities during construction and operation of the Project. Provide copies of any agreements with communities and other constituencies impacted by the Project, not already covered in the Fisheries Mitigation Plan or the Environmental Mitigation Plan. Discuss the status of implementing the community outreach plan. Provide documentation identifying the level of public support for the Project including letters from public officials, newspaper articles, etc. Include information on specific localized support and/or opposition to the Project of which Proposer is aware.

Equinor Wind believes that engagement with stakeholders is a critical component of successful project development. For that reason, Equinor Wind has been actively engaged with coastal communities, elected officials, relevant state agencies and the public since acquiring the rights to pursue development of an offshore wind project off the coast of New York. These efforts have been designed to ensure that these key groups are kept informed about the development of the project and to solicit feedback regarding their views and concerns. Equinor Wind has actively worked to take into account stakeholder views in the design of the Empire Wind Project, including tailoring the layout of the facility to respect certain uses of the existing lease area.

If the Empire Wind Project is selected through this RFP, Equinor Wind will continue to engage in efforts to ensure that stakeholders are informed of project developments and address issues of concern that may arise in the future. Equinor Wind believes that the Empire Wind Project currently enjoys significant stakeholder support, yet recognizes that project development is dynamic and that it will be critical to continue to work to strengthen Equinor Wind's relationship with potentially affected communities and other stakeholder groups as the project moves forward.

The company's stakeholder engagement is driven by four foundational principles that guide all of the work of Equinor Wind, Equinor ASA, and their affiliates both in New York and around the globe:

- **Openness:** We promote transparency and embrace diversity and new perspectives.
- **Courageousness:** We use foresight, identify opportunities, and manage risk.
- **Collaboration:** We engage with, respect, and earn the trust of our business partners and of society.
- **Caring:** We seek zero harm to people, acting in a sustainable, ethical, and socially responsible manner.

In accordance with these principles, Equinor Wind is firmly committed to developing the Empire Wind Project in a manner that takes into account the interests of New York stakeholders and supports New York's economic and environmental goals. Consistent with this commitment, Equinor Wind has been soliciting the views of a broad array of stakeholders, working to incorporate these ideas into the design, planning, construction and eventual operations of the project wherever possible.

14.1 Methodology

The Empire Wind team employs a systematic approach to stakeholder engagement that allows us to identify and track the full range of potentially affected stakeholders and their views. This approach allows Equinor to ensure that all stakeholder views are considered and addressed appropriately.

Equinor engages stakeholders in a manner that respects the level of impact the project could have on their lives and their specific areas of interest. In order to guide these efforts, Equinor organizes stakeholder engagement using three primary factors:

1. Areas of Influence
2. Stakeholder Interest Areas
3. Organization Type

14.1.1 Areas of Influence

In order to obtain a geospatial understanding of areas impacted by the project, Equinor Wind has created four zones that help us calibrate the level of engagement by location. These zones reflect the relative proximity of potentially affected stakeholder groups to the lease area. Figure 61 provides map of these zones.

Figure 61: Areas of Influence

[redacted]

Zone 1

- Current users of the offshore wind lease area and their representatives
- Communities adjacent to ports used for support of the Empire Wind Project

Zone 2

- People living within the viewshed of the project, including business owners, and their representatives.
- Conservationists focused on species in the lease area

Zone 3

- Beachgoers or seasonal visitors to the viewshed area
- Communities hosting construction of onshore cable, from landfall to substation, during the construction period
- Conservationists focused generally on ocean health

Zone 4

- All NY ratepayers

14.1.2 Stakeholder Interest Areas

In addition to the areas of influence explained above, each individual stakeholder with whom we engage or plan to engage is linked to its respective area(s) of interest. Some stakeholders have multiple interests in the project; others may have only one central interest. Ten primary interest areas have been delineated, under which multiple sub-interests may apply:

1. Commercial fishing
2. Recreational fishing
3. Viewshed
4. Navigation
5. Supply chain
6. Jobs
7. Environment
8. Cost
9. Climate Change
10. Local on-land construction (from cable landfall to substation)

14.1.3 Organization Type

Equinor Wind also tracks which types of organizations it is interacting with as a means to ensure equitability and responsiveness to a broad range of concerns (recognizing that not all stakeholders belong to an organization). To formulate an effective strategy and process, organizations are sorted into six central categories:

1. Affected Communities
2. Non-Government Organizations
3. Government
4. Commercial Organizations
5. Educational Institutions
6. Labor Unions

14.2 Engagement Activities to Date

Engagement with stakeholders and public officials surrounding development of offshore wind resources off the coast of New York has been ongoing since BOEM began formally considering the potential development of offshore wind resources within lease area OCS-A 0512. As detailed in Section 8 of this application, as part of this process, BOEM conducted extensive outreach to potentially affected state governments, public officials, and other stakeholders to solicit their views regarding the potential development of offshore wind resources in the lease area, including holding a series of technical workshops in both New Jersey and New York. During this same period, the State of New York was creating the Offshore Wind Master Plan, including more than a dozen studies of important elements of building responsibly-sited offshore wind arrays, and conducting extensive stakeholder engagement.

14.2.1 Comprehensive Approach to Outreach

Since signing the offshore wind lease in March 2017, Equinor Wind has worked to identify and engage stakeholders at multiple levels. The company's engagement consists of a variety of different approaches, tailored to reach the broadest possible segment of the stakeholder audience in the most effective and appropriate manner. These outreach efforts include:

- Frequent in-person meetings with highly engaged groups, such as environmental non-governmental organizations, labor unions, educators, biologists, government agencies, and representatives of affected communities.
- Direct outreach in the form of emails, phone calls, and meetings based on individual stakeholder levels of interest and satisfaction, as discussed in the methodology section above.
- Social media activity, including providing updates about the project on Facebook and Twitter.
- A website presence – www.empirewind.com – that provides constantly updated information about Empire Wind, including project characteristics, fisheries and environmental information, Frequently Asked Questions, and more.

- Ongoing discussions with public officials at the state and local levels to help ensure that constituent needs are recognized and addressed as the project evolves.
- Issuances of notices about Equinor Wind's survey activities to local police, fire, and others in potentially affected communities to encourage stakeholder engagement and keep these communities informed of developments and activities in the lease area.

14.2.2 Targeted Stakeholder Engagement

Equinor Wind has engaged in a wide variety of targeted stakeholder activities focused on different aspects of project development. Equinor Wind has met with NY labor unions, NY-based environmental advocacy groups, NY universities and community colleges, local elected leaders, commercial and recreational fisheries representatives, among a host of other groups. These efforts have included:

- Engagement with members of the commercial and recreational fishing communities through meetings held by BOEM, as well as our own outreach initiatives.
    - To date, the Equinor Wind team has had over 200 engagements with fishermen from New York and neighboring fishing communities such as New Jersey and Rhode Island, through our dedicated fisheries liaison.
    - Equinor Wind also has participated at numerous events and trade shows throughout the state for commercial and recreational fishermen, including the NY Sportfishing Federation Forum, in an effort to build relationships and keep these groups informed about the progress of the Empire Wind Project.
    - Equinor Wind also has developed a simulator that allows members of fishing communities to interact with a model of the Empire Wind Project, including navigating around and within the wind farm.
- Meetings with key labor leaders and groups, including the directors of the Building Trades Council for New York and Long Island and leaders of Climate Jobs NY, to solicit their input on developing supply chain, job training, and other important aspects of the project and to keep them informed of the types of employment opportunities that will be created by the Empire Wind Project.
- Close engagement with NYSERDA and other relevant New York State agencies, including the NYSDEC and NYSOPRHP.
- Frequent dialogue and collaboration with leading environmental advocacy groups, including the Natural Resources Defense Council, the National Wildlife Federation, and the Sierra Club, regarding the development of the project.
    - In 2017 and 2018, Equinor Wind held two in-depth environmental roundtables for representatives from local and national environmental organizations. The roundtables were held on Long Island and at the New York Aquarium in Coney Island, New York.

  - Equinor Wind also has solicited the input of these and other environmental organizations on its survey plans and has incorporated their feedback as appropriate.
- Dialogue with marine mammal experts to discuss monitoring efforts with regard to marine mammals in the lease area.
  - Notably, Equinor Wind has entered into a Grant Agreement with the Wildlife Conservation Society ("WCS") to facilitate buoy based real-time monitoring of the spatial and temporal distribution of the four key large whale species, including North Atlantic right whales, within the Lease Area. An additional sponsorship with WCS's New York Aquarium facilitates an educational display of the presence of whales as detected by the real-time buoys.
- Dialogue with southern New York utilities, including Consolidated Edison, PSEG Long Island, National Grid, the New York Power Authority, and the Long Island Power Authority to discuss potential partnerships and ways of collaborating with these utilities to contribute to meeting New York's environmental and reliability objectives.
- Frequent discussions with elected officials and their staff representing interested communities, including representatives of Nassau County and members of the New York Senate and Assembly representing Staten Island, the City of Long Beach, Brooklyn, and other potentially affected communities.
- Equinor Wind is actively collaborating on environmental research and monitoring with the State University of New York ("SUNY") Stony Brook's School of Marine and Atmospheric Sciences ("SoMAS") on Long Island, in an effort to enhance understanding of marine life in the lease area. SoMAS is in the process of completing a BOEM funded study to increase understanding of the Atlantic sturgeon in the New York Bight. Contributing to this, Equinor Wind installed three of SoMAS' Atlantic sturgeon sensors on the metocean moorings installed within the lease area in December 2018 as part of Equinor Wind's site assessment activities.
- Equinor Wind has been providing support and guidance to the SUNY Maritime College as it moves forward to establish the NY Offshore Wind Energy Center in cooperation with SUNY Farmingdale.
- Meetings with representatives of low- and moderate-income communities in proximity to potential port redevelopment sites.
- Engaging with Native American representatives, including leadership from the Shinnecock Indian Nation and the Unkechaugi Indian Nation on Long Island, to inform them of developments within the lease area and survey activities.
- Active participation with leading offshore wind industry associations, forums and events, including the New York Offshore Wind Alliance, the American Wind Energy Association, and the Business Network for Offshore Wind.

Equinor Wind believes that its stakeholder engagement to date has provided an effective means to identify and address potential stakeholder concerns and take these concerns into account in the design and planning of the project to the extent feasible, as well as to build public support for the project.

To demonstrate the level of public support for the Empire Wind Project, Equinor Wind is providing copies of letters of support received from relevant stakeholders as Attachment 39. In addition, copies of news articles about the Empire Wind Project are provided as Attachment 40.

14.3 Future Engagement

Equinor Wind recognizes that the community outreach efforts that have been made thus far are only the beginning, and that it will be critical to continue to engage in dialogue with interested stakeholders throughout project development and operation, to incorporate their feedback into project planning as appropriate. Equinor Wind expects that these efforts will include:

- Organization of open houses and an increasing number of events in potentially affected communities.
    - Close engagement, open houses, and meetings in communities hosting the project's cable landfall, underground cable route, and substation.
    - Public meetings and continued discussions with communities adjacent to ports that support the development, operation, and maintenance of the Empire Wind Project.
    - Continued engagement with representatives of potentially affected communities, from the leadership of Nassau and Suffolk Counties to representatives of coastal villages.
- Continued dialogue with Nassau County officials to examine which jobs and facilities created as a result of the Empire Wind Project could be located within the county.
- Continued discussions with businesses in Suffolk County who are eager to become suppliers to the offshore wind industry, including drone-manufacturer ULC Robotics, whose Suffolk County-built drones were used on the Block Island offshore project.
- Regular newsletter updates—by email, social media and in print—informing communities of the status of the project.
- Continued meetings with labor organizations to identify opportunities to work collaboratively to ensure that the development of the Empire Wind Project and broader offshore wind industry benefits New York workers.
- Continued briefings and collaboration with environmentalists and marine scientists, including daily contact with scientists who monitor whales and other marine life in and around the lease area.
- Close, frequent contact with those potentially affected by construction, including mariners, fishermen, and communities near ports or interconnection cable.

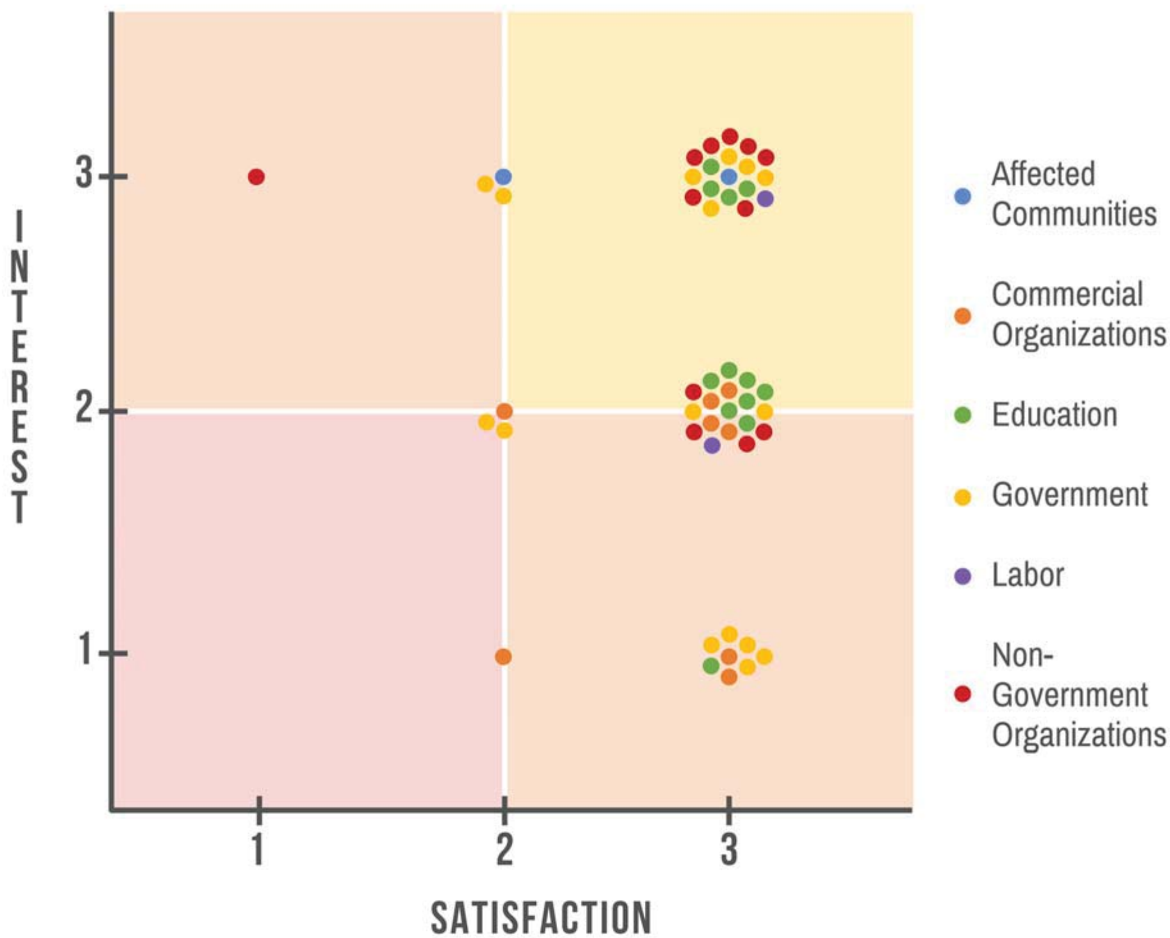
- Continued engagement and collaboration with local universities and colleges to promote awareness of offshore wind and help ensure that New York workers have the necessary foundational skills to capture the benefits of this growing industry.
- Continuing membership and support for civic, business, education, and other groups that enhance our host communities.

14.3.1 Stakeholder Mapping

Using the classification system and zone designations described in the Methodology section above, Equinor Wind maintains a database of current and potential stakeholders, both individuals and groups, for Empire Wind. The purpose of this database is to map Equinor Wind's engagement with stakeholders and ensure that all views are taken into account.

Figure 62 below provides an example of a scatter chart that Equinor Wind uses to track the interest of stakeholders and their level of satisfaction with the project. Stakeholders in the upper right portion are considered high interest and high satisfaction—stakeholders who are highly engaged and supportive, helping Equinor Wind to spread the word about the value of the project. Stakeholders in the upper left portion are highly interested, yet dissatisfied at present with what they know of the project.

Figure 62: Stakeholder Scatter Chart



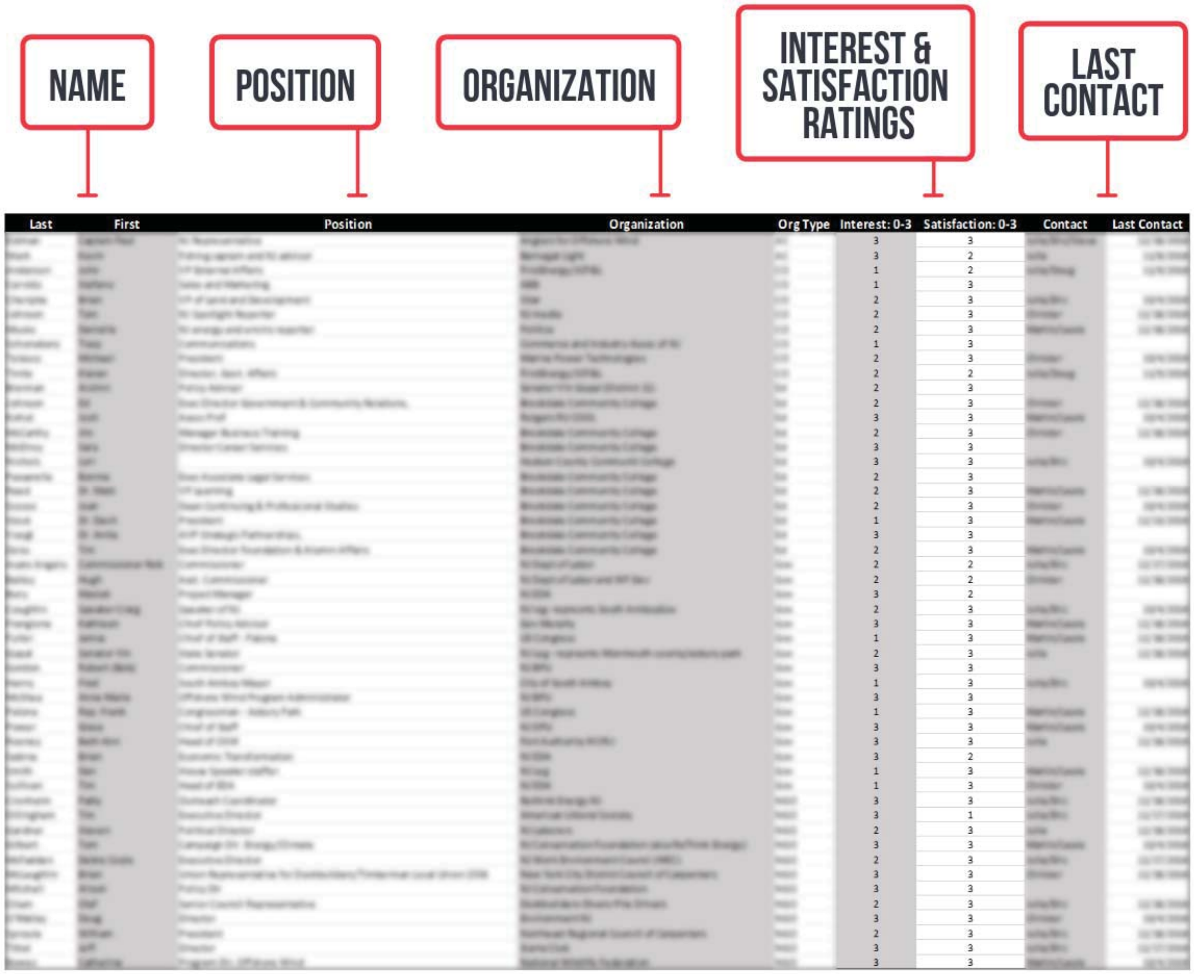
Mapping stakeholder views based on level of interest and satisfaction allows Equinor Wind to identify groups that may require further engagement to ensure that their interests and concerns are taken into account and addressed appropriately.

This approach has a proven track record of effectiveness and has already resulted in design changes to the Empire Wind Project. For example, following dialogue with commercial fishermen, Equinor Wind modified its plan for the turbine layout to ensure that it takes into account the direction that commercial fishermen typically drag their nets.

14.4 Stakeholder Engagement Matrix

Matching stakeholder categorization with rankings and project phases provides another useful tool to implement and manage stakeholder engagement. Figure 63 depicts a sample of the matrix—representing a sample of the outreach activity we have undertaken to date—shows the tracking method we use to help ensure all stakeholders receive the time and attention they require on the subjects they care about most.

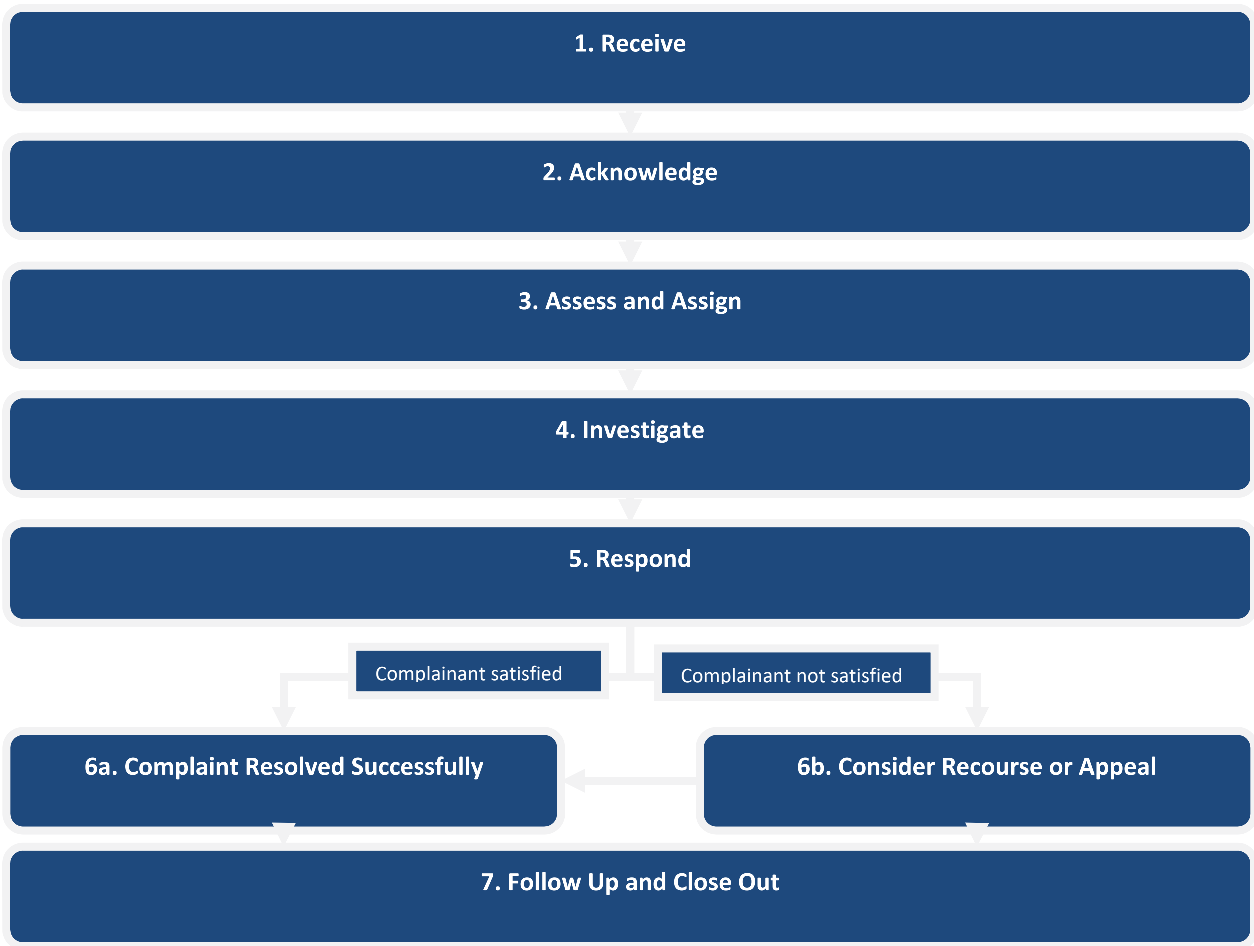
Figure 63: Stakeholder Engagement Matrix



14.5 Grievance Management

As described in our guiding principles, Equinor Wind strives to engage and cooperate with any and all stakeholders to resolve concerns. Nevertheless, we recognize that additional action is sometimes required to bridge different points of view. Accordingly, Equinor Wind has implemented an open and transparent stakeholder grievance process that ensures that grievances are received and responded to in a timely manner, and then tracked so that results can be analyzed. Figure 64 below provides an overview of the stakeholder grievance process.

Figure 64: Community Grievance Management Process



While our goal is always to resolve concerns before they reach the level of a formal grievance, Equinor Wind recognizes the value of establishing a formal process to allow stakeholders to raise concerns.

14.6 Monitoring and Reporting

Equinor Wind generates monthly reports detailing its engagement with stakeholders in order to ensure that the Equinor Wind team is consistently working towards the goal of taking into account stakeholder needs. Our team seeks continuous improvement over the course of every project.

14.7 Resources and Responsibilities

The Empire Wind team is comprised of individuals with the knowledge and experience necessary to carry out a highly complex project with the involvement and support of New York's dynamic stakeholder community.

Julia Bovey is the director of external affairs for Empire Wind. She has worked on stakeholder management, energy policy, and communications in the renewable energy space for 15 years, including for New York State at the Department of Public Service as the first Director of the Long Island Office. In that position, she gained invaluable experience working with Long Islanders to address their concerns about energy and the environment.

In addition, project team members are on the ground engaging stakeholders throughout the state, in keeping with our overall stakeholder strategy and the Engagement Matrix. For instance, Permitting Manager Martin Goff conducts roundtables with environmental scientists and meets with the regulatory agencies on a regular basis to provide project updates and discuss design concepts. As head of ports and foundations, Arturo Rodriguez is on hand for stakeholder meetings with communities near ports, answering questions and presenting information about potential effects on neighborhoods. Laura Morales, head of on-shore permitting, is engaged with leaders of communities that could potentially host the project's interconnection cable from landfall to substation and is also engaged with the regulatory authorities.

Empire Wind also counts on the knowledge and expertise of a team of local consultants on communications and stakeholder engagement.

14.8 Conclusion

Equinor Wind believes that ongoing community engagement is key to the success of the Empire Wind Project. Driven by the values of being Open, Courageous, Collaborative, and Caring, Equinor Wind looks forward to continuing to engage with stakeholders to ensure that the development of the Empire Wind Project listens and responds to stakeholders and aligns with New York's environmental and economic objectives.

15 VISIBILITY AND VIEWSHED IMPACTS

Proposers must address a Project's visibility from shore. If a Project is proposed to include turbines less than 20 statute miles from the nearest shoreline point of any state, Proposers must explain (i) how the Project will minimize adverse impacts related to visibility of turbines, including potential impacts on the local and state economy and historic and visual resources, such as publicly-accessible viewsheds, and (ii) how consideration of economic and environmental concerns contributed to the proposed distance from shore.

Additionally, all Proposals, regardless of distance from the nearest shoreline, must include a visibility study that presents visual simulations of the proposed Offshore Wind Generation Facility. Visibility studies must include a map or maps along with supporting GIS shape files that depict the nearest coastline, the boundary of the proposed site to be developed and any other reasonable reference points (e.g. coastal cities, historic sites, other wind energy areas). Simulations must be single frame, photographic images with superimposed simulations of the proposed wind turbine technology configured to represent a commercially-scaled and technically feasible scenario that is consistent with the proposed Project including operating capacity, wind turbine size, and generic spacing and configuration. Viewing instructions must be included on each simulation.

Visual simulations must represent, at a minimum, clear, partly cloudy, and overcast conditions during early morning, mid-afternoon, and late day, as well as one simulation at night with the turbines lit under clear conditions. Visual simulations must be provided from a minimum of two representative vantage points which represent the closest points to shore from any turbine within the Offshore Wind Generation Facility and, if applicable, any sensitive or historic viewpoints within 20 statute miles of the nearest turbine. The visibility study must also include analysis of the percentage of time during which different visibility conditions are expected to occur based on past meteorological data.

The simulations must be provided in a format suitable to be printed or electronically viewed by the public and/or the Scoring Committee.

Equinor Wind believes that the proposed location of the Empire Wind Project makes the project uniquely positioned to efficiently supply ORECs to support New York's renewable energy goals. As a practical matter, the distance of a project from shore is a critical driver of project costs. With the Empire Wind Project being developed in a portion of the lease area ranging from 14 to 25 miles offshore of Long Island, Equinor Wind believes that the Empire Wind Project will be capable of meeting New York's offshore wind needs more cost effectively than projects that are located farther from shore.

At the same time, Equinor Wind recognizes the importance of ensuring that the development of offshore wind projects does not adversely affect viewshed resources. The majority of New York's coastlines are highly developed and/or are popular tourist destinations. Seasonal tourism associated with beaches and offshore recreational activities (*e.g.*, water sports, sport fishing, whale watching) are important to the local economies. A number of historical resources (*e.g.*, lighthouses, old military bases) and preserved natural areas (*e.g.*, Gateway National Recreation Area, Fire Island National Seashore) are also located along the shoreline.

For that reason, Equinor Wind is tailoring the development of the Empire Wind Project in a manner that minimizes visibility and the potential impact on viewshed resources, including employing the following mitigation measures:

- Sympathetic maritime navigation night lighting systems for offshore and onshore structures where feasible; and
- Smart aviation lighting systems, such as an ADLS, further discussed in Section 9.2.

In addition, Equinor Wind has conducted a visibility study that simulates the visibility of the Empire Wind Project from Key Observation Points ("KOP") along the New York coastline consistent with NYSERDA's requirements in the RFP in order to evaluate the likely visual impact of the Empire Wind Project. As discussed further below, this visibility study demonstrates that the construction of the Empire Wind Project will not have a material impact on viewshed resources along the New York coastline. Even in clear conditions – which account for only 17% of daylight hours – the visibility of the Empire Wind Project will be limited to a small percentage of the viewshed. The Empire Wind Project will be less visible or not visible at all during partly cloudy or overcast conditions – which together account for approximately 66% of daylight hours. During the nighttime, the Empire Wind project will not be visible at all from the New York coastline except when its ADLS is engaged to ensure that the project is visible to approaching aircraft. As a result, the development of the Empire Wind Project is not expected to adversely affect the economies of coastal communities or historic and visual resources.

Equinor Wind notes that the visual impact of the Empire Wind Project will be thoroughly vetted through BOEM's evaluation of the COP. This provides further assurance that the Empire Wind Project will be developed in a manner that does not adversely affect viewshed resources.

15.1 Visual Simulation

15.1.1 Approach

In order to provide a foundation for Equinor Wind's visual assessment of the project, Equinor Wind reviewed and consulted existing visibility studies and resources concerning the lease area, including:

- NYSERDA's Visibility Threshold Study ("NYSERDA VTS") prepared as part of the New York Offshore Wind Master Plan;
- BOEM's Evaluation of Visual Impact on Cultural Resources/Historic Properties: North Atlantic, Mid-Atlantic, South Atlantic, and Florida Straights (2012); and
- BOEM's Renewable Energy Viewshed Analysis and Visualization Simulation for the New York Outer Continental Shelf Call Area: Compendium Report (2015) ("Compendium Report").

In accordance with industry practices, the Equinor Wind Empire Project visual simulation is based on an assessment of potentially impacted or sensitive viewing locations. A preliminary list of 34 sensitive viewpoints within 20 statute miles of the nearest turbine was initially developed based on viewpoints identified in BOEM's Compendium Report and on locations identified as having potential visibility. The list was subsequently refined to three *representative* KOPs for the visual simulations. Figure 65 illustrates the location of all viewpoints identified in the 20-mile buffer, including those selected for the visual simulations for this proposal.

Figure 65: Locations of Sensitive Viewpoints and those Selected for the Purposes of this Proposal

[redacted]

Equinor Wind selected the KOPs for the visibility simulation based on the proximity to the proposed location of the Empire Wind Project and taking into account viewing location types (*e.g.*, shoreline; inland/elevated views; and sensitive historic properties). The KOPs studied include:

- **Jones Beach State Park (Short Beach):** This is a shoreline viewpoint that is located on Short Beach, within Jones Beach State Park on Long Island, which represents the closest point to shore from any turbine in the lease area
- **Merrick Road Town Park:** This elevated viewpoint is from the historic Merrick Road Town Park and Golf Course

- **Jacob Riis Park Promenade:** Although this viewpoint is located just outside the 20-mile buffer, it is a location viewed from the narrowest point (*i.e.,* the apex of the triangle of the lease area)

Figure 66 below identifies each viewpoint and the distance of the nearest turbine location

Figure 66: Location of Simulations and Distance to Nearest Turbine for Empire Wind Project

Name	Location	Distance to Nearest Turbine[2]
Jones Beach State Park (Short Beach)[1]	Wantagh, NY	14.4 miles
Merrick Road Town Park and Golf Course	Merrick, NY	18.7 miles
Jacob Riis Park Promenade[1]	Queens, NY	20.2 miles
[1] Indicates a viewpoint included in BOEM's Compendium Report (2015), which was selected by BOEM in coordination with the National Park Service ("NPS"). [2] The distance is based on the proposed layout of the Empire Wind Project, assuming a 1-nm buffer from the outside boundary of the lease area.		

Once the KOPs were selected, Equinor Wind received approvals from the appropriate agencies and authorities to take representative photographs from each KOP location during an initial site visit. The photographs provided a baseline inventory of existing conditions of the viewshed from each KOP, including any existing visual obtrusions, such as marine vessels, or in the case of nighttime photos, any ambient lighting from the surrounding area. At each KOP, a panorama, or an overlapping series of photographs was captured using a NIKON D90 digital single lens reflex camera ("DSLR") equipped with a 35-millimeter ("mm") lens.[29] Photo documentation also included recording global positioning system ("GPS") coordinates and field notes (*e.g.*, date/time photographs were taken, weather, direction of photograph).

Using photographs taken during the site visit, the simulations were created by combining site photography with accurate, rendered computer models of the proposed facilities to predict what would be seen if the Empire Wind Project were represented in the photographed setting. This methodology also allows the simulations to capture the existing conditions, which includes vessel traffic from shipping lanes located in the area.

More specifically, to create the photo simulations, the location data captured by the GPS device attached to the camera during the site visit was transferred to design software that combines the geographic information system ("GIS") data and a 3D model of the Empire Wind Project. The views from the photographs were matched in the 3D modeling software using virtual cameras with the same focal length and field-of-view as the DSLR camera settings used to capture the photographs. Date- and time-specific lighting was added to the 3D model to depict early morning, mid-afternoon, late day, and nighttime. In order to simulate the various weather conditions, the Daylight Systems parameters in the 3D model were changed so that the amount of particulate

[29] When used with a 1.5x cropped-sensor camera such as the NIKON D90, a 35-mm lens is considered a "52-mm equivalent lens." A 52-mm equivalent lens is considered a "normal lens" that most closely approximates the field of vision of the human eye. In photos taken using the combination of the D90 and a 35-mm lens, the size and scale objects in the background and foreground are depicted realistically and are not distorted.

matter in the air could be adjusted so that the scene is completely clear or overcast. A haze-driven sky model was then used to adjust the visual falloff, or how far you can see in the given weather condition, based on the weather condition being simulated. Once the day, time and weather conditions were added to the 3D model, renderings from the virtual cameras were created. The renderings were then overlaid on the site photography and any necessary modifications to the existing landscape were made to the images.

As shown in Attachment 41, for each of the KOPs, visual simulations have been developed to represent clear, partly cloudy, and overcast conditions during early morning, mid-afternoon, and late day, as well as two simulations at night. One simulation at night is with the ADLS activated, which would only be when aircraft are within a certain distance of the wind farm The second nighttime scenario is when the turbines are not lit, as the ADLS is not activated. In this last scenario, turbines are not visible at all, as any navigational lighting at the base of the turbines would be below the horizon. In accordance with the RFP guidelines, the simulations have been provided in a format suitable to be printed or electronically viewed by the public and/or the Scoring Committee. For proper viewing, all simulations should be printed 11”x17” in full size with no scaling and viewed from an arm’s length away (approximately 24 inches).

As summarized in Figure 67, from areas along the coastline of New York, the perceived scale of the turbines will be relatively small, amounting to fractions of an inch for viewers onshore. The table below provides information regarding distance to the nearest turbine, amount of that turbine visible, and the size of the visible portion of the turbine represented in the simulation for each representative vantage point from which the simulations were created.

Figure 67: Summary of Visibility of Wind Turbines from KOPs

Name	Amount of Nearest Turbine Visible	Percent of Turbine Visible	Size of Visible Portion of Nearest Turbine in Simulation
Jones Beach State Park (Short Beach)	687.5 ft	14.4 miles	0.21 inches
Merrick Road Town Park and Golf Course	592.6 ft	18.7 miles	0.14 inches
Jacob Riis Park Promenade[1]	553.7 ft	20.2 miles/ 32.5 km	0.12 inches

15.1.2 Frequency of Scenario Conditions

As shown in the attached visual simulations,[30] Equinor Wind has evaluated the anticipated frequency of each simulation scenario. Because the Empire Wind Project is located within the Area of Analysis ("AoA") included in NYSERDA's VTS, the NYSERDA VTS was reviewed to identify the typical or average weather conditions and visibility conditions expected to occur within the Empire Wind Project area and the percentage of time during which different visibility conditions were expected to occur. The NYSERDA VTS assessed the visibility of a hypothetical wind farm at various distances (13.2 and 30 miles) from shore under different meteorological conditions within the AoA. The AoA identified in the NYSERDA VTS consisted of the Atlantic shoreline of Long Island and off-shore views roughly perpendicular to that shoreline. Weather data was examined in the study to determine how frequently each combination of visibility (*i.e*., less than 10 miles or greater than 10 miles), background sky conditions (*i.e*., clear, partly cloudy, or overcast), and time of day (morning, midday, afternoon) is likely to occur during a typical year. The analysis was based on hourly meteorological surface data collected from the DS3505 data set available from the National Climatic Data Center ("NDCD") for the weather stations at the John F. Kennedy International Airport and the Long Island-MacArthur Airport for a period of six years.

Based on data collected from the weather stations and the results of the analysis, during daytime hours,[31] overcast conditions were most common over the course of a year occurring approximately 60% of the daylight hours. Clear conditions occur in approximately 17% of the daylight hours, followed by partly cloudy conditions which occurred approximately 6% of daylight hours. Under these three types of conditions, it is assumed that visibility would be 10 miles or greater. For the remaining 16% of the daylight hours, for which NYSERDA did not classify, visibility was less than 10 miles.

The most frequent condition is overcast skies during the morning, which occurs 21.8% of daylight hours, followed by overcast skies during midday and afternoon hours, which occurs 21.5% and

[30] The related GIS shape files are provided as Attachment 42 to the bid.

[31] The NYSERDA VTS did not assess nighttime conditions with the exception of the use of nighttime aviation warning lights.

17% of daylight hours, respectively. The least frequent weather condition is partly cloudy skies during the midday hours (1.8% of total daylight hours). Figure 68 provides a summary of frequency of occurrence of the various time of day/weather scenarios.

Figure 68: Frequency of Occurrence of Various Time of Day/Weather Scenarios

Time of Day	Percentage of Daylight Hours		
	Clear	Partly Cloudy	Overcast
Morning	7.6	2.2	21.8
Midday	4.2	1.8	17.0
Afternoon	5.3	1.9	21.5
Total	17.1	5.9	60.3

15.1.3 Results

As shown in the visual simulations, the Empire Wind Project is not likely to be highly visible for the majority of the time under most conditions and, as a result, is not expected to have significant impacts on local or state economies dependent on tourism of publicly-accessible viewsheds. As provided in the visual simulations for this proposal, only portions of the proposed Project are expected to be visible from KOPs identified, and only under certain climatic conditions. In many cases, the visibility is limited to a very small percentage of the viewshed or not visible at all. For example, at the closest KOP, Jones Beach (Short Beach), turbines would account for only 0.21 inches of the total view space. Visibility slightly increases during late day timeframes, but is strongly influenced by clear or cloudy conditions, with turbines less visible during partly cloudy or overcast scenarios. As demonstrated by climate trend data compiled by NYSERDA, clear conditions only occurred in approximately 17% of daylight hours, which is another key point to consider when evaluating impacts to the viewshed. Further, the offshore areas within and adjacent to the lease area support commercial, military and recreational vessel traffic; thus, the scenic viewshed from an onshore vantage point is not currently unobstructed.

There will likely be some occasions when there will be visibility of some of the structures in the Empire Wind Project. Visibility varies widely based on conditions and impacts vary on subjective opinion and will be addressed based on feedback from stakeholders as the project continues to develop. It is important to note that in some cases, the presence and visibility of wind turbines has resulted in economic benefits, for example where people visit the coastline to see these features offshore, including offshore sightseeing trips. In any case, based on the mitigation measures discussed above (*e.g.*, sympathetic lighting and ADLS) and Equinor Wind's commitment to following state and federal regulations and best practices, impacts are not expected to be significantly adverse.

15.2 COP Visual Impact Assessment

While Equinor Wind believes that the visual study prepared in support of this RFP is sufficient to demonstrate that the development of the Empire Wind Project will not have a material impact on viewshed resources, the visual impact of the Empire Wind Project will be further evaluated and expanded as part of the COP. In particular, detailed landscape and visual impact assessments ("VIA") will be required to support BOEM's NEPA process[32] and associated consultations under Section 106 of NHPA. Section 106 of the NHPA requires that federal agencies take into account the effect of their undertakings on significant cultural resources, which includes historic properties that could be impacted by modified viewsheds during construction and operation. Historic properties that have been listed on, or are eligible for listing on, the National Register of Historic Places are considered significant cultural resources and may include properties of traditional, religious, and cultural importance to Native American tribes.

In order to provide a basis for BOEM's assessment, Equinor Wind will be preparing a separate VIA in support of the development of the Empire Wind Project. BOEM does not have specific guidelines on conducting a VIA or associated visual simulations. However, BOEM's *Guidelines for Information Requirements for a Renewable Energy Construction and Operations Plan (2016)* (BOEM's COP Guidelines) indicate that the visual resource assessment should apply appropriate viewshed mapping, photographic and virtual simulations, computer simulation, and field inventory techniques to determine, with reasonable accuracy, the visibility of the proposed project to sensitive and scenic viewpoints. Equinor Wind's approach to the VIA has been consistent with these guidelines, as described within this section. In addition to BOEM's COP Guidelines, NYSERDA is currently developing guidelines for offshore energy VIAs, which may be adopted by BOEM. The NYDPS also has requirements for conducting VIAs with photographic simulations for upland components of the Project. Depending on the timeframe that NYSERDA's guidance is available in relation to the timing of study completion and COP submission, Equinor Wind can review and incorporate the NYSERDA guidelines, as applicable.

On November 6, 2018, Equinor Wind submitted a VIA study plan to BOEM, the National Park Service ("NPS"), the NY ORPHP, and the NYSDEC. The VIA study plan for the Empire Wind Project was developed based on BOEM and federal agency guidelines. The VIA study plan provides information on determining project visibility, viewshed mapping, simulations (photographic, virtual, computer), identification of sensitive viewers/important viewpoints, and determining visual contrast. Currently, Equinor Wind anticipates that the VIA will evaluate the KOPs identified above as well as other points along the New York and New Jersey coasts. The VIA will also include visual simulations of additional locations, which will be produced in panoramic and formatted for larger viewing, as is the industry standard.

Since submitting the VIA study plan, Equinor Wind has received feedback from BOEM on the scope of the study, which will be reflected in the final VIA that is conducted. The NY ORPHP has

[32] 30 C.F.R. § 585.627(a)(7).

indicated that the plan was acceptable to its office and Equinor Wind has not yet received responses from NPS or NYSDEC.

Currently, Equinor Wind expects that the VIA will evaluate the impact on scenic areas that could be affected by the development of the project within a 35 mile radius of the study area surrounding the lease area, including the KOPs set out in this proposal. The selection of the Study Area was based on maximum visibility under optimal viewing conditions (*i.e.*, a clear, sunny day), the proposed turbine height/curvature of the earth, and the topography within the lease area. BOEM's study titled *Renewable Energy Viewshed Analysis and Visualization Simulation for the New York Call Area (2015)* (BOEM's NY Call Area Study) and the NYSERDA VTS were also consulted.

The VIA will provide a robust assessment of the full visibility of the Empire Wind Project, including both onshore and offshore components. The VIA will provide an assessment of all currently proposed and future phases of development and will include accurate and realistic photographic and virtual simulations, in addition to field inventory techniques and a delineation of the onshore viewshed to determine the visibility of the project. Among other things, the VIA will include:

- Detailed printouts, along with detailed viewing instructions, that will provide a realistic assessment of the likely visual impact of the construction and operation of the project; and

- A video simulation, including two condensed 24-hour time lapse videos that will depict the visibility of the project under a wide range of conditions and times of day/night.

Based on the preliminary results of the VIA, it is anticipated that viewers along the coasts of New York would have limited visibility of the project's offshore structures (wind turbines and offshore substations), with the impact varying based on location, elevation, and prevailing atmospheric conditions. A final version of the VIA will be submitted with the COP in 2019 and will be subject to review by BOEM, relevant state and federal agencies, and interested stakeholders through the NEPA process.

16 NEW YORK ECONOMIC BENEFITS

Proposers must submit their claimed Incremental Economic Benefits and Contingent Economic Benefits by category using the Offer Data Form and support these claims by submitting an Economic Benefits Plan. All claimed expenditures and investments should be in real dollars (U.S.) at the time of Proposal submission.
The Economic Benefits Plan must include descriptions and supporting documentation for their Incremental Economic Benefits and Contingent Economic Benefits claims, as described below.
The prorated portion of investments in oversized transmission and interconnection facilities not needed to support the Offshore Wind Generation Facility shall not be included as an Economic Benefit.

Equinor Wind is enthusiastic about the opportunity to support New York in achieving its objective of becoming a strategic hub for the offshore wind industry on the east coast. Equinor Wind believes that New York's demonstrated commitment to promoting the development of significant offshore wind resources as reflected in New York's Green New Deal, its central geographic location, well-developed port infrastructure, and highly skilled workers make the state well-suited to become the center of the growing offshore wind industry.

As the holder of an offshore wind lease within the New York Offshore Wind Energy Area, Equinor Wind and its parent companies are committed to the growth and development of the offshore wind industry in New York. Equinor Wind has already made significant investments in developing the offshore wind industry in New York in connection with its efforts to evaluate and develop its lease area. [redacted]

[redacted]

As discussed further below, if selected to supply ORECs to New York through this RFP, Equinor Wind will significantly expand its investments and commitments to New York by creating thousands of new jobs for New York workers, investing millions of dollars in New York bussinesses, and fostering the growth of a robust offshore wind supply chain and workforce that has the potential to make New York a regional hub for sourcing, logistics, and construction of offshore wind facilities.

[redacted]

Specifically, the selection of the Empire Wind Project through this RFP process will:

- **Create good paying jobs for New York workers**: [redacted]
- **Promote New York supply chain development**: [redacted]
- **Support the engagement of New York businesses and workers:** [redacted]
- **Benefit Ratepayers:** [redacted]
- **Create Additional Cost Savings Through Reducing Emissions**: [redacted]

[redacted]

16.1 Incremental Economic Benefits

The following subsections provide an overview of the incremental economic benefits that will be generated by the development, construction, and operation of the Empire Wind Project. As a general matter, this discussion focuses on the employment opportunities that will be created and the expenditures that will be made by Equinor Wind (or its affiliates) and its direct suppliers and contractors. As described further below, even when only the jobs and expenditures of Equinor Wind and its direct suppliers and contractors are taken into account, [redacted]

Figure 69: Overview of Category 1 and Category 2 Incremental Economic Benefits

	FTEs	Expenditures
Categories 1 and 2 Benefits	[redacted]	[redacted][34]

Equinor Wind believes that the Category 1 and Category 2 benefits set out above will foster the development of an offshore wind workforce and supply chain that will help ensure that New York workers and businesses benefit from the development of offshore wind resources to meet New York's environmental goals and those of other states throughout the region.

In addition to the economic benefits set out above, Equinor Wind plans to make significant investments in New York businesses and workers as well as research and development to promote New York's efforts to develop a robust offshore wind supply chain and workforce within the state. For example, Equinor Wind plans to establish a dedicated fund to promote workforce and community development and collaborate with local universities to support the creation of additional opportunities for New York workers.

Importantly, the incremental economic benefits set out above represent only a portion of the economic development opportunities that will be unlocked as a result of the development of the Empire Wind Project. In order to quantify the full range of economic opportunities that will be created in connection with the Empire Wind Project, Equinor Wind asked ICF to conduct an economic benefit study of the Empire Wind Project. [redacted]

[34] All expenditures are provided in 2019 dollars.

[redacted]

16.1.1 Category 1: Project-Specific Spending and Job Creation in New York State Employment Opportunities

Job Creation

Based on Equinor Wind's internal estimates and information received from suppliers,[35] Equinor Wind currently anticipates that the development of the Empire Wind Project will create a range of short-term and long-term positions for New York workers in connection with the development of the Empire Wind Project, both during the initial period of project development and construction and during the operational life of the project. Specifically, [redacted]

[redacted]

[redacted]

[36] For the purpose of the Economic Development Plan, an FTE is defined as equal to 2,080 hours per year.

[redacted]

Figure 71: Employment Opportunities and Compensation

16.1.2 Category 2: Offshore Wind Industry- Related Supply Chain and Infrastructure Investment

Supply Chain and Transportation Facilities

In addition to the employment opportunities and expenditures described above, Equinor Wind plans to make significant investments in New York ports and facilities. These investments will not only support the development of the Empire Wind Project but will ensure that New York has the infrastructure necessary to support the development of offshore wind facilities designed to serve New York's renewable energy goals and those of other states located along the eastern seaboard.

[redacted]

[redacted]

[redacted]

Figure 74: Type of Civil Construction Jobs

[redacted]

16.1.3 Category 3: Input Activities

Equinor Wind has developed a plan to increase the economic benefits associated with the Empire Wind Project through additional investments in, and engagements with, New York workers and businesses. These engagements and investments are an extension of Equinor's company-wide commitment to ensuring that its activities create lasting value for local communities through its business activities, including direct and indirect local employment, local procurement, and social investments.

Business Engagement Plan

Equinor Wind believes that a well-developed local supply chain is critical to the successful development of an offshore wind industry in New York and to reducing the costs associated with the development of such projects. For that reason, Equinor Wind is committed to ensuring that New York businesses are fully apprised of potential opportunities to support the development of the Empire Wind Project.

Equinor Wind already has engaged in substantial efforts to identify opportunities for New York businesses to support the development of the Empire Wind Project. Notably, in February 2018, Equinor Wind retained the Renewables Consulting Group, a company based in Brooklyn, New York, to create a New York and regional supplier database of companies capable of supporting the development of the Empire Wind Project. These efforts resulted in a supplier directory containing local and regional businesses capable of supporting the project ("Equinor Wind Supply Directory"). Equinor Wind has utilized the Equinor Wind Supply Directory as the foundation for its efforts to tailor the development of the Empire Wind Project in a manner that maximizes the economic opportunities and benefits created for New York.

The following subsections describe additional efforts that Equinor Wind plans to make to create opportunities for New York businesses and workers in the event that the Empire Wind Project is selected through this RFP process.

[redacted]

[redacted]

Communication of Opportunities to New York Businesses

Equinor Wind will use a dedicated online web portal to communicate opportunities to supply goods or services to the Empire Wind Project and provide updates on procurement activities in order to ensure that New York businesses are informed of opportunities to support the development of the project. In accordance with Section 2.2.9 of the RFP, in the event that the

Empire Wind Project is selected through this RFP, Equinor Wind will communicate all opportunities to support the Empire Wind Project with an anticipated contract value of $5 million or greater not already committed to the New York State vendor list maintained by NYSERDA at the time of execution of a contract awarded as a result of this RFP process. Equinor Wind is committed to making certain that these suppliers receive timely notification of opportunities to support the project and would welcome the opportunity to work with NYSERDA to establish a mechanism that ensures that suppliers that register and appear on the New York State vendor list are timely informed of opportunities as they arise. New York businesses that pursue opportunities to supply goods or services to the Empire Wind Project would then be evaluated in light of Equinor's existing procurement and supplier standards and requirements. [redacted]

Before sending out any request for information, request for proposals, or invitations to tender to potential suppliers, Equinor Wind will review the NYSERDA vendor list and the Equinor Wind Supply Directory to identify, and reach out to, potential New York suppliers qualified and capable of providing the goods or services at issue. These efforts would be in addition to establishing a mechanism to ensure timely communication to New York businesses of opportunities to support the project consistent with Section 2.2.9 of the RFP.

In addition to the outreach efforts described above, Equinor Wind will hold supply chain events following the selection of the Empire Wind Project through this RFP to help create additional opportunities for New York businesses. These supplier events will be timed to give New York businesses the opportunity to interact with Tier 1 Suppliers selected to support the development of the project and to identify potential subcontract and supplier opportunities.

Equinor Wind will also consider carefully how to target these events. A strategy successfully employed on previous projects includes working together with local business support organizations that will allow the project to engage with potential lower-tier suppliers. Our experience also suggests that focused supply chain engagement results in significant opportunities to local companies. The purpose of these events will be to encourage new entrants to the offshore wind sector, remove barriers to entry, and improve awareness and access to project opportunities.

Efforts to Shortlist Pre-Qualified New York State Companies

Equinor Wind is committed to ensuring that New York companies are given a fair opportunity to support the development of the Empire Wind Project, either directly to Equinor Wind or its Tier 1 Suppliers. For that reason, Equinor Wind will include New York businesses on Equinor Wind's bidders list so long as they have been pre-qualified as a potential supplier to Equinor Wind.

To be pre-qualified as a direct supplier to Equinor Wind and be admitted on the bidders' list, suppliers must have the capability and experience to deliver the proposed scope of work, meet pre-defined technical qualification requirements and satisfy minimum safety, quality, and integrity due diligence requirements. Qualification of new products/technology can take time, depending on the maturity of the product/technology. The prequalification process is specifically designed for each procurement and may include simple follow-up questions or thorough investigations (*e.g.*, site visits and audits).

If the Empire Wind Project is selected through this RFP process, Equinor Wind will support efforts by New York businesses to become pre-qualified to supply goods and services to the Empire Wind Project. As an initial matter, as part of the supplier events and other activities described above, Equinor Wind will provide New York businesses with information regarding the criteria that they must meet in order to be engaged to support the Empire Wind Project.

These efforts will compliment Equinor Wind's efforts to support pre-qualification efforts through its existing online portal, "How to become an Equinor Supplier," which provides guidance to potential bidders regarding how to qualify to do business with Equinor, gives potential bidders the opportunity to register their interest in supporting the project, and ask questions regarding qualification requirements. [redacted]

Subdividing Work Packages To Increase New York Firms' Prospects for Success

Equinor Wind currently is employing a multi-contract procurement strategy for the Empire Wind project based [redacted] Each of the parties that executes a contract (*i.e.,* Tier 1 Suppliers) will deliver different elements of the design, supply, fabrication, installation, commissioning, and operation of the project.

In addition to allowing Equinor Wind to identify the most cost-effective allocation of risk and responsibilities, Equinor Wind believes that a multi-contracting strategy will maximize the opportunities for New York businesses by increasing the opportunities to compete to obtain a contract supporting the project.

Requirements for Tier 1 Suppliers

- [redacted]
- [redacted]

Workforce Development Plan

Equinor Wind appreciates the importance of ensuring that the Empire Wind Project contributes to the development of a workforce with the skills necessary to attract offshore wind manufacturers and developers to the State. While Equinor Wind believes that New York's world-class workforce already makes New York uniquely situated to benefit from the development of a robust offshore wind industry on the east coast, in the event that the Empire Wind Project is selected through this RFP, Equinor Wind plans to take a number of steps to foster the further growth and development of the workforce capabilities that will make New York a national leader in the offshore wind industry.

Creation of Community Benefits Fund

In the event that the Empire Wind Project is selected through this RFP, Equinor Wind will commit to provide a total of [redacted] to a new community benefits fund that will focus on supporting workforce transition and development and providing support for communities in the vicinity of sites associated with activities related to the development of the Empire Wind Project. The community benefits fund's primary focus will be on providing financial support for initiatives focused on fostering the development of a "green workforce" within New York. [redacted]

Support for the SUNY Offshore Wind Energy Center

In recent months, Equinor Wind has been providing support and guidance to the SUNY Maritime College as it moves forward to establish the NY Offshore Wind Energy Center in cooperation with SUNY Farmingdale. In the event that the Empire Wind Project is selected, Equinor Wind plans to continue its support of the Offshore Wind Energy Center by offering in-kind support to help develop offshore wind programs and training at the center. Equinor Wind also appreciates the importance of ensuring that graduates of the center are able to find employment upon graduation. For that reason, Equinor Wind has committed to interview successful graduates of the certificate program that submit an application for open positions with Equinor Wind.

Support for Local Apprenticeship and Internship Programs

Equinor has a long history of supporting job training in the communities in which it operates and manages a range of apprenticeship and internship programs that are designed to provide "on the job" training and support for members of the communities in which it operates. For instance, Equinor currently operates an apprenticeship and internship program in the UK that provides new entrants to the offshore wind labor force with hands-on training on Equinor's existing offshore wind assets. In order to identify local candidates for these programs, Equinor holds a "skills day" with local universities to raise awareness about the program and encourage local members of the community to apply.

If the Empire Wind Project is selected through this RFP, Equinor Wind will work to establish a local apprenticeship program similar to those operated in connection with its UK assets in order to provide opportunities to members of the local communities and ensure a pool of technicians within New York State with the skills necessary to support the growing offshore wind project. As part of these efforts, Equinor Wind will explore collaborating with local labor organizations and universities to identify suitable candidates and increase public awareness of these programs.

Supporting Workforce Transition

Equinor Wind strongly supports New York's effort to ensure that an increasing portion of the state's electricity needs are met using renewable energy. Equinor Wind recognizes, however, that the transition to new technologies and resources has the potential to create new challenges for New York workers as older generation resources retire or otherwise seek to exit the market.

Equinor Wind is committed to minimizing workforce disruption associated with the changing generation mix by creating new opportunities for workers seeking to transition from other parts of the electric sector to supporting the development and operation of renewable resources. Consistent with this objective, Equinor Wind plans to establish a bespoke, internal training program designed to draw upon workers that have experience operating thermal generation resources and provide them with the training necessary to support offshore wind resources. Equinor Wind currently expects that these efforts will include:

- Early recruitment of operations and maintenance staff to allow sufficient time for training with the goal of ensuring that the core operations and maintenance team would be in place one year prior to the start of operations.
- Involving operations and maintenance staff in construction and commissioning activities to ensure that these employees receive the training necessary to effectively assume responsibility for the project.
- Placing operations and maintenance personnel in training secondments to carry out "on the job" training at Equinor's existing offshore wind assets in Europe.
- Ensuring that there is an experienced team assembled in New York with a history in existing offshore wind farm operations at the time of the commencement of operations in order to ensure that newly hired employees receive the benefits of the experience gained from Equinor's more than 10-years of operation of offshore wind resources.
- Giving operations and maintenance employees access to Equinor's Internal Global Development Program, which highlights new talent within the company and places them on an accelerated intensive program to aid their development and to understand Equinor's strategy and culture.
- Fostering the development of skills by allowing operations and maintenance employees to attend Equinor University, which provides Equinor employees with training through courses that cover a wide range of subjects relevant to renewable resources. Access to this program will accelerate the competence of the Equinor New York workers and bolster the competence of the renewables workforce in New York state.

Engagement With Labor Organizations

Equinor Wind has already undertaken substantial efforts to create opportunities for New York workers through dialogue with New York labor unions and organizations. The New York Trades Council and Green Jobs NY have been especially helpful. For Instance, Equinor Wind has supplied the unions with detailed assessments of the types of jobs and skills needed at each stage of the project, from permitting and construction through to operations. In the event that the Empire Wind Project is selected through the RFP process, Equinor Wind will reach out to these labor organizations to solicit their input on how to enhance the employment opportunities for New York workers, including pursuing negotiation of a Project Labor Agreement with appropriate labor organizations.

Investments in Research & Development

Throughout its history, Equinor has supported research and development activities in connection with its offshore projects. The Empire Wind Project is no exception and Equinor Wind already is engaged in a number of efforts to promote the development of offshore wind research and development activities in New York State:

- Christer af Geijerstam, President of Equinor Wind, serves on the Board of Directors of the National Offshore Wind Research and Development Consortium ("R&D Consortium") administered by NYSERDA and Equinor Wind has committed to provide $50,000 to support the consortium's work

- [redacted]

- Equinor Wind is currently discussing a potential research and development partnership with the Long Island-based ULC Robotics, a developer and manufacturer of unmanned aerial vehicles, to explore the creation of advanced, purpose-built vertical take-off and landing aircraft to support offshore wind project operations. A copy of a letter of support from ULC is provided as Attachment 39.

- Equinor Wind is actively collaborating on environmental research and monitoring with SUNY Stony Brook's SoMAS on Long Island, in an effort to enhance understanding of marine life in the lease area. SoMAS is in the process of completing a BOEM-funded study to increase understanding of the Atlantic sturgeon in the New York Bight. Contributing to this effort, Equinor Wind installed three of SoMAS' Atlantic sturgeon sensors on the metocean moorings installed within the lease area in December 2018 as part of Equinor Wind's site assessment activities.

Equinor is working together with SUNY Stony Brook to apply for a grant from the R&D Consortium to develop high fidelity wind resource modeling, which has the potential to increase performance of offshore wind projects that are constructed to supply energy, capacity, and ORECs to New York. The models will be validated by operational data from Equinor wind farms, and local NY metocean conditions will be used as basis for the simulations of improved wind park control.

16.2 Contingent Economic Benefits

[redacted]

[redacted]

[redacted]

[redacted]

[redacted]

[redacted]

[redacted]

16.3 Verification Of Economic Benefits

Equinor Wind recognizes the importance of establishing a clear and transparent plan to ensure objective verification of the economic benefits actually generated by the development of a project selected to supply ORECs through this RFP. For that reason, Equinor Wind has developed a plan for verifying the Incremental and/or Contingent Economic Benefits generated by the Empire Wind Project. This verification plan is based on Equinor Wind's experience with demonstrating compliance with local content requirements in other jurisdictions and is founded upon ongoing evaluation and assessment of economic benefits throughout the contract term.

16.3.1 Verification Plan

In accordance with the requirements of the RFP, Equinor Wind will prepare an Economic Benefits Report documenting the total dollar amounts of actual economic benefits accrued to New York in Categories 1 and 2, as well as Equinor Wind's efforts to achieve the commitments described in Category 3. This Economic Benefits Report and supporting documentation will be subject to audit and verification by an independent Certified Public Account ("CPA") as described in the RFP.

[redacted]

[redacted]

[redacted]

16.3.2 Documentation

This section provides a preliminary overview of the types of documentation that Equinor Wind anticipates using as the foundation for verifying the economic benefits associated with the development of the Empire Wind Project. Equinor Wind notes that this list should be considered preliminary and is subject to change.

Value of Project-Specific Spending and Supply Chain Investments

[redacted]

[redacted]

Transmission Upgrades

In order to verify the amounts spent on upgrading transmission facilities, Equinor Wind expects that it will provide copies of the invoices received from the relevant transmission owner. However, the final documentation that will be used for verification will be confirmed following the execution of an interconnection agreement with NYISO.

Fees and Expenditures by Equinor Wind

Equinor Wind anticipates that it will use typical supporting documentation to verify the fees and expenses paid by Equinor Wind, including expense claims, invoices, contracts, and time sheets for Equinor project team members working within New York.

Category 3 Benefits

The documentation that could be used to substantiate Category 3 economic benefits could include agreements or other evidence of partnerships with relevant community groups and organizations, letters of support, memoranda of understanding, and documentation of internship and apprenticeship positions created.

16.4 Ratepayer and Emissions Impact

While the foregoing discussion focuses on the significant employment opportunities and investments in New York businesses and supply chain development that will be made in connection with the Empire Wind Project, developing the Empire Wind Project will generate a range of economic benefits that go beyond the benefits set out above. Notably, the development of the Empire Wind Project will confer additional economic benefits on New York by reducing production costs and emissions.

In order to quantify the full range of the rate and emissions-reduction benefits associated with the development of the Empire Wind Project, ICF simulated the operation of the wholesale electricity markets in the eastern interconnection using the ABB PROMOD IV production cost modeling software. As explained in detail in the attached ICF report, ICF's analysis demonstrates that the development of the Empire Wind Project will:

- **Significantly Reduce Production Cost:** [redacted]
- **Benefit Ratepayers:** [redacted]

[redacted]

- **Create Additional Cost Savings Through Reducing Emissions**: [redacted]

17 PROPOSER CERTIFICATION

Proposer must complete and submit the Proposer Certification in Appendix B. The Proposer Certification must be signed by an authorized officer or other duly authorized representative of Proposer.

Equinor Wind's Proposer Certification is provided under separate cover.

18 EXCEPTIONS TO AGREEMENT

If Proposer is proposing any exceptions to the Agreement, included as Appendix F, Proposer must provide a redlined markup of the Agreement and provide an explanation and justification for each requested change.

Note that ORECRFP18-1 is a competitive procurement. Competitive procurement rules and the Offshore Wind Order limit NYSERDA's ability to alter the terms of the Agreement. Should the Project receive an award, NYSERDA will contact Proposers to schedule a discussion regarding the terms identified in the redlined markup of the Agreement. Requested changes that recognize the limitations imposed by the competitive procurement rules and the Offshore Wind Order will have no impact on the scoring or evaluation of the Proposal.

A marked-up version of the draft agreement is provided as Attachment 45.

PUBLIC COPY - CONFIDENTIAL INFORMATION REMOVED

Equinor Wind US LLC

Section 12

Fisheries Mitigation Plan

Table of Contents

Table of Figures

12 FISHERIES MITIGATION PLAN

Proposers must include in their Proposal a Fisheries Mitigation Plan in as much detail as possible that describes how Proposer will mitigate adverse impacts on the commercial fishing industry that may be caused by the Project. Elements of the Fisheries Mitigation Plan are described in detail in Appendix D. Proposers are advised to review the Fish and Fisheries Study prepared for the New York State Offshore Wind Master Plan with respect to the potential impacts of offshore wind energy development on the fishing industry, and also are advised to include in their mitigation plan the appropriate Best Management Practices described in the Master Plan and supporting studies.

12.1 Summary

Equinor Wind welcomes the opportunity to submit a Fisheries Mitigation Plan ("FMP") as part of its application to supply offshore renewable energy certificates to New York. Equinor Wind recognizes the importance of balancing the interests of responsible offshore wind energy development with fisheries resources and uses that may be present in the project area. From experience with the development of offshore wind energy facilities, Equinor Wind believes that the responsible development of offshore wind energy resources can be compatible with fisheries resources and commercial and recreational fishing.

Equinor Wind is submitting this FMP to provide an overview of the efforts that have been made to date to minimize the impacts to, and coexist with, the fishing industry and the measures proposed for the future to avoid or minimize impacts to the fishing industry as the project matures. This FMP has been prepared to set out Empire Wind's guiding principles towards fisheries coexistence and will be used for consultation with the fishing industry, including with the New York State Fisheries Technical Working Group ("F-TWG") to provide a roadmap for future work as the project matures.

As discussed further below, Equinor Wind's approach to fisheries mitigation is founded upon the fisheries mitigation hierarchy. More specifically, this approach means that we anticipate and avoid impacts on fisheries resource and fishers; minimize impacts where avoidance is not possible; and take steps to offset any significant residual adverse impacts that are predicted to remain. Equinor Wind believes that it is critical that the Empire Wind Project be developed in a manner that minimizes disruption to the natural environment, natural resources, and existing uses of the lease area.

Equinor Wind believes that mitigation measures to reduce impacts on fisheries should be identified and developed in close consultation with relevant fisheries stakeholders early in the project development process. This should be through an iterative process of project design, including site selection, cable routing, timing of works, and consideration of construction and operations methods. The Empire Wind Project Team has been following these principles rigorously since Equinor Wind secured the Lease Area in 2017. Equinor Wind endeavors to minimize disruption to fisheries at all stages of project life, including during survey activity, construction, operations, maintenance, and decommissioning. These consultations have already yielded valuable insights that have been incorporated in Equinor Wind's survey and planning processes. Among other things, Equinor Wind has taken the following steps to minimize the potential impact on fisheries resources:

- [redacted]
- [redacted]
- [redacted]

The following sections summarize Equinor Wind's approach to coexistence and communication with the commercial and recreational fishing communities throughout all stages of the project life. A summary is also provided that explains how impacts will be assessed and how mitigation measures will be considered and applied. Furthermore, the following sections set out principles for how Equinor Wind will work with the fishing industry to avoid or minimize impacts and collaborate on conducting research and monitoring. Naturally, the FMP will continue to evolve through consultation with the F-TWG and the fishing industry as the project develops through the continued use of adaptive management.

12.2 Coexistence Philosophy

Equinor Wind's approach and philosophy to project development is premised on the belief that the fishing industry and offshore wind energy developments can be compatible and can co-exist. Equinor Wind believes that co-existence can be achieved by carefully evaluating existing uses of the lease area, avoiding impacts where feasible, or reducing impacts through mitigation. This philosophy has proven effective within Equinor's European wind project portfolio and the best practices that have been developed in support of prior projects will now be leveraged here in the U.S.

Equinor Wind believes that a successful coexistence strategy requires open and regular communication between Equinor Wind and the fishing industry, starting with the development and survey phase, and continuing through permitting, construction, operation, and decommissioning of the wind farm. For that reason, in February 2018, Equinor Wind released a draft Fisheries Liaison & Outline Coexistence Plan ("FLP") to provide an overview of Equinor Wind's approach to development and consideration of fisheries resources. The FLP is available on the Empire Wind website and is provide as Attachment 34.

As set forth in the FLP, Equinor Wind does not intend to restrict or apply for broad-based restrictions on fishing activities within the operational wind farm area(s), or electrical export cable area(s). To the extent that any restrictions are necessary, these may be limited to standard safety zones during the construction phase, and operational safety zones around manned or sensitive offshore platforms. The approach to how safety zones will be employed will be determined through completion of a Navigational Safety Risk Assessment ("NSRA") and in consultation with the F-TWG, fishing community and relevant agencies (*e.g.*, U.S. Coast Guard; "USCG").

The FLP was developed to present Equinor Wind's proposed approach to liaising, consulting, and coexisting with the fishing industry. The FLP will continue to be updated and evolve in consultation with the fishing industry as the project moves through the various stages of development, including feedback on the FMP from fisheries working groups such as F-TWG and the Responsible Offshore Development Alliance ("RODA").

In addition to using in-house experience gained from past liaisons and coexisting with the fishing industry in Equinor Wind's offshore wind energy developments in Europe (*e.g.*, Sheringham Shoal, Dudgeon Offshore Wind Farm, Dogger Bank and Hywind Scotland), as well as decades of company-wide experience working with fisheries as part of our offshore Oil and Gas operations, Equinor Wind has been following industry best practices in the interest of achieving its objective of co-existence to evolve this FMP. Consistent with the NYSERDA's New York State Offshore Wind Master Plan (2017), this includes, but is not limited to:

- Development of Mitigation Measures to Address Potential Use Conflicts between Commercial Wind Energy Lessees/Grantees and Commercial Fishermen on the Atlantic Outer Continental Shelf, BOEM 2014-654;
- Best Practice Guidance for Offshore Renewables Developments: Recommendations for Fisheries Liaison - Fishing Liaison with Offshore Wind and Wet Renewables Group (FLOWW), UK;
- Fishing and Submarine Cables Working Together – published by the International Cable Protection Committee;
- Bureau of Ocean Energy Management (BOEM) 2015 – Guidelines for Providing Information on Fisheries Social and Economic Conditions for Renewable Energy Development on the Atlantic Outer Continental Shelf Pursuant to 30 Code of Federal Regulations (CFR) Part 585;
- BOEM 2013 – Guidelines for Providing Information on Fisheries for Renewable Energy Development on the Atlantic Outer Continental Shelf Pursuant to 30 CFR Part 585;
- BOEM n.d.(a) – Previously Identified Offshore Wind Development Concerns;
- BOEM n.d.(b) – Possible Best Management Practices and Mitigation Measures to Reduce Conflicts between Fishing and Wind Industries;
- Hooker 2014 – Bureau of Ocean Energy Management Fishing and Offshore Energy - Best Management Practices;
- McCann 2012 – Developing Environmental Protocols and Modelling Tools to Support Ocean Renewable Energy and Stewardship;

- Ecology and Environment 2014 – Development of Mitigation Measures to Address Potential Use Conflicts between Commercial Wind Energy Lessees/Grantees and Commercial Fishermen on the Atlantic Outer Continental Shelf: Report on Best Management Practices and Mitigation Measures;
- Virginia Coastal Zone Management Program (VCZMP) 2015 – Collaborative Fisheries Planning for Virginia's Offshore Wind Energy Area;
- Lipsky et al. 2016 – Addressing Interactions between Fisheries and Offshore Wind Development: The Block Island Wind Farm;
- Moura et al. 2015 – Options for Cooperation between Commercial Fishing and Offshore Wind Energy Industries: A Review of Relevant Tools and Best Practices;
- Gray et al. 2016 – Changes to fishing practices around the UK as a result of the development of offshore windfarms – Phase 1;
- Petruny-Parker et al. 2015 – Identifying Information Needs and Approaches for Assessing Potential Impacts of Offshore Wind Farm Development on Fisheries Resources in the Northeast Region;
- Mid-Atlantic Fishery Management Council (MAFMC) 2014 – Offshore Wind Best Management Practices Workshop;
- New York States Offshore Wind Master Plan: Fish & Fisheries Study, Section 6 and Appendix D (2017); and
- Anticipated best practice guidance tools that may be developed through initiatives such as F-TWG, E-TWG, RODA, and other groups.

Equinor Wind will continue to reference these resources, as well as others that may develop at appropriate stages of project maturity.

12.3 Communications and Collaboration

Openness is a core value and cornerstone of Equinor Wind's approach to fisheries liaison and communications. Regular, open consultation will be key to ensuring that all parties are well informed in order to provide meaningful input in design and mitigation options. This will facilitate working towards the joint objective of avoiding or minimizing impacts, while enabling the responsible and sustainable development of offshore wind energy in the Lease Area. All efforts for the Empire Wind Project will also contribute to any successful future lease areas within the New York Bight by sharing experiences and lessons learned throughout this process.

Active communication and dialogue with the fisheries stakeholders begins during the early planning stages of project development. Equinor Wind has used early feedback received from relevant stakeholders to minimize disruption from survey activity and as part of early phase spatial planning and project design. Further details regarding mitigation during surveys is provided in Section 12.7.2 and for spatial planning and project design in Section 12.7.4.

In order to ensure that Equinor Wind continues to engage with relevant stakeholders regarding the development of the Empire Wind Project, Equinor Wind will continue to consult with the fishing industry through its participation in working groups such as F-TWG, RODA and via our dedicated Fisheries Liaison Officer ("FLO"). Equinor Wind also is participating on international fisheries groups, including the UK's Fishing Liaison with Offshore Wind and Wet Renewables Group ("FLOWW"), where lessons learned and best practices developed in collaboration between developers and the fishing industry from a more mature offshore wind energy market can be applied to where relevant in the U.S.

Additionally, Equinor Wind has engaged and will continue to engage, in fisheries conferences and committees, maximizing the opportunities to discuss the Empire Wind Project and solicit feedback. For example, Equinor Wind has presented project updates at the New England Fisheries Habitats Committee in New Bedford, MA; the American Fisheries Society Annual Meeting in Atlantic City, NJ; and BOEM's New York Bight Task Force Meetings held in New York and New Jersey, as well as manning an Empire Wind information stand at the New York Sports Fishing Forum for recreational fishers in Long Island, NY. Equinor Wind expects to continue these efforts throughout the development of the project.

In addition, an Offshore Fisheries Liaison Representative ("OFLR") has been and will be present on board Equinor Wind's research and survey vessels during all project related survey activities in order to give the active fishers in the field an opportunity to communicate with the OFLR and/or document any active fishers in the field. This provides Equinor Wind and the FLO a "live" perspective of fisheries use in and around the project area. Additional details on the FLO and OFLR activities are provided in Sections 12.3.1 and 12.3.3, respectively.

Equinor Wind also participates in and has representatives on New York State's Environmental Technical Working Group ("E-TWG") ensuring there is overlap on fisheries resource issues with the F-TWG, and New York State's Maritime Technical Working Group ("M-TWG") covering overlapping maritime navigation and safety issues.

Equinor Wind is fully committed to continuing participation in the TWGs as the Empire Wind offshore wind energy development matures and is committed to consulting and working with representatives of the F-TWG on the FMP. Currently, Equinor Wind is represented on the F-TWG by Martin Goff, who has many years of experience cooperating with the fishing industry in relation to offshore wind, and Stephen Drew, FLO for Empire Wind, who has over 25 years of experience in collaboration between offshore industries and commercial fisheries. See Attachment 1 for Martin Goff's resume and see Section 12.3.1 for more detail on Mr. Drew's experience. Equinor Wind has attended all F-TWG meetings to date and currently is working with RODA and other fisheries organizations for the purpose of consulting on wind farm layouts and transit lanes. Equinor Wind has also attended and contributed to all E-TWG meetings scheduled to date, including attending New York State's "State of the Science Workshop" held in Long Island, New York (13-14 November 2018).

Effective, clear and inclusive communication is required to ensure Equinor Wind can reach as many affected stakeholders as possible in order to share project-related information and solicit feedback. Equinor Wind intends that its fisheries outreach will be as inclusive as possible. Equinor Wind expects that its primary engagement with fisheries stakeholders will be through Fisheries Industry Representatives ("FIR") or groups such as F-TWG and RODA, as well as engaging with individual fishers.

In the following sections, Equinor Wind has provided a summary of key communications and resources implemented to date and to be implemented for the continued life of the project(s).

12.3.1 Fisheries Liaison Officers

Equinor Wind has contracted an FLO with extensive knowledge and first-hand experience in the regional fishing industry to aid in facilitating communication between Equinor Wind and the fishing industry. The FLO also supports Equinor Wind in the identification of potential impacts and mitigation measures and assists with data gathering to inform the environmental and social impact assessments related to commercial and recreational fishing. The FLO will act on Equinor Wind's behalf throughout all development stages, including surveys and design; construction; operation; and decommissioning phases. The primary roles and responsibilities of Equinor Wind's FLO are:

- To serve as the primary point of contact between the project and the fishing fleets;
- To log all interactions between the project team and fisheries representatives accurately and in a way that can be shared by the project team;
- To maintain a fisheries stakeholder database and contact list for all identified fishers operating within or areas adjacent to the offshore wind lease area and export cable corridors throughout all stages of the project, with the database including details to aid further targeted engagement and mitigation
- To arrange meetings with the fishing industry throughout all stages of project development, with frequency, timings, and method of communication appropriate to the level of activity at the time;
- To consult the relevant FIRs (see Section 12.3.2 below);
- To maintain regular liaison with relevant fishermen's associations, individual skippers, and vessel owners, the Mid-Atlantic Fishery Management Council, and any relevant fisheries regulatory bodies as appropriate;
- To disseminate project-related activities which could potentially interact with fisheries. This can include:
    - A description of the survey activity or other works to be undertaken;
    - The location and timing of survey activities;
    - The coordinates of partially and/or fully installed infrastructure;
    - Updates on planned activities at the project;
    - Details of the vessels performing work at the project;

    - Survey and installation vessel transit routes to and from site;
    - The locations and timings of safety exclusion zones that may be required during installation or maintenance activities;
    - Health and safety standards and obligations pursuant to the International Regulations for Preventing Collisions at Sea;
    - Empire Wind contractor obligations towards fisheries, in line with the principles of the FLP/FMP; and
    - Conflict avoidance response procedures and reporting procedures;

- To be available to receive and relay back to Equinor Wind all relevant concerns from the fishing community in respect of the various activities associated with the project;
- To keep the fishing community updated of any changes in project design, or scheduling;
- To assess and advise Equinor Wind on the need for, and subsequently support Equinor Wind in organizing, guard vessels;
- To support Equinor Wind in developing procedures and managing the process for handling snagged gear or lost gear resulting from interaction with the wind farm structures;
- To monitor fishing activity within the wind farm site and export cable corridors during all phases of the project, including during survey activities for the purpose of data gathering and for the use in deconflicting fishing and surveys;
- To support Equinor Wind in making wind farm survey, installation and operations and maintenance contractors aware of relevant fishing activities, including any relevant fishermen's sensitivities, and procedures for communicating with fishing vessels at sea;
- To advise and support Equinor Wind on the procurement of OFLRs to be present offshore during survey activities; and
- To attend and contribute to working groups, including F-TWG.

Empire Wind Fisheries Liaison Officer, Stephen Drew, Sea Risk Solutions

Stephen Drew of Sea Risk Solutions ("Sea Risk") is representing Equinor Wind as FLO. Stephen previously supported NYSERDA as FLO for the New York Offshore Wind Master Plan, where Stephen gained further experience with the northeast fisheries, including crucial experience related to the interaction between fisheries and offshore wind development in the New York Bight. Equinor Wind believes that this consistency is beneficial to existing fisheries relations; comes with an existing network of contacts; and adds additional expert knowledge to Equinor Wind when it comes to expressions of concern or requests for mitigation to date.

Based in New Jersey, Stephen Drew is the Founding Partner of Sea Risk. Prior to founding the firm, Stephen spent 15 years developing and managing the marine liaison group for a major subsea cable supplier. He pioneered methods of proactive Automatic Identification System ("AIS") use for subsea cable protection in Singapore and The Gulf, achieving significant fault rate reduction. He managed marine liaison and risk mitigation at cable landings in 25 countries and served five years on the International Cable Protection Committee Board of Directors. He has negotiated and served as liaison officer in cable/fishing agreements on the US West Coast. Prior experience includes Fishery Industry Officer for the United Nations Food and Agriculture Organization; Fishery Observer Program Manager; and five years' commercial fishing in New England. He is fluent in Spanish, with working ability in Portuguese and French. He holds B.S. and M.M.A. (Master of Marine Affairs) degrees from the University of Rhode Island.

Empire Wind Fisheries Liaison Officer, Wolfgang Rain, Sea Risk Solutions

In addition to Stephen, Wolfgang Rain acts as supporting FLO to ensure there is always FLO coverage on hand, which will be important particularly during offshore survey operations and future construction activities. Wolfgang joined Sea Risk as a Partner after nine years managing the marine liaison program for a major cable supplier and ship operator. He has expertise in subsea cable permitting and regulatory issues, AIS monitoring and notification, fault investigation, cable awareness, liaison with maritime authorities, shipping interests, fishermen and others in more than 20 countries in Asia, Europe, Middle East, Africa, India, and the Americas. He has negotiated and served as liaison officer in cable/fishing agreements on the US West Coast. He speaks Spanish, Japanese, Vietnamese, Russian and German. Additional experience includes extensive work as a commercial fisherman in Norway, the Russian Far East and Alaska, as well as international scientific fisheries observer on high seas vessels in the Southern Ocean, Western and North Pacific, and the Bering Sea. He holds a B.S. in Animal Science from Washington State University.

Empire Wind Fisheries Liaison Officer, Elizabeth Marchetti, Sea Risk Solutions

Elizabeth Marchetti also acts as supporting FLO. Elizabeth joined Sea Risk with extensive fisheries experience along the Atlantic seaboard. She started her career within the commercial fishing industry and has been working with the fishing community for over fifteen years. She has served as a Field Scientist aboard fishing vessels researching lobster recovery, fishing gear development, and a broad range of other studies in fisheries science, management, and technology. As a NOAA Port Agent she supported biosampling as well as fishermen's inquiries about management, reporting, and other issues. From 2015 to 2018 she served as Fisheries Liaison during the installation and operation of the Block Island Wind Farm, the first offshore wind farm operating in the USA. In addition to her liaison responsibilities Elizabeth serves on our team of AIS managers, supporting subsea cable awareness and protection. Elizabeth has also supported the Empire Wind project by serving as an OFLR during geophysical, geotechnical and benthic survey activities in the Empire Wind lease area during summer 2018 (Section 12.3.3 for details). She holds a Bachelor of Science Degree in Marine Biology from the University of Rhode Island.

FLO Contact details:

Email: Stephen Drew sdrew@searisksolutions.com

Email: Wolfgang Rain wrain@searisksolutions.com
Email: Elizabeth Marchetti emarchetti@searisksolutions.com
Phone: +1-908-339-7439 / +1-206-427-6553

In addition to supporting Equinor Wind on the Empire Wind offshore wind energy development and entire OCS-A 0512 Lease Area, Sea Risk also supports Equinor Wind in our recently acquired Massachusetts offshore wind energy development lease OCS-A 0520. The fisheries work leading up to and beyond the lease sale provides an increased regional perspective of the fisheries organizations, their key concerns and mitigation options available to developers. Where feasible, fisheries outreach will be combined for both the New York Bight and Massachusetts leases to minimize stakeholder fatigue and maintain consistency, noting that each wind farm project should be treated on a case by case basis, while also recognizing similar regional and fishery-specific considerations.

12.3.2 Fishing Industry Representatives

Fishing Industry Representatives ("FIRs") are essential contacts within the fishing community to ensure flows of information and communications between Equinor Wind, the FLO and the fishing community. Identifying potential impacts and addressing them with mitigation is a two-way process, which relies on stakeholder and developer participation to achieve those goals. Appreciating that stakeholder fatigue can be an impact itself on the fishing industry, using FIRs as main points of contact are a means to mitigate pressures on individual fisher's time from the outset.

FIRs are expected to represent and/or relay the views of the majority of fishers within his or her remit. It is important that the FIRs have the backing and support of the fisheries they represent. The FIRs should be able and willing to disseminate information from the FLO or Equinor Wind to the fishing community and vice versa on a timely and all-inclusive basis. The FIR is normally an individual who has worked extensively within or currently represents the industry in that particular sector, port or region. The primary responsibilities of the FIR are:

- To be the main focal point for liaison with the fisheries under their representation;
- To liaise and cooperate with the FLO to ensure the objectives of the FLP and co-existence strategy are achievable;
- To feedback to the FLO any fishers' concerns, data, or requests for meetings;
- To identify individuals or small groups of fishermen that can contribute to topic-specific technical discussions;
- To support, encourage and facilitate any meaningful discussions on potential impacts and appropriate mitigation measures to support minimizing impacts and coexistence; and
- To assist in the distribution of notices and relevant project information to fisheries under their representation and to follow up that all relevant parties received such notices.

Equinor Wind has identified and engaged multiple FIRs, who were already in place as the main points of contact within several fishing organizations. At this time, Equinor Wind understands that many of the organizations already have trusted and respected representatives and that currently there is no need for Equinor Wind to establish new FIRs. However, Equinor Wind is open to identifying and working with additional FIRs in the event that such a need presents itself. For example, some fishing organizations have nominated RODA as their principal FIR, acting as the main point of contact between Equinor Wind and those fishing organizations. However, Equinor Wind will engage with newly nominated FIRs as well.

- [redacted]
- [redacted]

12.3.3 Offshore Fisheries Liaison Representatives

Where appropriate and feasible, Offshore Fisheries Liaison Representatives ("OFLRs") have been, and will continue to be, present on vessels that are working on behalf of Equinor Wind in wind farm-related activities (*e.g.*, survey vessels and installation vessels). The main purpose of the OFLR is to mitigate impacts to fisheries in the field by avoiding or minimizing disruption to normal fishing practices during surveys, construction and maintenance activities. This is done by (i) ensuring a flow of information on fishing activity from the FLO onshore through to the vessel master; (ii) advising the vessel master of any signs of fishing activity to avoid in the field; (iii) providing a communications link with fishing vessels encountered on site to enquire on activity; (iv) disseminating information to fishing vessels in the field; and (v) observing and recording fishing practices in the field to help inform the project development and related mitigation and impact assessments.

Equinor Wind has selected and will continue to select known and respected OFLRs with experience in the fishing industry, and where possible, current or retired Captains of fishing vessels or fisheries observers. When feasible, the background and experience of the OFLR is matched with the areas and timing of fisheries that may be present when the wind farm vessels are in the lease area. The primary responsibilities of the OFLR are:

- To maintain daily contact with, and keep records of, fishing vessels observed to be within the vicinity of the work areas of wind farm-related vessels;
- To keep the masters and watch officers of wind farm-related vessels informed of fishing vessels in the vicinity of their working area and the gears and modes of operation of such fishing vessels;
- To keep fishing vessels advised of the locations, operations, schedules, and safety zones of wind farm vessels; and
- To provide on-site ad-hoc assistance and advice to wind farm-related vessel officers with the objective of minimizing hindrance to fishing activities, avoiding conflicts, and ensuring the commitments in the co-existence plan are adhered to.

With support from the FLO, Equinor Wind has succeeded in recruiting OFLRs who are known and respected in the fishing industry. The services provided by the OFLRs have contributed to a record of no reported claims or incidents of conflict in Equinor Wind's survey operations spanning March 2018 through December 2018. Equinor Wind continues to actively solicit OFLRs in all states along the east coast with relevant experience. The OFLRs to date include individuals with a broad range of experience and skills, as detailed below:

[redacted]

12.3.4 Identification of Industry Contacts and Interested Parties

Effective consultation is essential for sharing information and soliciting feedback, with the aim of aiding in the identification of potential impacts and potential viable avoidance or mitigation options. Effective consultation is facilitated with the establishment of a comprehensive contact database for local and regional fisheries associations, societies, groups, individual fishers and the various industry organizations. This database is maintained and regularly updated by the FLO in conjunction with Equinor Wind's key project team members.

Equinor Wind appreciates that some fisheries information, such as discrete fishing sites, can be commercially sensitive to those fishers. In these circumstances, Equinor Wind will work with the individual fishing organization/fisher to establish confidentiality agreements for the purpose of sharing information for the objective of using such information to work towards avoiding or minimizing impacts.

Members of the commercial and recreational fishing communities are identified through various different channels and include, but are not limited to:

- Contacting fishing industry leaders known through 25 years of the FLOs' liaison experience, including those contacts gained through acting as FLO for NYSERDA during the development of the New York State Offshore Wind Master Plan;
- Contacting fishing industry association leaders;
- Attending Fishery Management Council ("FMC") meetings;
- Attending meetings about offshore wind and other related topics;
- Manning stands at commercial and recreational fishing forums;
- Recommendations from state fisheries staff and NMFS staff;
- Fisheries Management Council Advisory Panel lists online;
- Public comments and documents online;
- Word of mouth from the fishing community;
- AIS monitoring including ship identification;
- Fishing vessels identified offshore during surveys by the OFLR;
- NMFS permit holder lists online;
- Dock visits; and
- Fisheries contacts information referenced in NYSERDAs New York State Offshore Wind Master Plan Fish and Fisheries Study (2017; Appendix J).

12.3.5 Communication Channels

As previously noted, Equinor Wind intends to reach a wide range of potentially affected parties in order to provide project updates, communicate during offshore activities, and to solicit feedback on the offshore wind energy development. In order to achieve this, Equinor Wind is taking a broad approach to dissemination of information. Equinor Wind will continue to use these practices as the project develops and will add further outlets as appropriate. Equinor Wind has been engaging with the fishing industry since being awarded the OCS-A 0512 Lease, with Equinor Wind's FLO representing Empire Wind and the Lease Area from January 2018 onwards. The FLO has documented over [redacted] contact events when including individual email notices. The comprehensive and inclusive fisheries outreach effort to date can be seen in Attachment 35.

Notices, information and project details have and will be distributed to the fishing community via the following methods and media:

- Contact with FIRs;
- Contact with fisheries associations;
- Directly from the FLO to individual fishermen not represented by an FIR, but identified on the FLO's database;
- USCG Notice to Mariners;
- Electronic email distribution to commercial fishing permit holders (NOAA or state agencies);
- Empire Wind's website- "Fisheries" page;
- Through fisheries-specific websites such as F-TWG and RODA should these developer information pages be developed as planned;
- Local harbor masters;
- State Fisheries mailing lists;
- 3D Simulation Tool demonstrations;
- Survey flyers;
- Statements of Common Ground ("SoCG");
- Fisheries specific newsletters;
- Presentations or networking at fishing conferences and exhibitions; and
- Notices in fishing news publications.

Throughout the consultation process, Equinor Wind will be open to consideration of other means or methods to that would provide for effective and efficient communication with the fisheries stakeholders.

Aid to Communications: 3D Simulation Tool

From experience developing offshore wind farms in Europe, Equinor Wind appreciates that it can be a challenge for the maritime community to offer meaningful feedback when the potential effects of the wind farm are only conceptual. This is even more challenging in the U.S. where there are no existing large offshore wind farms of comparable scope to use as a proxy. As such, Equinor Wind has developed a 3D offshore wind energy development simulation tool to facilitate consultation with the maritime community, building on a model developed for Equinor's Dogger Bank offshore wind energy development in the U.K. The model seeks to provide some perspective on turbine layouts, size and spacing where this is difficult to convey on paper charts. In particular, this can help focus discussions related to the ability to fish and transit between turbines.

The model has been designed for the user to select all weather and sea conditions, times of the day and year, and viewpoints from the bridge of fishing vessels with the ability to transit through the wind farm at user-selected speeds, bearings and environmental conditions. Appreciating the variety of fishing vessel types operating in the northeast U.S., the model includes five representative fishing vessels to select from. See Figures 1-4 for examples of these simulations.

Figure 1: Model Overview of a Wind Farm Layout

Figure 2: Model Simulation of Fishing Vessel Transiting Wind Farm in Clear Conditions.

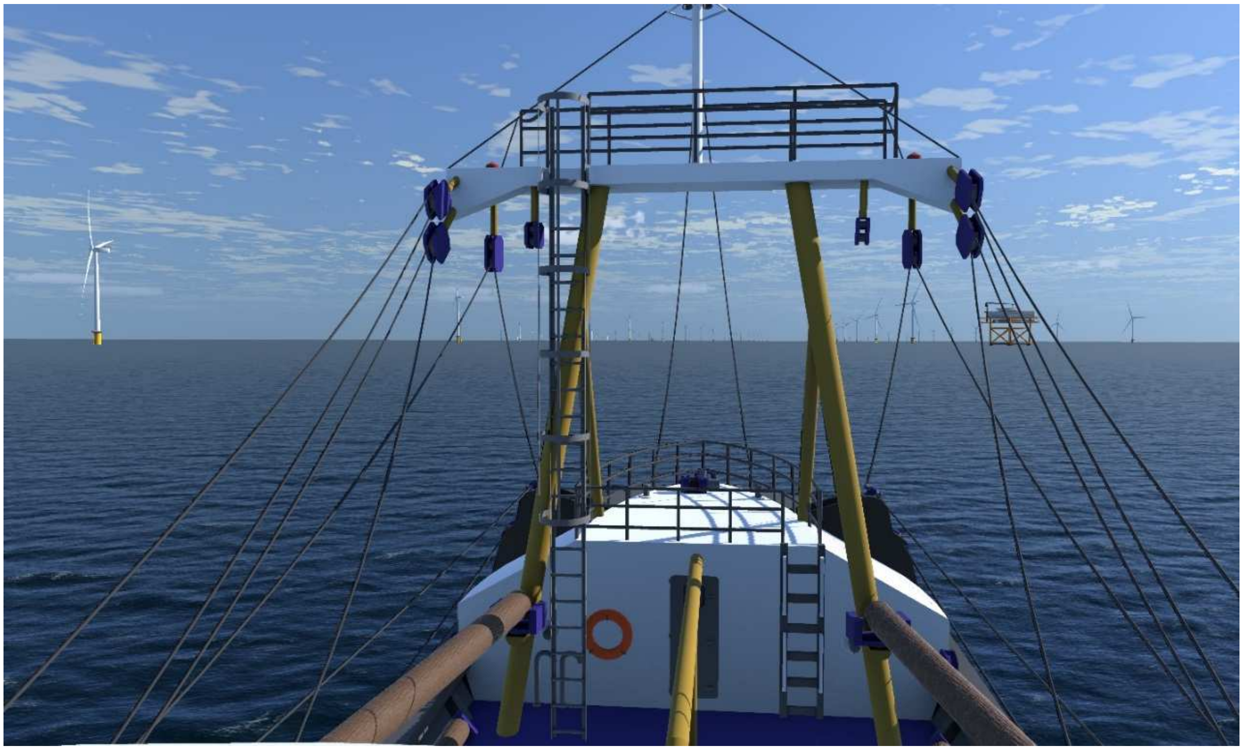

Figure 3: Model Simulation of Fishing Vessel Transiting Wind Farm in Stormy Conditions.

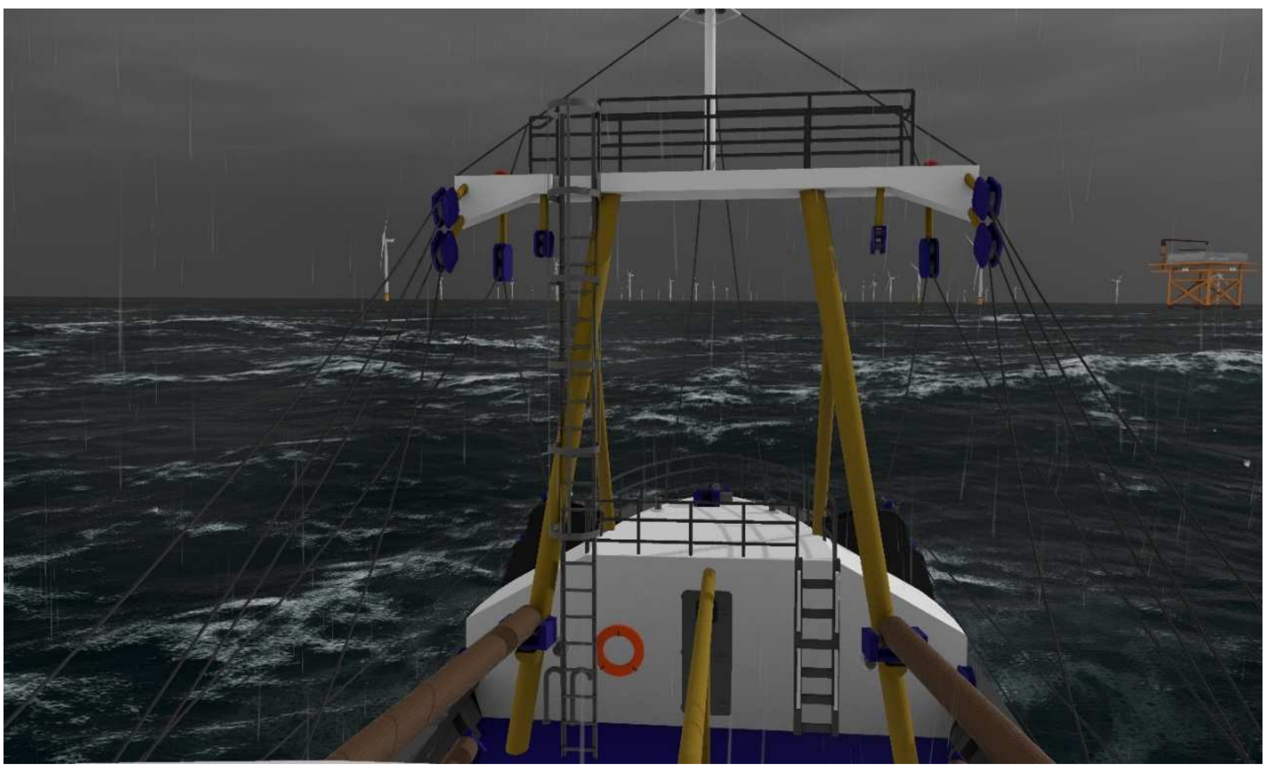

Figure 4: Examples of Types of Fishing Vessels that Can be Applied to the Simulation

The model is also used in consultation with the wider maritime industry to address impacts on maritime navigation safety and to inform layouts that facilitate search and rescue.

Equinor Wind has made the 3D model tool available for use in stakeholder meetings and will consider requests for FIRs to download and use the models to support consultation with their relevant members. Equinor Wind is committed to making the model available in F-TWG meetings to aid discussions on the FMP, as well as making it available for general F-TWG and M-TWG discussion purposes.

The 3D Simulation Tool may also be useful in wider stakeholder engagement, for example in schools, public meetings or awareness campaigns, and as such Equinor Wind is open to considering requests for additional usage.

Aid to Communications: Survey Flyers

Equinor Wind has and will continue to reach multiple fishers to solicit feedback and inform on survey activities via project specific Survey Flyers. The Survey Flyers include information related to survey schedule and activities; contact details for the vessel, OFLR and FLO; contacts in the event of an emergency; and a request for feedback should the information pose a potential conflict.

To date, Equinor Wind has issued hard and digital copies of Survey Flyers to contacts on the contacts database. For example, the Survey Flyer in February 2018 covered the start of offshore geophysical and geotechnical surveys in the Lease area, and the Survey Flyer in November 2018 provided an update on current operations and schedules. Examples of previously issued Survey Flyers can be seen in Attachment 36.

Equinor Wind will continue to issue Survey Flyers for future offshore surveys, with the next planned notice scheduled in advance of the Spring 2019 offshore survey campaign. Equinor Wind intends to adopt the same principle during offshore activities related to the construction, operations and decommissioning phases; that is, issuing flyers as a means of notifications to the fishing community at appropriate intervals/project milestones and in advance of activities.

Aid to Communications: Fisheries Newsletters

Equinor Wind will disseminate information and solicit feedback via project specific newsletters aimed solely at the fishing community. This is an approach that was successfully used by Equinor Wind with positive feedback from the fishing community in Europe. The Fisheries Newsletter includes:

- A project overview and update;
- Permitting, survey and construction schedules;
- Details of upcoming consultation meetings;
- Specific announcements related to requests for information;
- Links to other sources of information; and
- Contact information.

[redacted]

F-TWG Commitment and State Consultations

Equinor Wind is committed to working with organizations representing multiple fisheries groups such as F-TWG and RODA as a means to engage with the fishing industry, regulators and other developers more effectively. These groups will also serve as forums for identifying and collaborating on research needs and disseminating relevant information.

As previously stated, Equinor Wind has made a commitment to continue participation in the F-TWG and E-TWG and is committed to consulting and working with members of the F-TWG on the FMP. Equinor Wind is currently represented on the F-TWG by Martin Goff, who has many years of experience cooperating with the fishing industry in relation to offshore wind energy developments, and Stephen Drew, FLO for Empire Wind, who also comes with over 15 years of experience of collaboration between offshore industries and fisheries. Equinor Wind has attended all F-TWG meetings to date and has attended and contributed to all E-TWG meetings to date.

Should Equinor Wind be awarded a contract to supply offshore wind renewable energy certificates through this solicitation process, Equinor Wind will attend a project specific F-TWG session to present and consult on this FMP. It is beneficial to all parties if this session is held as soon after RFP award as feasible, and as such, Equinor Wind encourages the F-TWG to pre-arrange the session(s). Equinor Wind proposes to present all aspects of this FMP to the F-TWG during an all-day workshop, or as deemed appropriate by the wider F-TWG, soliciting and responding to feedback as it is received. Equinor Wind is committed to attending as many subsequent sessions as required in order to meet the goals of this FMP and the F-TWG coexistence philosophy.

Equinor Wind is also committed to consulting with New York state agencies throughout the offshore wind energy development process. There has already been engagement to date on matters including, but not limited to, the Empire Wind project development updates and schedules, benthic and fisheries resources, fisheries outreach and coexistence, avian and bat studies, onshore ecology, visual assessments and historic properties. Equinor Wind is committed to continue consulting with New York state, as other state agencies as appropriate, as the project continues to develop up to and post submission of all relevant state and federal permits.

Equinor Wind has already submitted a Site Assessment Plan (“SAP”) proposing the installation and operation of several meteorological and oceanographic (“metocean”) buoys and related site assessment activities. The SAP was submitted in June 2018. Equinor’s SAP was deemed complete on August 22, 2018 and approved November 21, 2018. The metocean buoys were installed December 2, 2018. In addition to federal agencies, Equinor Wind consulted with the relevant state agencies during SAP development and prior to SAP submission, including the New York State Department of Environmental Conservation (“NYSDEC”).

The next significant phase of development will be the submission of the Construction and Operation Plan (“COP”) describing all the activities necessary for the construction, operation, and decommissioning of the proposed offshore wind facility. [redacted] At the time of COP submittal, Equinor Wind will provide a copy to the New York Department of State, the NYSDEC, the New York State Office of Parks, Recreation and Historic Preservation, the New York State Department of Public Service, the New York Office of General Services, and NYSERDA so that they may review the COP concurrently with BOEM. In the event that a state agency requests a meeting, Equinor Wind will participate to discuss and attempt to resolve any issues that are identified, as applicable.

Equinor Wind already has been consulting with relevant state agencies and fisheries organizations as it develops the COP, including to inform the baseline characterization for fisheries resource and fishing practices, and for spatial planning and mitigation options of the offshore wind energy development. Equinor Wind has adopted a “no surprises” approach, whereby at COP submission all interested parties will have had opportunities to consult and input into the project. Equinor Wind will continue to consult with state agencies and fisheries organizations up to the point of COP submittal. As such, where feasible, state agencies and the fishing industry will have had opportunities to input into the COP pre-submission.

It is acknowledged that the awardee of the offshore wind energy contract should consult on the FMP post-contract award, with the objective of seeking and applying as much consultation feedback on the FMP as possible before the project advances to a stage where modifications are difficult. Due to the potentially short time period between contract award and COP submittal, Equinor Wind will proactively consult on the FMP, wherever feasible, to ensure there is sufficient time for feedback on fisheries related matters to be addressed prior to COP submission.

Communications During Surveys, Site Design, Construction, and Operations

Details regarding (i) Equinor Wind’s communication with the fishing community in advance of and during offshore site surveys, and (ii) Equinor Wind’s proposal to continue this communication as part of the FMP are covered in Section 12.7.2.

Details regarding how Equinor Wind is communicating with, and proposes to continue to communicate with, the fishing industry on matters related to construction and operations activities are also provided in Section 12.7.2.

Statements of Common Ground

As a means of aiding communications between Equinor Wind and the fishing industry, Equinor Wind proposes establishing Statements of Common Ground (“SoCG”). The principle of SoCGs is adopted from experience of using them during consultation with different stakeholders in the U.K. and Europe, including the fishing industry.

SoCGs are established between developers and stakeholders (in this case fisheries organizations) to set out the areas of agreement, disagreements, and any issues that remain unresolved between the two parties in relation to the proposed development. In particular, a SoCG seeks agreement on the degree to which access to commercial and recreational fisheries will be sufficiently protected during surveys, construction, operation and decommissioning of the project, and sets those out as clear recorded goals that can be referenced. This also helps to focus attention on matters unresolved or highlighted of being of key concern or priority, as well as giving regulatory agencies, for example BOEM and USCG, an insight into the consultation process and progress made for their decision making.

SoCGs are updated at appropriate intervals with the goal of achieving agreement on all matters. Typical contents include:

- A description of the proposed development and affected party (in this case fisheries organization);
- A summary of consultation to date between both parties;
- Matters agreed, disagreed, unresolved relating to:
    - Communication/Consultation;
    - Baseline data;
    - Impact assessments;
    - Mitigation;
    - Wind farm construction and decommissioning;
    - Wind farm design and operation;
    - Matters for further discussion; and
    - Supporting information.

Equinor Wind will solicit the opportunity of establishing an SoCG for each individual fisheries organization, appreciating that impacts and objectives differ based on the fishery location, gear type, season of operation, target commercial species and potential impacts from the offshore wind energy development. An example of an existing executed SoCG from another Equinor offshore wind farm development can be seen in Attachment 38.

12.4 Monitoring and Research (Pre-, During and Post-Construction)

Equinor Wind is committed to collecting and evaluating existing data, conducting research studies, incorporating feedback from the fishing community, and conducting site specific or collaborative regional surveys and research in order to establish a baseline characterization of the lease area's natural habitat, resources and uses. Establishing this baseline data is necessary to identify and quantify potential impacts from the proposed offshore wind energy development, identify mitigation options to avoid or minimize impacts, and establish protocols for monitoring impacts or data gaps where appropriate. Equinor Wind's efforts to establish baseline data and monitor for potential impacts are and will be conducted in accordance with best practices, including BOEM guidance as well as consideration of recommendations for further research from groups such as F-TWG and E-TWG. The purpose of this section is to provide an overview of Equinor Wind's approach to establishing baseline data, monitoring for potential impacts and changes in usage, and assessing and quantifying changes attributable to project activities.

Equinor Wind acknowledges that ongoing research and monitoring at the project site is important to refine the understanding of impacts, potential mitigation options, and for future planning purposes, including facilitating the responsible leasing and development of potential future offshore wind energy areas within the New York Bight in line with New York State's ambitious offshore wind energy targets. As part of the development of the Empire Wind Project, Equinor Wind is committed to exploring appropriate monitoring protocols. These could include, for example, monitoring of potential behavioral responses or changes in spatial and temporal distribution of biological resources or fishing practices as a direct result of the offshore wind energy development. Monitoring is further discussed in Section 12.4.4 and Section 12.5.

A robust data- and evidence-derived baseline characterization is important for identifying potential impacts, avoidance and mitigation options and monitoring protocols. Equinor Wind describes the current and planned efforts towards establishing baselines for benthic and fisheries resources in Section 12.4.2 and fishing activity in Section 12.4.3.

12.4.1 Baseline data

Baseline data may be categorized for use in two distinct areas:

- A baseline dataset that characterizes an area by habitat type, based on the presence, absence, or relative abundance of species, and by spatial and temporal use of the relevant area by receptors that may be impacted positively (positive beneficial) or negatively (negative adverse) by the development of an offshore wind energy development; and

- A baseline dataset used to monitor the impact of an offshore wind energy development before, during and after the development of a project.

Since executing the OCS-A 0512 lease in March 2017, Equinor Wind has been working diligently to understand the characteristics of the Lease Area and the potential environmental and social impacts of the Empire Wind Project. The fisheries baseline studies and information presented in this FMP is the product of numerous studies and analyses that have been conducted to date regarding the potential environmental impacts and benefits of the Empire Wind Project. Because detailed design, site evaluation, and environmental impact assessments remain ongoing, the FMP focuses on the process that has/will be used for identifying environmental receptors, baseline data, effects, and environmental impacts. Baseline data will continue to be refined as the project matures, with additional detail provided in the COP, which Equinor Wind will submit to BOEM in connection with the development of the Lease Area.

As part of the federal and state permitting processes, regulations and guidance are in place to ensure an acceptable baseline is established and that impacts are judged against that baseline. In accordance with these requirements, Equinor Wind has been actively engaging with relevant state and federal regulators and stakeholders regarding its approach to the baseline characterization of the Lease Area. Equinor Wind will continue consulting with the fishing community on baseline data, including via the F-TWG, RODA and through direct outreach.

Baselines can be established by using existing published reports, studies, data or data portals, or by direct data collection through surveys and desktop assessments. Equinor Wind's first step in establishing baseline data for the Lease Area has been a thorough literature review, data mining and gap analysis exercise to establish what information already exists. Equinor Wind evaluated the extent to which existing and publicly available data sources were suitable for characterizing benthic habitat and fisheries resources in the relevant area, including evaluation of NYSERDA's Master Plan Fish and Fisheries Study (2017; Appendix J). In 2018, as part of its survey activities, benthic sampling was conducted which included grab samples and photographs of the benthic habitat at specified intervals within the lease area and along the export cable corridor(s). The survey work will continue in 2019. The benthic information collected will have a direct relationship to the types of fisheries resources expected to be present, based on habitat type (*e.g.*, hard-bottom, soft bottom). The published data in conjunction with the survey data are supporting the preliminary characterization of baseline conditions in accordance with federal and state requirements and guidelines. [redacted]

12.4.2 Benthic and Fisheries Resources

This section describes the benthic and fisheries resources that are associated with Equinor Wind's Project Area. This discussion includes the following information on each resource or receptor:

(1) information currently available; (2) efforts to further collect data; (3) potential effects that are likely to have an impact; and (4) potential mitigation options that Equinor Wind is committing to or can be considered as appropriate to results from further studies and impact assessments. This section on benthic and fisheries resource has also been included in the Environmental Mitigation Plan ("EMP") as part of this proposal.

Regulatory Context

The fisheries of the United States are managed within a framework of overlapping international, federal, state, interstate, and tribal authorities. Individual states and territories generally have jurisdiction over fisheries in marine waters within 3 nautical miles ("nm") (3.5 miles ("mi") or 5.6 kilometers ("km")) of their coasts. Federal jurisdiction includes fisheries in marine waters inside the U.S. Exclusive Economic Zone ("EEZ"), which encompasses the area from 3 to 200 nm (3.5 to 230 mi or 5.6 to 370 km) offshore of any U.S. coastline (NOAA 2016). In addition to the regional fishery management councils ("FMCs"), an array of multi-state fisheries commissions coordinate conservation and management of the common interstate nearshore fishery resources—marine finfish, shellfish, and anadromous fish—for sustainable use. Together with National Marine Fisheries Service ("NMFS"), a division of the National Oceanic and Atmospheric Administration ("NOAA"), these councils maintain fishery management plans for specific species or species groups to regulate commercial and recreational fishing within their geographic regions. NMFS's Highly Migratory Species Division is responsible for tuna, sharks, swordfish, and billfish in the Atlantic Ocean (NMFS 2009). FMCs are required to identify essential fish habitat ("EFH") for each fishery covered under a fishery management plan. EFH is defined as the waters and seafloor necessary for spawning, breeding, or growth to maturity (16 U.S.C. § 1802(10)). "Fish" is defined as "finfish, mollusks, crustaceans, and all other forms of marine animals and plant life other than marine mammals and birds" (16 U.S.C. § 1802(12)). The role of the benthic habitat as a fisheries resource is fundamental to the identification of EFH, as reflected in the emphasis on EFH in BOEM's benthic survey guidance (BOEM 2013a). The guidance recommends that the NMFS EFH mapper tool (http://www.habitat.noaa.gov/protection/efh/habitatmapper.html) be used for species identification and habitat characteristics at any particular location (BOEM 2013a, page 4).

Impacts to benthic habitats and fisheries resources are managed under various federal laws including the Magnuson-Stevens Fishery Conservation and Management Act ("MSA"), Endangered Species Act ("ESA"), and NEPA. In support of the COP and associated evaluations of potential project-related impacts for Federal and State permit applications, BOEM's site characterization requirements in 30 C.F.R. § 585.626 are being applied to the benthic habitat and fisheries resource assessments.

BOEM is required to consult with NMFS as part of the NEPA process and if a proposed project is expected to adversely affect EFH. An adverse effect is defined as "any impact which reduces the quality and/or quantity of essential fish habitat," which includes physical, chemical, and biological impacts (NMFS 2004). Effects may manifest in a number of ways, either directly or indirectly, and on any spatial scale, including areas beyond EFH. For example, changes in water quality, benthic communities, or prey availability may constitute an adverse effect on EFH. BOEM must also consult with NMFS under Section 7 of the ESA for actions described in the COP that may affect anadromous fish species listed under the ESA. State agencies will also be consulted as part of the coastal consistency determination.

Preliminary Resource Characterization

Benthic habitat can be used to support prediction of the presence of fisheries resources, by providing information on sediment size/type, density, presence of submerged vegetation and other characteristics. The offshore lease area and large portions of the proposed export cable corridors are predominantly characterized as sand with isolated patches of gravel-sand. Finer grained sediments are expected within the New York Harbor. Although generally flat, the New York Bight contains sand ridges, filled valleys, shoal-retreat massifs, and paleoshorelines (NYSERDA 2017; Appendix A). In general, benthic habitat throughout the lease area is relatively homogeneous. During the BOEM offshore wind planning process prior to the lease auction, an isolated topographic high, known for its value to commercial and recreational fishing, was identified to the northwest of the lease area; this area, called Cholera Bank, is a sensitive feature that was subsequently removed from the lease area prior to lease sale. The National Centers for Coastal Ocean Science and BOEM are preparing comprehensive seafloor substrate maps of the New York Bight, with a particular focus on the lease area. Information from that study will be incorporated into the COP as appropriate when it becomes available and will be combined with Equinor Wind's site-specific benthic sampling to generate full benthic habitat maps.

A review of available data on seagrasses concluded that neither of the two seagrasses native to the New York Bight region exist within the lease area (NYSERDA 2017; Appendix A). Suitable habitat for seagrasses is limited to water shallower than 39 feet ("ft") (12 meters ("m")). While not present within the lease area, seagrasses are found along coastal areas, including the barrier island systems Long Island, and will, therefore, form part of the assessment for cable landfall locations and onshore cable routing.

Fish and invertebrate species of interest in the lease area fall into three groups based on regulatory status: (1) species managed under the MSA; (2) species listed under the ESA; and (3) non-game fish and invertebrate species that are considered important prey (or shelter, in the case of biogenic habitats) for fish and wildlife. Extensive long-term datasets are available to characterize fisheries resources in the lease area. In 2016, NYSERDA initiated three-year aerial surveys of sharks, rays, and large bony fish in the area (2017; Appendix J). Additional surveys will focus on fish and invertebrate population structure and distribution, and identification of potential impacts on EFH and sensitive habitats. NYSERDA concluded that the combined datasets from Marine-life Data Analysis Team ("MDAT"), the aerial fish surveys, and the Virginia Institute of Marine Science's Northeast Area Monitoring and Assessment Program together provide support for siting decisions for wind energy that would not interfere with fisheries resources.

In NYSERDA's Master Plan, the physical and biological character of the seafloor was described within the New York Bight through analysis of Multibeam Echo Sounder (MBES) and benthic survey data (2017; Appendix A). This in conjunction with the NYSERDA Master Plan Fisheries Study (2017; Appendix J) and additional scientific literature provide additional information to support describing baseline conditions as Equinor Wind develops the baseline conditions for its assessments.

Fish and Invertebrate Species Managed Under the MSA

Virtually all coastal U.S. waters are designated as EFH for at least one managed species. Designated EFH is an indicator of underlying habitat features important to fish. EFH delineates areas where the species may occur based on known occurrence of the species or habitat features important to the species/life stage. Construction, operation, and decommissioning of the project has the potential to directly and indirectly affect managed marine finfish and invertebrates as well as marine and estuarine habitats (including EFH) that support managed species and their prey. Therefore, locations of designated EFH for various life stages of managed species will be foundational to the benthic and fisheries resource assessment.

Just as the location of benthic EFH can serve as an approximate guide to locations of benthic fisheries species, locations of heavy harvests of managed fisheries are often associated with areas of physical impact. In fact, BOEM's benthic guidance recommends that areas affected by bottom-tending mobile fishing gear be identified and suggests that "publicly available commercial fishing data" be used to characterize benthic habitats (BOEM 2013a, page 5). In particular, heavy bottom trawls are known to disturb benthic EFH in many locations. The characterization of baseline benthic habitat conditions will take into account locations where heavy gear is expected to have caused physical injury to bottom habitats. On a similar basis, the location of historic and contemporary anchoring locations of large cargo vessels and tankers will be recorded, for localized disturbance to benthic EFH.

EFH has been designated in the lease area for various life stages of more than two dozen non-migratory managed species, including finfish, sharks and rays, and invertebrates, as provided in Figure 5. Designated EFH for three (3) coastal migratory pelagic and seventeen (17) highly migratory managed fish species also occurs in the lease area, as provided in Figure 6. EFH is designated in the lease area by both the Mid-Atlantic Fishery Management Council ("MAFMC") and the New England Fishery Management Council ("NEFMC") for species that occur in both jurisdictions. EFH for other species and/or life stages may be present along the export cable corridor. On April 9, 2018, the *Federal Register* published NEFMC's Final Rule, which modified the designation of EFH for numerous species that occur in the lease area (NEFMC's Omnibus Essential Fish Habitat Amendment 2; 50 C.F.R. Part 648). In this Final Rule, NMFS approved: (1) all of the updated EFH; (2) all of the recommended habitat area of particular concern ("HAPC"); (3) the majority of the habitat management area recommendations; (4) all of the seasonal spawning area recommendations; and (5) the framework and administrative recommendations.

Figure 5: Non-Migratory Species with Designated EFH within the Lease Area

	Managed Species		Egg	Larval	Juvenile	Adult

Federal & State-Listed Endangered Fish Species

Three federally-listed endangered fish may occur in the lease area: (1) Atlantic salmon (*Salmo salar*); (2) the Atlantic sturgeon (*Acipenser oxyrinchus*); and (3) shortnose sturgeon (*Acipenser brevirostrum*). On August 17, 2017, NOAA NMFS designated critical habitat for the Atlantic sturgeon in certain areas, including the New York Bight (Endangered and Threatened Species; Designation of Critical Habitat for the Endangered New York Bight, Chesapeake Bay, Carolina and South Atlantic Distinct Population Segments of Atlantic Sturgeon and the Threatened Gulf of Main Distinct Population Segment of Atlantic Sturgeon; 50 C.F.R. Part 226). New York classifies the Atlantic sturgeon as protected. Both the manta ray (*Manta birostris*) and the oceanic whitetip shark (*Carcharhinus longimanus*) were recently classified as threatened under the ESA (50 C.F.R. Part 223). The most current official distribution and abundance data on these species are available from NMFS. Independent researchers often publish supplemental data on various aspects of endangered species in localized areas, such as movement patterns, spawning locations, life history traits, and other factors that may be relevant to the impact analysis. New York classifies the shortnose sturgeon (*Acipenser brevirostrum*) as endangered. The shortnose sturgeon is found in the lower portion of the Hudson River from river mile 0 (southern Manhattan) to river mile 152 (the Federal dam at Troy) (NYSDEC Shortnose Sturgeon Fact Sheet, available at: http://www.dec.ny.gov/animals/26012.html). NYSDEC lists a number of other fish species as endangered, most if not all, are associated with fresh water habitat which will be evaluated, as applicable to the export cable route.

It is virtually impossible to demonstrate the absence of a rare species within its historical range; therefore, these three endangered fish species will be assumed present in the lease area, albeit in limited abundance and frequency based on the type of habitat that is present. More details on the spatial and temporal distribution of Atlantic sturgeon is expected to be available soon, resulting from BOEM funded studies carried out by Stony Brook University. Equinor Wind has also made its metocean moorings available to Stony Brook University to attach Atlantic sturgeon receivers to in order to gather more data. This has resulted in three additional sensors being deployed in the lease area in December 2018 and an additional sensor to be installed in spring 2019. Data will be collected from these sensors for approximately another two years, to develop a broader knowledge of Atlantic sturgeon movements in the vicinity of the lease area.

Non-Game Fish and Invertebrate Species

Useful data on the distribution and abundance of non-game fish and invertebrates come from many sources, including fisheries management plans, peer-reviewed literature, and NMFS reports. Although the Estuarine Living Marine Resource database (NOAA 2000) has not been kept current, the descriptions of spatial and temporal distributions of species (by life stage) in Hudson River/Raritan Bay and the Great South Bay provide a framework for describing current conditions in the area of the proposed cable landing(s). NYSERDA recently reviewed the Ocean Biogeographic Information System and confirmed that typical invertebrates of recreational and commercial interest in the lease area include longfin and shortfin squid, lobster, horseshoe crab, blue crab, scallop, ocean quahog, and Atlantic surfclam (NYSERDA Master Plan; 2017; Appendix J). NYSERDA also reviewed the available data on the suitability of habitat and the presence of living coral. Most coral habitat is well to the east of the lease area (near the continental shelf break). However, a small area of coastal Long Island was identified as having habitat suitable to support corals (NYSERDA 2017; Appendix A). The New York Department of State ("NYSDOS") has designated 250 areas within the potential export cable corridors as Significant Coastal Fish and Wildlife Habitats (NYSERDA 2017; Appendix J).

Ongoing and Planned Assessments

BOEM has published recommended approaches for assessing benthic habitat and fisheries resources during the permitting phase of offshore wind projects: (1) *Guidelines for Providing Benthic Habitat Survey Information for Renewable Energy Development on the Atlantic Outer Continental Shelf* (Benthic Guidelines; BOEM 2013a); and (2) *Guidelines for Providing Information on Fisheries for Renewable Energy Development on the Atlantic Outer Continental Shelf* (Fisheries Guidelines; BOEM 2013b). Because fisheries resources are defined by their use as commodities, BOEM has also provided guidance on evaluating the impact of wind projects on the socioeconomic aspects of fishing: *Guidelines for Providing Information on Fisheries Social and Economic Conditions for Renewable Energy Development* (BOEM 2015a), which are further referenced in Section 12.

Existing Data Collection and Monitoring Efforts

Under BOEM funding as part of their efforts to map the lease area during the leasing stage, and subsequently continuing after the Lease was awarded to Equinor Wind, NOAA's National Ocean Service ("NOS") conducted extensive surveys over three years using sonar and sediment grabs using research vessel Research Vessel ("RV") Nancy Foster, adding to data collected earlier in 2013 on RV Ferdinand Hassler (NOAA NOS Survey Report). [redacted]

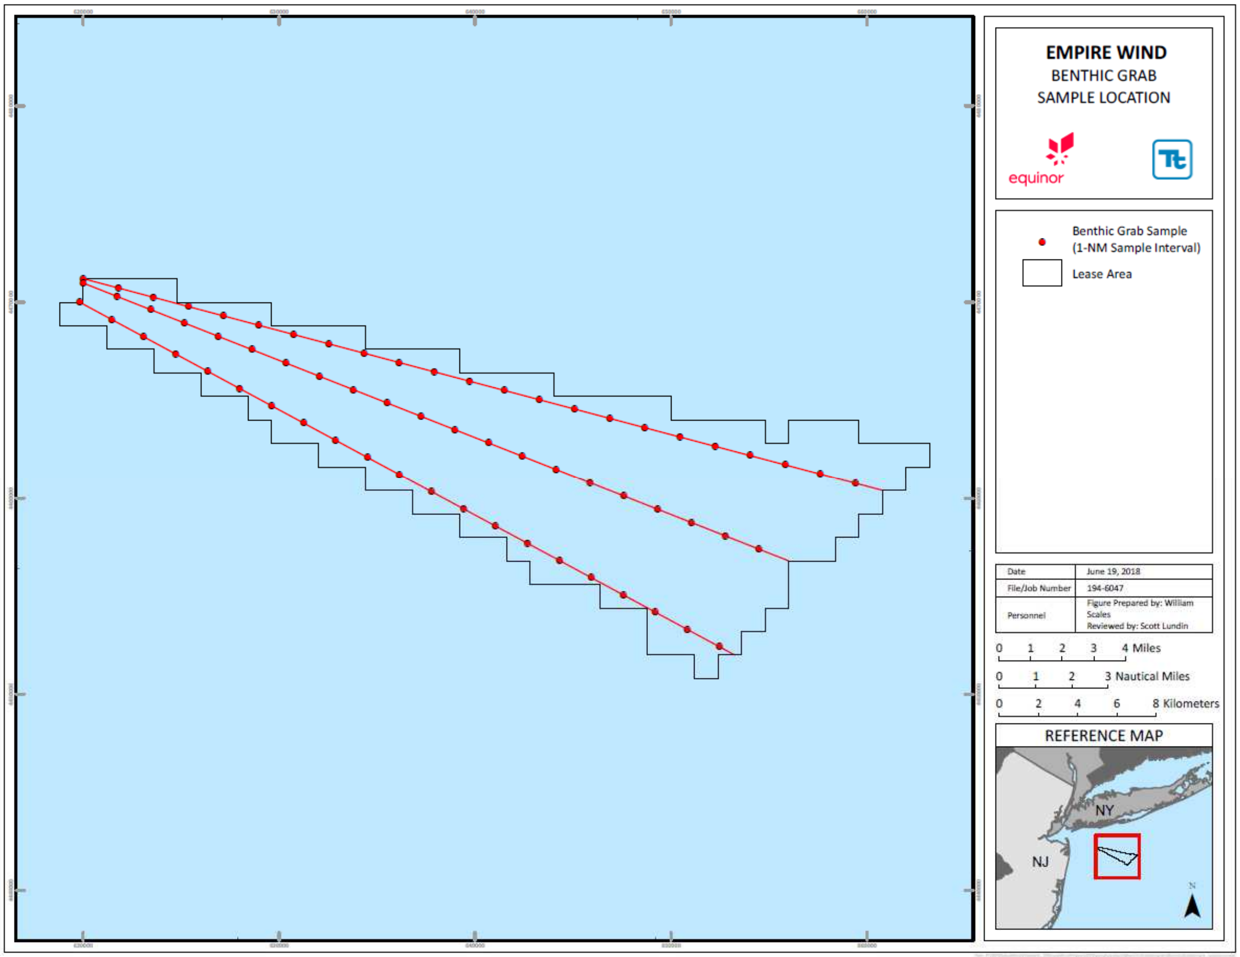
Equinor Wind Data Collection

To support the assessment of benthic and fisheries resources in the lease area, Equinor Wind conducted geophysical, benthic, and geotechnical work from March 2018 to November 2018 across the entire lease area and a large proportion of export cable corridors, with additional geophysical, benthic, and geotechnical surveys planned for 2019 to fill in any data gaps, in particular from landfall to the 65 ft (20 m) depth contour. The plans for the 2018 surveys were submitted to BOEM in November 2017 and subsequently approved in February 2018. An Incidental Harassment Authorization ("IHA") was submitted to NOAA NMFS and issued in April 2018. A High-Resolution Geophysical ("HRG") Survey Plan was also issued. In the spirit of openness and transparency, Equinor Wind has made these documents available for download from the Empire Wind webpage at www.empirewind.com/environmental.

Equinor Wind contracted Alpine Ocean Seismic Survey Inc. ("Alpine") to perform the surveys, using survey vessels RV Shearwater and RV Ocean Researcher from March 18, 2018, to December 2, 2018. The survey equipment and scope included, but was not limited to, the following:

- Gridded survey lines at a spacing of approximately 98 ft by 1,640 ft (30 m by 500 m);
- Depth sounding (multibeam echosounder) to determine site bathymetry and elevations;
- Magnetic intensity measurements (gradiometer) for detecting local variations in the regional magnetic field from geological strata and potential ferrous objects on and below the bottom;
- Seafloor imaging (sidescan sonar survey) for seabed sediment classification purposes, to identify natural and man-made acoustic targets on the seabed, as well as any anomalous features;
- Shallow penetration sub-bottom profiler to map the near-surface stratigraphy (from seabed surface to 16.4 ft (5 m) below seabed) soils below the seabed;
- Medium penetration sub-bottom profiler to map deeper subsurface stratigraphy as needed (soils down to 75-100 m below seabed);
- CPTs and Vibracores in the lease area and along the export cable corridors;
- Sediment grab samples and drop-down video images at 67 sampling locations (see Figure 7) to support the interpretation of geophysical data to characterize surficial sediment conditions and benthic habitat, including macrofaunal analysis with samples sieved at 0.5 mm mesh size.

Figure 7: Locations of 2018 Benthic Survey Campaign within Lease Area



Data from the 2018 HRG and benthic surveys will be analyzed and reported on in 2019 to applicable stakeholders. Preliminary and anecdotal results from the survey crew are consistent with descriptions of the expected habitat from previous studies. Full results will inform planning and mitigation with additional survey data in 2019 being added as appropriate and used in the development of the COP and other State and Federal permit applications as required.

Equinor Wind is currently planning and procuring contractors to conduct benthic sampling along the proposed export cable corridors, with sampling expected to take place in spring 2019. Sampling will be as consistent with the benthic sampling conducted within the lease area and will include as a minimum the following:

- Sediment grab samples for grain size analysis;
- Drop-down camera and/or video images;

- Grab samples for macrofauna.

In addition, and as previously noted, BOEM has funded studies that are being carried out by Stony Brook University to monitor the spatial and temporal distribution of Atlantic sturgeon within the New York Bight and Equinor Wind's lease area. The study is coming to a close at the time of writing. Equinor Wind has made its metocean moorings available to Stony Brook University to attach Atlantic sturgeon receivers to in order to gather more data. This has resulted in three additional sensors being deployed in the lease area in December 2018 and an additional sensor to be installed in spring 2019. Data will be collected from these sensors for approximately an additional two years.

Baseline Summary

Equinor Wind evaluated the extent to which existing, and publicly available data sources are suitable for characterizing benthic habitat and fisheries resources in the lease area. Both published data and ongoing survey efforts in the lease area and surrounding waters support the preliminary characterization of baseline conditions in accordance with Federal and State requirements and guidelines.

Furthermore, Equinor Wind presented the list of data sets proposed to be utilized for the baseline characterization of benthic and fisheries resources to NOAA NMFS in March 2018 and August 2018. NOAA NMFS provided feedback, including additional data sets to use, and agreed with the conclusion that there is sufficient existing data for a baseline characterization in the lease area.

As such, additional benthic and fisheries surveys are not deemed to be required within the lease area for the purpose of the COP impact assessments, spatial planning or mitigation, however Equinor Wind will consult with E-WTG, F-TWG, RODA, and the fishing industry, including fisheries scientists and managers on requirements for further surveys for targeted fisheries monitoring and research.

12.4.3 Commercial and Recreational Fishing

Both commercial and recreational fishing are important activities in the waters in and surrounding the Lease Area. Commercial fishing typically consists of either fixed or mobile fishing gear. Fixed gear fisheries use static gear such as lobster pots, fish traps, and gillnets, which are set in one location and then checked or retrieved later. Mobile gear fisheries use dynamic, mobile fishing gear such as otter trawls, mid-water trawls, purse seines, dredges, and rod and reel which are deployed while in motion aboard a vessel.

Recreational fishing in the region involves fishing vessels operating out of numerous ports located in New Jersey, New York, Connecticut, Rhode Island, and southeastern Massachusetts, including the Elizabethan Islands, Nantucket and Martha's Vineyard (RIDEM 2017). Recreational fishing occurs year-round but is most intensive from April through November. There are three types of saltwater recreational fishing activities common offshore and along the coasts of the New York Bight; shore-based fishing, fishing by private vessels and fishing by charter vessels.

The marine aquaculture industry, which is predominantly focused on shellfish, is also present along the coast from New Jersey to Massachusetts.

Regulatory Framework

Regionally, fishing in US federal waters of specific species is governed, under the MSA, 16 U.S.C. § 1801 et seq., through eight Regional Fishery Management Councils that develop species-specific FMPs. These FMPs establish specific fishing quotas, seasons, and closed areas. NOAA NMFS works in partnership with Regional Fishery Management Councils to assess and predict the status of fish stocks, set catch limits, ensure compliance with fisheries regulations, and reduce bycatch. NOAA Fisheries Highly Migratory Species Office manages highly migratory species, such as tuna, sharks, swordfish, and billfish, in U.S. Atlantic Ocean, Gulf of Mexico, and Caribbean waters that travel long distances, crossing domestic and international boundaries. Specific to the Lease Area, the NEFMC, MAFMC, and the Atlantic States Marine Fisheries Commission ("ASMFC") manage the multiple species and fisheries in federal waters. While the NEFMC is principally managing the fishery resources of New England (Maine, New Hampshire, Massachusetts, Rhode Island, Connecticut), there is considerable overlap with the Mid-Atlantic Council concerning species with ranges that span between the two councils.

The ASMFC supplements state regulations and fisheries management within federal waters. In particular, since 1996 the ASMFC has managed the lobster fishery within state waters from Maine to Virginia. This fishery is currently managed under Amendment 3, Addenda I-XXVI. Since 2015, the ASFMC has also managed the Jonah crab fishery within this same range under the Interstate Fishery Management Plan and Addenda I-III. Under the Jonah crab fishery management plan, participation in the directed fishery for this species is tied to a lobster permit. Lobsters are managed under three separate stocks: Gulf of Maine, Georges Bank, and Southern New England. The stocks are divided into seven management areas.

Within individual state waters and potentially directly affected by project activities, commercial and recreational fisheries are managed by NYSDEC. Coastal cities and towns within these states manage the residential shellfisheries in all waters within their boundaries that are not closed by respective state agencies for public health or other reasons, with the exception of the commercial harvests that remain under respective state control.

The NYSDEC Division of Marine Resources manages and maintains the state's living marine, estuarine and anadromous resources, (marine fish 6 NYCRR Part 40; lobster and crabs 6 NYCRR Part 44) and protects and enhances the habitat upon which these resources depend. NYSDEC works in cooperation with adjoining states and U.S. federal agencies concerning marine fisheries regulations.

Additionally, New York has established CMPs as part of the National Coastal Zone Management Program which addresses coastal issues, including sustainable and resilient coastal community planning, ocean planning, and planning for energy facilities and development. These programs are a voluntary partnership between the federal government and U.S. coastal and Great Lakes states and territories authorized by the CZMA of 1972 and administered by NOAA.

In 2009 the Governors of New Jersey, New York, Delaware, Maryland, and Virginia signed the Mid-Atlantic Governors' Agreement on Ocean Conservation. The Agreement established the MARCO as a partnership to address new ocean challenges and opportunities through agreed upon shared regional priorities. MARCO leverages existing state and federal resources, knowledge, and partnerships to build a stronger base of information and experience to make well-informed decisions in the best interest of the states and their constituents on these priorities.

Within this comprehensive regulatory framework, commercial and recreational fishing remains an important segment of regional economies. The seafood product preparation and packaging and wholesale and retail seafood sales sectors are major parts of the commercial fishing industry. Marinas, Navigational Services, Port & Harbor Operations, and Ship & Boat Building sectors provide goods and services to both commercial and recreational fisheries. Recreational anglers also support sales and employment for fishing equipment retailers, purchase goods from bait and tackle shops, rent or buy boats, or pay for charter vessels. Additional expenditures can also include food and drink purchases from local restaurants, gas for vessels, and lodging at local hotels for fishing trips. While vessels from as far away as North Carolina and Florida make use of the infrastructure present in the region to unload and sell fish (RI Ocean SAMP 2010), local ports potentially impacted by the project mainly range from New Jersey to through southeastern Massachusetts.

Preliminary Resource Characterization, Ongoing and Planned Assessments – Fishing

Equinor Wind is gathering data on both commercial and recreational fishing practices within the Lease Area and adjacent waters through multiple sources and approaches, including referencing the work of others. For example, New York State's Master Plan Fish and Fisheries Study (2017; Appendix J) provides an excellent overview of fishing areas throughout the NY Bight based on input from various stakeholders, including valuable summary figures of commercial fishery intensity, recreational fishing area. Other sources include BOEM's New York Bight leasing efforts; federal efforts by NOAA NMFS; and additional state efforts NYSDEC and Rhode Island Department of Environmental Management ("RIDEM"). In addition, emphasis has been on seeking and verifying fisheries use through direct consultation with the commercial and recreational communities. To date most of this information has been used for the purpose of identifying potential impacts and then attempting to avoid or reduce potential impacts through thoughtful spatial planning, layouts and best practices during surveys.

The key data sources referenced for the purpose of understanding the fisheries use baseline are summarized, but not limited to the following:

- BOEM's 2017 Study entitled, Socio-Economic Impact of Outer Continental Shelf Wind Energy Development on Fisheries in the U.S. Atlantic;
- State by State analyses of public, commercial fisheries statistics as published by the NOAA Office of Science and Technology;
- NOAA Fisheries Marine Recreational Information Program (MRIP) data on recreational fishing;
- Rhode Island Department of Environmental Management - Division of Marine Fisheries' paper entitled, Spatiotemporal and economic analysis of vessel monitoring system data within wind energy areas in the greater North Atlantic;
- The Mid-Atlantic Regional Ocean Council ("MARCO") Data Portal;
- The BOEM & NOAA Marine Cadastre National Viewer for geospatial data; and
- The Northeast Regional Ocean Council's ("NROC") spatial data portal.

As previously described, direct engagement with the fishing community is key to understanding the fisheries use in the Lease Area and waters of adjacent areas. This has been an extensive part of Equinor Wind's efforts towards understanding fisheries use in the Lease Area and adjacent waters. The consultation with the fishing community can be seen in Attachment 35

As well as using existing data sources and gathering data through consultation, Equinor Wind is also collecting data on fisheries in the field. [redacted]. Although AIS data is picked up by onshore antennas, the quality and spatial and temporal coverage in parts of the Lease Area may be occasionally negatively affected by atmospheric conditions. [redacted]

However, not all fishing vessels are required to have AIS installed or transmitting, and not all vessels have AIS switched on or transmit correct details. As such, AIS cannot be solely relied on as a proxy for fishing effort. [redacted]

[redacted]

Other efforts to build on the understanding of existing fishing effort include:

- Taking nautical charts to recreational and commercial fishers and asking them to mark fished areas and hang ups. Equinor Wind has included Long Range Navigation ("LORAN") to help aid positioning.
- Requesting navigation plotter/logger data of tows, for example these have been provided by a number of trawlers and used for planning purposes
- General discussions with fishers.
- Using fisheries resource baseline and in particular commercial species, as a proxy to areas that are or may be fished.
- Using long term purchased AIS datasets, real-time AIS data and collecting AIS in the field.
- [redacted]
- Visual and radar observations in the field, conducted by the OFLR.
- Observations from the Equinor Wind digital aerial avian surveys, where vessel images were an opportunistic data point.

[redacted]

12.4.4 Monitoring and Research Opportunities

As described previously, Equinor Wind acknowledges that ongoing research and monitoring at the project site is important to refine the understanding of impacts, potential mitigation options, and for future planning purposes, including facilitating the responsible leasing and development of future offshore wind energy areas within the New York Bight in line with New York State's ambitious offshore wind energy targets. As part of the development of the Empire Wind offshore wind energy development, Equinor Wind is committed to exploring appropriate monitoring protocols, for example monitoring of potential behavioral responses or changes in spatial and temporal distribution of biological resources or fishing practices as a direct result of the offshore wind energy development.

In addition, Equinor Wind is in favor of developing and supporting research initiatives that focus on addressing coexistence; that is, research that improves the opportunities for continued and improved access for recreational and commercial fishing in the operational offshore wind energy developments. This may include research aimed at innovative technical approaches to issues such as turbine spacing, impacts on navigation equipment, trawling equipment and information dissemination options.

As the operator of three offshore wind farms in the U.K. (Sheringham Shoal 317 MW, Dudgeon Offshore Wind Farm, 402 MW and the world's first commercial floating offshore wind farm Hywind Scotland, 30 MW), [redacted]

Equinor Wind is also enthusiastic about the possibility of exploring collaborative research and monitoring efforts. Where common approaches to studies can be made, for example related to access to fishing grounds or common benthic and fish species. Equinor Wind is open to collaborate with other offshore wind energy developers on matters such as funding and providing suitable locations and operational support. Equinor Wind has successfully worked with other offshore wind energy developers on collaborative research and can continue to build on these established relationships.

Likewise, Equinor Wind is also open to collaborative research and monitoring opportunities with other organizations as appropriate. Equinor Wind would advocate for groups such as F-TWG, E-TWG and RODA as being the forums for which these research opportunities are explored and addressed.

Equinor Wind is also committed to making nonproprietary data available that can support fisheries research. As an example, Equinor Wind will be making the following fisheries related studies and/or data publicly available either through the COP process or directly on the Empire Wind webpage:

- 2018 benthic survey report covering the "SAP" related survey locations within the Lease Area (benthic grab samples with grain size and macro fauna analysis, drop down video stills, habitat description);

- 2018 benthic survey report covering "COP" related survey locations within the Lease Area totaling 67 sample locations (benthic grab samples with grain size and macro fauna analysis, drop down video stills, habitat description);

- 2019 benthic survey report covering "COP" related survey locations within the proposed export cable corridors (benthic grab samples with grain size and macro fauna analysis, drop down video stills, habitat description);

- 2017 to 2018 digital aerial survey images, monthly and quarterly reports of avian species, marine mammals, sea turtles and data of large bony fish assemblages as observed from the 12 x monthly digital aerial surveys carried out from November 2017 to October 2018; and

- Oceanographic data not deemed proprietary, for example seawater temperature and salinity, from the "Metocean Facilities" deployed within the Lease Area.

Additional publicly available datasets for other non-fisheries resources and studies are described further in the Environmental Mitigation Plan (Section 13).

Equinor Wind is willing to make non-commercially sensitive data from its metocean buoys available for research, for example into how oceanographic variability affects species abundance and spatial and temporal variability. Equinor Wind is currently in discussions with Rutgers University Department of Marine and Coastal Sciences on sharing the seawater temperature data to help support the understanding of the "cold pool" effect driving spatial and temporal distribution of marine life in the New York Bight. The cold pool phenomenon was frequently raised in New York State's State of the Science Workshop (November 2018) as well as BOEM's NY Bight Task Force Meeting (November 2018). In this regard, it is Equinor Wind's belief that understanding physical and biological drivers on biological resource spatial and temporal distribution is essential in order to identify and robustly design effective and meaningful future research and monitoring.

Equinor Wind is open to exploring other outlets for sharing information, for example Equinor Wind can upload fisheries related datasets and reports to the F-TWG webpage and/or RODA webpage. Version control is important however, and it is essential that stakeholders have access to the most recent studies. As such, the issue of version control and key repositories for this data will be further discussed and agreed in F-TWG and E-TWG.

Additional details related to the existing collaborations, and potential future collaborations designed to support other research opportunities can be found in Section 16.

Fisheries Resource

Further research and monitoring is important where data and knowledge gaps remain that may present uncertainties over potential adverse impacts attributable to the effects of offshore wind farm development. It is important that these effects are better understood in order to more accurately quantify impacts, identify potential mitigation options, and reduce uncertainty and conservatism built into impact assessments. This may also help to avoid or reduce impacts through adaptive management in future offshore wind energy leases and developments.

Where feasible, monitoring and research should ideally be targeted towards interactions between offshore wind energy developments and the receptors it is being judged against. From the outset, any research and monitoring should be statistically robust, such that changes in spatial and temporal distribution, and/or behavior pre, during and post construction can be detected at levels statistically attributable to the effects. For some biological monitoring, this level of robustness is not always possible as many outside factors can influence these variations with much greater significance than the factors that can be attributed to causes from offshore wind energy developments. This may be especially true in a dynamic environment such as the New York Bight. For example, attributing changes in a target commercial fish species abundance to offshore wind energy development presents challenges as abundance and distribution can vary spatially and temporally due to outside factors and pressures such as fishing quotas, oceanographic conditions (seawater temperature, nutrients), and distribution and availability of that receptors food resource. As such, for highly variable receptors there has been a shift away from pre, during and post construction monitoring of abundance and distribution of wildlife in Europe, and a focus towards behavioral responses associated with different phases of offshore wind energy developments. Equinor Wind has been involved in this work in Europe and would advocate for similar initiatives in the northeast U.S. These experiences have been and can continue to be shared via the F-TWG and E-TWG.

As a means to determine the statistical power of proposed studies, Equinor Wind advocates that technical experts conduct statistical power analyses up front in the planning process before implementing any future studies. In addition, F-TWG and/or E-TWG are appropriate forums to focus on the development of such analyses and should be part of this planning process. Finally, the fishing industry, fisheries managers and fisheries scientists all have an ability to input into potential monitoring requirements and methodologies, and where appropriate, may also have an opportunity to conduct the monitoring.

Equinor Wind has already participated in and funded novel research and monitoring for offshore wind energy developments and in offshore oil and gas developments where results have relevance to offshore wind energy developments. For example, Equinor collaborated in the UK Carbon Trust ORJIP One Bird Collision Avoidance Study (ORJIP One), UK Carbon Trust ORJIP Four Acoustic Deterrent Devices (ORJIP Four), and the developer led DEPONS (Disturbance Effect on the Harbour Porpoise in the North Sea, DEPONS, 2015).

Equinor Wind has also conducted novel research and monitoring on our existing offshore wind energy developments, for example the tagging of breeding Sandwich terns with GPS loggers to monitor foraging patterns in relation to the Equinor operated Dudgeon Offshore Wind Farm, U.K. Equinor is also part of the Sound and Marine Life joint industry program, which supports research to help increase the understanding of the effect of sound on marine life generated by oil and gas exploration and production activity, with some aspects being directly relatable to offshore wind energy developments, for example offshore seismic surveys and impact pile driving. Equinor Wind would be pleased to provide more details on these studies in F-TWG and/or E-TWG to support future study design.

Fishing

Equinor Wind advocates for monitoring and research initiatives that focus on addressing coexistence and continued and improved access for recreational and commercial fishing in the operational wind farm. This involves a more technical approach to issues such as turbine spacing, impacts on navigation equipment and information dissemination requirements for safe fishing, as demonstrated by discussions with stakeholders to date.

Equinor is committed to working with the F-TWG and wider fishing community, as well as relevant state and federal authorities up to and post RFP contract award to establish the key fisheries coexistence data gaps, the potential studies that can better inform these gaps or impacts, to agree on methodologies and conduct meaningful studies.

Monitoring changes in pre and post construction fishing effort due to the presence of an offshore wind energy development can be challenging. Many factors dictate fishing effort within a given area on a seasonal and year by year basis which make statistically detecting “change” difficult. For example, fishing effort may be influenced by factors such as quota, presence of a mobile species, market prices, fuel prices and fisheries closures. As such, due to the complexities and the need to design a methodology that has both industry and fisheries support, Equinor Wind proposes that such studies be discussed as part of the F-TWG. In addition, Equinor Wind will consult on potential monitoring and research via other fisheries groups such as RODA and FLOWW. The first step may be to carry out a study on comparing fishing effort in the Lease Area and adjacent waters year to year over the past five years prior to offshore wind energy development to test variability and whether further change can be statistically detected.

Equinor Wind is committed to studying if and why fishing activity may be affected by its offshore wind energy development, and where relevant, then determining what measures can be implemented to avoid or reduce the likelihood of negative adverse effects through design and mitigation. All efforts have been addressing this upfront in the early design phase; however, should impacts present themselves during later development, including into the operations phase, Equinor Wind can consider several options; (i) explore whether further mitigation can be applied to reduce impacts (*e.g.*, improved access through technical solutions to fishing practices and/or navigation equipment); (ii) using adaptive management by applying mitigation in the spatial planning and layouts of later phases of the Lease development; and (iii) sharing the results so that they can be used in adaptive management on a wider scale, for development of future lease areas in the New York Bight and wider offshore wind energy space.

12.5 Supporting Other Research

As described in Section 12.4, Equinor Wind is committed to collaborate with the fishing community, F-TWG, E-TWG and RODA, other offshore wind energy developers and third-party groups to conduct robust and relevant research studies that relate to fisheries resource or fishing practices in relation to offshore wind energy developments.

As described in Section 12.4.4, as well as making the Empire Wind offshore wind energy area available for monitoring and research when it can be done in a safe and practical manner, Equinor Wind is also willing to consider proposal requests to access existing Equinor's operating offshore wind energy developments in Europe. We acknowledge that some of the research opportunities that can facilitate coexistence may need to be conducted in operational offshore wind farms. Equinor Wind is currently the operator of three offshore wind farms in the U.K. (Sheringham Shoal 317 MW, Dudgeon Offshore Wind Farm, 402 MW and Hywind Scotland, 30 MW). Due to potential differences in biological resources, this research may be best suited to studies related to fishing feasibility within operational wind farms. Options can be discussed through the F-TWG, E-TWG, RODA or in direct consultation with the fishing industry.

Equinor Wind is also willing to make data available that can support wider fisheries research that may not be directly linked to offshore wind farm developments, but can inform future fisheries practices. For example, Equinor Wind is willing to make non-commercially sensitive data from the metocean data buoys available for research into how oceanographic variability affects species abundance and spatial and temporal variability. Commercially sensitive data is deemed to be for example, but not limited to, wind resource data and operational availability estimates, but can be clarified further with the F-TWG at the time of consulting on research opportunities.

[redacted]

[redacted] Equinor Wind is also committed to working with the F-TWG and E-TWG to (i) prioritize key research needs and data gaps; and (ii) establish best practices for evaluating techniques and proposals;.

In addition to the financial commitment, Equinor Wind will, where feasible, consider making existing wind farm related vessels or buoys available for research opportunities where this does not materially impact existing objectives of those resources. For example, Equinor Wind will consider proposals for adding additional or third-party self-contained sensors on survey vessels, construction vessels, O&M vessels, wind farm structures or wind farm related buoys and metocean moorings. As a demonstration of this commitment, Equinor Wind has already provided this opportunity to SUNY Stony Brook ("Stony Brook") so that they could attach three receiver gates to the metocean moorings that were deployed in December 2018. [redacted]

As further demonstration of Equinor Wind's commitment to novel and collaborative research and monitoring, Equinor Wind is collaborating with the Wildlife Conservation Society ("WCS") and Woods Hole Oceanographic Institute ("WHOI") on real-time large whale detection and notification buoys in a minimum 2-year monitoring program. [redacted]

12.6 Avoiding, Mitigating and Minimizing Impacts- Benthic & Fisheries Resources

Benthic and fisheries resource characterization has been described in Section 12.4.2. This section describes the potential impact producing factors on those resources that have been identified to date, and how Equinor Wind intends to avoid or mitigate those effects during surveys, construction, operations and decommissioning to minimize the impacts where feasible.

12.6.1 Potential Impacting Factors

An understanding of the potential effects from offshore wind energy developments that have the potential to impact benthic and fisheries resources, either positively or negatively, have come from experience, literature on the subject and from New York State's Offshore Wind Master Plan Fish & Fisheries Report (2017; Appendix J). The potential impact producing factors identified that are relevant to benthic habitats and fisheries resources are as follows:

- Short-term temporary physical disturbance to habitats and species resulting from seabed preparation, anchor spreads, jack-up barge footings and the installation of subsea cables during construction, decommissioning and limited maintenance periods;
- Short-term temporary habitat loss resulting from seabed preparation, anchor spreads, jack-up barge footings and the installation of subsea cables during construction, decommissioning and limited maintenance periods;
- [redacted]
- Short-term temporary increased suspended sediment concentration and deposition (smothering) resulting from seabed preparation and the installation of subsea cables during construction and decommissioning, and from short duration scouring events during operations;
- Temporary exposure to accidental spills, pollution or trash from project related vessels;
- Long-term temporary habitat loss or modification resulting from the presence of foundations, scour material and surface cable protection during operations;
- Long-term temporary changes to existing physical oceanographic conditions during operations due to the presence of structures; and
- Potential exposure to Electromagnetic Fields ("EMF") during operations.

12.6.2 Potential Mitigation

The baseline characterization and assessment of future potential impacts on benthic habitats and fisheries resources from the construction, operation, and decommissioning of the project must satisfy the requirements of various regulations and jurisdictional agencies. As such, collaboration and coordination with BOEM, NOAA NMFS, NYSDEC and relevant stakeholders throughout the development and planning process, will be critical to the success of the project. In order to mitigate for the potential impacts to benthic habitats and fisheries resources associated with the construction, operations, and decommissioning of the project, Equinor Wind is implementing the following mitigation measures:

- Avoiding, to the extent possible, siting structures (wind turbines, offshore substations, and submarine cables) in areas of sensitive habitat;
- Using best management practices and timing during cable installation activities to minimize sediment resuspension and dispersal in areas of known historically contaminated sediments;
- [redacted]
- A commitment to sufficiently bury electrical cables where feasible, minimizing seabed habitat loss and reducing the effects of EMF;
- Consideration of the timing of construction activities; working with the fishing industry and fisheries agencies on sensitive spawning and fishing periods to actively avoid or reduce interaction with receptors, where feasible;
- Using industry Best Practices for vessel operation, and implementing an Oil Spill Response Plan ("OSRP").

More confidence in the type and level of impacts to benthic and fisheries resources will be determined as the project matures and on submission of the COP. However, certain assumptions can be made at this stage for the purpose of the bid, based on preliminary information and experience, as described in further sections.

Surveys

Equinor Wind is following BOEM best practice guidance for surveys and submitting survey plans for review and approval prior to survey activity, which addresses potential impacts to benthic and fisheries resources during survey activities, for example exposure to noise through geophysical surveys or disturbance to habitats and species through benthic and geotechnical sampling. Where there is potential for impacts on threatened or endangered species, NOAA NMFS is included in the survey plan review in coordination with BOEM.

Sensitive benthic habitats are actively avoided where feasible, by taking this into consideration in the planning phase, for example routing export cable corridors to avoid sensitive habitats and therefore avoid the need for intrusive surveys there. This practice will be continued as the Empire Wind project develops. In addition, real-time avoidance is and will continue to be applied for seabed intrusive sampling by the use of drop down cameras to inspect the seabed prior to taking samples. For the summer 2018 geotechnical and benthic sampling, the team of Environmental Scientists onboard the survey vessel provided this real-time monitoring.

As such, and where feasible, sensitive benthic habitats will be avoided to the greatest extent possible when conducting seabed intrusive surveys through a combination of avoidance through spatial planning pre-survey, then avoidance during surveys through real-time monitoring.

Construction

Habitat Loss

With embedded mitigation in place, including project siting to avoid sensitive habitats, Equinor Wind expects that impacts to sensitive benthic habitats and fisheries resources resulting from seabed disturbance and temporary habitat loss will be avoided or reduced to as low as feasible. With expected high recoverability rates of immobile species and the return of mobile species following the disturbing activity, Equinor Wind does not expect significant adverse impacts. Disturbance to the seabed habitat during construction is expected to recover within a relatively short time period, with recolonization expected within several years for most species. The level of disturbance from construction activities is likely to be consistent with seabed disturbance and recovery resulting from existing anthropogenic pressures in the lease area and adjacent waters, such as bottom contacting commercial fishing activities and commercial vessel anchoring.

With highly sensitive habitats being avoided through spatial planning and micro siting, the potentially affected areas are therefore expected to be of the relatively homogenous sand or sandy gravel habitat type. The overall affected area during construction activities is expected to be an insignificant proportion of the overall available habitat in context to the Empire Wind offshore wind energy development, full lease area, and available similar habitats and species in adjacent waters. Equinor Wind will calculate actual affected areas and habitat loss and will share those results with the E-TWG and F-TWG, as well as publishing as part of the COP.

Suspended Sediments and Deposition

Exposure to increased suspended sediment concentration and potential smothering of benthic organisms and fish larvae resulting from cable installation and seabed preparation is expected to be short-term in duration and within the timescales of a tidal cycle. Sediments in the lease area are of a sand to gravelly sand nature and settlement rates are relatively fast. The suspended sediment concentrations generated through construction activity are also expected to be within the background levels of wave-induced suspended sediments from natural storm events, such as "nor-easters" typical of the region. In this instance the affected areas are expected to be localized and significantly smaller than affected areas from natural storm events. Equinor Wind will be carrying out sediment transport modeling to quantify the suspended sediment concentrations, durations and affected areas and will share these results with the F-TWG, as well as publishing as part of the COP.

Water Quality

The routing of the export cable corridor has taken into consideration existing and historic dumping grounds (charted) and has actively avoided them where feasible. As stated, much of the routing is in areas that are characterized as sand, where larger grain-sizes reduces the potential for contamination to be present. More information on sediment properties and potential impacts will become available as data from the 2018 surveys is analyzed and reported and as Equinor Wind completes additional nearshore surveys and sediment sampling in 2019, where chemical characterization will occur in areas of grain-size <90%. The information gathered will inform a sediment transport analysis. If contaminants are present, any release of contaminants will be of a short-term temporary nature and of limited spatial coverage. Additionally, Best Management Practices will be defined to further mitigate these effects.

Underwater Noise

[redacted]

Operations

Electromagnetic Fields

Equinor Wind intends to mitigate for potential EMF effects by burying cables to sufficient burial depths based upon existing fishing practices and cable burial risk assessments. Where target burial depth is not feasible, for example, due to challenging seabed conditions or cable crossings, the cables will be sufficiently protected with surface cable protection. The likelihood for receptor-effect interaction will be reduced, with impacts not expected to be significant adverse. The UK National Policy Statement for Renewable Energy Infrastructure EN-3 (DECC, 2011) states that for offshore wind, electrical cables that are sufficiently protected or buried will not result in significant impacts on sensitive species. It is however appreciated that species within the lease area will be different to those in U.K. waters and, therefore, Equinor Wind is open to discussing further monitoring and research to fill any data gaps through the E-TWG and F-TWG. Equinor Wind will carry out EMF modeling and assessments as part of the COP submission.

Suspended Sediments and Deposition

Existing information indicates the subsurface currents within the lease area and adjacent waters are expected to be typically less than 0.32 ft/s (0.10 m/s). To better understand the physical environment, Equinor Wind has installed current meters in the lease area as of December 2, 2018 to collect site-specific measurements and will also be performing sediment transport modeling as part of the COP assessments. Based on the existing information, the relatively low near-bed current speeds are not expected to generate significant quantities of suspended sediments and deposition from scouring. Equinor Wind is conducting further studies to identify where scour protection may be required, which will further reduce the magnitude of suspended sediments affecting receptors. Similar to construction activities, the suspended sediment concentrations generated through scour in the operations phase are also expected to be within the background levels of wave-induced suspended sediments during natural storm events, such as '"nor-easters" typical of the region. In this instance the affected areas are expected to be localized and significantly smaller than affected areas from natural storm events.

Loss of Habitat

The seabed in the lease area and adjacent areas surrounding is relatively homogenous, made up of sand and sandy gravel. More detailed information on the habitat type and benthic community will become available as data from the 2018 and 2019 surveys become available and NOAA NOS Survey Report referenced in Section 13.6.3 is published.

[redacted]

The introduction of hard structures to an otherwise sandy mobile seabed may be considered a positive beneficial impact, as the hard structures offer a new habitat type for colonizing based on the associated 'reef' effect (see BOEM "Rigs to Reefs" at https://www.bsee.gov/what-we-do/environmental-focuses/rigs-to-reefs). The change to habitat type and potential change to species may be topic for further monitoring and research in consultation with F-TWG and E-TWG.

Decommissioning

Impacts resulting from decommissioning activities are not expected to exceed impacts resulting from construction. Moreover, with requirements expected for the removal of structures at or just below the seabed level, Equinor Wind expects the seabed will recover to its pre-construction condition within a relatively short timeframe. Decommissioning impacts and mitigation will require further consideration and should form part of future E-TWG and F-TWG discussion points. Approaches and requirements will likely further be refined as European offshore wind energy developments near closer to decommissioning and as US offshore wind energy development matures. Equinor Wind will use those experiences to apply to decommissioning best practices to avoid and minimize impacts associated with the Empire Wind Project, as appropriate.

12.7 Avoiding, Mitigating and Minimizing Impacts- Fishing

This section summarizes Equinor Wind's intentions and efforts towards identifying potential impacts to the fishing industry and how those impacts have been or will be addressed through avoidance or mitigation. Consideration is given to the period covering survey activities; activities up to and including the construction phase; the operational life of the offshore wind energy development(s); and decommissioning.

Further details of impact assessments for commercial and recreational fisheries will be developed as the project matures towards COP submission, and through continued engagement with the fishing community. Equinor Wind believes there are opportunities to reduce impacts on recreational and commercial fisheries to as low as practical, where additional mitigation options still to be explored as part of ongoing consultation, information gathering, and project design. As such, Equinor Wind believes that there are opportunities to ensure significant adverse impacts can be avoided, and where these cannot be avoided, potentially offset.

12.7.1 Potential Impacting Factors

The potential impact producing factors relevant to commercial and recreational fishing have been identified through previous experience, referencing literature and best practice guidelines on fisheries, for example in NYSERDA's Fish and Fisheries Study (2017; Appendix J), and direct feedback from the fishing community. This has also been a subject of study by NOAA NMFS, as presented in NY's State of the Science conference (November 2018) and BOEM's NY Bight Task Force Meeting (November 2018). Equinor Wind will continue to consult with the fishing community to ensure that all relevant potential impacts or concerns are identified and addressed as appropriate. The identified impact producing factors and/or concerns are as follows:

- Adverse impacts to target commercial fish species resulting from offshore wind energy development surveys, construction activities, operations and decommissioning.
- Positive beneficial increases in species biodiversity and abundance during operations.
- Short term temporary displacement or restricted access to traditional fishing grounds during surveys and construction and decommissioning.
- Long term temporary displacement or restricted access to traditional fishing grounds during operations.
- Navigational safety concerns during construction due to partially constructed infrastructure.
- Navigational safety concerns during surveys, construction, operations and decommissioning due to increased project related vessel traffic.
- Navigational safety concerns during operations due to changes in existing vessel patterns, for example displacement of existing vessels.
- Navigational safety concerns while transiting due to the presence of structures (*e.g.,* allision and impacts on navigation equipment during operations.

- Navigational safety concerns while fishing due to the presence of structures, subsea cables, cable protection, scour protection, furrows and dropped objects during operations.
- Positive beneficial increase in search and rescue capabilities at sea during operations (as seen in Forewind's SoCG; see Attachment 38).
- Increased transit times due to the presence of structures and/or restricted access during operations.
- Increased resource pressure on existing commercial fisheries due to the attraction of other fisheries, for example an increase in recreational fisheries and fixed gear fisheries.
- Navigational safety concerns for existing commercial fisheries due to the attraction of other fisheries, for example an increase in recreational fishing vessels and fixed gear.
- Increased pressures on existing fisheries in adjacent waters due to fisheries displaced from the project area.
- Navigational safety concerns due to the presence of partially removed structures at decommissioning.

Each of these identified potential impacts are addressed in the following sections, either with in built mitigation being applied, commitments to mitigation, or suggestions for mitigation that should be considered as part of the F-TWG consultation and as the project matures.

12.7.2 Potential Mitigation

Surveys

Equinor Wind has committed to minimizing adverse impacts to fisheries during Empire Wind's project related offshore surveys by pro-actively avoiding potentially conflicting activities with fishing. Where feasible, Equinor Wind will avoid areas being fished at the time of survey activities and take steps to survey alternative areas. This has been achieved so far through thoughtful spatial planning and scheduling, applying consultation feedback, notifications of planned surveys, fisheries liaison during surveys, fisheries liaison and observations in the field during surveys, real-time monitoring of potentially conflicting activities, and adaptive management approaches.

Equinor Wind's commitments to avoid or mitigate impacts during surveys are described below, including examples of where these commitments have been put into practice already.

Pre-Survey Avoidance through Spatial Planning

Measures to minimize impacts started at the early design stage and it is Equinor Wind's intention to continue to follow this process going forward. Through the use of pre-survey consultation, Equinor Wind tries to first reduce the risk of potential conflicting activities in the planned areas for surveys and development.

For example, when planning export cable corridors, Equinor Wind consulted with the fishing industry on areas between the Lease Area and potential landfalls, so that the export cable corridors could be routed to avoid apparent high use, high value, and high sensitivity areas. This ensured surveys could proactively plan to avoid fishing activity, but also avoid future impacts during cable installation and in operations where feasible. In addition to consultation, Equinor Wind utilized available fisheries data, habitat data, information on existing subsea telecommunication cables and pipelines and the company's own extensive experience in developing offshore wind farms and offshore oil and gas platforms (with associated pipelines and/or electrical cables) for planning the proposed export cable route(s).

This pre-survey consultation with fisheries also gave Equinor Wind valuable information related to cable burial requirements and concerns over surface cable protection, should burial not be feasible. For example, feedback from the clam dredge industry on dredge penetration provided valuable information regarding requirements for sufficient burial depths. Survey methodologies were adjusted accordingly to ensure sufficient data was collected to be able to inform cable burial feasibility to these depths. Likewise, feedback on the concerns of cable surface protection, in particular concrete mattresses, led to planning routes where feasible cable burial is a primary objective.

Pre-Survey Planning: Timing

Where feasible, Equinor Wind has and will continue to plan the timing of offshore surveys to avoid or reduce the risk of conflicting with fishing activity. As an example, pre-survey consultation with the squid fishery and data reviews indicated that in some years the squid fishery can be concentrated in the Lease Area in the months of May through September, most likely in the western section of the Lease Area around a feature known as Cholera Bank, which lies directly west and outside of the Lease Area. As a means to mitigate impacts on the squid fishery, Equinor Wind adapted the survey line plan to cover the Cholera Bank area in May and June so that the survey vessel could be clear of the area if the squid fishing was present later that season. As such, there have been no reports of impacts on the squid fishery through Equinor Wind's survey activities.

This practice will be continued for future offshore surveys where feasible and in consultation with the fishing community.

Notifications

Equinor Wind is committed to disseminating information related to offshore survey activities to the fishing community in advance of surveys. This can be achieved using several different approaches or media and is in addition to the wider project notification (see Section 12.3.5). The purpose of early and often notifications is to; (i) solicit feedback if the proposed activities have the potential for impacts so that mitigating actions can be considered presurvey; (ii) warn of increased vessel activity; (iii) provide contact details for the FLO, OFLR and vessel should contact need to be made; (iv) keep the fishing community updated on the project related activities in general; and (v) advise when survey activities have finished.

To date, Equinor Wind has contacted approximately [redacted], survey flyers, and calls related to survey activity. In addition, some of the survey information has been re-broadcasted by state agencies and fishermen's organizations that have agreed to distribute the materials to their members, and has been included in notifications through USCG Notices to Mariners.

The inclusion of OFLRs when appropriate and feasible also means notifications can be provided in "real-time." For example, if the OFLR observes a fishing vessel in the field, the OFLR has the ability to contact that fisher via radio to disseminate information.

In addition to notifications, Equinor Wind will regularly solicit feedback on fishing activity during surveys, through a combination of direct outreach to the fishing community, state fisheries agencies and federal fisheries agencies. As an example, Equinor Wind's FLO actively sought additional sources of information on the location of fishing activity through periodic inquiries to NOAA NMFS regarding general fleet movements, and through monitoring non-confidential data available through VMS. During the summer 2018 geophysical surveys, emphasis was on monitoring the squid fishery fleet movements leading up to and during the period when they are known to fish within the lease area. [redacted]

Adaptive Management: Survey Areas and Export Cable Routes

Equinor Wind has incorporated flexibility into the offshore survey schedule and spatial planning for the offshore wind energy area and export cable corridors so that an adaptive management approach can be taken as more information is collected during surveys and stakeholder outreach. This has been applied through several practices.

First, the team onboard the survey vessels had the mandate to modify planned survey areas. For example, surveyors had a mandate to alter planned routes in favor of alternate areas that had not been identified in pre-survey consultation or data if they determined the planned route was likely to be of high importance to the fisheries.

Further, during the summer 2018 geophysical survey, real-time side scan sonar data identified areas of potentially hard ground in sections of the export cable corridor in an otherwise predominantly sandy seabed. The harder ground can be associated with crab & lobster fishing, or recreational fishing. The OFLR also observed surface marker buoys associated with fixed gear. A decision was subsequently made in real time to avoid this area, modify the survey plan for the export cable corridor and then survey alternative areas deemed to be of lower potential conflict.

Equinor Wind will continue to use this form of adaptive mitigation going forward as remaining or additional sections of export cable routes are surveyed in 2019.This same technique may also be used at the time of detailed design surveys, should they be required pre-installation.

Adaptive Management: Timing of Surveys

If certain areas cannot be avoided altogether through spatial planning due to a lack of technically and commercially feasible alternatives, the timing of surveys can be planned to avoid or minimize disturbance to fishing activity. As an applied example, during the summer 2018 geophysical surveys, a short section of the export cable corridor from the Lease Area to landfall contained a high density of fixed lobster fishing gear. An appraisal of alternative cable routes to the north and south of this section did not provide any suitable alternatives without significant deviation and increased technical and commercial challenges. As such, avoidance through adaptive spatial planning was not feasible and the section was upheld, subject to exploring further mitigation to deconflict the section in the construction and operations phase with the relevant fishery. The presence of the experienced OFLR onboard meant the OFLR would be able to advise the vessel master on safely navigating through the section, avoiding fishing gear. However, a conservative decision was made by the project team to avoid potential conflict from the survey activity altogether and cease surveys in this area until a time when less fishing gear was present, and risks were reduced. Through the FLO, Equinor Wind learned this particular area closes to fixed gear fishing during the month of May. Equinor Wind plans to complete the survey of this section of the route in May 2019, if feasible due to scheduling and other considerations, which will reduce the potential risk of disruption and potential impacts to this fishery. If, during survey work, it is determined this area cannot be avoided during active fishing, Equinor Wind is committed to work with the fisheries to determine the best methods to conduct the survey work and minimize disturbance.

Adaptive Management: Real-Time Monitoring

Equinor Wind has adopted a real-time monitoring approach to improve its ability to apply the adaptive management options previously described during surveys; that is, to pro-actively avoid surveying areas being fished to avoid potential conflicts.

Many northeastern fishing vessels broadcast their information with the Automated Identification System (“AIS”). Requirements for AIS on fishing vessels are limited, but it can be a valuable source of information on vessel movements in some areas and under certain conditions. Sea Risk, the company providing Equinor Wind’s FLO, has years of experience using AIS in relation to subsea cable damage prevention in the U.S. and overseas, monitoring AIS in real-time with specialized software on a 24/7 basis.

As an example of this approach being trialed and then implemented for the full survey period, during the summer 2018 geophysical survey the FLO was tasked with operating AIS software loading real-time vessel movements in the New York Bight 24/7. Every morning during the survey, Sea Risk reviewed and recorded a 24-hour visual record of vessel movements for distribution by email to the survey vessel, OFLR, onshore survey manager and Equinor Wind. Although there can be issues with AIS data quality, and not all fishing vessels broadcast, it nonetheless provided valuable information about fleet movements and activity of larger vessels. The daily AIS snapshot provided the survey and other project participants a preview of vessels heading in their direction, transiting and working nearby. Although no fishing vessels were observed within areas of potential conflict that required modifications to the survey plans, it provided the tools to make modifications to planned efforts in advance, should there have been a need.

This system also facilitates data collection of fishing practices and transits within the Lease Area and export cable corridors for use in identifying potential impacts and addressing with mitigation. For example, detailed movements of different mobile gear types in the area, including scallop and clam dredges and bottom trawls, are being used to consider maneuverability, speed, towing areas, and water depths of fishing vessels active in the lease as input to the design of turbine layouts, orientation, and spacing.

Equinor Wind is committed to having the real-time AIS monitoring approach as a tool to be considered for future surveys, where appropriate.

Adaptive Management: Consultation During Surveys

In addition to the efforts described above, the FLO actively sought additional sources of information including periodic inquiries to NOAA NMFS regarding general fleet movements, and non-confidential data that can be gained with the VMS. Where potential conflicts with fishermen have become apparent, the survey vessel has moved away.

Summary of Proposed Mitigation for Future Survey Activity

Based on the experience of applying mitigation to avoid or reduce impacts on fisheries during surveys to date, Equinor Wind intends to apply the following mitigation during future survey activities:

- The outset philosophy of purposefully avoiding fishing activity, where feasible;
- Using adaptive management to avoid fishing activity during surveys;
- Pre-survey consultation on proposed survey areas to inform spatial planning to avoid high sensitivity areas;
- Pre-survey consultation on proposed survey areas to inform the planning and scheduling of surveys to avoid fishing activity;
- Real-time adaptive management of the location of export cable corridors and project areas that survey data and visual observations shows to have the potential to impact fisheries during the operations phase;
- Use of an OFLR where appropriate and feasible;

- Real-time monitoring of fishing activity to pro-actively direct survey vessels away from fishing;
- Ongoing consultation during survey activity to seek information of intentions to fish in areas being surveyed; and
- Regular dissemination of survey activity information to the fishing and maritime communities via media including survey flyers, email mailshots, USCG Notice to Mariners ("NTMs"), information posted on the project-specific website, and making survey activity information available on fisheries targeted websites such as the F-TWG operations page and/or RODA.

Construction

Equinor Wind will approach construction activity with a similar philosophy to those employed for survey activities; that is to avoid conducting construction activity at times and in locations where active fishing is underway. However, due to the complexity, schedule and costs associated with construction activities in comparison to surveys, this requires different approaches to reach the same outcome. Some of the details of how construction will take place, when and in what areas is still being determined as the project matures, and as such estimates described within are based on experience and literature. Commitments for the construction phase will be discussed and agreed upon as part of the consultation of the FMP with the F-TWG and other applicable parties.

The type of construction activity and impact to the project through implementing mitigation needs consideration. Mitigation needs to be both effective and proportionate to the reduction in impact that mitigation will have. In some circumstances, if impacts to fishers remain significant and adverse, alternative mitigation or offsets may be a preferred and a more appropriate option.

Equinor Wind is familiar with certain types of avoidance or mitigation measures that can be employed based on previous experience of developing offshore wind energy projects. Additional measures may be identified and explored in consultation with the fishing community. These are addressed on an impact-by-impact basis, as described in Section 12.7.1. Potential construction related-impacts are summarized again below:

- Adverse impacts to specific commercial fish species, resulting from offshore wind energy development construction activities;
- Short-term temporary displacement or restricted access to traditional fishing grounds during offshore wind energy development construction;
- Navigational safety concerns during offshore wind energy development construction due to partially built infrastructure (*e.g.*, as a result of foundations being installed a season before wind turbines); and
- Navigational safety concerns during due to increased project related construction vessel traffic.

Impacts on fisheries resources, in particular target commercial species is covered in Section 12.6.2 and is therefore not repeated in this section. However, some of the commitments and mitigation options aimed at avoiding or minimizing impacts to fisheries resources will have direct applicability on fishing access. This is covered further below.

As with surveys, Equinor Wind will, where feasible, plan to avoid construction activities in areas and/or at times when fishing activity is likely to be present or is present. This requires two distinct approaches; pre-planning of timing and location to avoid conflicting activities; and, adaptive management during construction activities. In addition, Equinor Wind can consider "rolling construction zones," whereby discrete areas of construction activity are closed to other vessels for safety reasons, without restricting larger areas (*e.g.*, within the boundaries of the entire offshore wind development area). These approaches are discussed further below.

Pre-Planning Timing and Location

As with surveys, where feasible, Equinor Wind will determine sensitive timing and locations of fishing activity to help plan avoidance measures (*e.g.*, avoidance of the squid fishery that data and consultation has shown can be concentrated in the Lease Area from May to September). As previously mentioned, it is not always possible to avoid conflicting activities during construction, as some timing is limited by other external factors such as construction vessel availability, seasonal restrictions, weather and schedule delays; however, Equinor Wind can use information like this to minimize the "likelihood" of interaction. For example planning for construction activities, such as foundation installation or inter-array cable laying, in this area outside an area of potential peak squid fishery. Equinor Wind understands that the location of focused squid fishing may vary year to year; therefore, continuous consultation with these stakeholders will allow for effective construction scheduling.

In addition, consultation can offer alternative options for fisheries less subject to spatial and temporal fluctuations and seasonality of target species. Equinor Wind will share as much scheduling information as early as possible so that fishers can also plan around construction activities. For example, sharing a set start date, duration and locations of construction activity may provide the scallop fishery an opportunity plan longer term fishing areas, with the option to fish conflicting areas prior to or after that particular construction activity. It is possible that temporary displacement from a traditional ground may still occur, but with pre-warning and the ability to make alternative plans, the effects of that impact can be reduced.

Equinor Wind will commit to provide as much notice as possible to facilitate consultation and pre-planning for both parties through the suite of options described in Section 12.3.5, including but not limited to:

- Survey/Construction Flyers;
- Through email shots and notifications sent via the FLO direct to fishing contacts, FIRs and state fisheries agencies;

- Through direct communication in meetings;
- Notifications on Equinor Wind's webpage and fisheries webpages such as F-TWG and RODA, as appropriate;
- In Fisheries Newsletters; and
- USCG NTMs.

In addition, Equinor Wind is committed to exploring the following pre-planning timing and location options with the F-TWG and fishing industry:

- Protocols for regular two-way dissemination of information related to fishing and construction activity to aid timing and location planning; and
- Consideration of planned or expected timing, location and type of fishing activity when planning construction locations and timing.

Adaptive Management Timing and Location

With the challenges associated with accurate timing of construction activity and equally challenging nature of predicting the spatial and temporal presence of some highly mobile fish species, it may not always be possible to avoid conflicting activities as planned. Best practices to reduce the likelihood of conflicting activities may fail if a mobile commercial species appears at a different location or construction timing accelerated is modifed. In these circumstances adaptive management must be considered.

If, for example, a high number of fishing vessels are already fishing for, or have opportunities to start fishing for, squid Equinor Wind can consider, in consultation with representatives of that fishery, options to move some pre-planned construction activity to an alternative location. If there is flexibility to do this without significant and disproportionate impacts to the construction activity, then this can be considered.

The use of real-time monitoring with AIS, visual observations from the OFLR and regular updates on the fleet movements from the FLO and FLO sources can all contribute toward understanding (i) fleet movements, (ii) where and when potential conflicts may arise, and (iii) how to avoid or mitigate any such potential conflicts.

Equinor Wind will commit to have an OFLR on board project related construction vessels, where appropriate and feasible to aid with adaptive management and to help with the dissemination of information to/from the FLO to/from the vessel master and/or fishers in the field.

In summary, the adaptive management options Equinor Wind is committing to explore further with the F-TWG and the fishing industry are:

- Protocols for regular two-way dissemination of information related to fishing and construction activity to aid adaptive project construction location decision making;

- Use of real-time monitoring of fishing activity, such as AIS, to aid adaptive project construction location decision making;
- Protocols and situations in which the project can consider modifying construction timing and location within short notice periods; and
- Use of an OFLR onboard project related construction vessels to aid communications and monitoring of fishing activity.

[redacted]

[redacted]

[redacted]

[redacted]

[redacted]

Advanced and continued notifications to the fishing community are essential for all options described in this section to be effective. As such, and if implemented, Equinor Wind will establish notification protocols in consultation with F-TWG and the fishing industry for the use of fixed, partially fixed or rolling construction and safety zones. Should these options be applied, Equinor Wind will commit to having an OFLR onboard the project related construction vessels to further aid communications in the field.

The options Equinor Wind is committing to explore further with the F-TWG and the fishing industry to avoid or reduce short term temporary impacts from temporary displacement during construction activity are:

- Advanced dissemination of planned construction schedules and locations to aid alternate planning for fishers;
- Advanced and continued communications and notifications related to the timing and location (for example implementation and lifting) of construction and safety zones; and
- Rolling construction and safety zones.

Navigational Safety: Partially Built Structures

Potential risks identified through consultation with the fishing and maritime communities, from experience and from relevant literature, include, but are not limited to:

- Allisions with or snagging of fishing gear on installed wind turbine foundations prior to tower and wind turbine installation due to lack of visual reference;
- Allisions with or snagging of fishing gear on installed offshore substation foundations prior to topside installation due to lack of visual reference;
- Snagging of fishing gear on electrical cables laid on the seabed awaiting burial or protection; and
- Snagging of fishing gear on areas of seabed preparation prior to foundation installation.

Equinor Wind is committed to safety and proposes the following mitigation measures to reduce the likelihood of fishing vessels encountering the risks identified above. The mitigation is a combination of effective communications and dissemination of information and effective marking, lighting and safety measures in line with federal and international regulations (*e.g.*, USCG and COLREGS). Navigational safety in itself is being assessed as part of the COP and forms part of Equinor Wind's Navigation Safety Risk Assessment ("NSRA"). Mitigation measures will be consulted on with USCG, F-TWG and the fishing industry, as well as with the wider maritime community. Equinor Wind proposes to present the NSRA at the F-TWG during consultation on the FMP. Mitigation measures, include but are not limited to:

- Marking & lighting of partially built structures following Private Aids to Navigations ("PATONS");
- Dissemination of charted locations of partially built structures to the fishing community via the previously described notifications channels;
- Provision of locations of partially built structures in digital formats that can be uploaded to typical navigation equipment, for example navigation plotters;
- USCG NTMs;
- Provision of locations of partially built structures for updating NOAA Nautical Charts, as well as USCG Local Notices to Mariners at more frequency (*i.e.*, weekly);
- Consultation with the fishing community with the potential to establish temporary safety exclusion zones around partially installed wind farm electrical cables;
- Provision of safety vessels around high risk structures, including utilizing vessels in the fishing fleet to act as safety vessels; and
- Prescribed transit routes for offshore wind energy development construction and support vessels to/from port to/from the offshore wind energy development;
- Real-time monitoring and notifications to fishing vessels approaching areas of potential risk.

Navigational Safety: Increased Construction Vessel Traffic

Increased vessel traffic due to the offshore wind energy development related construction and support vessels has been identified by the fishing industry as a potential navigation safety risk, with concerns over an increased likelihood of collision between a fishing vessel and construction vessel. Navigational safety and associated mitigation options will be covered as part of Equinor Wind's NSRA, which Equinor Wind will share with the fishing industry for consultation, and can present to the F-TWG while consulting on the FMP. Equinor Wind will seek to minimize the likelihood of a vessel to vessel encounter through planning and mitigation. Mitigation options that Equinor Wind is open to explore with the fishing industry include, but are not limited to:

- Advanced and regular dissemination of information of planned construction activities, timing, locations, transit routes, vessel details, vessel contact details and project contacts to the fishing community via the suite of notifications options previously described;
- Prescribed transit routes for offshore wind energy development construction and support vessels to/from port to/from the offshore wind energy development;
- Offshore wind energy development construction and support vessels to following best practice guidance, including COLREGS;

- A commitment that Equinor Wind will make all offshore wind energy development construction and support vessels aware of the final FMP and prescribed mitigation measures;
- A commitment that Equinor Wind will, where appropriate and feasible, have an OFLR onboard at least one offshore wind energy development construction and support vessels in the field to aid communications; and
- Potential real-time monitoring of fishing vessel activity to monitor for and avoid through contact, potential conflicting activities.

Operations

Equinor Wind has set out with the objective to coexist with the fishing community, with particular emphasis on applying thoughtful planning and mitigation measures that enable continued access to traditional fishing grounds during the operational phase, while also balancing technically and commercially feasible offshore wind energy developments that offer value to the New York rate payer and meet New York State's ambitious offshore wind targets.

The planning and mitigation options that will be considered for minimizing impacts to fisheries are described in this section. These measures are in direct response to the concerns and potential impacts identified in consultation with the fishing community, from direct experience from developing offshore wind energy developments and from recommendations in literature such as NYSERDA's Fish and Fisheries Study (2017).

Potential impacts from the offshore wind energy development, as a whole for all phases of development, are covered in Section 12.7.1. The potential impacts attributable to the operations phase are summarized again below:

- Adverse impacts to target commercial fish species resulting from offshore wind energy developments;
- Positive beneficial increases in species biodiversity and abundance;
- Long-term temporary displacement or restricted access to traditional fishing grounds;
- Navigational safety concerns due to increased offshore wind energy development related vessel traffic;
- Navigational safety concerns due to changes in existing vessel patterns, for example displacement of existing vessels;
- Navigational safety concerns while transiting due to the presence of structures (*e.g.,* allision and impacts on navigation equipment);
- Navigational safety concerns while fishing due to the presence of structures, subsea cables, cable protection, scour protection, furrows and dropped objects;
- Positive beneficial increase in search and rescue capabilities at sea with Equinor Wind's operations equipment/staff;

- Increased transit times due to the presence of structures and/or restricted access during operations;
- Increased resource pressure on existing commercial fisheries during operations due to the attraction of other fisheries, for example an increase in recreational fisheries and fixed gear fisheries;
- Navigational safety concerns for existing commercial fisheries due to the attraction of other fisheries, for example an increase in recreational fishing vessels and fixed gear; and
- Increased pressures on existing fisheries in adjacent waters due to displaced fisheries from the offshore wind energy development area.

Initial Feedback for Design Parameters

Thoughtful spatial planning and project design can be one of the most effective means of avoiding or reducing impacts on fisheries during the operations phase.

The approach Equinor Wind has taken to establish design parameters that foster coexistence includes; (i) solicitation of early feedback from the fishing community on concerns and design requirements; (ii) use of that feedback to set high level spatial constraints to feed into survey plans; (iii) use of that feedback to set design rules that foster coexistence and can be used to generate initial site planning and wind farm layouts; (iv) consultation with the fishing community on plans and draft layouts; and (v) use of that feedback on draft layouts to modify as appropriate and feasible for COP submission. Equinor Wind started this process early, with the goal of having mitigation plans and layouts included in the COP submission that have been generated through consultation, consensus and where available, based on data and evidence.

[redacted] However, Equinor Wind is progressing on the basis of a successful RFP award and is currently at stage (iv) as noted above; that is, Equinor Wind is seeking feedback from the fishing industry on draft layouts having been through steps (i) to (iii). Equinor Wind expects to be at a mature stage (iv) and progressing to stage (v) when consulting with F-TWG on the FMP.

The first step in Equinor Wind's approach has been to solicit and gather as much information as possible on existing and likely future fishing practices in the Lease Area and adjacent areas, from: concerns raised and risks identified from direct engagement with the fishing industry; past experience developing offshore wind farms; referencing the New York State Master Plan Fish and Fisheries Study (Chapter 5.2; 2017) and referring to best practice guidance. Some existing concerns and best practice guidance can be applied. However, due to the potential variation in fisheries resources, fishing practices and local conditions varying site by site, and in many instances within a site, it is Equinor Wind's view that each wind farm project should be assessed and planned on a case by case basis. As such, site-specific feedback via direct consultation with the fishing community has been the most effective method.

Meaningful and targeted feedback at the very early stages of project development can be limited where the absence of specific details on project design and site-specific survey data limits what project specific feedback the fishing community can provide above and beyond what exists in best practice guidance. Feedback Equinor Wind received in those early stages was still incredibly useful and applied in the early design process. Information gained from the period from OCS-A 0512 Lease award (April 2017) through spring 2018 was used to set early design constraints so that spatial planning, wind farm design, and layouts took into account fishing at the earliest stage possible.

Based on inputs from the fishing and maritime communities, and experience developing offshore wind farms in Europe, Equinor Wind established a set of "Layout Rules" within which initial designs have been based. The intention being that Equinor Wind can plan survey activities and further mature designs around the Layout Rules, with follow up consultation with the fishing and maritime communities on site plans, wind farm layouts, and export cable corridors generated from these.

As an example, feedback from the fishing community, which was based on the entire OCS-A 0512 Lease Area, included, but was not limited to:

- The northwestern part of the Lease Area and adjacent waters of the Cholera Bank supports a highly mobile squid fishery, which can be intensively fished for periods of 1-3 months in some years (anecdotal reports of up to 60 vessels at a time), and may be elsewhere for several years.
- The Lease Area supports some scallop fishing. The larger fleet tends to prefer waters of 25 fathoms and deeper, while the greatest depth in the lease area is approximately 23 fathoms. However, some "day boats" may work in the area, as well as boats of any size in case of rough weather offshore, or a particularly large localized set of scallops. The scallop fishing seen in the Lease Area tends to concentrate in the eastern, deeper section.
- The Lease Area supports some monkfish gillnetting, spread out across the Lease Area in some seasons and years. It tends to focus in the southeast section of the Lease Area.
- The northwest tip of the Lease Area and adjacent waters of the Cholera Bank supports a small lobster fishery, where there are patches of harder seabed compared to predominantly sand and gravel elsewhere in the Lease Area.
- The clam dredge fishery has concerns related to the export cable routes, wind turbine spacing and sufficient cable burial.
- Fisheries have requested Equinor Wind to:
    - Bury all electrical cables;
    - Avoid use of concrete mattresses to protect electrical cables, should sufficient burial not be achieved. Cable protection material should be sympathetic to fishing practices;

- Orient rows of wind turbines in dominant trawling directions; that is to orient rows of wind turbines parallel to the water depth contours, in a southwest to northeast direction;
- Space wind turbines as far apart as possible. Requests have varied from 1nm, 2nm and 4nm;
- Maintain a level of consistency in wind turbine alignment in clear rows;
- Align turbine rows for compatibility with traditional practices that facilitate coexistence of static and mobile gear fishermen, for example on LORAN lines ending in 5.
- Coordinate with the fishing industry during surveys, construction activity and scheduled and unscheduled maintenance;
- Identify measures that minimize effects of wind turbines on radar interference;
- Identify measures that minimize the effects of EMF on fisheries resources;
- Minimize the effects of underwater noise during construction and operations on fisheries resource;
- Provide unrestricted access to traditional fishing grounds;
- Define protocols for snagged or lost gear;
- Provide waivered liability for fishing vessels damaging wind farm assets;
- Define transit corridors for fishing vessels transiting from New Jersey to/from eastern Long Island and New England;
- Define fixed, predictable transit routes for wind farm related construction and maintenance vessels to/from ports and the wind farm area.
- Consult and seek approval for proposed wind farm layouts and export cable corridors before concluding on final designs.

As described in previously in Section 12.3.5, Equinor Wind is seeking to enter into a SoCG with each fishing organization as a means of recording feedback and tracking how those concerns are being addressed.

[redacted]

As seen in Figure 8, the fishing industry provided plotter tracks from eight trawlers for multiple years. These helped us understand common tow orientations, reinforcing reports of trawling aligned with bathymetry.

[redacted]

[redacted]

[redacted]

[redacted]

[redacted]

[redacted]

[redacted]

[redacted]

During surveys from March through November 2018, fishing was monitored closely to avoid potential conflict, combining radar, onboard visual, and AIS. Concerning the interest in transit lanes, AIS tracks were recorded for fishing vessels crossing the Lease Area. Figure 11 below depicts the data from one trawler over the period June – October 2018. Straight lines across the lease indicate transits.

[redacted]

[redacted]

The following sections describe how that feedback has been addressed, to date.

Layout Rules

Feedback from both the fishing and maritime communities resulted in Equinor Wind establishing layout rules from which to apply to the first phase of designing wind farm layouts. The layout rules established for the initial phase of planning are described below. Equinor Wind will consider committing to the principles of final layout rules at COP submission, providing clarity to the fishing and maritime communities as to what layouts could be selected from the design envelope at the final stage of project development.

It should be noted that the layout rules are designed to facilitate safe navigation and access. The layout rules are not designed to replace or supersede other existing primary navigation aids which should be employed and will significantly reduce risk (*e.g.*, vessel bridge navigation equipment). The layout rules used in this initial design phase are:

Empire Wind Offshore Wind Energy Area, Location

Prior to factoring in fisheries, the technical, commercial and operational constraints dictated the location of the preferred first offshore wind energy development area within the Lease Area, the Empire Wind project area, in order to maximize benefits from the build out of this area. These considerations are described in Section 3 of the RFP submission. The proposed project area was then considered for compatibility with the existing fisheries active in or adjacent to the area. As covered in Sections 12.4.3 and 12.7.4 information on existing fisheries and feedback on the site use came from existing data sources or from direct consultation with the fishing community.

A mitigation and design consideration available to a developer at this stage if there is risk of a significant adverse impact on a fishery that cannot reduced through other planning or mitigation is to "avoid" the area altogether. For example, with Equinor as partner in the Forewind consortium developing the Dogger Bank offshore wind farms in the U.K., a conscious project decision was made to "avoid" a consistent year-to-year sand eel fishery (*i.e.*, sand lance), that supported tens of fishing vessels over sustained seasonal periods, with limited alternative areas in adjacent waters. The fisheries resource also supported marine mammals and avian species as an important prey resource. On that basis, the developable area of what would be an equivalent lease area was reduced to remove the potentially affected area and receptors.

Appreciating that fishing can occur anywhere in the Lease Area, including the proposed Empire Wind project area, consideration was given to distinct areas of significant use that might be consistent with the Dogger Bank example described above. As previously noted, the northwestern part of the Lease Area and adjacent waters of the Cholera Bank was identified as supporting a highly mobile squid fishery, which can be intensively fished for periods of 1-3 months in some years (anecdotal reports of up to 60 vessels at a time). Upon further analysis, it was evident that this fishery was highly mobile and did not show site fidelity on a consistent year-to-year basis, with the fishery sometimes moving to other parts of the Lease Area or to other areas of the adjacent waters and wider New York Bight at varying levels of intensity. With this taken into consideration, it was not deemed proportionately effective to avoid this area, but to explore further mitigation options in project design.

Perimeters and Layout Clarity

The layout rules were followed to ensure that all wind farm structures were placed in a manner that provided consistency and clear line of sight, with no protruding structures that may increase navigation risk. On this basis, the location of the offshore substation, which will be determined following completion of surveys, will be located in the same manner to maintain consistency.

Straight lines of wind turbines on the perimeters have been adopted to provide clarity of the boundary of the wind farm area for vessels' navigation in proximity to the Empire Wind area, for example commercial vessels using the TSS, as well as reducing the effect of disorientation to fishers with a clearer boundary.

Perimeter wind turbines have been placed in a manner that maintains unobstructed rows with a clear entrance, transit and exit into, through and out of the Empire Wind project area without altering course.

Orientation of Wind Turbine Rows

Equinor Wind included at least one line of orientation of wind turbine rows into the layout to facilitate unobstructed straight channels within which to continue towing mobile gear without altering course while under tow. With the Empire Wind proposed layout, this resulted in three distinct lines of orientations, increasing the options for set mobile gear tow headings.

In direct response to feedback that mobile fishing is predominantly along bathymetric contours which generally follow a southwest to northeast direction in the Lease Area, Equinor Wind adjusted the primary turbine rows to be in a southwest to northeast direction. Equinor Wind believes this will support the unobstructed towing of mobile gears in a manner consistent with towing patterns today. As well as supporting existing towing patterns, the additional wind turbine row orientations support options for unobstructed towing of mobile gear in a north to south direction and a north-west to south-east direction. Some fishermen recommend east-west row orientations in the interest of coexistence for potential future increases in static gear with the existing mobile gear fishery. However, as of this draft that seems less practical because; in this Lease Area we have heard of no fishermen's formal or informal agreements for placement of static and mobile gear; static gear here is relatively limited, with some lobster pots on the northwest corners and sporadic monkfish gillnets mainly in the southeast; and a southwest-northeast orientation is more compatible not only with trawl tows but also fishing vessel transits. Equinor Wind believes layouts should be aligned with existing practices, but is willing to engage in further consultations as part of F-TWG, RODA and fishing industry.

It should be noted that the southwest to northeast orientation also facilitates existing fishing vessel transit routes from ports in New Jersey to/from New England.

Wind Farm Cables

[redacted]

Proposed Empire Wind Farm Layout – Summary

Equinor Wind has applied fishing industry feedback and best practice guidance to the planning and indicative design and layout of the proposed Empire Wind offshore wind energy area. It is believed that the indicative layout sets out to avoid and reduce impacts where feasible, while balancing the technical, commercial and safety considerations for developing and offshore wind energy development and at the same time meeting New York State's ambitious offshore wind targets. This is achieved through taking into consideration safe navigation through: (i) the fixing of structures in straight or aligned rows, (ii) orienting rows in the dominant mobile gear tow directions, (iii) burying cables, (iv) planning for consistent and clear entrance and exits into and out of the wind farm, and (v) requiring future wind farm phases to be consistent with Empire Wind in design and layouts, but marked, lit and identifiable as a different wind farm to aid orientation. Equinor Wind welcomes feedback on the assumptions, efforts and prosed layouts in the F-TWG and will continue to consult on the layouts with the fishing industry.

Where risks are not completely avoided, further mitigation options are addressed in the following sections to reduce those risks to as low as reasonably practical.

Navigational Safety: Wind Farm Cables

As previously described, Equinor Wind will sufficiently bury inter-array and export electrical cables where feasible. This activity will result in: (i) reducing the likelihood of potential damage to the cables, (ii) ensuring energy security, and (iii) avoiding or reducing the risk of navigational safety to fishers from accidentally snagging on cables with fishing gear or being displaced from traditional fishing areas due to the presence of cables. Equinor Wind will endeavor to bury cables at burial depths targeted as appropriate to the existing fishing practices and cable burial risk assessments within the Empire Wind Project area. Target burial depths along the export cable corridor will be determined in accordance with prevailing identified fishing activities, commercial shipping and anchoring, and state and federal regulations and requirements.

Equinor Wind will coordinate with the fishing industry and F-TWG on cable burial, including using fishing industry input in the project specific Cable Burial Risk Assessment.

Preliminary geological data obtained from desktop studies and site-specific surveys conducted in 2018 suggest that inter-array cable burial is expected to be feasible for the majority of the Empire Wind Project area using existing cable trenching and burial tools. Full survey results are expected to be available to help inform this process by the time Equinor Wind consults with F-TWG on the FMP. However, where cable burial is not feasible, for example due to localized challenging geology or when crossing third-party cables, Equinor Wind will work with the fishing industry to select cable protection materials that are sympathetic to fishing activities. In response to feedback from the fishing industry, Equinor Wind will not select concrete mattresses as a primary option for cable protection. Cable protection requirements will be assessed on a case by case site specific basis taking into consideration cable risk, fishing practices and relevant state and federal requirements.

Equinor Wind further proposes to reduce the likelihood of snagging incidents through post installation surveys, notifications and communications. Equinor Wind will explore the following options with the fishing industry and F-TWG:

- Subject to state and federal approvals, sharing with fishers the “as-laid” inter-array cable positions and sections of surface cable protection for inclusion on NOAA Nautical Charts, navigation plotters, or as hard copy or digital charts
- Post cable lay surveys to determine actual cable burial depth versus target cable burial.
- Site specific periodic cable burial inspection surveys as appropriate to the level of risk of future exposure or intensity of fishing
- Emergency contacts list for fishers to report exposed or suspected exposed cables
- Emergency procedures and protocols, including compensatory measures for snagged or lost gears

- “Trawlability” surveys

Navigational Safety: Wind Farm Structures

[redacted]

- [redacted]
- [redacted]
- [redacted]

[redacted]

Industry wide concerns have also been raised about fishing vessels transiting through offshore wind energy developments. This is a topic of discussion for offshore wind lease areas in Massachusetts. Based on this issue, Equinor Wind collected information related to transiting fishing vessels with respect to the Empire Wind offshore development area and wider Lease Area. Information was derived from direct feedback through consultation with fishers and through inspection of AIS for fishing vessels traveling at a speed suggesting transit rather than engaged in fishing.

The data showed few vessels that regularly transit through or in adjacent waters to the Lease Area, with most, if not all, transiting from fishing ports in New Jersey to and from fishing grounds in New England.

Consideration is given to the likelihood of an allision with a wind turbine during transit. Fishing vessel Captains use transits as a rest period, handing over the wheelhouse to less experienced second or third mates or crew, with potentially less experience in navigation and seamanship.

However, it is expected that regardless of wind turbines being present within the Lease Area, the most experienced crew member, most likely the Captain, will be at the wheelhouse with a heightened sense of alertness when crossing the Lease Area due to the fact the transit crosses four busy TSS. It is also expected that transits through offshore wind energy developments would also call for experienced crew in the wheelhouse thus reducing the risk of an allision due to a relatively inexperienced crew. However, Equinor Wind is open to exploring funding of further training for all crew for transiting through operational wind farms, which could be done through maritime simulation training schools within the New York Bight should this potential impact require further mitigation.

The setting of wind turbine rows in a southwest to northeast orientation, primarily to aid continued trawling along existing trawl patterns and bathymetric contours, also lends itself to the historic transit pattern, with little or altering of course required to transit through a row a wind turbines.

Due to the shape of the Lease Area, transits through the Lease Area from a general south to north are of a fairly short distance, typically ranging from between 2 to 4 nautical miles. Therefore, the duration of transit is short and combined with the orientation of rows, and the minimum 5 rotor diameter spacing of wind turbines, fishers are expected to be able to transit through in most conditions. Equinor Wind is aware that concerns are also related to transits in very poor weather conditions, with some requests from the fishing industry for between 2 to 4 nautical mile transit lanes to accommodate safe transit in poor weather. In light of the position of the Lease Area, it’s possible that during poor weather, vessels will elect to take a route closer inshore and therefore west of the Lease Area. However, some fishing vessels may prefer to take the transit offshore. Equinor Wind is monitoring BOEM’s leasing efforts in the New York Bight, with clear indications that BOEM intends to accommodate an offshore transit fairway east of the Lease Area. Equinor Wind will commit to work with BOEM, USCG, F-TWG, RODA and the fishing industry, as well as the maritime industry, to work towards offshore transit fairways prior to further lease areas are finalized. On this basis, Equinor Wind believes that potential impacts from transiting in very poor weather will be mitigated by the future implementation of transit fairways east of, and outside of, the Lease Area. Equinor Wind will also offer to facilitate transit discussion by offering use of the 3D Wind Farm Simulation Tool, as described in Section 12.3.5.

Navigational Safety: Increased Vessel Traffic

Empire Wind related vessel traffic during the operations phase is likely to be limited to the Operations and Maintenance (“O&M”) vessels servicing the wind turbines and offshore substation. This will be a Service Operations Vessel (“SOV”) and approximately two support Crew Transfer Vessels (“CTVs”). The increase in vessel traffic compared to background baseline levels is low and as such, the likelihood of collision is still low. However, this risk can be lowered further still to as low as reasonably practical through further mitigation and best practices. Equinor Wind will consider the following mitigation measures:

- Notifications to the fishing and maritime community of any unscheduled O&M different to normal vessel operations, for example Jack-up rigs or cable inspection and maintenance vessels. OFLRs used where appropriate
- A communications plan with key contacts and emergency procedures between the Empire Wind operations base and the fishing industry
- Establishing set transit routes for O&M vessels to/from the shore operations base

It should also be noted that in Europe the presence of offshore wind farm development vessels in the offshore locations has been deemed a positive beneficial impact, in that they offer immediate search and rescue facilities and safe havens to mariners in distress that may otherwise rely on emergency assistance from agencies based farther away.

Operations Impacts on Fisheries Resources

[redacted]

Operations Impacts from Modified Fisheries

A concern that has been raised by the commercial fishing industry is that the positive beneficial impact of the enhancement of biodiversity and abundance of species from the introduction of hard structures (Section 12.6.2) will attract larger numbers of recreational fishing vessels to the area, which may result in conflicting activities with the commercial fishing fleet. In addition, concerns have been raised about existing fisheries being displaced into other fishing grounds. It is too early in the Empire Wind development process to predict or quantify potential modifications to recreational and commercial fisheries, and therefore the potential mitigation measures that can be applied either in the spatial planning and design of the offshore wind facility or during the operations phase. This is an industry wide question that is best addressed through groups such as F-TWG, RODA and FLOWW in a collaborative approach. Equinor Wind will participate and contribute to these discussions as appropriate.

Modifications Post RFP Award

[redacted]

[redacted]

[redacted]

[redacted]

Decommissioning

Impacts during decommissioning are not expected to exceed those of during construction or operations, and with mitigation in place similar to that proposed as for construction activities, Equinor Wind believes that impacts will not exceed those described for the survey, construction and operations phase for both fisheries resource and fishing (Sections 18.2, 18.3 and 18.4 respectively).

However it is clear that both the offshore wind energy development industry, regulatory agencies and the fishing industry need more information on the effects of decommissioning, and while those effects and associated impacts may become clearer from the eventual decommissioning of offshore wind energy developments in Europe, or from experiences of decommissioning offshore oil and gas platforms in the Gulf of Mexico, Equinor Wind is willing to collaborate on research initiatives via F-TWG and E-TWG to address some of these questions.

12.9 Additional Considerations

The overall approach for development of this FMP has been to acknowledge the dynamic nature of executing a successful offshore wind energy development off the coast while considering the complex dynamics of the fisheries resources and stakeholders. As such, Equinor Wind has and will continuously evaluate and evolve this FMP so that all the components of the FMP are complete and sufficient. Given the nuance of offshore wind development in the United States, Equinor Wind expects that additional guidance and information will become available throughout the planning process and we will continue to consider its relevance to the FMP. Further, Equinor Wind will continue to rely on experience both from the mature overseas offshore wind industry and any experience that results from other offshore wind developments in the eastern seaboard of the United States.

Section 13

Environmental Mitigation Plan

Table of Contents

Table of Figures

13 ENVIRONMENTAL MITIGATION PLAN

Proposers must include in their Proposals a detailed Environmental Mitigation Plan that describes how Proposer will mitigate adverse environmental impacts that may be caused by the Project. Elements of the Environmental Mitigation Plan are described in detail in Appendix E. Proposers are advised to review the environmental studies prepared for the New York State Offshore Wind Master Plan with respect to the potential impacts of offshore wind energy development on the environment, and also are advised to include in their mitigation plan the appropriate Best Management Practices described in the Master Plan and supporting studies.

13.1 Summary

Equinor Wind welcomes the opportunity to submit an Environmental Mitigation Plan ("EMP") as part of its application to supply offshore renewable energy certificates ("ORECs") to New York. Equinor Wind is firmly committed to responsibly developing the Empire Wind Project in a manner that avoids or minimizes adverse impacts to the natural environment and resources to the maximum extent possible, while fostering the sustainable growth of offshore wind energy development in the New York Bight.

As part of this commitment, Equinor Wind believes that from the outset measures to avoid or mitigate adverse environmental impacts while maximizing the positive beneficial environmental impacts of an offshore wind energy project should be:

- Identified and developed in consultation and coordination with the relevant stakeholders;
- Based on robust baseline characterization that has been developed in consultation with relevant stakeholders;
- Evidence based and founded on the latest science;
- Where data gaps exist or the receptor-effect interactions are unknown, information gaps are satisfied through targeting data collection, monitoring and/or research;
- Incorporated into spatial planning, for example project siting and design; and
- Applied to how the project is implemented, for example surveys construction methods and operations and maintenance activities.

As such, this EMP sets out to summarize Equinor Wind's approach to: understand the natural and biological environment through baseline characterization; assess potential impacts; identify avoidance; mitigation or enhancement opportunities; understand how these will be considered and applied; identify the steps taken to consult with the relevant stakeholder groups to get feedback and buy in on decisions; and describe how Equinor Wind will conduct monitoring, data collection, and/or collaborative strategic research.

Since executing the lease in March 2017, Equinor Wind has been working diligently to understand the physical and biological characteristics and uses of the lease area. This EMP is the product of numerous studies and analyses that have been conducted to date, including work conducted by others (*e.g.*, NYSERDA's Offshore Wind Master Plan (2017); "Master Plan"). This information is being compiled to understand existing conditions and potential environmental impacts and benefits of the Empire Wind Project and therefore, what mitigation or enhancements can be exercised to reduce negative adverse effects or boost positive beneficial effects.

Detailed design, site evaluation, and environmental impact assessments for the Empire Wind Project remain ongoing. Therefore, this version of the EMP focuses on the process that will be used for identifying environmental receptors, baseline data characterization, potential effects, and the associated potential environmental impacts. The EMP also provides details regarding how potential impacts may be mitigated to the maximum extent possible given the current status of project development, and in further consultation with the relevant stakeholder groups including New York State Environmental Technical Working Group ("E-TWG"). Naturally, this EMP will continue to evolve through consultation and as the project matures, with additional detail and information provided in the Construction and Operation Plan ("COP") that Equinor Wind will submit to the U.S. Department of Interior, Bureau of Ocean Energy Management ("BOEM") in connection with the development of the lease area.

Equinor Wind recognizes the importance of adaptive management for any project, and in particular, a large-scale project such as the Empire Wind offshore wind energy development. Throughout each stage of the Project, Equinor Wind will continue to evolve its procedures for the evaluation and mitigation of environmental resources.

As described, this EMP sets out the intended approaches to responsible development, however some of these efforts are already underway or completed and evident in the approach taken, for example, offshore site surveys, baseline data collection and project design, and are therefore described as part of this EMP.

Similarly, Equinor Wind's approach to responsible development in regards to fisheries resource and fishers is covered in the Fisheries Mitigation Plan ("FMP") (see Section 12).

13.2 Communications and Collaboration

Openness is a core value and cornerstone of Equinor Wind's approach to engaging with and sharing data with stakeholders. Regular, open consultation will be key to ensuring that all interested parties are well informed in order to provide input into data, design, and mitigation options. This will facilitate working towards the joint objective of avoiding or minimizing impacts, while enabling the responsible and sustainable development of offshore wind energy in the lease area. All efforts for the Empire Wind Project will also contribute to successful future lease areas within the New York Bight by sharing experiences and lessons learned throughout this process.

Equinor Wind is approaching project development towards the COP and other state and federal permits on a "no surprises" basis; that is, sharing project updates, plans, results and information regularly and at all stages of the project so that all relevant interested parties have had sufficient opportunities to input into these processes, while also being sensitive to the potential for stakeholder fatigue. Equinor Wind intends to submit the COP and state and federal permits having taken regulatory agencies and stakeholders through the process. If data gaps or deficiencies or opportunities are to be identified, Equinor Wind believes it is best to do this at an early stage so that they can be addressed. This early and often approach has allowed Equinor Wind to identify, validate, and avoid potential negative impacts associated with offshore wind adaptively, to the best of its abilities. In instances where negative impacts cannot be avoided, Equinor Wind has been proactive in identifying appropriate mitigation approaches with input from stakeholders, such that any mitigation decided upon will be appropriate and effective to offset such impacts.

This type of approach has identified opportunities for collaboration in monitoring and research to support characterizing baseline conditions as described in later sections of this EMP. It is expected that additional studies will be identified as the Empire Wind Project progresses that will be appropriate for characterizing changes associated with offshore wind development to inform the stakeholder community through this open and active relationship.

13.2.1 Stakeholder Engagement

Active communication and dialogue with stakeholders begins during the early planning stages of project development, with Equinor Wind using feedback received from stakeholders to tailor the various phases of the Empire Wind Project.

Equinor Wind has been and will continue to engage with regulatory agencies, Environmental NGOs ("ENGOs"), research institutions and relevant stakeholders either via independent meetings or through environmental round tables in order to maximize opportunities to discuss the project and solicit feedback. For example, Equinor Wind has held "Environmental Roundtables" with ENGOs, held "Inter-agency Roundtables" with state and federal agencies, presented project updates and responded to questions at BOEM's New York Bight Task Force Meetings, and has held [redacted] related to environmental and permitting matters since lease award in March 2017 (see Attachment 17. This process will continue throughout the development of the Empire Wind Project, such that stakeholders are well aware of and able to input into planned activities, including pre-construction surveys, construction, operation and decommissioning.

Effective, clear and inclusive communication is required to ensure Equinor Wind can reach as many affected or interested stakeholders as possible in order to share project-related information and solicit feedback. Equinor Wind intends that its outreach will be as inclusive as possible. Additional details on outreach are described in Sections 12 and 14, including tracking tools in use. Examples of stakeholder engagement relevant to the EMP are covered in the following sections.

New York State Environmental Technical Working Group

Equinor Wind has committed to actively participate and contribute to the New York State E-TWG as a means to collaborate on best practices and research for offshore wind energy development, balancing responsible development while fostering opportunities for future offshore wind energy development in the New York Bight. Equinor Wind is represented on the E-TWG by Head of Environment and Permitting for Equinor Wind US, Martin Goff, a Chartered Marine Scientist bringing with him over 6-years of experience developing offshore wind energy developments in Europe and more than 10-years prior to that as a Physical Oceanographer supporting offshore energy and construction projects. Martin has represented Equinor in similar environmental and permitting groups to E-TWG in the U.K., including the Renewables U.K. Consents and Licensing Group ("RUK CLG"), Southern North Sea Offshore Wind Forum ("SNSOWF"), The Carbon Trusts ORJIP group and steering committee and Natural England's/The Crown Estates' Environmental Strategic Monitoring Group. Martin has attended all E-TWG meetings to date.

Martin is supported on the E-TWG by Head of External Affairs, Julia Bovey and Environment and Permitting Manager, Laura Morales. Additional details regarding Martin, Julia and Laura's experience are provided in Section 2.

Equinor Wind is committed to continued presence and participation on E-TWG and sees the group as an effective vehicle for prioritizing and focusing discussions on impacts, mitigation and collaborative research. Equinor Wind considers the ENGOs on E-TWG as a proxy "ENGO steering committee" for engagement with the ENGO community on responsible development.

Equinor Wind also attended and participated in the E-TWG State of the Science Workshop in Long Island, New York (13 – 14 November 2018).

New York State F-TWG, M-TWG and T-TWG

In addition to E-TWG, Equinor Wind is an active participating member of the Fisheries Technical Working Group ("F-TWG"). As such Equinor Wind has a good overview of the different groups and objectives, in particular the E-TWG and F-TWG where there is overlap on matters related to benthic and fisheries resources. Due to the overlap, both E-TWG and F-TWG are represented by the same personnel in Equinor Wind as outlined above.

Federal Agencies

Equinor Wind has been actively engaging with federal agencies since lease award in March 2017. A key part to ensuring a smooth permitting process and soliciting feedback on baseline data requirements has been and will continue to be engaging with the federal agencies, with BOEM as lead agency as a group, as well as individually. In this respect Equinor Wind held an "intra-agency" workshop in December 2017 attended by all federal agencies relevant to the permitting process. This also included state agencies for additional overlap and identification of responsibilities between federal and state permitting jurisdiction and requirements.

In addition, Equinor Wind has attended and presented Empire Wind project updates at New York Bight Task Force meetings, including in Riverhead, NY, Trenton, NJ, and New York City, NY. This has provided opportunities for federal and state agencies to ask questions, direct Equinor Wind towards suitable data sets, highlight potential data gaps and set the scene for follow up one on one agency meetings.

Bureau of Ocean Energy Management ("BOEM")

Equinor Wind is in regular communications with BOEM as lead agency on the Empire Wind offshore wind energy development. In addition to face to face workshops at BOEM offices in Sterling, VA and our office in Washington D.C., Equinor Wind and BOEM have scheduled monthly calls to discuss project updates, data and survey plans. These monthly calls will continue as the project develops. In addition, Equinor Wind and BOEM have unscheduled calls as appropriate to cover specific matters and involving specific subject matter experts.

NOAA National Marine Fisheries Service

Equinor Wind has been in consultation with the NOAA National Marine Fisheries Service ("NMFS") in relation to development of survey plans, baseline characterization data, for example, benthic and fisheries data sources and providing feedback on Equinor Wind's data collection efforts, and strategic advice on threatened and endangered species. Equinor Wind has also coordinated with NMFS on Incidental Harassment Authorizations ("IHAs") for geophysical surveys and the potential future requirements for IHAs in relation to construction activities. Equinor Wind has met with NMFS in meetings on several occasions in addition to conference calls. Equinor Wind expects to work closely with NMFS in the lead up to COP submission and then post COP submission for IHAs.

Other Federal Agencies

As well as BOEM and NMFS, Equinor Wind has been regularly engaging with other federal agencies related to the project, including the Fisheries and Wildlife Service ("FWS"), Environmental Protection Agency ("EPA"), U.S. Coastguard and U.S. Army Corps of Engineers ("USACE") and National Parks Service ("NPS"). Further details of the consultation can be found in Attachment 17.

New York State Agencies

Equinor Wind has actively engaged with New York State agencies through the Empire Wind development process. Equinor Wind intends to continue communications with these groups as the project develops, sharing COP sections prior to COP submission for feedback where feasible, and a commitment to sharing the COP with state agencies at COP submission. Equinor Wind also participated in a state inter-agency meeting to discuss state specific permitting studies necessary above and beyond COP requirements on December 11, 2018, which included New York State Department of Public Services ("NYSDPS"), related to the Article VII process. Additional examples of outreach is provided below, while details on permits and approvals are provided in Section 10.

New York State Department of Environmental Conservation

Equinor Wind has had in person meetings with New York State Department of Environmental Conservation ("NYSDEC") covering project updates and plans, environmental data collection, baseline data and potential mitigation options, fisheries resource and fishing, as well as seeking advice on relevant data sources for fishing and ecological resources in the New York Bight and New York state waters.

New York State Department of State

Equinor Wind has had in person and teleconference meetings with New York State Department of State ("NYSDOS") covering project updates and plans as it relates to the coastal resources and policies. Additionally, NYSDOS has been engaged as part of the consistency determination(s) required for Equinor Wind to complete survey work within three nautical miles of the coastline.

New York State Office of Parks, Recreation and Historic Preservation

New York State Office of Parks, Recreation and Historic Preservation has been contacted for several aspects of the Empire Wind Project. Much of the coastline consists of preserved parks and/or historical sites. First and foremost, NYSOPRHP has been contacted to discuss Equinor Wind's approach to characterizing terrestrial archaeology, underwater archaeology and historic architecture. This was provided in writing on December 13, 2018 and NYSOPRHP provided concurrence on December 19, 2018. In addition, viewshed is a subject of discussion for offshore wind developments. Equinor Wind has been proactive in providing its approach to visual simulations presented within this proposal in writing on November 6, 2018. NYSOPRHP provided concurrence on November 29, 2018. Equinor Wind also provided additional information during an in-person meeting on December 12, 2018. Follow up meetings are planned to present the results of these simulations, as provided in Section 15.

Environmental Non-Governmental Organizations

Equinor Wind recognizes that close coordination with the relevant ENGOs is essential to developing offshore wind energy projects that meet New York State's and Equinor's ambitious offshore wind energy targets, but in a manner that is responsible and maintains continued support from the ENGO community for future offshore wind energy opportunities. Equinor Wind has been engaging with ENGOs in several different forums. For example, Equinor Wind has held two "Environmental Round Tables" aimed specifically at the ENGO community. We chose to locate these on Long Island in order to maximize exposure to New York based or affiliated ENGOs as well as ENGOs at the national level. The roundtables included: project updates, permitting schedule, surveys planned or being conducted, survey results, baseline data assumptions, mitigation options, and open question and answer sessions. Equinor Wind is considering future ENGO Round Tables, with the next roundtable likely to be at a time when Equinor Wind can present relevant environmental chapters of the COP submission, ideally pre-COP submission to incorporate and address feedback as appropriate. As a minimum, Equinor Wind will seek a roundtable to present the COP post submission.

Equinor Wind has also been engaging and will continue to engage directly with individual ENGO groups throughout the project development, including those represented on the E-TWG.

Equinor Wind has entered into collaborative research and monitoring with the Wildlife Conservation Society ("WCS") and Woods Hole Oceanographic Institution ("WHOI"), as described in Section 13.3.1 and further detailed under Section 13.5.3 (see Equinor Wind-WCS Collaboration); has cooperated with the Natural Resource Defense Council ("NRDC"), National Wildlife Federation ("NWF") as detailed in Section 13.5.4; and WCS on observations during seismic surveys in the lease area (see Section 13.5.3 under Protected Species Observer Data).

As previously described, Equinor Wind considers the ENGOs on E-TWG as an appropriate "ENGO steering committee" for future matters related to developing the Empire Wind offshore wind energy project.

Equinor Wind expects to continue close and open communications with the ENGO community going forward, particularly focused on developing avoidance and mitigation measures in relation to future survey, construction and operations activities related to marine mammals and avian species.

Tribal Nations

The regulations under Section 106 of the National Historic Preservation Act require Equinor Wind, via the BOEM NEPA process, to consult not only with the State Historic Preservation Offices ("SHPOs"), but also with representatives of federally recognized Indian tribes. NYSERDA's Offshore Wind Master Plan's Cultural Resources Study (2017; Appendix H; Master Plan Cultural Resources Study) identified that the Shinnecock Indian Nation ("Shinnecock") expressed interest in offshore wind energy projects offshore of New York State. Equinor Wind has been engaging with the Shinnecock during the development of Empire Wind, including in relation to environmental matters. Equinor met with Shinnecock Council to introduce the project and consult on offshore geophysical and geotechnical survey plans and has provided project status updates at appropriate intervals. Equinor Wind and the Shinnecock expect to hold a meeting in the near future, pre-COP submission, to discuss survey results, including results from the benthic surveys, marine mammals data, and archaeological and cultural resources assessments. Additionally, Equinor Wind will consult with the Shinnecock to discuss the results of the visual simulations.

General Public

As with all stakeholder groups, Equinor Wind's approach towards outreach with the general public is covered in the Community Outreach Plan, Section 14 of the RFP. From an environmental perspective, Equinor Wind endeavors to address any feedback or questions raised in relation to environmental concerns the Empire Wind offshore energy development may have, responding to questions directly in open house public meetings where appropriate.

Equinor Wind intends to have a presence at Empire Wind COP related public hearings to address questions and comments and is open to having a presence at New York State public meetings, open houses or webinars as required.

13.3 Environmental Monitoring and Research

Consistent with Equinor Wind's openness policy, Equinor commits to make publicly available any information or data and supporting metadata that is developed throughout the Empire Wind Project that enhances the understanding of environmental characteristics, or use by wildlife, of any offshore, nearshore or onshore areas, so long as it is not considered proprietary in nature. Any data acquired as a result of monitoring required by NYSDOS, NYSDEC, NYSERDA or other regulatory bodies will be made available as soon reasonable after collection and validation on an ongoing and routine basis. The repository of such data will be defined and agreed upon between Equinor Wind and the applicable agency.

Equinor Wind acknowledges that ongoing research and monitoring at the project site is important to refine the understanding of impacts, potential mitigation options, and for future planning purposes, including facilitating the responsible leasing and development of potential future offshore wind energy areas within the New York Bight in line with New York State's ambitious offshore wind energy targets. As part of the development of the Empire Wind offshore wind energy development, Equinor Wind is committed to exploring appropriate monitoring protocols, for example monitoring of potential behavioral responses or changes in spatial and temporal distribution of biological resources as a direct result of the offshore wind energy development.

In addition, Equinor Wind is in favor of developing and supporting research initiatives that focus on addressing coexistence; that is, research that improves the opportunities for continued and improved access for recreational and commercial fishing in the operational offshore wind energy developments. This may include research aimed at innovative technical approaches to issues such as turbine spacing, impacts on navigation equipment, trawling equipment and information dissemination options. Further details can be seen in the Fisheries Mitigation Plan, Section 12.

As the operator of three offshore wind farms in the U.K. (Sheringham Shoal 317 MW, Dudgeon Offshore Wind Farm, 402 MW and the world's first commercial floating offshore wind farm Hywind Scotland, 30 MW), Equinor Wind can also consider exploring collaborative opportunities to conduct research and monitoring in those operational wind farms. Options can be discussed through the E-TWG or in direct consultation with relevant stakeholders.

Equinor Wind is also enthusiastic about the possibility of exploring collaborative research and monitoring efforts. Where common approaches to studies can be made, for example related to avian species and marine mammals. Equinor Wind is open to collaborate with other offshore wind energy developers on matters such as funding and providing suitable locations and operational support. Equinor Wind has successfully worked with other offshore wind energy developers on collaborative research and can continue to build on these established relationships.

Likewise, Equinor Wind is also open to collaborative research and monitoring opportunities with other organizations as appropriate. Equinor Wind would advocate for groups such as E-TWG and F-TWG as being the forums for which these research opportunities are explored and addressed.

Finally, and as previously stated, Equinor Wind is committed to making nonproprietary data available that can support research. Equinor Wind recognizes the value of data-sharing and data transparency to enhance the scientific community's understanding of environmental characteristics, offshore, nearshore or onshore. As an example, Equinor Wind will be making the following studies and/or data publicly available either through the COP process or directly on the Empire Wind webpage:

- 2018 benthic survey report covering the "SAP" related survey locations within the lease area (benthic grab samples with grain size and macro fauna analysis, drop down video stills, habitat description);
- 2018 benthic survey report covering "COP" related survey locations within the lease area totaling 67 sample locations (benthic grab samples with grain size and macro fauna analysis, drop down video stills, habitat description);
- 2019 benthic survey report covering "COP" related survey locations within the proposed export cable corridors (benthic grab samples with grain size and macro fauna analysis, drop down video stills, habitat description);
- 2017 to 2018 digital aerial survey images, monthly and quarterly reports of avian species, marine mammals, sea turtles and large bony fish assemblages as observed from the 12 x monthly digital aerial surveys carried out from November 2017 to October 2018; and
- Oceanographic data, not deemed proprietary, for example seawater temperature and salinity, from the "Metocean Facilities" deployed within the lease area.

Additional publicly available datasets for other resources and studies are described further in this EMP (*e.g.*, Sections 13.5.3 and 13.7.2).

As a further example of sharing data, Equinor Wind is willing to make non-commercially sensitive data from our metocean buoys available for research. Equinor Wind is currently in discussions with Rutgers University Department of Marine and Coastal Sciences on sharing the seawater temperature data to help support the understanding of the "cold pool" effect driving spatial and temporal distribution of marine life in the New York Bight. The cold pool phenomenon was frequently raised in New York State's State of the Science Workshop (November 2018) as well as BOEM's NY Bight Task Force Meeting (November 2018). In this regard, Equinor Wind believes that understanding physical and biological drivers on biological resource spatial and temporal distribution is essential in order to identify and robustly design effective and meaningful future research and monitoring.

Equinor Wind is open to exploring other outlets for sharing information, for example Equinor Wind can upload fisheries related datasets and reports to the F-TWG webpage and/or RODA webpage. Version control is important, however, and it is essential that stakeholders have access to the most recent studies. As such, the issue of version control and key repositories for this data will be further discussed and agreed in E-TWG and F-TWG.

[redacted]

Much of the data collection for this project will become available as a mechanism of the permits and authorizations that are required under the project, which will be subject to public comment. For example, studies that are being conducted in support of the Construction and Operations Plan ("COP") (*e.g.*, benthic, cultural resources, fisheries, marine mammals, sea turtles, birds, and bats) will be included as appendices of the COP, with the exception of any redacted information that meets the requirements of "proprietary", as well as spatial information considered sensitive under the Endangered Species Act or the National Historic Preservation Act.

Equinor is open to sharing field-collected data if it is finalized in advance of COP or other application submittal with other government agencies or public entities and will work with Federal and State agencies and other stakeholders to determine the best method of achieving this goal. As part of its active stakeholder outreach, Equinor Wind is sharing information with various entities, including ENGOs, during on-going stakeholder and special interest meetings. Information that has undergone final quality assurance/quality control ("QA/QC") can be made available upon request to educational institutions, environmental groups or other interested parties. As previously mentioned, Equinor Wind has already made data and reports available including from offshore high resolution aerial surveys of birds and other marine life, which are available on a publicly accessible website, the same website as NYSERDA's aerial survey results.

Equinor Wind is committed to collaboration opportunities for research and/or monitoring with the appropriate agencies, developers or research institutions. We recognize that there is an interest in understanding how the environment responds to the installation of offshore wind structures and activities. We also recognize that these facilities offer additional opportunities to initiate studies not directly considering the offshore wind industry (*e.g.*, installation of oceanographic and climatic monitors further off the coast to what is currently employed). As detailed within this EMP, Equinor Wind is actively cooperating with entities such as WCS, WHOI and SUNY Stony Brook. Discussions have been on-going with other research institutes, such as Rutgers University as noted above. These agreements afford us the opportunity to contribute to peer-reviewed publications (*e.g.*, scientific journals) and other mechanisms to further the scientific knowledge of the offshore environment and how humans interact with it. Equinor Wind also interacts with international institutions, by contributing to organizations such as the Carbon Trust. Equinor Wind makes an effort to meet with any interested parties when contacted to discuss prospective research matters.

13.3.1 Supporting Other Research

Equinor Wind is committed to collaborate with the scientific community, E-TWG, relevant stakeholders, other offshore wind energy developers and third-party groups to conduct robust and relevant research studies that relate to environmental resources and offshore wind energy developments.

In addition to making the Empire Wind offshore wind energy area available for monitoring and research when it can be done in a safe and practical manner, Equinor Wind is also willing to consider requests to access existing Equinor's operating offshore wind energy developments in Europe.

Equinor Wind will, where feasible, consider making existing wind farm related vessels or buoys available for research opportunities. For example, Equinor Wind will consider proposals for adding additional third-party self-contained sensors on survey vessels, construction vessels, O&M vessels, wind farm structures or wind farm related buoys and metocean moorings. As a demonstration of this commitment, Equinor Wind has already provided this opportunity to SUNY Stony Brook so that they could attach three receiver gates to the metocean moorings that were deployed in December 2018. [redacted]

As further demonstration of Equinor Wind's commitment to novel and collaborative research and monitoring, Equinor Wind is collaborating with WCS and WHOI on real-time large whale detection and notification buoys in a minimum 2-year monitoring program. [redacted]

Further research and monitoring is important where data and knowledge gaps remain that present uncertainties over potential significant adverse impacts attributable to the effects of offshore wind farm development. It is important that these effects are better understood in order to more accurately quantify impacts, identify potential mitigation options, and reduce uncertainty and conservatism built into impact assessments. This may also help to avoid or reduce impacts through adaptive management in future offshore wind energy leases and developments.

Where feasible, monitoring and research should ideally be targeted towards interactions between offshore wind energy developments and the receptors it is being judged against. From the outset, any research and monitoring should be statistically robust, such that changes in spatial and temporal distribution, and/or behavior pre, during and post construction can be detected at levels statistically attributable to the effects. For some biological monitoring, this level of robustness is not always possible as many outside factors can influence these variations with much greater significance than the factors that can be attributed to causes from offshore wind energy developments. This may be especially true in a dynamic environment such as the New York Bight. For example, attributing changes in a target commercial fish species abundance to offshore wind energy development presents challenges as abundance and distribution can vary spatially and temporally due to outside factors and pressures such as fishing quotas, oceanographic conditions (seawater temperature, nutrients), and distribution and availability of that receptors food resource. As such, for highly variable receptors there has been a shift away from pre, during and post construction monitoring of abundance and distribution of wildlife in Europe, and a focus towards behavioral responses associated with different phases of offshore wind energy developments. Equinor Wind has been involved in this work in Europe and would advocate for similar initiatives in the northeast U.S. These experiences can be shared via the ETWG and F-TWG.

As a means to determine the statistical power of proposed studies, Equinor Wind advocates that technical experts conduct statistical power analyses up front in the planning process before implementing any future studies. In addition, F-TWF and/or E-TWG are appropriate forums in which to discuss the development of such analyses and should be part of this planning process.

Finally, the fishing industry, fisheries managers and fisheries scientists all have an ability to input into potential monitoring requirements and methodologies, and where appropriate, may also have an opportunity to conduct the monitoring. Equinor Wind has already participated in and funded novel research and monitoring for offshore wind energy developments and in offshore oil and gas developments where results have relevance to offshore wind energy developments. For example, Equinor has funded and collaborated in the UK Carbon Trust ORJIP One Bird Collision Avoidance Study (ORJIP One), UK Carbon Trust ORJIP Four Acoustic Deterrent Devices (ORJIP Four), and the developer led DEPONS (Disturbance Effect on the Harbour Porpoise in the North Sea, DEPONS, 2015).

Equinor Wind has also conducted novel research and monitoring on our existing offshore wind energy developments, for example the tagging of breeding Sandwich terns with GPS loggers to monitor foraging patterns in relation to the Equinor operated Dudgeon Offshore Wind Farm, U.K. Equinor is also part of the Sound and Marine Life joint industry program, which supports research to help increase the understanding of the effect of sound on marine life generated by oil and gas exploration and production activity, with some aspects being directly relatable to offshore wind energy developments, for example offshore seismic surveys and impact pile driving. Equinor Wind would be pleased to provide more details on these studies in E-TWG to support future study design.

Consistency with NYSERDA's Offshore Wind Master Plan

New York State, under the direction of NYSERDA, has been evaluating the potential for offshore wind for New York since 2016. In its development of the New York State Offshore Wind Master Plan ("Master Plan") (NYSERDA Report 17-25; NYSERDA 2017), NYSERDA has summarized the feasibility for offshore wind supporting NY State renewable energy goals by identifying potential locations and mechanisms (*e.g.*, procurement, cost reduction, supply chain). The Master Plan also includes twenty different studies to support responsible and cost-effective development many of which document natural resources that are addressed in this EMP, including:

- Appendix A: Analysis of Multibeam Echo Sounder and Benthic Survey Data;
- Appendix D: Birds and Bats Study;
- Appendix I: Environmental Sensitivity Analysis;
- Appendix J: Fish and Fisheries Study; and
- Appendix L: Marine Mammals and Sea Turtles Study.

In many or all cases, the Empire Wind lease area is completely or mostly included within the study areas for these assessments. Figure 1 provides an example of NYSERDA's Fish and Fisheries Studies Area of Analysis (AoA) within the New York Bight region in relation to the Empire Wind Lease Area.

Figure 1: [redacted]

[redacted]

Many of the studies completed or in progress for the Project to document baseline conditions are following similar methodologies as those utilized in NYSERDA's Master Plan and NYSERDA's ongoing studies (*e.g.*, aerial baseline survey for marine wildlife). It is also important to note that methodologies developed for the Project-specific studies were prepared in consultation with state and federal regulators and the relevant ENGOs. Therefore, it is the expectation that results from the Project studies will provide value to the scientific community in documenting the extent of various resources within the New York Bight. It is also important to note that drawing on the efforts of NYSERDA has allowed the environmental assessment and permitting schedule for the Empire Wind Project to be significantly de-risked, shortened, evaluated within a more regional context, and is overall more efficient in terms of realizing New York State's ambitious goals for renewable energy through offshore wind energy developments.

The NYSERDA natural resources appendices previously referenced identify recommendations for future studies; approaches to surveys and studies; and/or best management practices for mitigation. Some examples are provided in Figure 2. Equinor Wind, has taken these recommendations into consideration as it has developed its studies for documenting baseline conditions, and in many cases have incorporated them. Equinor Wind will also consider these in development of future studies and identification of mitigation techniques. This will facilitate an ability to compare and contrast information gathered by various entities in an "apples to apples" manner. Further, the Empire Wind Project offers the opportunity to broaden the long-term regional understanding of natural resources in the New York Bight and responses of these resources to offshore wind energy development (both direct and indirect) as part of the on-going and future monitoring studies associated with the project.

Figure 2: Examples of NYSERDA Master Plan Appendices Study Recommendations

Benthic (Appendix A)	Birds and Bats (Appendix D)	Fish & Fisheries (Appendix J)	Marine Mammal & Sea Turtles (Appendix L)
Survey collection following BOEM's guidelines (one sample per 1-2 km^2)	Shipboard and/or aerial surveys	Engage multiple interests in development of survey protocols	Consideration of actual presence, use patterns and sensitivity of particular receptors in mitigation and best management practices.
Use of acoustic and optical data	Field surveys for bats using acoustic monitoring and/or radio telemetry	Prioritize studies on species that are commercially or ecologically important	
Use of Coastal and Marine Ecological Classification Standard ("CMECS") Biotic Component classifier	Post-construction monitoring to include evaluation of collision fatalities and displacement	Enhance scientific knowledge for data-poor species	
		Consider the potential to introduce invasive and/or non-native species	

13.4 Baseline Data, Environmental Impacts and Mitigation Approach

This section sets out Equinor Wind's approach to establishing the baseline characterization of existing conditions and receptors within potentially affected areas, potential environmental impacts, and mitigation measures, which are detailed for the various natural resources identified for describing in the New York RFP, in Sections 13.5 through 13.7.

Further details regarding the regulatory requirements for identifying baseline conditions and impact assessments are covered in the Environmental Assessment Permitting Plan in Section 8.

As illustrated in Section 8, Environmental Assessment and Permitting Plan, and Section 10, Project Schedule, at the time of writing, Equinor Wind is currently in the process of collecting baseline data, analyzing data from site specific surveys, conducting assessments and carrying out extensive consultation on baseline data, potential receptors and potential environmental impacts, with the intention to finalize the environmental impact assessments to inform spatial planning and in support of submission of State and Federal permit applications. As such, this EMP sets out what is known about the existing baseline, what the potential impacts could be from the project, and what potential mitigation options Equinor Wind will employ to avoid or reduce impacts where feasible. It also identifies what data gaps require additional effort, or where further monitoring and research is required. This information will also form the basis of the COP under the National Environmental Policy Act ("NEPA") process and any other State and Federal permit applications.

Assessment Inventory

Baselines can be established by using existing published reports, studies, data or data portals, or by direct data collection through surveys and desktop assessments. Equinor Wind's first step in establishing baseline data for the lease area has been a thorough literature review, data mining, and gap analysis exercise to establish what information already exists. Equinor Wind evaluated the extent to which existing and publicly available data sources were suitable for characterizing environmental resources in the relevant area, including evaluation of NYSERDA's Master Plan (2017).

To support the baseline characterization of resources onshore and offshore, Equinor Wind has or is in the process of completing the following assessments, which will consist of both desktop and/or field surveys:

- Offshore site characterization surveys including, oceanographic and meteorological (metocean) measurements, geophysical and geotechnical investigations, sediment & water quality sampling, benthic sampling (physical properties), and marine archaeological resource surveys and reviews;
- Offshore biological baseline resource surveys including avian surveys, bat monitoring, marine mammal and sea turtle surveys, benthic sampling (biological), and fisheries resource assessments;
- Wetlands delineations;
- Terrestrial cultural surveys;
- Terrestrial wildlife assessments;
- Visual and historic properties surveys;
- Onshore acoustic surveys and in-air modeling;
- Onshore traffic analysis;

- Underwater acoustic modeling;
- Air quality modeling;
- Sediment transport analysis;
- Navigation Risk Safety Assessment;
- Aviation Assessments;
- Tourism and recreation;
- Offshore cable burial risk assessments; and
- Electromagnetic Field ("EMF") modeling.

The published data in conjunction with the survey data are supporting the preliminary characterization of baseline conditions in accordance with federal and state requirements and guidelines. Equinor Wind consults with appropriate stakeholders to discuss research that may support the characterization. As an example for one receptor group, Equinor Wind presented the list of data sets proposed to be utilized for the baseline characterization of benthic and fisheries resources to NOAA NMFS in March 2018. NOAA NMFS provided feedback, including additional data sets to use, and agreed with the conclusion that this approach is sufficient for the baseline characterization in the Project Area. Equinor Wind also plans to discuss this approach with NYSDEC in the near future and will continue to consult with E-TWG and F-TWG to understand what new information may become available to support the baseline characterization.

Lastly, Equinor Wind will draw on extensive first-hand experience developing offshore and onshore energy assets around the world, including offshore wind energy developments in Europe. The results of these baseline characterization assessments and an understanding of potential impacts will inform the engineering and design decisions on the project as well as the development of appropriate mitigation and monitoring. This analysis will be presented in the COP and other Federal and State permit applications.

The Design Envelope Approach

As part of the wider lease area development process, Equinor Wind will adopt a design envelope approach, sometimes referred to as the Rochdale Envelope approach. This approach is consistent with BOEM's guidelines for the COP process as detailed in its Draft Design Envelope Guidelines (BOEM, 2018).

Equinor Wind will utilize this approach for permitting given the development approach at this stage of this Project, as well as timing of individual future phased projects within the lease area that are dictated by power offtake auctions. However, it is expected that these uncertainties will be resolved as the project matures. Moreover, developments in offshore wind technology far outpace the permitting process, for example wind turbine size and capacity is evolving at an accelerated rate, and therefore some flexibility is needed to ensure that when the project reaches a Final Investment Decision ("FID") and/or construction, the project can select the best available technology. In general, the latest technology offers the best value for the ratepayer and lower overall environmental impacts. As part of the environmental impact assessments, a worst-case development scenario will be taken from the design envelope into the impact assessment calculation, which may not always reflect the level of impacts from the final design chosen. As such, the design envelope approach limits how much specificity can be placed on the environmental impacts at this stage, but typically provides a conservative assessment.

It is understood that other permits required for offshore wind energy developments making landfall and connecting into New York and therefore New York State Department of Environmental Conservation ("NYSDEC") jurisdiction (onshore to 3 nautical miles) will require a more refined design. As such, activities associated with the export cable landfall, onshore export cable, and substation improvements may take a narrower design envelope approach to support any required applications. Historically, landfall and onshore is less likely to encounter technical advancements at the same pace as offshore, such as the previously provided example of wind turbine size and associated foundations sizes and types.

Impact Producing Factors

A summary of the potential impact producing factors that may occur as a result of the Empire Wind offshore energy development activities are summarized below and addressed in more detail on a receptor-by-receptor basis in later sections, to the extent possible at this time. A full appraisal of effects and potential environmental impacts will be described in the COP and other State and Federal permit applications.

Potential Impact Producing Factors:

- Seafloor Disturbance – the installation/decommissioning of foundations, export cable(s), and scour protection will disturb the seafloor.
- Land Disturbance – the installation/decommissioning of the onshore transmission cable and substation(s) will disturb the onshore land.
- Sediment Suspension and Deposition – during installation and decommissioning activities, sediment will temporarily be suspended into the water column, with the potential for resuspension of sediments from scouring during operations.
- Underwater Noise – survey activities and installation activities have the potential to temporarily generate noise in the lease area, and, to a lesser extent, the surrounding area.
- Noise – onshore and offshore construction activities will temporarily create noise. Onshore substations may generate noise during operation.
- EMFs – during operations EMF fields may be detectable along the offshore and onshore cable routes, and infield cable arrays.
- Spills – during surveys, construction, operations, and decommissioning, there is the potential for accidental releases or discharges of pollutants, oil, trash, etc.
- Vessel and Onshore Traffic – increased vessel traffic during surveys, construction, operations, and decommissioning.

- Air Emissions – during construction, operations, and decommissioning activities, vessels traveling to and from the project site will result in a small amount of emissions. Generators or other equipment used for both onshore and offshore facilities may also result in emissions. There will be a positive overall net reduction in air emissions as a result of the operating wind farm.
- Change in Habitat – during operation, wind turbines, foundations, scour material, and substations will modify existing habitat.
- Disturbance, Displacement and Collision – the presence of wind turbines, substations and vessels may result in the disturbance and displacement of both wildlife and other marine users.
- Lighting – wind farm related vessels, wind turbines, offshore substations, and onshore substations will be equipped with lighting measures which have the potential to disturb.

The baseline characterization, survey efforts, and potential environmental impacts and mitigation are described in Sections 13.5 through 13.7 on a receptor-group basis.

It should also be noted that as part of this RFP submission, Equinor Wind only describes those receptor groups identified in the New York RFP; however Equinor Wind is actively assessing all relevant receptor groups as identified in the New York State Master Plan (NYSERDA, 2017), BOEM's Construction and Operations Plan ("COP") guidance (BOEM, 2016) and those receptors highlighted of being of key concern to interested parties.

Environmental Impact Assessments and Mitigation

Environmental impact assessments can be used as a tool for quantifying potential impacts and identifying if those impacts require further mitigation to bring them to acceptable levels or require further monitoring to quantify impact levels post implementation of a project. This process requires project and site-specific inputs, which generally include:

- Project description, either detailed or within a specified design envelope;
- A description of how the project will be developed;
- A description of the existing baseline environment;
- Baseline evaluation and, where necessary, baseline data collection;
- A description of the likely effects resulting from the proposed development;
- Identification of receptors most likely to be impacted by the project;
- Evaluation of the likely impacts on the receptors;
- Alternatives analysis;
- An appraisal of the quality and certainty of available data, effects, and potential impacts;
- Mitigation measures to avoid, reduce, or offset negative impacts;
- Measures to enhance positive beneficial impacts;
- Monitoring requirements; and
- A consideration of cumulative effects.

For the purposes of offshore wind energy development, an environmental impact is defined as the consequences borne by a receptor, either positive or negative, resulting from an effect produced directly or indirectly by the project. The impact level is a combination of the sensitivity or 'value' of that receptor along with the magnitude and type and duration (*e.g.*, temporary or permanent) of the effects on that receptor. These impacts can be classified as being negative (adverse) or positive (beneficial).

In order to properly assess environmental impacts, it is important to first understand and quantify the receptor. This quantification includes an understanding of the physical presence or absence of a receptor along with its abundance, spatial and temporal boundaries, and sensitivity characteristics. This is carried out through robust baseline assessments, and where required, further project-specific baseline data collection. This process includes referencing existing information on that receptor's sensitivity and protection status. Additionally, it is important to understand a receptor's ability to withstand effects when exposed, such as adaptability, tolerance, recoverability and its value as an overall resource. Finally, the effect must be quantified by considering its magnitude, the temporal and spatial extent of the effect, the level of change of that effect compared to existing baseline conditions, and the likelihood of a receptor-effect interaction.

Mitigation is a means for either reducing adverse impacts or increasing the beneficial impacts on a receptor. These measures typically take two forms: (1) modifying the effects through design, spatial planning, or timing (avoidance and mitigation); or (2) through offsetting unavoidable adverse impacts through compensatory measures. Again, the type and level of mitigation required is dependent on the final project design, the level of impact and the appropriate and proportionate balance of considering mitigation effectiveness and value versus the "cost" of that mitigation to the project, where for example cost can include, but is not limited to a negative impact on project commercial and technical scope, loss of social and environmental opportunities (*e.g.*, health benefits, socio-economic benefits), and indirect increases in impacts on other receptors.

13.5 Marine Mammals and Sea Turtles

This section describes the baseline characterization for marine mammals and sea turtles that Equinor Wind has determined to be associated with the Empire Wind Project Area through a combination of existing data sources and direct survey effort, including identifying where further surveys will be conducted or could be considered as part of a monitoring or research study. Consideration is given to the NYSERDA Master Plan Marine Mammals and Sea Turtles Study (2017; Appendix L)

This section includes the following information on each resource or receptor: (1) information currently available; (2) efforts to further collect data; (3) potential effects that are likely to have an impact; and (4) potential mitigation options that can be employed.

13.5.1 Regulatory Context

Impacts to marine mammals and sea turtles are regulated under various federal laws including the Marine Mammal Protection Act ("MMPA"), ESA, and NEPA. These regulations require consultation between the lead agency (BOEM) and other federal and state agencies with jurisdiction over marine mammals and sea turtles, including NMFS, United States Fish and Wildlife Service ("USFWS"), and NYSDEC.

In support of the COP, marine mammal and sea turtle resources will be assessed to comply with BOEM's site characterization requirements in 30 C.F.R. § 585.626(3). BOEM must also consult with NMFS under Section 7 of the ESA for actions that could affect protected marine species under NMFS's jurisdiction (*e.g.*, various marine mammals, sea turtles, and fish species). Consultation is required for approval of a COP as the activities described in a COP may affect listed marine species. State agencies will also be consulted as part of the coastal consistency determination process.

Underwater noise is considered an activity with the potential to harass or harm protected species, referred to as "take," under the MMPA and ESA; where unauthorized "take" is prohibited. NOAA has established impact criteria referred to as Level A and Level B harassment. Level A harassment is defined as any act of pursuit, torment, or annoyance that has the *potential to injure* a protected species stock in the wild. Level B harassment is defined as any act of pursuit, torment or annoyance that has the *potential to disturb* a protected species stock in the wild by causing a disruption of behavioral patterns, including, but not limited to, migration, breathing, nursing, breeding, feeding, or sheltering. The criteria are further separated for impulsive and non-impulsive (*i.e.*, continuous) sounds.[1] Figure 3 sets out NOAA-established guidance for evaluating noise impacts, which defines harassment thresholds for broad categories of marine species.

[1] Pile driving and High Resolution Geophysical (HRG) equipment are considered impulsive. Dynamic Positioning (DP) thrusters on vessels and the routine operation of a wind turbines are considered a continuous noise source.

Figure 3: NOAA Established Acoustic Criteria and Metrics for Marine Mammals, Fisheries and Sea Turtles

Functional Hearing Group	Estimated Auditory Bandwidth	Representative Animals	Level A Impulsive	Level A Non-Impulsive	Level B Impulsive	Level B Non-Impulsive
Low-Frequency Cetaceans	7 Hz to 35 kHz	Whales	219 dB_{peak} & 183 dB SEL_{cum}	199 dB SEL_{cum}	160 dB re: 1 µPa (RMS)	120 dB re: 1 µPa (RMS)
Mid-Frequency Cetaceans	150 Hz to 160 kHz	Dolphins	230 dB_{peak} & 185 dB SEL_{cum}	198 dB SEL_{cum}		
High-Frequency Cetaceans	275 Hz to 160 kHz	Harbor Porpoise	202 dB_{peak} & 155 dB SEL_{cum}	173 dB SEL_{cum}		
Phocid Pinnipeds	50 to 86 kHz	Seals	218 dB_{peak} & 185 dB SEL_{cum}	201 dB SEL_{cum}		
Sea Turtles	Up to 1.2 kHz	Turtles	207 dB_{Peak} 180 dB re: 1 µPa (RMS)		166 dB re: 1 µPa (RMS)	
ESA-Listed Fish	NA	Atlantic Sturgeon	206 dB_{Peak} & 187 dB SEL_{cum} (fish >2g) 183 dB SEL_{cum} (fish <2g)		150 dB re: 1 µPa (RMS)	

Notes:
dB_{peak} = peak decibel level; dB re: 1 µPa (RMS) = decibels relative to 1 micopascal (root mean square); g = gram; Hz = hertz; kHz = kilohertz; SEL_{cum} = cumulative sound exposure level; NA = Not Applicable

In 2018, NMFS released a revision to its *Technical Guidance for Assessing the Effects of Anthropogenic Sound on Marine Mammal Hearing* (NOAA NMFS 2018). This guidance assigns species of cetaceans and pinnipeds to functional hearing groups based on their hearing characteristics. The hearing groups include low-frequency cetaceans (baleen whales), mid-frequency cetaceans (dolphins, toothed whales, beaked whales, bottlenose whales), high-frequency cetaceans (true porpoises, Kogia, river dolphins, cephalorhynchid, *Lagenorhynchus cruciger, L. australis*), Phocid pinnipeds (true seals), and Otariid pinnipeds (sea lions and fur seals). All but the Otariid pinniped hearing groups have the potential to occur within the lease area. Each group has its own hearing ability and noise threshold, where impacts should be considered (Southall et al. 2007). NOAA uses two measures of potential harassment: peak dB and SELcum. For Level B harassment, NOAA Fisheries uses an interim sound threshold guideline of 160 dB rms 90 percent re 1 micropascal (µPa) for pulsed sound and 120 dB rms re 1 µPa received level (both unweighted) for continuous sound.

There is little information available on the effects of noise on sea turtles, and the hearing capabilities of sea turtles are also poorly understood. Some studies have demonstrated that sea turtles have fairly limited capacity to detect sound, although all results are based on a limited number of individuals and must be interpreted cautiously (Popper et al. 2014). Limited research has shown that the upper limit of the hearing range of sea turtles is generally in the range of 1,000 to 1,200 hertz (Hz) (Tech Environmental 2006, Martin et al. 2012). McCauley et al. (2000) serves as the best available information on the levels of underwater noise that may produce a startle, avoidance, and/or other behavioral or physiological response in sea turtles. McCauley noted that decibel levels of 166 decibels (dB) root mean square (RMS) re: 1 micropascal (µPa) were required before any behavioral reaction (*e.g.*, increased swimming speed) was observed, and decibel levels above 175 dB RMS re: 1 µPa elicited avoidance behavior of sea turtles. NOAA Fisheries (NOAA NMFS GARFO, 2016) provides further guidance with a Level A threshold for sea turtles set at 180 dB RMS re 1 µPa RMS to prevent mortalities, injuries, and most auditory impacts.

Noise injury thresholds have been established by the Fisheries Hydroacoustic Working Group and adopted by NOAA Fisheries. NOAA's Greater Atlantic Regional Fisheries Office has applied these standards for assessing the potential effects of ESA-listed fish species exposed to elevated levels of underwater sound produced during pile driving (NOAA NMFS GARFO 2016). These fish noise thresholds are based on sound levels that have the potential to produce injury or elicit a behavioral response. The metrics used consider both peak level (dB_{Peak}) and cumulative sound exposure level (SEL_{cum}).

13.5.2 Preliminary Resource Characterization

The Empire Wind project area, including the associated offshore export cable corridor and landfall includes coastal beaches, coastal waters, continental shelf waters, and offshore waters. The marine mammal (cetaceans and pinnipeds) and sea turtle species known to occur within the waters of the New York Bight and the lease area are provided in Figure 4, as identified from several sources (identified at the bottom of the figure). These animals include thirty-nine marine mammals and five sea turtles. All thirty-nine marine mammal species identified in Figure 4 are protected by the MMPA, and some are additionally protected by the ESA or by New York state law.

Figure 4: Marine Mammal and Sea Turtle Species Known to Occur Within the Waters of the New York Bight

Common Name	Scientific Name	Federal Status	NY Status	Estimated Population[1]	Known NY Bight Distribution	Occurrence in NY Bight	Seasonal Occurrence
Toothed Whales (Odontoceti)							
Sperm whale	*Physeter macrocephalus*	E	E	2,288	Along and over continental shelf[3,4]; around Montauk Point[4]; Deep ocean waters[4]	Common[4,7]	Unknown[4]
Atlantic spotted dolphin	*Stenella frontalis*	N/A	N/A	44,715	Primarily deeper waters [5]	Common[5]	Seasonal[5]
Atlantic white-sided dolphin	*Lagenorhynchus acutus*	N/A	N/A	48,819	On continental shelf and slope[5]	Common[5]	Seasonal[5]
Blainville's beaked whale	*Mesoplodon densirostris*	N/A	N/A	7,092	Deep ocean waters[5]	Common[5]	Seasonal[5]
Bottlenose dolphin[a]	*Tursiops truncatus*	N/A	N/A	11,548	Coastal and offshore[1]	Common[5]	Year-round[5]
Common dolphin	*Delphinus spp.*	N/A	N/A	70,184	Coastal and offshore[1]	Common[5]	Year-round[5]

Common Name	Scientific Name	Federal Status	NY Status	Estimated Population[1]	Known NY Bight Distribution	Occurrence in NY Bight	Seasonal Occurrence
Clymene dolphin	*Stenella clymene*	N/A	N/A	12,524	Over continental slope and deep ocean waters[7]	Extremely Rare[7]	N/A
Cuvier's beaked whale	*Ziphius cavirostris*	N/A	N/A	6,532	Deep ocean waters[5]	Common[5]	Seasonal[5]
Harbor porpoise	*Phocoena*	N/A	SC	79,833	Great South Bay[3]	Common[5]	Seasonal[3]
Long-finned pilot whale	*Globicephala melas*	N/A	N/A	5,636	Over continental shelf to slope[5]	Common[5]	Year-round[5]
Pantropical spotted dolphin	*Stenella attenuata*	N/A	N/A	3,333	Primarily deeper waters [5]	Common[5]	Seasonal[5]
Rough-toothed dolphin	*Steno bredanensis*	N/A	N/A	271	Over continental slope, shelf, and deep ocean waters[7]	Extremely Rare[7]	N/A
Risso's dolphin	*Grampus griseus*	N/A	N/A	18,250	Along continental slope[5]	Common[5]	Year-round[5]
Sowerby's beaked whale	*Mesoplodon bidens*	N/A	N/A	7,092	Deep ocean waters[5]	Common[5]	Seasonal[5]
Striped dolphin	*Stenella coeruleoalba*	N/A	N/A	54,807	Over continental slope[5]	Common[5]	Seasonal[5]

Common Name	Scientific Name	Federal Status	NY Status	Estimated Population[1]	Known NY Bight Distribution	Occurrence in NY Bight	Seasonal Occurrence
True's beaked whale	*Mesoplodon mirus*	N/A	N/A	7,092	Deep ocean waters[5]	Common[5]	Seasonal[5]
Dwarf sperm whale	*Kogia sima*	N/A	N/A	3,785	Over outer continental shelf[5]	Rare[5,7]	N/A
Gervais' beaked whale	*Mesoplodon europaeus*	N/A	N/A	7,092	Deep ocean waters[5]	Rare[5]	N/A
Killer whale	*Orcinus orca*	E	N/A	Unknown	Over continental shelf and rise[5]; Open sea and offshore waters[4]	Rare[5]	N/A
Northern bottlenose whale	*Hyperoodon ampullatus*	N/A	N/A	Unknown	Deep ocean waters[5]	Rare[5]	N/A
Fraser's dolphin	*Lagenodelphis hosei*	N/A	N/A	492	Over continental slope and deep ocean waters[7]	Extremely Rare[7]	N/A
Pygmy killer whale	*Feresa attenuata*	N/A	N/A	Unknown	Deep ocean waters[5]	Rare[5]	N/A
Pygmy sperm whale	*Kogia breviceps*	N/A	N/A	3,785	Over continental slope[5]	Rare[5,7]	N/A

Common Name	Scientific Name	Federal Status	NY Status	Estimated Population[1]	Known NY Bight Distribution	Occurrence in NY Bight	Seasonal Occurrence
False killer whale	*Pseudorca crassidens*	N/A	N/A	442	Over continental slope and deep ocean waters[5,7]	Extremely Rare[7]	N/A
Short-finned pilot whale	*Globicephala macrorhynchus*	N/A	N/A	21,515	Over continental shelf to slope[5]	Rare[5]	N/A

Common Name	Scientific Name	Federal Status	NY Status	Estimated Population[1]	Known NY Bight Distribution	Occurrence in NY Bight	Seasonal Occurrence
Melon-headed whale	*Peponocephala electra*	N/A	N/A	1,175	Deep ocean waters[7]	Extremely Rare[7]	N/A
Spinner dolphin	*Stenella longirostris*	N/A	N/A	Unknown	Deep ocean waters[5]	Rare[5]	N/A
White-beaked dolphin	*Lagenorhynchus albirostris*	N/A	N/A	2,003	On and over continental shelf[5,7]	Extremely Rare[7]	N/A
Baleen Whales (Mysticeti)							
Minke whale	*Balaenoptera acutorostrata*	N/A	N/A	2,591	On and over continental shelf[5]	Common[1]	Seasonal[1]
North Atlantic Right whale	*Eubalaena glacialis*	E / CE	E	440	Primarily coastal[4]	Common[4]	Seasonal[4]
Humpback whale	*Megaptera novaeangliae*	E	E	Unknown	Becoming more coastal[4]; may be in inlets[4]	Common[4]	Seasonal[4]
Finback whale	*Balaenoptera physalus*	E	E	1,618	Throughout[4]	Common[4]	Year-round[4]
Blue whale	*Balaenoptera musculus*	E	E	Unknown	Not well known[4]; primarily deep waters[4]	Rare[4]	N/A
Sei whale	*Balaenoptera borealis*	E	E	357	Continental shelf and slope waters[5]; throughout[4]	Rare[4]	N/A

Common Name	Scientific Name	Federal Status	NY Status	Estimated Population[1]	Known NY Bight Distribution	Occurrence in NY Bight	Seasonal Occurrence
Bryde's whale	*Balaenoptera edeni*	E	N/A	7	Continental Shelf and slope waters[5,7]	Extremely Rare[7]	N/A
Pinnipeds (Pinnipedia)							
Gray seal	*Halichoerus grypus*	N/A	N/A	Unknown	Coastal and continental shelf waters[5]	Common[5]	Seasonal[5]

7. NYSERDA 2017; Appendix L

Some of the species listed are noted as “extremely rare” (NYSERDA 2017; Appendix L); however, they are included as documented sightings. For most of these species, there are no data on seasonality, density, or abundance. That said, there are several ongoing, multi-year studies and surveys currently being conducted. NYSERDA (2017; Appendix L) reviewed the available data and has provided summaries of “Best Available Data” in the form of comprehensive lists of datasets for marine mammals and sea turtles and notes that current studies will provide reliable species counts when they are complete. These combined studies and models, in addition to studies being conducted by Equinor Wind (further described below), will be useful and likely will provide support for spatial planning, construction and operations decisions, and inform the application of appropriate mitigation.

Ambient sound levels in the lease area are largely influenced offshore by the volume of shipping activity entering and exiting the ports of New York. Ships produce low-frequency noise from engine and propeller cavitation.

13.5.3 Ongoing and Planned Assessments

To support the assessment of marine mammals and sea turtles, BOEM has issued *Guidelines for Providing Information on Marine Mammals and Sea Turtles for Renewable Energy Development on the Atlantic Outer Continental Shelf Pursuant to 30 C.F.R. Part 585 Subpart F* (Marine Mammal and Sea Turtle Guidelines; BOEM 2013c).

Existing Data Collection and Monitoring Efforts

Equinor Wind has evaluated readily available spatial data including ongoing and completed survey efforts. Of particular relevance to the Empire Wind offshore wind energy development are the ongoing and active data collection efforts of: NYSDEC, Schlesinger and Bonacci 2014, NYSERDA, WCS, and the Atlantic Marine Assessment Program for Protected Species (“AMAAPS”) surveys (NOAA NEFSC 2017 and SEFSC 2016). Collectively, these studies provide current and relevant data about the lease area.

Data collected during NYSDEC’s multi-year, monthly aerial survey data collection effort from March 2017 through February 2020 provides current information on the presence of marine mammals and sea turtles directly in and around the lease area, and where possible (where enough detections have been sighted), will provide density and abundance estimates. Figure 5 illustrates the transect lines for this study developed by NYSDEC with input from NOAA NMFS.

Figure 5: Transect lines for the NYSDEC Aerial Surveys for Whales in the New York Bight[2]

NYSERDA is funding a similar aerial survey program evaluating the New York Bight area, including the Offshore Planning Area ("OPA") and a period covering the Wind Energy Area ("WEA") that overlap with the Empire Wind lease area and associated project area (see Figure 6). These surveys are done on a quarterly basis. Data and information includes maps of each species sighted and all species by season and year; calculation of the relative abundance or density for each species of whale by month, season, and year; inter-annual variability; summary of numbers of whales in each group by sex and age; summary of behavioral observations; summary of sea turtle sightings; and summary of environmental data.

[3] Source: https://remote.normandeau.com/nys_overview.php

WCS in collaboration with Woods Hole Oceanographic Institute ("WHOI") has deployed a passive acoustic monitoring device to the southeast of the lease area that is collecting near real-time acoustic observations of whale species, including North Atlantic right whale, sei whale, humpback whale and fin whale. In addition to providing several years' worth of valuable information on the presence or absence of vocalizing marine mammals, the data buoy is recording the ambient sound environment at the southern end of the lease area.

Other passive acoustic surveying is being conducted by the Bioacoustics Research Program at Cornell University's Lab of Ornithology ("BRP") via their work with NYSDEC. Cornell University is conducting the passive acoustic monitoring survey for 6 large whale species (right, fin, sei, blue, sperm, and humpback) in the New York Bight. The survey consists of 15 autonomous recorders placed in and around the shipping lanes, from the shelf break to the New York Harbor. Acoustic data have been and will be are collected year-round, from October 2017 through September 2020, and downloaded from the recorders every four months. This passive acoustic monitoring within the New York Bight will assist in environmental assessments and in increasing baseline marine mammal data for the area which is part of the approximate 16,000 square mile New York Offshore Planning Area ("OPA"). This roughly 16,000 square mile portion of the New York Bight has been identified as an area of interest for potential development of offshore renewable energy projects. The data are being collected to provide information on the presence, relative distribution, and daily, monthly, and seasonal distribution of these six species. It will also characterize the ambient noise in the shipping lanes and patterns of ambient noise in this region which is expected to provide data on marine mammal acoustic masking potential.

The AMAAPS effort is a collaborative study between NOAA, BOEM, USFWS, and the U.S. Navy with the goal of providing enough information to develop models and other tools which will provide seasonal, spatially-explicit density estimates for marine mammals and sea turtles (and seabirds) in the western North Atlantic Ocean. Broad-scale data are being collected over multiple years as well as the collection of finer-scale data at selected sites. Information is currently available from surveys conducted from 2010-2016. Other data collection efforts include the Georgia Department of Natural Resources' focus on tagging right whales and Geographic Information Gateway, CetMap, and other efforts to collect spatial data.

Equinor Wind Data Collection and Monitoring

APEM Ltd Digital Aerial Surveys

Equinor Wind has contracted APEM Ltd., supported by Normandeau Inc., to conduct monthly digital aerial surveys across the lease area, which includes the capturing digital images and of marine mammals and sea turtles in addition to avian species, large fish assemblages and opportunistic vessel sightings. To ensure the survey methods were consistent with BOEM guidelines, a survey plan, "Avian Survey Protocol", which included marine mammals and sea turtles, was submitted and approved by BOEM and US FWS.

Digital aerial surveys were subsequently carried out from November 2017 to October 2018, with monthly results, monthly reports and quarterly reports made publicly available on the following webpage:

https://remote.normandeau.com/ewind_overview.php.

Equinor Wind is committed to continuing to make this data available in as near real-time as possible, subject to the delay between image capture and the time associated with image processing, species identification and quality control.

APEM and the methodology chosen was influenced by NYSERDA having used APEM and these methods to conduct quarterly digital aerial surveys over the New York Bight and OCS-A 0512 lease area from summer 2016 to summer 2017, then ongoing surveys over the New York Bight continuing into winter 2018/2019 at the time of writing. This included the consistency associated with the public webpage to display results.

A summary of the scope of the Equinor Wind digital aerial survey is as follows:

- Surveys conducted once per month over a 12-month period;
- Image resolution at sea surface of 1.5 cm ground sampling distance (“GSD”);
- Grid survey design;
- Grid imagery footprint of 310 m by 219 m;
- A 2.5-mi (4 km) buffer around the lease area;
- Minimum of 20% of the lease area and buffer imaged, with 10% of area analyzed;
- Monthly results displayed online; and
- Monthly and quarterly reporting, also provided online.

Figure 7: Grid Survey Design Over Lease Area and 2.5-mile Buffer

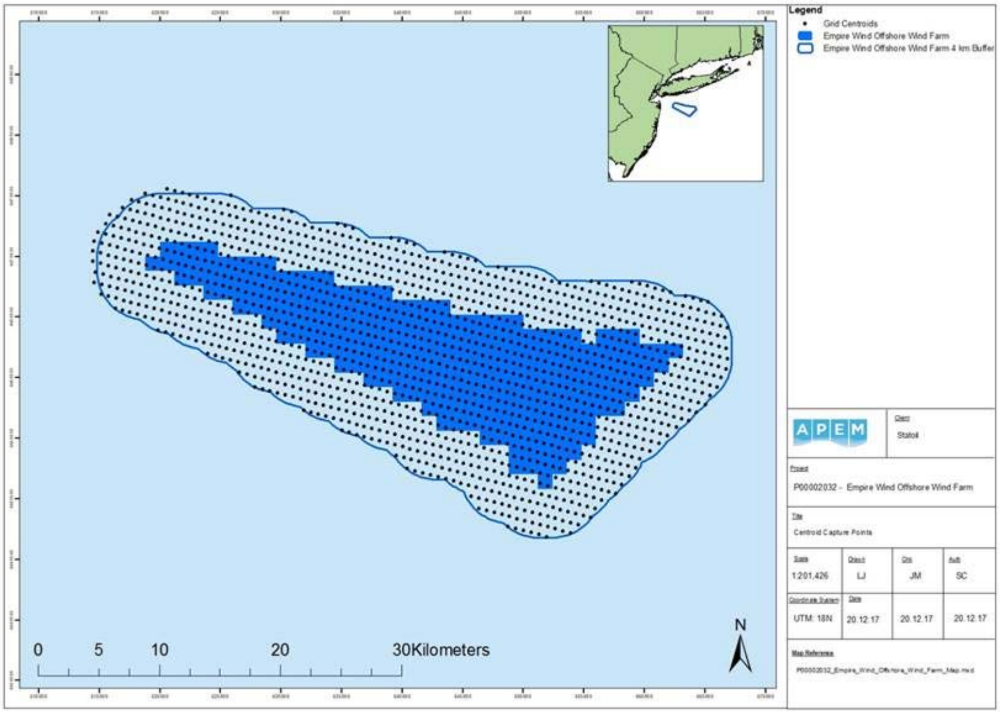

Figure 8: Survey Flight Path Over Lease Area and 2.5-Mile Buffer

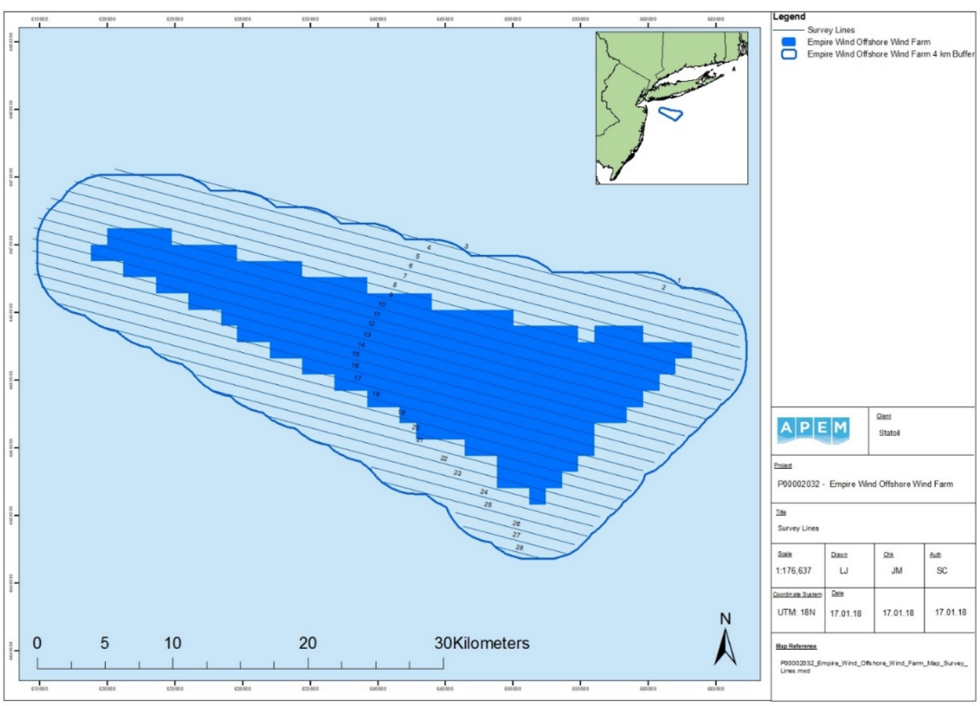

As described, the assessment approach and methods were designed to supplement the substantial body of existing data and meet BOEM's data requirements for site characterization studies to evaluate the potential effects of the proposed project. While the primary purpose of this study was to assess the presence of avian species, marine mammal sighting data was also collected, processed and quality controlled across the lease area. The supplemental quarterly digital aerial surveys conducted by APEM Ltd. on behalf of NYSERDA provides an excellent spatial and temporal characterization, providing not only additional data in a common approach and format in the lease area, but a wider regional context that provides more value in the context of assessing impacts.

Avian and marine mammal surveys are historically the longest lead time items for baseline data collection leading up to impact assessments, typically with a minimum of two years of data collection to account for inter-annual variations in spatial and temporal distribution. NYSERDA's early efforts on data collection has meant that Equinor Wind has been able to reduce this time down to one year of data collection to add to the existing effort, effectively bringing the impact assessment process forward by a year, having the ability to apply the results into design decisions at an earlier stage and bringing the COP schedule, and therefore the opportunity for permit approvals, construction and first power to New York forward by approximately a year.

Protected Species Observer Data

Equinor Wind used Protected Species Observers ("PSOs") during offshore geophysical surveys to mitigate against the potential risk of vessel strikes and exposure to noise on marine mammals and sea turtles. (Previous mitigation and proposed future mitigation during surveys is further detailed in Section 13.5.4.) In addition to providing mitigation, the PSOs also served an important function for furthering the understanding of the spatial and temporal distribution of marine mammals from recording observations in the field by recording visual observations and passive acoustic monitoring. Observations covered the period of 11 March 2018 to 3 December 2018 during the 2018 geophysical, geotechnical and benthic survey program. A total of 387 marine mammals and 34 sea turtles observations were made[4], along with geographic position and where possible species identification, behavior, photographs and notes on specific features or marks. The observations also form part of a NOAA NMFS IHA requirement to report on PSO observations at prescribed intervals.

In the spirit of collaboration and data sharing, Equinor Wind will commit to make these PSO reports and data available upon request, but at a minimum will provide the reports to the ENGOs represented on the E-TWG (*e.g.*, WCS), for use in their ongoing research. Equinor Wind will commit to share future PSO observations reports, as appropriate.

[4] Observations included visual and acoustic monitoring. In some instances, the same individual would be identified with both methods (*i.e.*, two observations).

In addition, Equinor Wind requested that the Lead PSO be available for contact with WCS' Ocean Giants survey team in order to share real-time sightings information in the field so that: WCS could apply the information to their own boat-based whale observation surveys and the Lead PSO could apply the information to Equinor Wind's field surveys for areas that may need to be avoided at that specific time. This provided an ability to use an adaptive management approach to survey plans. Equinor Wind will commit to continue this practice for future activities where PSOs are used and where it does not affect the primary role of the Lead PSO.

Equinor Wind – WCS Collaboration

Understanding the potential risks of development of the Empire Wind offshore wind energy project on marine mammals and sea turtles, in particular, the highly vulnerable and endangered North Atlantic right whale, is key to ensuring Equinor Wind can identify potential impacts and then avoid or reduce those impacts where feasible through effective and proportionate mitigation. For example, seasonal timing restrictions on certain survey and construction activities have been raised as mitigation measures developers could adopt as best practice. There is agreement that time and area restrictions offer a means of mitigation in cases where there is limited information or alternative mitigation options; however, time and area restrictions also have limitations and may fail to protect 'pioneers' or late departing animals that may be present before or after a seasonal restriction is applied. In addition, opportunities for conducting these survey and construction activities may be lost if for example, no animals are present in the area in what could be deemed a closed period. Equinor Wind believes that avoidance and mitigation measures should therefore be data and evidence based where there is an opportunity to collect that data.

As such, Equinor Wind is pleased to announce a collaborative Grant Agreement with WCS and WHOI to develop and install two more real-time whale detection and monitoring buoys within the lease area for at least two-years, complimenting and adding to the existing WCS "Blue York" buoy on the eastern boundary of the Lease. The buoys will help to further understand the spatial and temporal distribution of the four large whale species: North Atlantic right whale, Fin whale, Sei whale and Humpback whale, within the lease area, and when added to existing arrays of passive acoustic detection moorings around the New York Bight, will also provide an understanding of the wider regional context.

The buoys are expected to be installed summer 2019, with a minimum of 2 years data collection up to summer 2021. The location of the buoys will be subject to avoiding anchoring in sensitive seabed habitats, permitting requirements and in consultation with the fishing industry to avoid conflicting activities.

Underwater Noise Measurements

Impact assessments will require the estimation of harassment zones based on anticipated source levels. The distance to Level A/B harassment thresholds will be calculated for noise emitting activities (*e.g.*, geophysical surveys [redacted]). Assessments will be based upon best available information, which may be derived from equipment providers or field measurements.

The lease area conditions require acoustic measurements for High Resolution Geophysical ("HRG") and geotechnical equipment operating at or below 200 kilohertz (kHz) at a minimum of two reference locations and in a manner that is sufficient to establish the following: source level (peak, SEL, and RMS sound levels at 3.28 ft (1 m)), a pattern of spreading loss, and the sound-exposure distance for ear injury for each marine mammal hearing group, sea turtles, and fish. The distance to the 166, 160, and 150 dB RMS behavioral thresholds (Level B harassment) must also be reported. The first location must be at a distance of 200 m from the sound source, and the second location must be as close to the sound source as technically feasible. These sound measurements should be taken at the reference locations at two depths (*i.e.*, a depth at mid-water and a depth at approximately 3.28 ft (1 m) above the seafloor). Equinor Wind has already conducted sound source Field Verification Trials ("FVT") for the 2018 geophysical surveys, with data presented to NOAA NMFS and BOEM to support distance thresholds for mitigating against and recording Level B take during survey operations.

Some data covering several years of timeseries currently exists on the ambient underwater sound levels within or near to the lease area, collected from noise sensors installed by WCS as part of their 'Blue York' real-time whale monitoring buoy. Additional measurements will be obtained from the collaborative work between WCS and Equinor Wind to provide further spatial context to ambient noise levels within or adjacent to the lease area.

Baseline Summary

Based on the four comprehensive marine resource surveys being conducted currently, Equinor Wind's monthly digital aerial surveys across the lease area, and the breadth of existing data, Equinor Wind has concluded that there are sufficient data to appropriately characterize and assess impacts to marine mammals and sea turtles in support of project development. During an August 2018 meeting with NOAA NMFS, Equinor Wind received confirmation that this baseline characterization approach would be sufficient to assess impacts to marine mammals and sea turtles. The further studies, monitoring and collaborations will further build on this existing baseline data and facilitate more effective, targeted mitigation and avoidance options.

13.5.4 Potential Impacts and Mitigation

The potential impact producing factors relevant to marine mammals and sea turtles during surveys, construction, operations, and decommissioning are as follows:

- Short-term temporary increases in underwater noise from geophysical survey activity in the pre-construction, construction and operations phases;
- [redacted]
- Long-term temporary increases in background underwater noise from operational wind turbines and operations and maintenance ("O&M") vessels during operations;
- Short-term temporary collisions from offshore wind energy project related vessels during construction and decommissioning;
- Long-term temporary collisions from offshore wind energy project related vessels operations; and
- Changes to prey resources during construction and operations.

Equinor Wind will have more confidence in the type and level of impacts to marine mammals and sea turtles as the Empire Wind offshore wind energy project matures, including upon submission of the COP. At which time, subsequent NOAA NMFS IHA or Letter of Intent assessment and applications would be filed, as appropriate. Equinor Wind's ongoing monitoring and studies will facilitate refining impact assessments and further monitoring during and post construction, or research aimed at behavioral responses, will provide additional insight into the receptor-effect relationship. Certain assumptions can be made at this stage for the purpose of this proposal, based on preliminary information assessed by Equinor Wind to date; experience from developing offshore wind energy develops; and sources such as Section 3 of NYSERDA's Master Plan: Marine Mammals and Sea Turtles Study (2017; Appendix L).

The approach to developing a baseline and assessment of future potential impacts on marine mammals and sea turtles from the effects from construction, operations and decommissioning of an offshore wind energy development must satisfy the requirements of various regulations and jurisdictional agencies. As such, collaboration and coordination with BOEM, NOAA NMFS, NYSDEC, E-TWG, ENGOs and relevant stakeholders throughout the development and planning process will be critical to the success of the Empire Wind offshore wind energy development. Equinor Wind is committed to this collaboration and coordination.

Equinor Wind is applying the following mitigation measures to avoid or mitigate potential impacts to marine mammals and sea turtles associated with the construction, operations and decommissioning of the offshore wind energy development:

- Consultation with regulatory agencies and ENGOs on potential requirements for time-of-year and time-of-day restrictions for survey activities with potentially impacting noise levels;
- [redacted]
- Exclusion and monitoring zones, enforced by qualified protected species observers ("PSOs") for survey activities with potentially impacting noise levels;
- [redacted]
- Soft starts to noise emitting survey equipment where technically feasible;
- [redacted]
- Real-time monitoring systems as appropriate (*e.g.*, visual observations by PSOs, passive acoustic monitoring, use of night vision and infrared during nighttime activities) to facilitate exclusion and monitoring zones;
- [redacted]
- Vessel collision avoidance mitigation measures for project related vessels working in or in transit to/from the offshore wind energy area; and

- Measures to avoid or reduce potential impacts to marine mammal and sea turtle prey resources (see Section 13.6, Benthic and Fisheries Resources).

A more detailed account of how these avoidance or mitigation measures will be applied or considered on a project specific and evidence basis, and in consultation with the relevant regulatory agencies, E-TWG, ENGOs and stakeholders, are described in the following sections.

Offshore Geophysical Surveys

Equinor Wind has already demonstrated a high level of commitment towards avoiding or reducing the likelihood and magnitude of impacts on marine mammals and sea turtles during offshore geophysical surveys to date and will continue to adopt mitigation measures in future surveys, as appropriate to the equipment being used, time of year, area being surveyed and potential presence of receptors. The main potential impacts to marine mammals and sea turtles from geophysical survey activities can be attributed to: increased underwater noise; and vessel strikes.

Survey Equipment Noise

For geophysical surveys carried out to date on the lease area and export cable corridors, Equinor Wind has adopted the following mitigations measures to avoid or reduce impacts from noise:

- Monitoring and applying exclusion zones as appropriate to the noise source and level and receptor, with noise sources and exclusion zones evidence based and determined by infield measurements and/or modeling where feasible;
- "Soft-starts" ramping up of survey equipment power/noise levels for specific equipment that has the potential for impact producing noise levels. Subject to being technically feasible for certain types of equipment;
- NOAA NMFS approved Protected Species Observers ("PSOs") for exclusion zone monitoring pre and during survey equipment operation, and monitoring during vessel transits; and
- Passive Acoustic Monitoring System ("PAMS") and PAMS operators and nighttime visual observation equipment.

[redacted]

[redacted]

In addition, Equinor Wind also accommodated the testing of new PAMS technology developed by [redacted] with potential for improved detection of low frequency cetaceans, in particular, North Atlantic right whales. Equinor Wind facilitated this equipment being tested alongside the existing PAMS equipment, with results expected to inform its effectiveness in future applications. In this regard, Equinor Wind has an is committed to exploring future opportunities to facilitate the trialing of new or novel third-party technologies where feasible.

In preparation of conducting surveys, all required mitigation and monitoring measures were compiled into a single document and provided to all crew members, PSOs and PAMS operators prior to commencement of survey operations. This "Protected Species Mitigation Protocol" is considered a "living document" that will be updated accordingly as Equinor Wind continues its survey activities in 2019 and forward.

Equinor Wind has a policy whereby every employee and contractor has the power to stop a job if that practice is deemed unsafe, without fear of repercussions. Equinor Wind applied the same principle during the 2018 surveys, whereby PSOs, vessel crew and survey crew were briefed at survey kick-off meetings that they had the power to request a power shutdown of noise emitting survey equipment via the Lead PSO should they believe a species of marine mammals was within that species exclusion zone, regardless of whether it had been observed by a PSO or detected on PAMS. It was also made clear that it was better to be on side of caution and that there would be no repercussions for this practice. Lead PSOs also had full mandate to request immediate power shutdowns of survey equipment on a "shutdown first, explain why later" basis, so that any discussions related to survey equipment power shutdown requests could be handled after the event and not potentially impact on asserting that mitigation. Equinor Wind will continue to adopt this approach of empowering all personnel onboard via the Lead PSO and giving the Lead PSO full mandate for mitigation decisions.

Vessel Strike Avoidance

Equinor Wind's vessel strike avoidance measures will (and have been) consistent with: (1) NOAA NMFS guidance to avoid ship collision with marine mammals and sea turtles; (2) conditions within the lease area; (3) and any Incidental Take Authorizations issued by NOAA NMFS. Vessel strike avoidance measures will include, but are not limited to, the following, except under extraordinary circumstances when complying with these requirements would put the safety of the vessel or crew at risk:

- During transit to and from the lease area, all vessels will use dedicated shipping lanes
- All vessel operators and crew will maintain vigilant watch for cetaceans and pinnipeds, and slow down or stop their vessel to avoid striking these protected species

- All vessel operators will comply with 10 knots or less speed restrictions in any Seasonal Management Area per NOAA guidance. This applies to all vessels operating from November 1 through April 30
- All vessel operators will reduce vessel speed to 10 knots or less when any large whale, any mother/calf pairs, whale or dolphin pods, or larger assemblages of non-delphinoid cetaceans are observed nearby an underway vessel (within 330 ft or 100 m).
- All vessels will maintain a separation distance of 1,640 ft (500 m) or greater from any sighted North Atlantic right whale
- If underway, vessels must steer a course away from any sited North Atlantic right whale at 10 knots or less until the 1,640 ft (500 m) minimum separation distance has been established. If a North Atlantic right whale is sited in a vessel's path, or within 330 ft (100 m) to an underway vessel, the underway vessel must reduce speed and shift the engine to neutral. Engines will not be engaged until the North Atlantic right whale has moved outside of the vessel's path and beyond 330 ft (100 m). If stationary, the vessel must not engage engines until the North Atlantic right whale has moved beyond 330 ft (100 m)
- All vessels will maintain a separation distance of 330 ft (100 m) or greater from any sighted non-delphinoid cetacean. If sighted, the vessel underway must reduce speed and shift the engine to neutral, and must not engage the engines until the non-delphinoid cetacean has moved outside of the vessel's path and beyond 330 ft (100 m). If a survey vessel is stationary, the vessel will not engage engines until the non-delphinoid cetacean has moved out of the vessel's path and beyond 330 ft (100 m)
- All vessels will maintain a separation distance of 164 ft (50 m) or greater from any sighted delphinoid cetacean. Any vessel underway will remain parallel to a sighted delphinoid cetacean's course whenever possible and avoid excessive speed or abrupt changes in direction. Any vessel underway must reduce vessel speed to 10 knots or less when pods (including mother/calf pairs) or large assemblages of delphinoid cetaceans are observed. Vessels may not adjust course and speed until the delphinoid cetaceans have moved beyond 164 ft (50 m) and/or are abeam of the underway vessel
- All vessels underway will not divert or alter course in order to approach any whale, delphinoid cetacean, or pinniped. Any vessel underway will avoid excessive speed or abrupt changes in direction to avoid injury to the sighted cetacean or pinniped
- All vessels will maintain a separation distance of 164 ft (50 m) or greater from any sighted pinniped
- All vessels will maintain a separation distance of 164 ft (50 m) or greater from any sighted sea turtle
- If NMFS should establish a Dynamic Management Area ("DMA") in the area of the work, within 24 hours of the establishment of the DMA, Equinor Wind will work with NMFS to shut down and/or alter project activities to avoid the DMA as appropriate

Vessel crew members responsible for navigation duties have and will continue to receive site-specific training on marine mammal sighting/reporting and vessel strike avoidance measures. Through this training, Equinor Wind will ensure that vessel operators and crew maintain a vigilant watch for cetaceans and pinnipeds and enact appropriate speed restrictions, including slowing down or stopping activity as appropriate to avoid striking these protected species. As appropriate, training programs will be provided to NOAA NMFS for review and approval prior to the start of activities. Confirmation of the training and understanding of the requirements will be documented on a training course log sheet. Signing the log sheet will certify that the crew members understand and will comply with the necessary requirements throughout the survey event.

Offshore Survey Summary

Equinor Wind has already demonstrated a commitment to minimizing impacts to marine mammals and sea turtles during pre-construction surveys. In accordance with a BOEM-approved survey plan and an IHA issued by NOAA NMFS, Equinor Wind completed extensive marine surveys in 2018 without any vessel strike incidents. Exclusion zones were established consistent with NOAA NMFS requirements, and throughout the pre-construction surveys, Equinor Wind has documented the required information for transmittal to the applicable stakeholders.

Equinor Wind will continue to consult with NOAA NMFS and other key stakeholders throughout the project development process in order to determine if any alternative or additional appropriate and proportionate mitigation measures may be necessary.

Based on a commitment and application of the avoidance and mitigation measures described in this section, impacts to marine mammals and sea turtles resulting from Empire Wind project-related geophysical survey noise or survey vessel collisions are not expected to be significant adverse. Additional marine mammals and sea turtles data collection from PSO observations, collaboration with other third-party survey efforts on sightings, and the facilitation for testing and research of new monitoring and mitigation equipment is deemed to have positive beneficial impacts.

Construction Activities

[redacted]

Vessel Strikes – Construction Vessels

Relevant vessel strike avoidance measures as described previously in this section will be adopted for Empire Wind project related vessels during construction activities.

Construction Summary

With vessel strike avoidance mitigation in place, the likelihood and magnitude of impacts to marine mammals from vessel collisions will be reduced to as low as feasible.

[redacted]

Operations

Potential impacts associated with the operations phase have been identified to include an increase in potential collisions from project-related vessels carrying out O&M or survey operations, changes to prey resources as a direct result of the offshore wind energy development, or potential impacts due to noise from operations vessels.

Vessel Strike Avoidance

[redacted] On this basis, the likelihood for an interaction between an Empire Wind vessel and marine mammal or sea turtle is reduced and with vessel speeds predominantly lower transiting from wind turbine to wind turbine, the magnitude of the effect is decreased. In addition, Equinor Wind will adopt vessel speed restrictions associated with seasonal management areas ("SMA") and dynamic management areas ("DMA") relevant to the size of the vessels used and other vessel strike avoidance measures, such as those described previously in Section 13.5.3, if applicable. Equinor Wind is open to consulting with relevant agencies, ENGOs and E-TWG on further appropriate and proportionate mitigation options, for example, real-time monitoring or observations of marine mammals when in transit and commitments to monitor daily reports on marine mammal sightings and DMAs.

Prey Resource

As described in Section 13.6, with sensitive spatial planning and siting of structures, impacts on fisheries resources that could serve as a source of prey for marine mammals and sea turtles are not expected to be significant adverse during the operations phase. Therefore, significant adverse impacts from reduced prey resource are not expected; however, Equinor Wind will consider whether this requires further monitoring in consultation with E-TWG, BOEM and relevant stakeholders.

Moreover, anecdotal evidence from Equinor's operational offshore wind farms in the U.K. suggests that the increase in species abundance and diversity caused by the introduction of hard structures and the subsequent 'reef effect' has had positive beneficial impacts on marine mammals associated with that particular prey resource.

Operational Noise

As described in New York State Offshore Wind Master Plan: Marine Mammals and Sea Turtles Study (2017; Appendix L), noise associated with operational offshore wind energy developments is likely to be of low risk, with operational noise levels expected to be within or around ambient noise levels. Operational noise measurements from existing operational offshore wind farms have resulted in noise levels that would not result in death or physical injury to marine mammals and sea turtles, with little or no displacement effect. It is also expected that marine mammals and sea turtles in this region are expected to have some level of tolerance to the level of noise generated by operational wind farms due to the potential existing natural and anthropogenic (shipping) background noise in the region. On this basis, no additional mitigation is prescribed, however Equinor Wind is open to engaging on this matter should potential impacts be presented.

Decommissioning

Impacts resulting from the decommissioning activities are not expected to exceed impacts resulting from the worst-case scenarios associated with construction. Moreover, it is expected that as monitoring during operations provides a better understanding of the spatial and temporal presence of marine mammals and sea turtles within the lease area, mitigation measures can be more tailored and effective at further reducing the likelihood and level of impacts.

The operations period can be seen as an opportunity for developers, agencies and stakeholders to collaborate on further research into the effects and potential impacts associated with decommissioning, using the experiences in Europe to help inform that process.

13.6 Benthic and Fisheries Resources

This section describes the benthic and fisheries resources that are associated with Equinor Wind's Project Area. This discussion includes the following information on each resource or receptor: (1) information currently available; (2) efforts to further collect data; (3) potential effects that are likely to have an impact; and (4) potential mitigation options that Equinor Wind is committing to or can be considered as appropriate to results from further studies and impact assessments. This section on benthic and fisheries resource has also been included in the Fisheries Mitigation Plan ("FMP") as part of this proposal.

In addition to the information below, Equinor Wind has provided the FMP setting out the proposed process for identifying baseline conditions and addressing potential impacts to commercial and recreational fisheries and Equinor Wind's coexistence strategy.

13.6.1 Regulatory Context

The fisheries of the United States are managed within a framework of overlapping international, federal, state, interstate, and tribal authorities. Individual states and territories generally have jurisdiction over fisheries in marine waters within 3 nautical miles ("nm") (3.5 miles ("mi") or 5.6 kilometers ("km")) of their coasts. Federal jurisdiction includes fisheries in marine waters inside the U.S. Exclusive Economic Zone ("EEZ"), which encompasses the area from 3 to 200 nm (3.5 to 230 mi or 5.6 to 370 km) offshore of any U.S. coastline (NOAA 2016). In addition to the regional fishery management councils ("FMCs"), an array of multi-state fisheries commissions coordinate conservation and management of the common interstate nearshore fishery resources—marine finfish, shellfish, and anadromous fish—for sustainable use. Together with National Marine Fisheries Service ("NMFS"), a division of the National Oceanic and Atmospheric Administration ("NOAA"), these councils maintain fishery management plans for specific species or species groups to regulate commercial and recreational fishing within their geographic regions. NMFS's Highly Migratory Species Division is responsible for tuna, sharks, swordfish, and billfish in the Atlantic Ocean (NMFS 2009). FMCs are required to identify essential fish habitat ("EFH") for each fishery covered under a fishery management plan. EFH is defined as the waters and seafloor necessary for spawning, breeding, or growth to maturity (16 U.S.C. § 1802(10)). "Fish" is defined as "finfish, mollusks, crustaceans, and all other forms of marine animals and plant life other than marine mammals and birds" (16 U.S.C. § 1802(12)). The role of the benthic habitat as a fisheries resource is fundamental to the identification of EFH, as reflected in the emphasis on EFH in BOEM's benthic survey guidance (BOEM 2013a). The guidance recommends that the NMFS EFH mapper tool (http://www.habitat.noaa.gov/protection/efh/habitatmapper.html) be used for species identification and habitat characteristics at any particular location (BOEM 2013a, page 4).

Impacts to benthic habitats and fisheries resources are managed under various federal laws including the Magnuson-Stevens Fishery Conservation and Management Act ("MSA"), Endangered Species Act ("ESA"), and NEPA. In support of the COP and associated evaluations of potential project-related impacts for Federal and State permit applications, BOEM's site characterization requirements in 30 C.F.R. § 585.626 are being applied to the benthic habitat and fisheries resource assessments.

BOEM is required to consult with NMFS as part of the NEPA process and if a proposed project is expected to adversely affect EFH. An adverse effect is defined as "any impact which reduces the quality and/or quantity of essential fish habitat," which includes physical, chemical, and biological impacts (NMFS 2004). Effects may manifest in a number of ways, either directly or indirectly, and on any spatial scale, including areas beyond EFH. For example, changes in water quality, benthic communities, or prey availability may constitute an adverse effect on EFH. BOEM must also consult with NMFS under Section 7 of the ESA for actions described in the COP that may affect anadromous fish species listed under the ESA. State agencies will also be consulted as part of the coastal consistency determination.

13.6.2 Preliminary Resource Characterization

Benthic habitat can be used to support prediction of the presence of fisheries resources, by providing information on sediment size/type, density, presence of submerged vegetation and other characteristics. The offshore lease area and large portions of the proposed export cable corridors are predominantly characterized as sand with isolated patches of gravel-sand. Finer grained sediments are expected within the New York Harbor. Although generally flat, the New York Bight contains sand ridges, filled valleys, shoal-retreat massifs, and paleoshorelines (NYSERDA 2017; Appendix A). In general, benthic habitat throughout the lease area is relatively homogeneous. During the BOEM offshore wind planning process prior to the lease auction, an isolated topographic high, known for its value to commercial and recreational fishing, was identified to the northwest of the lease area; this area, called Cholera Bank, is a sensitive feature that was subsequently removed from the lease area prior to lease sale. The National Centers for Coastal Ocean Science and BOEM are preparing comprehensive seafloor substrate maps of the New York Bight, with a particular focus on the lease area. Information from that study will be incorporated into the COP as appropriate when it becomes available and will be combined with Equinor Wind's site-specific benthic sampling to generate full benthic habitat maps.

A review of available data on seagrasses concluded that neither of the two seagrasses native to the New York Bight region exist within the lease area (NYSERDA 2017; Appendix Aa). Suitable habitat for seagrasses is limited to water shallower than 39 feet ("ft") (12 meters ("m")). While not present within the lease area, seagrasses are found along coastal areas, including the barrier island systems Long Island, and will, therefore, form part of the assessment for cable landfall locations and onshore cable routing.

Fish and invertebrate species of interest in the lease area fall into three groups based on regulatory status: (1) species managed under the MSA; (2) species listed under the ESA; and (3) non-game fish and invertebrate species that are considered important prey (or shelter, in the case of biogenic habitats) for fish and wildlife. Extensive long-term datasets are available to characterize fisheries resources in the lease area. In 2016, NYSERDA initiated three-year aerial surveys of sharks, rays, and large bony fish in the area (2017; Appendix J). Additional surveys will focus on fish and invertebrate population structure and distribution, and identification of potential impacts on EFH and sensitive habitats. NYSERDA concluded that the combined datasets from Marine-life Data Analysis Team ("MDAT"), the aerial fish surveys, and the Virginia Institute of Marine Science's Northeast Area Monitoring and Assessment Program together provide support for siting decisions for wind energy that would not interfere with fisheries resources.

In NYSERDA's Master Plan, the physical and biological character of the seafloor was described within the New York Bight through analysis of Multibeam Echo Sounder (MBES) and benthic survey data (2017; Appendix A). This in conjunction with the NYSERDA Master Plan Fisheries Study (2017; Appendix J) and additional scientific literature provide additional information to support describing baseline conditions as Equinor Wind develops the baseline conditions for its assessments.

Fish and Invertebrate Species Managed Under the MSA

Virtually all coastal U.S. waters are designated as EFH for at least one managed species. Designated EFH is an indicator of underlying habitat features important to fish. EFH delineates areas where the species may occur based on known occurrence of the species or habitat features important to the species/life stage. Construction, operation, and decommissioning of the project has the potential to directly and indirectly affect managed marine finfish and invertebrates as well as marine and estuarine habitats (including EFH) that support managed species and their prey. Adverse effects on habitat or species could secondarily affect the commercial and recreational fishing industries that these resources support. Therefore, locations of designated EFH for various life stages of managed species will be foundational to the benthic and fisheries resource assessment.

Just as the location of benthic EFH can serve as an approximate guide to locations of benthic fisheries species, locations of heavy harvests of managed fisheries are often associated with areas of physical impact. In fact, BOEM's benthic guidance recommends that areas affected by bottom-tending mobile fishing gear be identified and suggests that "publicly available commercial fishing data" be used to characterize benthic habitats (BOEM 2013a, page 5). In particular, heavy bottom trawls are known to disturb benthic EFH in many locations. The characterization of baseline benthic habitat conditions will take into account locations where heavy gear is expected to have caused physical injury to bottom habitats. On a similar basis, the location of historic and contemporary anchoring locations of large cargo vessels and tankers will be recorded, for localized disturbance to benthic EFH.

EFH has been designated in the lease area for various life stages of more than two dozen non-migratory managed species, including finfish, sharks and rays, and invertebrates, as provided in Figure 10. Designated EFH for three (3) coastal migratory pelagic and seventeen (17) highly migratory managed fish species also occurs in the lease area, as provided in Figure 11. EFH is designated in the lease area by both the Mid-Atlantic Fishery Management Council ("MAFMC") and the New England Fishery Management Council ("NEFMC") for species that occur in both jurisdictions. EFH for other species and/or life stages may be present along the export cable corridor. On April 9, 2018, the *Federal Register* published NEFMC's Final Rule, which modified the designation of EFH for numerous species that occur in the lease area (NEFMC's Omnibus Essential Fish Habitat Amendment 2; 50 C.F.R. Part 648). In this Final Rule, NMFS approved: (1) all of the updated EFH; (2) all of the recommended habitat area of particular concern ("HAPC"); (3) the majority of the habitat management area recommendations; (4) all of the seasonal spawning area recommendations; and (5) the framework and administrative recommendations.

Federal & State-Listed Endangered Fish Species

Three federally-listed endangered fish may occur in the lease area: (1) Atlantic salmon (*Salmo salar*); (2) the Atlantic sturgeon (*Acipenser oxyrinchus*); and (3) shortnose sturgeon (*Acipenser brevirostrum*). On August 17, 2017, NOAA NMFS designated critical habitat for the Atlantic sturgeon in certain areas, including the New York Bight (Endangered and Threatened Species; Designation of Critical Habitat for the Endangered New York Bight, Chesapeake Bay, Carolina and South Atlantic Distinct Population Segments of Atlantic Sturgeon and the Threatened Gulf of Main Distinct Population Segment of Atlantic Sturgeon; 50 C.F.R. Part 226). New York classifies the Atlantic sturgeon as protected. Both the manta ray (*Manta birostris*) and the oceanic whitetip shark (*Carcharhinus longimanus*) were recently classified as threatened under the ESA (50 C.F.R. Part 223). The most current official distribution and abundance data on these species are available from NMFS. Independent researchers often publish supplemental data on various aspects of endangered species in localized areas, such as movement patterns, spawning locations, life history traits, and other factors that may be relevant to the impact analysis. New York classifies the shortnose sturgeon (*Acipenser brevirostrum*) as endangered. The shortnose sturgeon is found in the lower portion of the Hudson River from river mile 0 (southern Manhattan) to river mile 152 (the Federal dam at Troy) (NYSDEC Shortnose Sturgeon Fact Sheet, available at: http://www.dec.ny.gov/animals/26012.html). NYSDEC lists a number of other fish species as endangered, most if not all, are associated with fresh water habitat which will be evaluated, as applicable to the export cable route.

It is virtually impossible to demonstrate the absence of a rare species within its historical range; therefore, these three endangered fish species will be assumed present in the lease area, albeit in limited abundance and frequency based on the type of habitat that is present. More details on the spatial and temporal distribution of Atlantic sturgeon is expected to be available soon, resulting from BOEM funded studies carried out by Stony Brook University. Equinor Wind has also made its metocean moorings available to Stony Brook University to attach Atlantic sturgeon receivers to in order to gather more data. This has resulted in three additional sensors being deployed in the lease area in December 2018 and an additional sensor to be installed in spring 2019. Data will be collected from these sensors for approximately and additional two years, to develop a broader knowledge of Atlantic sturgeon movements in the vicinity of the lease area.

Non-Game Fish and Invertebrate Species

Useful data on the distribution and abundance of non-game fish and invertebrates come from many sources, including fisheries management plans, peer-reviewed literature, and NMFS reports. Although the Estuarine Living Marine Resource database (NOAA 2000) has not been kept current, the descriptions of spatial and temporal distributions of species (by life stage) in Hudson River/Raritan Bay and the Great South Bay provide a framework for describing current conditions in the area of the proposed cable landing(s). NYSERDA recently reviewed the Ocean Biogeographic Information System and confirmed that typical invertebrates of recreational and commercial interest in the lease area include longfin and shortfin squid, lobster, horseshoe crab, blue crab, scallop, ocean quahog, and Atlantic surfclam (NYSERDA Master Plan; 2017; Appendix J). NYSERDA also reviewed the available data on the suitability of habitat and the presence of living coral. Most coral habitat is well to the east of the lease area (near the continental shelf break). However, a small area of coastal Long Island was identified as having habitat suitable to support corals (NYSERDA 2017; Apppendix A). The New York Department of State ("NYSDOS") has designated 250 areas within the potential export cable corridors as Significant Coastal Fish and Wildlife Habitats (NYSERDA 2017; Appendix J).

13.6.3 Ongoing and Planned Assessments

BOEM has published recommended approaches for assessing benthic habitat and fisheries resources during the permitting phase of offshore wind projects: (1) *Guidelines for Providing Benthic Habitat Survey Information for Renewable Energy Development on the Atlantic Outer Continental Shelf* (Benthic Guidelines; BOEM 2013a); and (2) *Guidelines for Providing Information on Fisheries for Renewable Energy Development on the Atlantic Outer Continental Shelf* (Fisheries Guidelines; BOEM 2013b). Because fisheries resources are defined by their use as commodities, BOEM has also provided guidance on evaluating the impact of wind projects on the socioeconomic aspects of fishing: *Guidelines for Providing Information on Fisheries Social and Economic Conditions for Renewable Energy Development* (BOEM 2015a), which are further referenced in Section 12.

Existing Data Collection and Monitoring Efforts

Under BOEM funding as part of their efforts to map the lease area during the leasing stage, and subsequently continuing after the Lease was awarded to Equinor Wind, NOAA's National Ocean Service ("NOS") conducted extensive surveys over three years using sonar and sediment grabs using research vessel Research Vessel ("RV") Nancy Foster, adding to data collected earlier in 2013 on RV Ferdinand Hassler (NOAA NOS Survey Report). [redacted]

Equinor Wind Data Collection

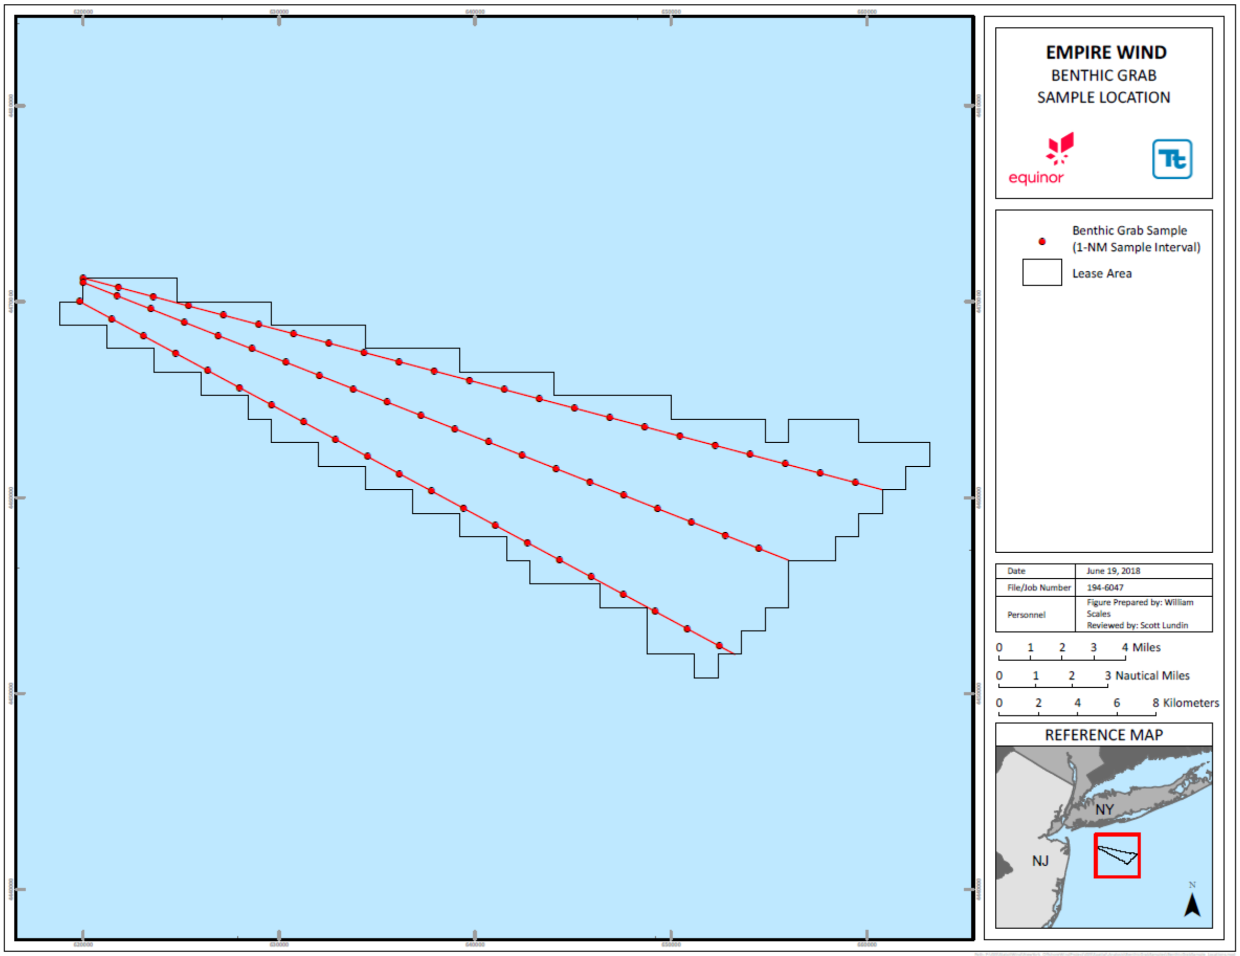
To support the assessment of benthic and fisheries resources in the lease area, Equinor Wind conducted geophysical, benthic, and geotechnical work from March 2018 to November 2018 across the entire lease area and a large proportion of export cable corridors, with additional geophysical, benthic, and geotechnical surveys planned for 2019 to fill in any data gaps, in particular from landfall to the 65 ft (20 m) depth contour. The plans for the 2018 surveys were submitted to BOEM in November 2017 and subsequently approved in February 2018. An

Incidental Harassment Authorization ("IHA") was submitted to NOAA NMFS and issued in April 2018. A High-Resolution Geophysical ("HRG") Survey Plan was also issued. In the spirit of openness and transparency, Equinor Wind has made these documents available for download from the Empire Wind webpage at www.empirewind.com/environmental.

Equinor Wind contracted Alpine Ocean Seismic Survey Inc. ("Alpine") to perform the surveys, using survey vessels RV Shearwater and RV Ocean Researcher from March 18, 2018, to December 2, 2018. The survey equipment and scope included, but was not limited to, the following:

- Gridded survey lines at a spacing of approximately 98 ft by 1,640 ft (30 m by 500 m);
- Depth sounding (multibeam echosounder) to determine site bathymetry and elevations;
- Magnetic intensity measurements (gradiometer) for detecting local variations in the regional magnetic field from geological strata and potential ferrous objects on and below the bottom;
- Seafloor imaging (sidescan sonar survey) for seabed sediment classification purposes, to identify natural and man-made acoustic targets on the seabed, as well as any anomalous features;
- Shallow penetration sub-bottom profiler to map the near-surface stratigraphy (from seabed surface to 16.4 ft (5 m) below seabed) soils below the seabed;
- Medium penetration sub-bottom profiler to map deeper subsurface stratigraphy as needed (soils down to 75-100 m below seabed);
- CPTs and Vibracores in the lease area and along the export cable corridors;
- Sediment grab samples and drop-down video images at 67 sampling locations (see Figure 12) to support the interpretation of geophysical data to characterize surficial sediment conditions and benthic habitat, including macrofaunal analysis with samples sieved at 0.5 mm mesh size.

Figure 12: Locations of 2018 Benthic Survey Campaign within Lease Area



Data from the 2018 HRG and benthic surveys will be analyzed and reported on in 2019 to applicable stakeholders. Preliminary and anecdotal results from the survey crew are consistent with descriptions of the expected habitat from previous studies. Full results will inform planning and mitigation with additional survey data in 2019 being added as appropriate and used in the development of the COP and other State and Federal permit applications as required.

Equinor Wind is currently planning and procuring contractors to conduct benthic sampling along the proposed export cable corridors, with sampling expected to take place in spring 2019. Sampling will be as consistent with the benthic sampling conducted within the lease area and will include as a minimum the following:

- Sediment grab samples for grain size analysis;
- Drop-down camera and/or video images;
- Grab samples for macrofauna.

In addition, and as previously noted, BOEM has funded studies that are being carried out by Stony Brook University to monitor the spatial and temporal distribution of Atlantic sturgeon within the New York Bight and Equinor Wind's lease area. The study is coming to a close at the time of writing. Equinor Wind has made its metocean moorings available to Stony Brook University to attach Atlantic sturgeon receivers to in order to gather more data. This has resulted in three additional sensors being deployed in the lease area in December 2018 and an additional sensor to be installed in spring 2019. Data will be collected from these sensors for approximately an additional two years.

Baseline Summary

Equinor Wind evaluated the extent to which existing, and publicly available data sources are suitable for characterizing benthic habitat and fisheries resources in the lease area. Both published data and ongoing survey efforts in the lease area and surrounding waters support the preliminary characterization of baseline conditions in accordance with Federal and State requirements and guidelines.

Furthermore, Equinor Wind presented the list of data sets proposed to be utilized for the baseline characterization of benthic and fisheries resources to NOAA NMFS in March 2018 and August 2018. NOAA NMFS provided feedback, including additional data sets to use, and agreed with the conclusion that there is sufficient existing data for a baseline characterization in the lease area.

As such, additional benthic and fisheries surveys are not deemed to be required within the lease area for the purpose of the COP impact assessments, spatial planning or mitigation, however Equinor Wind will consult with E-WTG, F-TWG, RODA and the fishing industry, including fisheries scientists and managers on requirements for further surveys for targeted fisheries monitoring and research.

A discussion of impact producing factors, potential impacts and how Equinor Wind proposes to avoid or mitigate to reduce those impacts to benthic and fisheries resource during surveys, construction, operations and decommissioning is provided in the following sections.

13.6.4 Potential Impacts and Mitigation

An understanding of the potential effects from offshore wind energy developments that have the potential to impact benthic and fisheries resources, either positively or negatively, have come from experience, literature on the subject and from New York State's Offshore Wind Master Plan Fish & Fisheries Report (2017; Appendix J). The potential impact producing factors identified that are relevant to benthic habitats and fisheries resources are as follows:

- Short-term temporary physical disturbance to habitats and species resulting from seabed preparation, anchor spreads, jack-up barge footings and the installation of subsea cables during construction, decommissioning and limited maintenance periods;

- Short-term temporary habitat loss resulting from seabed preparation, anchor spreads, jack-up barge footings and the installation of subsea cables during construction, decommissioning and limited maintenance periods;
- [redacted]
- Short-term temporary increased suspended sediment concentration and deposition (smothering) resulting from seabed preparation and the installation of subsea cables during construction and decommissioning, and from short duration scouring events during operations;
- Temporary exposure to accidental spills, pollution or trash from project related vessels;
- Long-term temporary habitat loss or modification resulting from the presence of foundations, scour material and surface cable protection during operations;
- Long-term temporary changes to existing physical oceanographic conditions during operations due to the presence of structures; and
- Potential exposure to Electromagnetic Fields ("EMF") during operations.

Potential Mitigation

The baseline characterization and assessment of future potential impacts on benthic habitats and fisheries resources from the construction, operation, and decommissioning of the project must satisfy the requirements of various regulations and jurisdictional agencies. As such, collaboration and coordination with BOEM, NOAA NMFS, NYSDEC and relevant stakeholders throughout the development and planning process, will be critical to the success of the project. In order to mitigate for the potential impacts to benthic habitats and fisheries resources associated with the construction, operations, and decommissioning of the project, Equinor Wind is implementing the following mitigation measures:

- Avoiding, to the extent possible, siting structures (wind turbines, offshore substations, and submarine cables) in areas of sensitive habitat;
- Using best management practices and timing during cable installation activities to minimize sediment resuspension and dispersal in areas of known historically contaminated sediments;
- [redacted]
- A commitment to sufficiently bury electrical cables where feasible, minimizing seabed habitat loss and reducing the effects of EMF;
- Consideration of the timing of construction activities; working with the fishing industry and fisheries agencies on sensitive spawning and fishing periods to actively avoid or reduce interaction with receptors, where feasible;
- Using industry Best Practices for vessel operation, and implementing an Oil Spill Response Plan ("OSRP").

More confidence in the type and level of impacts to benthic and fisheries resources will be determined as the project matures and on submission of the COP. However, certain assumptions can be made at this stage for the purpose of the bid, based on preliminary information and experience, as described in further sections.

Mitigation for recreational and commercial fishing practices is described in the FMP, Section 12.4.3 of this submission.

Surveys

Equinor Wind is following BOEM best practice guidance for surveys and submitting survey plans for review and approval prior to survey activity, which addresses potential impacts to benthic and fisheries resources during survey activities, for example exposure to noise through geophysical surveys or disturbance to habitats and species through benthic and geotechnical sampling. Where there is potential for impacts on threatened or endangered species, NOAA NMFS are included in the survey plan review in coordination with BOEM.

Sensitive benthic habitats are actively avoided where feasible, by taking this into consideration in the planning phase, for example routing export cable corridors to avoid sensitive habitats and therefore avoid the need for intrusive surveys there. This practice will be continued as the Empire Wind project develops. In addition, real-time avoidance is and will continue to be applied for seabed intrusive sampling by the use of drop down cameras to inspect the seabed prior to taking samples. For the summer 2018 geotechnical and benthic sampling, the team of Environmental Scientists onboard the survey vessel provided this real-time monitoring.

As such, and where feasible, sensitive benthic habitats will be avoided to the greatest extent possible when conducting seabed intrusive surveys through a combination of avoidance through spatial planning pre-survey, then avoidance during surveys through real-time monitoring.

Construction

Loss of Habitat

With embedded mitigation in place, including project siting to avoid sensitive habitats, Equinor Wind expects that impacts to sensitive benthic habitats and fisheries resources resulting from seabed disturbance and temporary habitat loss will be avoided or reduced to as low as feasible. With expected high recoverability rates of immobile species and the return of mobile species following the disturbing activity, Equinor Wind does not expect significant adverse impacts. Disturbance to the seabed habitat during construction is expected to recover within a relatively short time period, with recolonization expected within several years for most species. The level of disturbance from construction activities is likely to be consistent with seabed disturbance and recovery resulting from existing anthropogenic pressures in the lease area and adjacent waters, such as bottom contacting commercial fishing activities and commercial vessel anchoring.

With highly sensitive habitats being avoided through spatial planning and micro siting, the potentially affected areas are therefore expected to be of the relatively homogenous sand or sandy gravel habitat type. The overall affected area during construction activities is expected to be an insignificant proportion of the overall available habitat in context to the Empire Wind offshore wind energy development, full lease area, and available similar habitats and species in adjacent waters. Equinor Wind will calculate actual affected areas and habitat loss and will share those results with the E-TWG and F-TWG, as well as publishing as part of the COP.

Suspended Sediments and Deposition

Exposure to increased suspended sediment concentration and potential smothering of benthic organisms and fish larvae resulting from cable installation and seabed preparation is expected to be short-term in duration and within the timescales of a tidal cycle. Sediments in the lease area are of a sand to gravelly sand nature and settlement rates are relatively fast. The suspended sediment concentrations generated through construction activity are also expected to be within the background levels of wave-induced suspended sediments from natural storm events, such as “nor-easters” typical of the region. In this instance the affected areas are expected to be localized and significantly smaller than affected areas from natural storm events. Equinor Wind will be carrying out sediment transport modeling to quantify the suspended sediment concentrations, durations and affected areas and will share these results with the F-TWG, as well as publishing as part of the COP.

Water Quality

The routing of the export cable corridor has taken into consideration existing and historic dumping grounds (charted) and has actively avoided them where feasible. As stated, much of the routing is in areas that are characterized as sand, where larger grain-sizes reduces the potential for contamination to be present. More information on sediment properties and potential impacts will become available as data from the 2018 surveys is analyzed and reported and as Equinor Wind completes additional nearshore surveys and sediment sampling in 2019, where chemical characterization will occur in areas of grain-size <90%. The information gathered will inform a sediment transport analysis. If contaminants are present, any release of contaminants will be of a short-term temporary nature and of limited spatial coverage. Additionally, Best Management Practices will be defined to further mitigate these effects.

Underwater Noise

[redacted]

Operations

Electromagnetic Fields

Equinor Wind intends to mitigate for potential EMF effects by burying cables to sufficient burial depths based upon existing fishing practices and cable burial risk assessments. Where target burial depth is not feasible, for example, due to challenging seabed conditions or cable crossings, the cables will be sufficiently protected with surface cable protection. The likelihood for receptor-effect interaction will be reduced, with impacts not expected to be significant adverse. The UK National Policy Statement for Renewable Energy Infrastructure EN-3 (DECC, 2011) states that for offshore wind, electrical cables that are sufficiently protected or buried will not result in significant impacts on sensitive species. It is however appreciated that species within the lease area will be different to those in U.K. waters and, therefore, Equinor Wind is open to discussing further monitoring and research to fill any data gaps through the E-TWG and F-TWG. Equinor Wind will carry out EMF modeling and assessments as part of the COP submission.

Suspended Sediments and Deposition

Existing information indicates the subsurface currents within the lease area and adjacent waters are expected to be typically less than 0.32 ft/s (0.10 m/s). To better understand the physical environment, Equinor Wind has installed current meters in the lease area as of December 2, 2018 to collect site-specific measurements and will also be performing sediment transport modeling as part of the COP assessments. Based on the existing information, the relatively low near-bed current speeds are not expected to generate significant quantities of suspended sediments and deposition from scouring. Equinor Wind is conducting further studies to identify where scour protection may be required, which will further reduce the magnitude of suspended sediments affecting receptors. Similar to construction activities, the suspended sediment concentrations generated through scour in the operations phase are also expected to be within the background levels of wave-induced suspended sediments during natural storm events, such as '"nor-easters" typical of the region. In this instance the affected areas are expected to be localized and significantly smaller than affected areas from natural storm events.

Loss of Habitat

The seabed in the lease area and adjacent areas surrounding is relatively homogenous, made up of sand and sandy gravel. More detailed information on the habitat type and benthic community will become available as data from the [redacted]

[redacted] Micrositing to avoid sensitive habitats will be employed. Habitat loss can therefore be deemed long-term temporary, with the habitat expected to recover to existing conditions and benthic species expected to recolonize the area after decommissioning.

The introduction of hard structures to an otherwise sandy mobile seabed may be considered a positive beneficial impact, as the hard structures offer a new habitat type for colonizing based on the associated 'reef' effect (see BOEM "Rigs to Reefs" at https://www.bsee.gov/what-we-do/environmental-focuses/rigs-to-reefs). The change to habitat type and potential change to species may be topic for further monitoring and research in consultation with F-TWG and E-TWG.

Decommissioning

Impacts resulting from decommissioning activities are not expected to exceed impacts resulting from construction. Moreover, with requirements expected for the removal of structures at or just below the seabed level, Equinor Wind expects the seabed will recover to its pre-construction condition within a relatively short timeframe. Decommissioning impacts and mitigation will require further consideration and should form part of future E-TWG and F-TWG discussion points. Approaches and requirements will likely further be refined as European offshore wind energy developments near closer to decommissioning and as US offshore wind energy development matures. Equinor Wind will use those experiences to apply to decommissioning best practices to avoid and minimize impacts associated with the Empire Wind Project, as appropriate.

13.7 Avian and Bat Species

This section describes the avian and bat species associated with the Equinor Wind's Project Area. This discussion includes the following information on each resource or receptor: (1) information currently available; (2) efforts to further collect data; (3) potential effects that are likely to have an impact; and (4) potential mitigation options that can be employed.

13.7.1 Regulatory Context

Impacts to avian and bat species are regulated under various federal laws including ESA, NEPA, and the Migratory Bird Treaty Act. These regulations require consultation between the lead agency (BOEM) and other agencies, including USFWS and NYSDEC. New York also protects certain bird and bat species under the Endangered and Threatened Species Regulations at 6 NYCRR Part 182.

BOEM requires that a baseline assessment of avian and bat species and potential impacts be completed in support of the COP (30 C.F.R. § 585.626(a)(3)) and associated consultations under Section 7 be conducted with the USFWS. Consultation with USFWS is required for approval of a COP as the activities described in a COP may affect listed species. As the lead federal agency, BOEM is responsible for initiating and completing necessary consultations among federal and state agencies.

13.7.2 Preliminary Resource Characterization

A large number of bird species occur in or potentially fly over the New York Bight (and the lease area) as detailed in Figure 13. Of these potential bird species that may occur in the lease area, certain species are listed under the ESA and/or 6 NYCRR 182 as endangered or threatened.

Figure 13: Avian and Bat Species Known to Occur Within the Waters of the New York Bight

Family Common Name	Scientific Name	Fed. Status[4]	NY Status[5]	Known NY Bight Distribution	Occurrence in NY Bight	Seasonal Occurrence
Birds						
Ducks (Anatidae)						
Brant	*Branta bernicla*	N/A	N/A	Scattered, non-breeding, transient[1]	Rare[1]	Seasonal[1]
Canada Goose	*Branta canadensis*	N/A	N/A	Scattered, non-breeding, transient[1]	Rare[1]	Seasonal[1]
Mallard	*Anas platyrhynchos*	N/A	N/A	Scattered, non-breeding, transient[1]	Rare[1]	Seasonal[1]
American Black Duck	*Anas rubripes*	N/A	N/A	Scattered, non-breeding, transient[1]	Rare[1]	Seasonal[1]
Common Eider	*Somateria mollissima*	N/A	N/A	Winter migrant; Coastal, Bays[3]; near coastlines and islands, throughout Lease Area[1]	Common[1]	Seasonal[1]
King Eider	*Somateria spectabilis*	N/A	N/A	Winter; Coastal[3]	Rare[3]	Seasonal[1]
Harlequin Duck	*Histrionicus histrionicus*	N/A	N/A	Winter; Coastal[3]	Rare[3]	Seasonal[1]
Surf Scoter	*Melanitta perspicillata*	N/A	N/A	Winter migrant; Coastal[3]; near coastlines and islands, throughout Lease Area[1]	Common[1]	Seasonal[1]
White-winged Scoter	*Melanitta fusca*	N/A	N/A	Winter migrant; Coastal, Bays[3]; near coastlines and islands, throughout Lease Area[1]	Common[1]	Seasonal[1]
Black Scoter	*Melanitta nigra*	N/A	N/A	Winter migrant; Coastal, Bays[3]; near coastlines and islands, throughout Lease Area[1]	Common[1]	Seasonal[1]

Family Common Name	Scientific Name	Fed. Status[4]	NY Status[5]	Known NY Bight Distribution	Occurrence in NY Bight	Seasonal Occurrence
Long-tailed Duck (was Oldsquaw)	*Clangula hyemalis*	N/A	N/A	Winter migrant; Coastal, Bays[3]; near coastlines and islands, throughout Lease Area[1]	Common[1]	Seasonal[1]
Bufflehead	*Bucephala albeola*	N/A	N/A	Scattered, non-breeding, transient[1]	Rare[1]	Seasonal[1]
Red-breasted Merganser	*Mergus serrator*	N/A	N/A	Winter migrant; Coastal, Bays[3]; near coastlines and islands, throughout Lease Area[1]	Common[1]	Seasonal[1]
Grebes (Podicipedidae)						
Pied-billed Grebe	*Podilymbus podiceps*	BCC	T	Migrant[3]	Rare[3]	Seasonal[1]
Horned Grebe	*Podiceps auritus*	BCC	N/A	Winter migrant; Coastal, Bays[3]; non-breeding[2]	Rare[3]	Seasonal[1]
Red-necked Grebe	*Podiceps grisegena*	N/A	N/A	Winter migrant; Coastal, Bays, Shallow open water[3]; non-breeding[2]	Rare[3]	Seasonal[1]
Plovers (Charadriidae)						
American Oystercatcher	*Haematopus palliatus*	BCC	N/A	Migrant; breeder along coastal beaches and marshlands	Common[6]	Seasonal[6]
Black-bellied Plover	*Pluvialis squatarola*	N/A	N/A	Migrant and rare winter resident	Common[6]	Seasonal[6]
Semipalmated Plover	*Charadrius semipalmatus*	N/A	N/A	Migrant	Common[6]	Seasonal[6]
Piping Plover	*Charadrius melodus*	T	E	Breeding; Open sandy beaches; not well known migratory patterns[3]	Common[3]	Seasonal[3]
Phalaropes (Scolopacidae)						
Upland Sandpiper	*Bartramia longicauda*	BCC	T	Breeding and migrant; beach dunes and grasslands	Rare[6]	Seasonal[6]

Family Common Name	Scientific Name	Fed. Status[4]	NY Status[5]	Known NY Bight Distribution	Occurrence in NY Bight	Seasonal Occurrence
Red Knot	*Calidris canutus*	T	T	Migrant; Primarily coastal shorelines, rare winter resident[3]	Rare[1]	Seasonal[1]
Sanderling	*Calidris alba*	N/A	N/A	Migrant and winter resident; Primarily coastal shorelines	Common[6]	Seasonal[6]
Dunlin	*Calidris alpina*	N/A	N/A	Migrant and winter resident; Primarily coastal shorelines	Common[6]	Seasonal[6]
Purple Sandpiper	*Calidris maritima*	BCC	N/A	Migrant and winter resident; Primarily rocky coastal shorelines	Common[6]	Seasonal[6]
Least Sandpiper	*Calidris minutilla*	N/A	N/A	Migrant; Primarily coastal shorelines	Common[6]	Seasonal[6]
Semipalmated Sandpiper	*Calidris pusilla*	BCC	N/A	Migrant and rare winter resident; Primarily coastal shorelines	Common[6]	Seasonal[6]
Short-billed Dowitcher	*Limnodromus griseus*	BCC	N/A	Migrant and rare winter resident; Primarily coastal shorelines	Common[6]	Seasonal[6]
Red Phalarope	*Phalaropus fulicaria*	N/A	N/A	Migrant; Primarily pelagic shelf breaks, some inshore[3]	Common[1]	Seasonal[1]
Red-necked Phalarope	*Phalaropus lobatus*	N/A	N/A	Migrant; Pelagic shelf breaks[3]	Common[1]	Seasonal[1]
Skuas/Jaegers (Stercorariidae)						
South Polar Skua	*Stercorarius maccormicki*	N/A	N/A	Scattered, non-breeding, transient[1]	Rare[1]	Seasonal[1]
Great Skua	*Stercorarius skua*	N/A	N/A	Winter migrant; Pelagic[3]	Rare[3]	Seasonal[3]
Pomarine Jaeger	*Stercorarius pomarinus*	N/A	N/A	Migrant; Pelagic[3]; most abundant along shelf edge[1]	Rare[1]	Seasonal[1]
Parasitic Jaeger	*Stercorarius parasiticus*	N/A	N/A	Migrant; Pelagic, Seacoasts, Inland Coasts[3]	Rare[3]	Seasonal[3]

Family Common Name	Scientific Name	Fed. Status[4]	NY Status[5]	Known NY Bight Distribution	Occurrence in NY Bight	Seasonal Occurrence
Long-tailed Jaeger	*Stercorarius longicaudus*	N/A	N/A	Migratory, Pelage (less than 20 mi [32 km] offshore), Seacoasts, Inland waterbodies[3]	Rare[3]	Seasonal[3]
Alcids (Alcidae)						
Dovekie	*Alle alle*	N/A	N/A	Winter; Pelagic, Seacoasts[3]	Common[1]	Seasonal[3]
Atlantic Puffin	*Fratercula arctica*	N/A	N/A	Pelagic, Winter	Rare[1]	Seasonal[3]
Common Murre	*Uria aalge*	N/A	N/A	Wintering; Pelagic, Cliffs, Rocky Seacoasts (30 to 90 mi [48 to 145 km] offshore)[3]	Rare[1]	Seasonal[3]
Thick-billed Murre	*Uria lomvia*	N/A	N/A	Winter; Pelagic (less than 100 mi [161 km] offshore), Cliffs, Seacoasts[3]	Rare[1]	Seasonal[3]
Razorbill	*Alca torda*	N/A	N/A	Winter; Pelagic, Cliffs, Islands, Rocky Shores[3]	Rare[1]	Seasonal[3]
Gulls/Terns (Laridae)						
Black-legged Kittiwake	*Rissa tridactyla*	N/A	N/A	Winter migrant; Pelagic (less than 15 mi [24 km] offshore), Bays, Islands, Seacoasts[3]	Common[1]	Seasonal[1]
Bonaparte's Gull	*Larus philadelphia*	N/A	N/A	Wintering; Bays, Seacoasts, Pelagic (less than 15 mi [24 km] offshore)[3]	Rare[1]	Seasonal[1]
Little Gull	*Larus minutus*	N/A	N/A	Scattered, non-breeding, transient[1]	Rare[1]	Seasonal[1]
Laughing Gull	*Larus atricilla*	N/A	N/A	Breeding; Bays, Seacoasts, Islands[3]; Lease Area is close to northern limit	Common[1]	Seasonal[1]
Ring-billed Gull	*Larus delawarensis*	N/A	N/A	Winter migrant; Bays, Seacoasts, Fields[3]	Rare[1]	Year-round[1]

Family Common Name	Scientific Name	Fed. Status[4]	NY Status[5]	Known NY Bight Distribution	Occurrence in NY Bight	Seasonal Occurrence
Herring Gull	*Larus argentatus smithsonianus*	N/A	N/A	Winter breeding migrant; Bays, Coastal, Pelagic (inter/subtidal, less than 20 mi [32 km] offshore)[3]	Common[1]	Year-round[1]
Iceland Gull	*Larus glaucoides*	N/A	N/A	Scattered, non-breeding, transient[1]	Rare[1]	Seasonal[1]
Lesser Black-backed Gull	*Larus fuscus*	N/A	N/A	Winter migrant; Bays, Rocky or sandy coast[3]	Rare[1]	Seasonal[3]
Glaucous Gull	*Larus hyperboreus*	N/A	N/A	Wintering; Coastal, Pelagic, Inland waterbodies, intertidal, cliffs[3]	Rare[1]	Seasonal[3]
Great Black-backed Gull	*Larus marinus*	N/A	N/A	Winter breeding migrant; Bays, Coastal, Pelagic (less than 60 mi (97 km) offshore, intensely less than 15 mi [24 km])[3]	Common[3]	Year-round[3]
Sooty Tern	*Onychoprion fuscatus*	N/A	N/A	Summering, Breeding; less than 30 mi (48 km) offshore[1]	Common[1]	Seasonal[1]
Bridled Tern	*Sterna anaethetus*	N/A	N/A	Summering, Breeding; less than 30 mi (48 km) offshore[1]	Common[1]	Seasonal[1]
Least Tern	*Sterna antillarum*	E/BCC	T	Breeding, Migratory; Bays, Estuaries, Coastal, Rivers/Lakes, Beaches, Shallow Open Water[3]	Common[1]	Seasonal[1]
Black Tern	*Chlidonia niger*	BCC	E	Migratory; Bays, Seacoasts (off Long Island coast)[3]	Rare[3]	Seasonal[3]
Roseate Tern	*Sterna dougallii*	E	E	Breeding, Migratory; Bays, Seacoasts, Islands, Offshore waters[3]	Common[1]	Seasonal[1]

Family Common Name	Scientific Name	Fed. Status[4]	NY Status[5]	Known NY Bight Distribution	Occurrence in NY Bight	Seasonal Occurrence
Common Tern	*Sterna hirundo*	BCC	T	Breeding; Bays, Seacoasts, Beaches, Sandbars, Islands[3]; largest colony off Great Gull Island at east end of Long Island[1]	Common[1]	Seasonal[1]
Artic Tern	*Sterna paradisaea*	BCC	N/A	Summering, Breeding; less than 30 mi (48 km) offshore[1]	Common[1]	Seasonal[1]
Forster's Tern	*Sterna forsteri*	N/A	N/A	Breeding; Bays, Seacoasts, Closer to shore[3]	Common[1]	Seasonal[1]
Royal Tern	*Sterna maxima*	N/A	N/A	Migratory; Open sandy beaches, Seacoasts, Estuaries, primarily forage close to shore[3]	Common[1]	Seasonal[1]
Black Skimmer	*Rynchops niger*	BCC	SC	Breeding (nest on Long Island); Bays, Estuaries, Islands, Sandy Beaches, Shell Banks, Mudflats, forage near beaches, bays and calm inshore waters[3]	Common[3]	Seasonal[2]
Loons (Gaviidae)						
Common Loon	*Gavia immer*	N/A	SC	Winter migrant; Coastal, Pelagic, Bays, Islands[3] Abundant in New York Bay, Long Island	Common[1]	Seasonal[1]
Red-throated Loon	*Gavia stellata*	BCC	N/A	Winter migrant; Coastal, Pelagic, Bays[3]; near coastlines and islands, throughout Lease Area[1]	Common[1]	Seasonal[1]
Shearwaters (Diomedeidae)						

Family Common Name	Scientific Name	Fed. Status[4]	NY Status[5]	Known NY Bight Distribution	Occurrence in NY Bight	Seasonal Occurrence
Northern Fulmar	*Fulmarus glacialis*	N/A	N/A	Winter migrant; Pelagic, rarely more than 60 mi (97 km) offshore[3]	Common[1]	Seasonal[1]
Cory's Shearwater	*Calonectris diomedea*	N/A	N/A	Summering, Winter; Pelagic[3]; occur in center of Lease Area[1]	Common[1]	Seasonal[1]
Sooty Shearwater	*Puffinus griseus*	N/A	N/A	Summering migrant; Pelagic[3]; abundant south of central Long Island[1]	Common[1]	Seasonal[1]
Great Shearwater	*Puffinus gravis*	BCC	N/A	Summering migrant; Pelagic[3]; occur in center of Lease Area[1]	Common[1]	Seasonal[1]
Manx Shearwater	*Puffinus*	N/A	N/A	Summering migrant; Pelagic, Coastal inshore[3]	Rare[1]	Seasonal[1]
Audubon's Shearwater	*Puffinus lherminieri*	BCC	N/A	Wintering; Pelagic[3]	Rare[1]	Seasonal[1]
Storm-Petrels (Hydrobatidae)						
Wilson's Storm-Petrel	*Oceanites oceanicus*	N/A	N/A	Summering migrant; Pelagic[3]; abundant nearshore in summers, beyond shelf in spring and fall[1]	Common[1]	Seasonal[1]
Leach's Storm-Petrel	*Oceanodroma leucorhoa*	N/A	N/A	Summering migrant; Pelagic, primarily forages between 30 to 130 mi (48 to 209 km] offshore; Breeds on islands[3]	Common[1]	Seasonal[1]
Band-rumped Storm-Petrel	*Oceanodroma castro*	BCC	N/A	Summer offshore along shelf edge[1]	Rare[1]	Seasonal[1]
White-faced Storm-Petrel	*Pelagodroma marina*	N/A	N/A	Offshore along shelf edge[1]	Rare[1]	Seasonal[1]

Family Common Name	Scientific Name	Fed. Status[4]	NY Status[5]	Known NY Bight Distribution	Occurrence in NY Bight	Seasonal Occurrence
Gannets (Sulidae)						
Northern Gannet	*Morus bassanus*	N/A	N/A	Winter migrant; Pelagic (forages less than 40 mi [64 km offshore), Coastal[3]; aggregate near fishing activity[1]	Common[1]	Seasonal[1]
Cormorants (Phalacrocoracidae)						
Double-crested Cormorant	*Phalacrocorax auritus*	N/A	N/A	Wintering; Coastal (less than 20 mi [32 km] offshore)[3]; near east end of Long Island, New York Bay[1]	Common[1]	Seasonal[1]
Great Cormorant	*Phalacrocorax carbo*	BCC	N/A	Wintering; Coastal, Cliffs[3]; near east end of Long Island, New York Bay[1]	Common[1]	Seasonal[1]
Pelicans (Pelecanidae)						
Brown Pelican	*Pelecanus occidentalis*	N/A	N/A	Winter breeding migrant; Coastal (less than 50 mi [80 km] offshore), Bays[3]	Common[3]	Seasonal[3]
Herons (Ardeidae)						
American Bittern	*Botaurus lentiginosus*	BCC	SC	Migrant[3]	Rare[3]	Seasonal[3]
Least Bittern	*Ixobrychus exilis*	BCC	T	Migrant; Marshes[3]	Rare[3]	Seasonal[3]
Ospreys (Pandionidea)						
Osprey	*Pandion haliaetus*	N/A	SC	Breeding, Migratory; May forage offshore, may migrate through Lease Area[3]	Common[3]	Seasonal[3]
Accipiters (Accipitridae)						

Family Common Name	Scientific Name	Fed. Status[4]	NY Status[5]	Known NY Bight Distribution	Occurrence in NY Bight	Seasonal Occurrence
Bald Eagle	*Haliaeetus leucocephalus*	BCC	T	Migrant and local breeder along coastal areas.	Common[6]	Year-round[6]
Northern Harrier	*Circus cyaneus*	N/A	T	Breeding, Migratory; May migrate through Lease Area[3]	Common[3]	Seasonal[3]
Golden Eagle	*Aquila chrysaetos*	N/A	E	Migrant, winter resident along coastal beaches	Rare[6]	Seasonal[6]
Falcons (Falconidae)						
Peregrine Falcon	*Falco peregrinus*	BCC	E	Breeding, Migratory; May migrate through Lease Area, may forage offshore[3]	Common[3]	Seasonal[3]
Bats						
Eastern red bat	*Lasiurus borealis*	N/A	N/A	Coastal migrant[3]	Rare[3]	Seasonal[3]
Silver-haired bat	*Lasionycteris noctivagans*	N/A	N/A	Coastal migrant[3]	Rare[3]	Seasonal[3]
Hoary bat	*Lasionycteris cinereus*	N/A	N/A	Coastal migrant[3]	Rare[3]	Seasonal[3]

Family Common Name	Scientific Name	Fed. Status[4]	NY Status[5]	Known NY Bight Distribution	Occurrence in NY Bight	Seasonal Occurrence
Notes: BCC: Bird of Conservation Concern; SC: Special Concern; E: Endangered; T: Threatened; N/A: Not Applicable Bays: Enclosed or semi-enclosed coastal bays; Coastal: Nearshore waters of NY Bight within sight of land; Pelagic: Offshore waters of NY Bight out of sight of land Sources: 1. Kinlan et al. 2012 2. Rodewald 2015 3. NYSERDA 2010a, NYSERDA 2017b 4. USFWS 2008, USFWS 2017a, Ecology and Environment 2017 5. NYSDEC 2015a 6. eBird 2012						

Information on threatened and endangered species and/or their habitat is also available through USFWS IPaC (https://ecos.fws.gov/ipac/) and NYSDEC Environmental Resource Mapper (https://www.dec.ny.gov/animals/38801.html). These sources have identified the following species that may be present in the Empire Wind Project Area:

- Piping plover;
- Rufa red knot;
- Roseate tern;
- Peregrine falcon;
- Upland sandpiper; and
- Northern long-eared bat.

According to recent assessments and studies, the lease area provides habitat for approximately forty waterbird species, including seaducks, loons, gulls, scoters, terns, alcids, gannets, and shorebirds (NYSERDA 2010a, Kinlan et al. 2012, Kinlan et al. 2016, NYSERDA 2017d). With the exception of gulls, use of the lease area by most waterbird species is seasonal with the majority wintering within the sheltered inlets and bays found along the New York Bight. The lease area is located within the Atlantic Flyway and migratory birds are likely to pass through the lease area during spring and fall migration (NYSERDA 2010a, Kinlan et al. 2012, Kinlan et al. 2016).

Some passerine species (songbirds from the order Passeriformes), especially passerines that are long-distance migrants, may occur in offshore waters and may migrate through the lease area (NYSERDA 2010a, Kinlan et al. 2012, Kinlan et al. 2016, NYSERDA 2017d). Robinson Willmott et al. (2013)) reported that when migrating over offshore waters, passerines spend less than five percent of their time flying within the heights (65 to 656 ft or 19-199 m) that reach a wind turbine's rotor-swept zone at the time (see NYSERDA's Offshore Wind Study; 2017; Appendix D). As such, most passerines received a low collision sensitivity score, and all received low risk of displacement scores since open oceans do not provide habitat for passerines (NYSERDA 2017d). Equinor Wind notes that contemporary typical rotor swept zones extend to 850 ft and are increasing, and will make an assessment based on future developments in wind turbine size. Three passerines received a "medium" collision sensitivity score: barn swallow (*Hirundo rustica*), Kirtland's warbler (*Setophaga kirtlandii*), and Bicknell's thrush (*Catharus bicknelli*) (Robinson Willmott et al. 2013, NYSERDA 2017d). Kirtland's warbler is listed as a federally endangered species and winters in the Bahamas Islands. Kirtland's warbler is unlikely to pass through the lease area as the species' known migration route passes over Florida, Georgia and the Carolinas, well south of the lease area (Bocetti et al. 2014). Barn swallows are diurnal migrants that are common in North America (Brown and Brown 1999) but are likely to be rare occurrences far offshore in the lease area. Based on scant migratory data of Bicknell's thrush (state-listed as Special Concern), fall migration may occur over water while spring migration appears to be a more coastal land-route east of the Rocky Mountains (Townsend et al. 2015); therefore, it would be a rare migrant in the lease area.

The federally-listed threatened piping plover (*Charadrius melodus*) and red knot (*Calidris canutus ssp. rufa*), and the federally-listed endangered roseate tern (*Sterna dougallii dougallii*) are known to occur or migrate through the lease area (NYSERDA 2010a, Kinlan et al. 2012, Kinlan et al. 2016). The piping plover is also a state-endangered species that breeds in New York along sandy beaches and forages along tidal areas. Piping plovers tend to stay within narrow coastal margins during migration and are not expected to occur in the lease area (NYSERDA 2010a, Kinlan et al. 2012, Kinlan et al. 2016). The roseate tern is considered a state-listed endangered species and has nesting colonies on coastal areas in proximity to the lease area. Roseate terns may use the lease area to forage and/or migrate, but little activity is expected from roseate terns in the lease area during nesting and post-breeding staging periods (NYSERDA 2010a, Kinlan et al. 2012, Kinlan et al. 2016). The red knot is also a state-Threatened species. Red knots breed in the Arctic, and generally migrate along the Atlantic coast with little activity expected in the lease area.

Migrating raptors utilize barrier beaches for migration, most notably falcons, which are known to cross open water. Peregrine falcons (*Falco peregrinus*), a state-listed endangered species, migrate along the coast and over open water, and likely use the lease area (NYSERDA 2017; Appendix D). Breeding peregrine falcons may also be associated with the export cable route. Bald eagles (*Haliaeetus leucocephalus*) (state Threatened) and golden eagles (*Aquila chrysaetos*) (state Endangered) migrate and forage over land, inland water bodies, and bays, but generally do not migrate or forage over open ocean (NYSERDA 2017; Appendix D). The bald eagle was removed from the Endangered Species list by the U.S. Department of Interior in 2007. Per NYSDEC, the golden eagle is extirpated from New York state (*i.e.*, no longer occurs in the wild).

Bat occurrence patterns in the lease area, and offshore in general, are poorly understood. Bats that are known to currently or historically occur in New York include the big brown bat (*Eptesicus fuscus*), eastern red bat (*Lasiurus borealis*), hoary bat (*L. cinereus*), tri-colored bat (*Perimyotis subflavus*), silver-haired bat (*Lasionycteris noctivagans*), eastern small-footed bat (*Myotis leibii*), little brown bat (*M. lucifugus*), Indiana bat (*M. sodalis*), and northern long-eared bat (*M. septentrionalis*) (NYSDEC 2015b). The Indiana bat is both federally- and state-listed as endangered. Northern long-eared bats are a federally-listed and state-listed threatened species. The small-footed bat is a state-listed species of special concern. Long Island has areas documented as confirmed summer roosting habitat for the northern long-eared bat, which may be associated with the onshore export cable route, where removal of trees within a 150-foot buffer around known occupied maternity roost trees during the pup season (June 1 through July 31) will require a federal Incidental Take Permit under Section 4(d) of the Endangered Species Act. Big brown bat, tri-colored bat, eastern small-footed bat, little brown bat, northern long-eared bat and Indiana bat are all cave-dwelling species that do not migrate over the ocean, and thus are not expected to be in the lease area. Little is known about bat migration or foraging patterns offshore. Recent studies, however, have acoustically detected bats offshore (Peterson 2016; Tetra Tech unpublished data). Bats with the greatest potential to migrate through the lease area on their way between breeding and wintering grounds in the spring and fall are the three migratory tree species: eastern red bat, hoary bat, and silver-haired bat. Based on this information, it is expected that bat activity would likely be greater in uplands, and near the coastal beach and islands than farther offshore.

13.7.3 Ongoing and Planned Assessments

BOEM indicates that the level of surveys required will be assessed on a project-by-project basis. In its *Guidelines for Providing Avian Survey Information for Renewable Energy Development on the Atlantic Outer Continental Shelf Pursuant to 30 C.F.R. Part 585* (Avian Guidelines; BOEM 2017a), BOEM provides guidelines for the design and execution of such surveys.

Currently, in the United States, much is known about birds in estuarine, coastal, and inland habitats but less information is available for offshore habitats (Kinlan et al. 2012). One of the earliest attempts at collecting offshore data was the Manomet Bird Observatory's (now called Manomet Inc.) Cetacean and Seabird Assessment Program ("CSAP") from 1980 to 1988 (Kinlan et al. 2012). Spatially, temporally, and taxonomically, the CSAP database was the most comprehensive information source on seabird distribution in the northeastern United States. NYSERDA used the CSAP dataset to assess potential avian impacts of a proposed New York Bight offshore wind project (NYSERDA 2010a).

Since the development of the CSAP database, other specific regional baseline avian studies for projects have been conducted in the northeastern United States including coastal New Jersey studies for the NJDEP (NJDEP 2010a), the Rhode Island Block Island Wind Farm, and the Massachusetts Cape Wind Project. BOEM has also funded other baseline offshore and nearshore avian studies in nearby regions such as Massachusetts, Rhode Island, and in the Mid-Atlantic region (Paton et al. 2010, Williams et al. 2015, Veit et al. 2016). Sampling and avian survey protocols for the New Jersey Baseline Studies were developed using some of the methods in Camphuysen et al. (2004) and Gould and Forsell (1989) that used a combination of both aerial and boat-based surveys. The Block Island Wind Farm, which was developed approximately 3 mi (5 km) off of Block Island, employed multiple onshore and offshore survey methods for three years including the use of Merlin and Vesper Radar, boat-based and onshore avian surveys, aerial photography surveys, and passive acoustical bird and bat monitoring (Svedlow et al. 2012). Similarly, for the Cape Wind project, the developer and the Massachusetts Audubon Society conducted studies over a five-year period in the lease area, including boat and aerial work during all seasons from 2002 to 2006 (USDOI MMS 2009). Of particular significance to BOEM survey guidelines is the Mid-Atlantic Ocean Data Portal's relevance as a baseline confirmation of temporal use, abundance, and species distribution by avian species or groups in the lease area. The modeling data can also be used to potentially identify species that are high risk for collision or displacement, and species that are protected by federal and/or state laws.

To support the assessment of avian and bat species resources in the lease area, Equinor Wind evaluated readily available spatial data including ongoing and completed survey efforts. The assessment approach and methods were designed to supplement the substantial body of existing data already collected in the lease area. NYSERDA's Master Plan Birds and Bats Study also provides a summary of available information on birds and bats within the New York Bight Region (NYSERDA 2017; Appendix D). As described in Section 13.5.3 and associated figures, Equinor Wind has contracted APEM Ltd, supported by Normandeau Inc. to conduct monthly digital aerial surveys across the lease area, which includes the principal objective of capturing digital images of avian species , with supplimental marine mammals and sea turtles, large fish assemblages and opportunistic vessel sightings, following similar methodology to NYSERDA's ongoing surveys. To ensure the survey methods were consistent with BOEM guidelines, a survey plan, "Avian Survey Protocol", which included marine mammals and sea turtles, was submitted to BOEM and FWS.

Digital aerial surveys were subsequently carried out from November 2017 to October 2018, with monthly results, monthly reports and quarterly reports made publicly available on the following webpage:

https://remote.normandeau.com/ewind_overview.php.

Equinor Wind is committed to continuing to make this data available in as near real-time as possible, subject to the delay between image capture and the time associated with image processing, species identification and quality control.

APEM and the methodology chosen was influenced by NYSERDA having used APEM and these methods to conduct quarterly digital aerial surveys over the New York Bight and OCS-A 0512 lease area from summer 2016 to summer 2017, then ongoing surveys over the New York Bight continuing into winter 2018/2019 at the time of writing. This included the consistency associated with the public webpage to display results.

A summary of the scope of the digital aerial survey is as follows:

- Surveys conducted once per month over a 12-month period;
- Image resolution at sea surface of 1.5 cm ground sampling distance ("GSD");
- Grid survey design;
- Grid imagery footprint of 310 m by 219 m;
- A 2.5-mi (4 km) buffer around the lease area;
- Minimum of 20% of the lease area and buffer imaged, with 10% of area analyzed;
- Monthly results displayed online; and
- Monthly and quarterly reporting, also provided online.

As described, the assessment approach and methods were designed to supplement the substantial body of existing data and meet BOEM's data requirements for site characterization studies to evaluate the potential effects of the proposed project. The supplemental quarterly digital aerial surveys conducted by APEM Ltd. on behalf of NYSERDA provides an excellent spatial and temporal characterization, providing not only additional data in a common currency and format in the lease area, but a wider regional context that provides more value in the context of assessing impacts.

Avian surveys are historically the longest lead time items for baseline data collection leading up to impact assessments, typically with a minimum of two years of data collection to account for inter-annual variations in spatial and temporal distribution. NYSERDA's early efforts on data collection has meant that Equinor Wind has been able to reduce this time down to one year of data collection to add to the existing effort, effectively bringing the impact assessment process forward by a year, having the ability to apply the results into design decisions at an earlier stage and bringing the COP schedule, and therefore the opportunity for permit approvals, construction and first power to New York forward by approximately a year.

Figure 15 [redacted]

[redacted]

Equinor also co-funded and sat on the steering committee of the Carbon Trust ORJIP One Bird Collision Avoidance Study (Skov et al. 2018), looking at collision avoidance behavior of key seabird species around and within an operating offshore wind farm. Many of the species observed in the study are present in the lease area, and therefore those behavioral responses can be directly applied to assessments in the lease area.

As part of its onshore evaluation, Equinor Wind will continue desktop studies and stakeholder discussions for avian and bat species. During field studies, Equinor Wind will complete appropriate surveys to further characterize the project area and determine presence/absence of habitat within proposed project activities.

13.7.4 Potential Impacts and Mitigation

The potential impact producing factors relevant to avian and bat species are as follows:

- Short-term temporary disturbance and displacement resulting from project related vessels and plant during offshore and onshore construction activity;
- Short-term temporary disturbance and displacement from project related vessels during regular offshore maintenance activities during operations;
- Long-term temporary displacement through habitat loss resulting from the presence of wind turbines during operations;
- Collisions with operating wind turbines during operations;
- Barrier effects to migrating receptors resulting from the presence of the offshore wind farm during operations; and
- Indirect impacts resulting from changes to prey resources due to the offshore wind facilities during construction, operations, and decommissioning.

Potential Mitigation

The approach to developing a baseline and an assessment of future potential impacts on avian and bat species from construction, operations and decommissioning of the Empire Wind offshore wind energy development must satisfy the requirements of various regulations and jurisdictional agencies. As such, collaboration and coordination with BOEM, USFWS, NYSDEC, and relevant stakeholders throughout the development and planning process will be crucial to the success of the project. In order to mitigate for the potential impacts to avian and bat species associated with the construction, operations and decommissioning of the project, Equinor Wind is evaluating, and where feasible applying, the following mitigation measures:

- Siting of onshore cables along existing (cleared) rights-of-way, thereby minimizing tree clearing and disturbance of onshore habitat;
- Sympathetic lighting of onshore and offshore structures, vessels and plant to minimize disturbance and displacement (see Section 9.2 for additional details);

[redacted]

- Preparation of an OSRP;
- Trenchless cable installation methods for the export cable at landfall and onshore to avoid sensitive areas;
- Consideration of measures for discouraging and/or provision of alternative roosting;
- Considerate vessel movements in the vicinity of rafting bird; and
- Limiting onshore land disturbance measures to non-nesting seasons for sensitive species (time-of-year restrictions).

As part of on-going consultation with USFWS and NYSDEC, Equinor Wind will determine appropriate measures to address potential protected species associated with the onshore components of the project (*e.g.*, seasonal restrictions).

Construction

The lease area is regularly utilized by a variety of vessels, and as such, the addition of project-related construction vessels is not anticipated to significantly alter the existing baseline vessel effect already impacting the receptors in this area. With adequate mitigation for sympathetic lighting and protocols for construction vessels for the avoidance of large groups of resting birds, impacts resulting from project-related vessels during surveys and construction are not expected to be significant adverse.

Mitigation measures will be implemented to avoid sensitive avian sites during installation of the electrical cables at landfall and onshore. These measures include: avoiding sensitive areas through project siting in consultation with the relevant agencies and stakeholders, and where required, survey data; Horizontal Directional Drilling ("HDD"); and seasonal timing of construction activities to avoid sensitive periods, for example the nesting season. Therefore, impacts associated with onshore cable installation activities can be sufficiently avoided where feasible, and when not feasible, the mitigation options described above are likely to mean impacts to avian and bat species are not expected to be significant adverse.

Operations

The operations phase is deemed to have the highest likelihood for potential impacts on avian and bat species. This is due to the long term physical presence of offshore wind turbines creating a risk of avian and bat collisions, displacement, diversion through barrier effects, and changes to prey resources. Different species are impacted to varying degrees by the effects already identified. As such, it would not be appropriate to specify anticipated impacts on each receptor group, particularly as baseline data is still being analyzed and assessments are still underway.

Nonetheless, Equinor Wind maintains that impacts to avian and bat species will be sufficiently examined as part of BOEM's NEPA process as part of the COP, through state permitting processes and in consultation with USFWS and relevant stakeholders, and that, where appropriate, mitigation will be implemented to reduce impacts to as low as practicable.

Equinor Wind recommends best practice for the avoidance and mitigation of impacts on avian and bird species is discussed as part of the E-TWG.

Decommissioning

Impacts associated with the decommissioning of the project are not expected to exceed those resulting from the construction and operations of the project, with any displaced bird species likely to return soon after the removal of wind turbines.

13.8 Additional Considerations

The overall approach for development of this EMP has been to acknowledge the dynamic nature of executing a successful offshore wind energy development off the coast while considering the complex dynamics of the natural resources and stakeholders. Furthermore, as Equinor Wind continues to gather information on existing conditions, it will be used to further understand and develop the impact assessments associated with the proposed project. As such, Equinor Wind has and will continuously evaluate and evolve this EMP so that all the components of the EMP are complete and sufficient. Given the nuances of offshore wind development in the United States, Equinor Wind expects that additional guidance and information will become available throughout the planning process and we will continue to consider its relevance to the EMP. Further, Equinor Wind will continue to rely on experience both from the mature overseas offshore wind industry and any experience that results from other offshore wind developments on the eastern seaboard of the United States.

equinor

RECEIVED
MAR 10 2017
Office of Renewable Energy Programs

UNITED STATES DEPARTMENT OF THE INTERIOR BUREAU OF OCEAN ENERGY MANAGEMENT **COMMERCIAL LEASE OF SUBMERGED LANDS FOR RENEWABLE ENERGY DEVELOPMENT ON THE OUTER CONTINENTAL SHELF**	Office Sterling, VA	Renewable Energy Lease Number OCS-A 0512
	Cash Bonus and/or Acquisition Fee $42,469,725.00	Resource Type Wind
Paperwork Reduction Act of 1995 statement: *This form does not constitute an information collection as defined by 44 U.S.C. § 3501 et seq. and therefore does not require approval by the Office of Management and Budget.*	Effective Date April 1, 2017	Block Number(s) See Addendum A

This lease, which includes any addenda hereto, is hereby entered into by and between the United States of America, ("Lessor"), acting through the Bureau of Ocean Energy Management ("BOEM"), its authorized officer, and

Lessee	**Interest Held**
Statoil Wind US LLC	100%

("Lessee"). This lease is effective on the date written above ("Effective Date") and will continue in effect until the lease terminates as set forth in Addendum "B." In consideration of any cash payment heretofore made by the Lessee to the Lessor and in consideration of the promises, terms, conditions, covenants, and stipulations contained herein and attached hereto, the Lessee and the Lessor agree as follows:

Section 1: Statutes and Regulations.

This lease is issued pursuant to subsection 8(p) of the Outer Continental Shelf Lands Act ("the Act"), 43 U.S.C. §§ 1331 *et seq.* This lease is subject to the Act and regulations promulgated pursuant to the Act, including but not limited to, offshore renewable energy and alternate use regulations at 30 CFR Part 585 as well as other applicable statutes and regulations in existence on the Effective Date of this lease. This lease is also subject to those statutes enacted (including amendments to the Act or other statutes) and regulations promulgated thereafter, except to the extent that they explicitly conflict with an express provision of this lease. It is expressly understood that amendments to existing statutes, including but not limited to the Act, and regulations may be made, and/or new statutes may be enacted or new regulations promulgated, which do not explicitly conflict with an express provision of this lease, and that the Lessee bears the risk that such amendments, regulations, and statutes may increase or decrease the Lessee's obligations under the lease.

Section 2: Rights of the Lessee.

(a) The Lessor hereby grants and leases to the Lessee the exclusive right and privilege, subject to the terms and conditions of this lease and applicable regulations, to: (1) submit to the Lessor for approval a Site Assessment Plan (SAP) and Construction and Operations Plan (COP) for the project identified in Addendum "A" of this lease; and (2) conduct activities in the area identified in Addendum "A" of this lease ("leased area"), and/or Addendum "D" of this lease ("project easement(s)"), that are described in a SAP or COP that has been approved by the Lessor. This lease does not, by itself, authorize any activity within the leased area.

(b) The rights granted to the Lessee herein are limited to those activities described in any SAP or COP approved by the Lessor. The rights granted to the Lessee are limited by the lease-specific terms, conditions, and stipulations required by the Lessor per Addendum "C."

(c) This lease does not authorize the Lessee to conduct activities on the Outer Continental Shelf (OCS) relating to or associated with the exploration for, or development or production of, oil, gas, other seabed minerals, or renewable energy resources other than those renewable energy resources identified in Addendum "A."

Section 3: Reservations to the Lessor.

(a) All rights in the leased area and project easement(s) not expressly granted to the Lessee by the Act, applicable regulations, this lease, or any approved SAP or COP, are hereby reserved to the Lessor.

(b) The Lessor will decide whether to approve a SAP or COP in accordance with the applicable regulations in 30 CFR Part 585. The Lessor retains the right to disapprove a SAP or COP based on the Lessor's determination that the proposed activities would have unacceptable environmental consequences, would conflict with one or more of the requirements set forth in subsection 8(p)(4) of the Act (43 U.S.C. § 1337(p)(4)), or for other reasons provided by the Lessor pursuant to 30 CFR 585.613(e)(2) or 30 CFR 585.628(f)(2). Disapproval of plans will not subject the Lessor to liability under this lease. The Lessor also retains the right to approve with modifications a SAP or COP, as provided in applicable regulations.

(c) The Lessor reserves the right to suspend the Lessee's operations in accordance with the national security and defense provisions of section 12 of the Act and applicable regulations.

(d) The Lessor reserves the right to authorize other uses within the leased area and project easement(s) that will not unreasonably interfere with activities described in an approved SAP and/or COP, pursuant to this lease.

Section 4: Payments.

(a) The Lessee must make all rent payments to the Lessor in accordance with applicable regulations in 30 CFR Part 585, unless otherwise specified in Addendum "B."

(b) The Lessee must make all operating fee payments to the Lessor in accordance with applicable regulations in 30 CFR Part 585, as specified in Addendum "B."

Section 5: Plans.

The Lessee may conduct those activities described in Addendum "A" only in accordance with a SAP or COP approved by the Lessor. The Lessee may not deviate from an approved SAP or COP except as provided in applicable regulations in 30 CFR Part 585.

Section 6: Associated Project Easement(s).

Pursuant to 30 CFR 585.200(b), the Lessee has the right to one or more project easement(s), without further competition, for the purpose of installing gathering, transmission, and distribution cables, pipelines, and appurtenances on the OCS, as necessary for the full enjoyment of the lease, and under applicable regulations in 30 CFR Part 585. As part of submitting a COP for approval, the Lessee may request that one or more easement(s) be granted by the Lessor. If the Lessee requests that one or more easement(s) be granted when submitting a COP for approval, such project easements will be granted by the Lessor in accordance with the Act and applicable regulations in 30 CFR Part 585 upon approval of the COP in which the Lessee has demonstrated a need for such easements. Such easements must be in a location acceptable to the Lessor, and will be subject to such conditions as the Lessor may require. The project easement(s) that would be issued in conjunction with an approved COP under this lease will be described in Addendum "D" to this lease, which will be updated as necessary.

Section 7: Conduct of Activities.

The Lessee must conduct, and agrees to conduct, all activities in the leased area and project easement(s) in accordance with an approved SAP or COP, and with all applicable laws and regulations.

The Lessee further agrees that no activities authorized by this lease will be carried out in a manner that:

(a) could unreasonably interfere with or endanger activities or operations carried out under any lease or grant issued or maintained pursuant to the Act, or under any other license or approval from any Federal agency;

(b) could cause any undue harm or damage to the environment;

(c) could create hazardous or unsafe conditions; or

(d) could adversely affect sites, structures, or objects of historical, cultural, or archaeological significance, without notice to and direction from the Lessor on how to proceed.

Section 8: Violations, Suspensions, Cancellations, and Remedies.

If the Lessee fails to comply with (1) any of the applicable provisions of the Act or regulations, (2) the approved SAP or COP, or (3) the terms of this lease, including associated Addenda, the Lessor may exercise any of the remedies that are provided under the Act and applicable regulations, including, without limitation, issuance of cessation of operations orders, suspension or cancellation of the lease, and/or the imposition of penalties, in accordance with the Act and applicable regulations.

The Lessor may also cancel this lease for reasons set forth in subsection 5(a)(2) of the Act (43 U.S.C. § 1334(a)(2)), or for other reasons provided by the Lessor pursuant to 30 CFR 585.437.

Non-enforcement by the Lessor of a remedy for any particular violation of the applicable provisions of the Act or regulations, or the terms of this lease, will not prevent the Lessor from exercising any remedy, including cancellation of this lease, for any other violation or for the same violation occurring at any other time.

Section 9: Indemnification.

The Lessee hereby agrees to indemnify the Lessor for, and hold the Lessor harmless from, any claim caused by or resulting from any of the Lessee's operations or activities on the leased area or project easement(s) or arising out of any activities conducted by or on behalf of the Lessee or its employees, contractors (including Operator, if applicable), subcontractors, or their employees, under this lease, including claims for:

a. loss or damage to natural resources,
b. the release of any petroleum or any Hazardous Materials,
c. other environmental injury of any kind,
d. damage to property,
e. injury to persons, and/or
f. costs or expenses incurred by the Lessor.

Except as provided in any addenda to this lease, the Lessee will not be liable for any losses or damages proximately caused by the activities of the Lessor or the Lessor's employees, contractors, subcontractors, or their employees. The Lessee must pay the Lessor for damage, cost, or expense due and pursuant to this section within 90 days after written demand by the Lessor. Nothing in this lease will be construed to waive any liability or relieve the Lessee from any penalties, sanctions, or claims that would otherwise apply by statute, regulation, operation of law, or could be imposed by the Lessor or other government agency acting under such laws.

"Hazardous Material" means

1. Any substance or material defined as hazardous, a pollutant, or a contaminant under the *Comprehensive Environmental Response, Compensation, and Liability Act* at 42 U.S.C. §§ 9601(14) and (33);
2. Any regulated substance as defined by the Resource Conservation and Recovery Act ("RCRA") at 42 U.S.C. § 6991 (7), whether or not contained in or released from underground storage tanks, and any hazardous waste regulated under RCRA pursuant to 42 U.S.C. §§ 6921 *et seq.*;

3. Oil, as defined by the Clean Water Act at 33 U.S.C. § 1321(a)(1) and the Oil Pollution Act at 33 U.S.C. § 2701(23); or
4. Other substances that applicable Federal, state, tribal, or local laws define and regulate as "hazardous."

Section 10: Financial Assurance.

The Lessee must provide and maintain at all times a surety bond(s) or other form(s) of financial assurance approved by the Lessor in the amount specified in Addendum "B." As required by the applicable regulations in 30 CFR Part 585, if, at any time during the term of this lease, the Lessor requires additional financial assurance, then the Lessee must furnish the additional financial assurance required by the Lessor in a form acceptable to the Lessor within 90 days after receipt of the Lessor's notice of such adjustment.

Section 11: Assignment or Transfer of Lease.

This lease may not be assigned or transferred in whole or in part without written approval of the Lessor. The Lessor reserves the right, in its sole discretion, to deny approval of the Lessee's application to transfer or assign all or part of this lease. Any assignment will be effective on the date the Lessor approves the Lessee's application. Any assignment made in contravention of this section is void.

Section 12: Relinquishment of Lease.

The Lessee may relinquish this entire lease or any officially designated subdivision thereof by filing with the appropriate office of the Lessor a written relinquishment application, in accordance with applicable regulations in 30 CFR Part 585. No relinquishment of this lease or any portion thereof will relieve the Lessee or its surety of the obligations accrued hereunder, including but not limited to, the responsibility to remove property and restore the leased area and project easement(s) pursuant to section 13 of this lease and applicable regulations.

Section 13: Removal of Property and Restoration of the Leased Area and Project Easement(s) on Termination of Lease.

Unless otherwise authorized by the Lessor, pursuant to the applicable regulations in 30 CFR Part 585, the Lessee must remove or decommission all facilities, projects, cables, pipelines, and obstructions and clear the seafloor of all obstructions created by activities on the leased area and project easement(s) within two years following lease termination, whether by expiration, cancellation, contraction, or relinquishment, in accordance with any approved SAP, COP, or approved Decommissioning Application, and applicable regulations in 30 CFR Part 585.

Section 14: Safety Requirements.

The Lessee must:

a. maintain all places of employment for activities authorized under this lease in compliance with occupational safety and health standards and, in addition, free from recognized hazards to employees of the Lessee or of any contractor or subcontractor operating under this lease;

b. maintain all operations within the leased area and project easement(s) in compliance with regulations in 30 CFR Part 585 and orders from the Lessor and other Federal agencies with jurisdiction, intended to protect persons, property and the environment on the OCS; and

c. provide any requested documents and records, which are pertinent to occupational or public health, safety, or environmental protection, and allow prompt access, at the site of any operation or activity conducted under this lease, to any inspector authorized by the Lessor or other Federal agency with jurisdiction.

Section 15: Debarment Compliance.

The Lessee must comply with the Department of the Interior's non-procurement debarment and suspension regulations set forth in 2 CFR Parts 180 and 1400 and must communicate the requirement to comply with these regulations to persons with whom it does business related to this lease by including this requirement in all relevant contracts and transactions.

Section 16: Equal Opportunity Clause.

During the performance of this lease, the Lessee must fully comply with paragraphs (1) through (7) of section 202 of Executive Order 11246, as amended (reprinted in 41 CFR 60-1.4(a)), and the implementing regulations, which are for the purpose of preventing employment discrimination against persons on the basis of race, color, religion, sex, or national origin. Paragraphs (1) through (7) of section 202 of Executive Order 11246, as amended, are incorporated in this lease by reference.

Section 17: Certification of Nonsegregated Facilities.

By entering into this lease, the Lessee certifies, as specified in 41 CFR 60-1.8, that it does not and will not maintain or provide for its employees any segregated facilities at any of its establishments and that it does not and will not permit its employees to perform their services at any location under its control where segregated facilities are maintained. As used in this certification, the term "facilities" means, but is not limited to, any waiting rooms, work areas, restrooms and washrooms, restaurants and other eating areas, timeclocks, locker rooms and other storage or dressing areas, parking lots, drinking fountains, recreation or entertainment areas, transportation, and housing facilities provided for employees. Segregated facilities include those that are segregated by explicit directive or those that are in fact segregated on the basis of race, color, religion, sex, or national origin, because of habit, local custom, or otherwise; provided, that separate or single-user restrooms and necessary dressing or sleeping areas must be provided to assure privacy as appropriate. The Lessee further agrees that it will obtain identical certifications from proposed contractors and subcontractors prior to awarding contracts or subcontracts unless they are exempt under 41 CFR 60-1.5.

Section 18: Notices.

All notices or reports provided from one party to the other under the terms of this lease must be in writing, except as provided herein and in the applicable regulations in 30 CFR Part 585. Written notices and reports must be delivered to the Lessee's or Lessor's Lease Representative, as specifically listed in Addendum "A," either electronically, by hand, by facsimile, or by United States first class mail, adequate postage prepaid. Each party must, as soon as practicable, notify the other of a change to their Lessee's or Lessor's Contact Information listed in Addendum "A" by a written notice signed by a duly authorized signatory and delivered by hand or United States first class mail, adequate postage prepaid. Until such notice is delivered as provided in this section, the last recorded contact information for either party will be deemed current for service of all notices and reports required under this lease. For all operational matters, notices and reports must be provided to the party's Operations Representative, as specifically listed in Addendum "A," as well as the Lease Representative.

Section 19: Severability Clause.

If any provision of this lease is held unenforceable, all remaining provisions of this lease will remain in full force and effect.

Section 20: Modification.

Unless otherwise authorized by the applicable regulations in 30 CFR Part 585, this lease may be modified or amended only by mutual agreement of the Lessor and the Lessee. No such modification or amendment will be binding unless it is in writing and signed by duly authorized signatories of the Lessor and the Lessee.

I. Lessor and Lessee Contact Information

Lessee Company Number: 15058

(a) Lessor's Contact Information

	Lease Representative	Operations Representative
Title	Program Manager	Same as Lease Representative
Address	U.S. Department of the Interior Bureau of Ocean Energy Management 45600 Woodland Road Mail Stop VAM-OREP Sterling, VA 20166	
Phone	(703) 787-1300	
Fax	(703) 787-1708	
Email	renewableenergy@boem.gov	

(b) Lessee's Contact Information

	Lease Representative	Operations Representative
Name	Alyssa Karotkin	Same as Lease Representative
Title	Commercial Negotiator	
Address	2107 CityWest Blvd. Suite 100 Houston, TX 77042	
Phone	(713) 425-9338	
Fax	(713) 918-8290	
Email	alyka@statoil.com	

II. Description of Leased Area

The total acreage of the leased area is approximately 32,112 hectares (79,350 acres)

This area is subject to later adjustment, in accordance with applicable regulations (e.g., contraction, relinquishment).

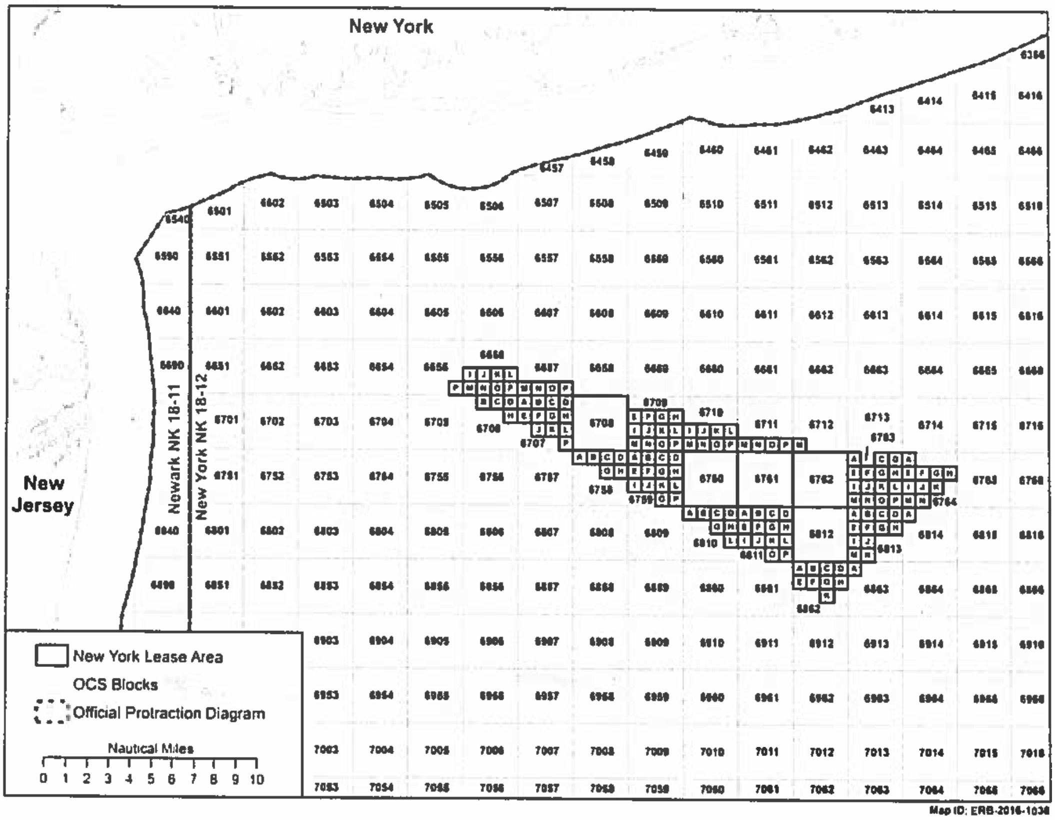
Lease OCS-A 0512

The following Blocks or portions of Blocks lying within Official Protraction Diagram New York NK18-12 are depicted on the map below and comprise 32,112 hectares (79,350 acres), more or less.

Official Protraction Diagram New York NK18-12

1) Block 6655 SE1/4 of SE1/4
2) Block 6656, S1/2
3) Block 6657, S1/2 of S1/2
4) Block 6706, N1/2 of NE1/4, SE1/4 of NE1/4, NE1/4 of NW1/4
5) Block 6707, N1/2, NE1/4 of SW1/4, N1/2 of SE1/4, SE1/4 of SE1/4
6) Block 6708, All of Block
7) Block 6709, S1/2 of N1/2, S1/2
8) Block 6710, S1/2
9) Block 6711, S1/2 of S1/2
10) Block 6712, SW1/4 of SW1/4
11) Block 6758, NE1/4, N1/2 of NW1/4
12) Block 6759, N1/2, , N1/2 of SW1/4, SE1/4
13) Block 6760, All of Block
14) Block 6761, All of Block
15) Block 6762, All of Block
16) Block 6763, NE1/4, NW1/4 of NW1/4, S1/2 of NW1/4, S1/2 ,
17) Block 6764, S1/2 of NE1/4, NW1/4 of NW1/4, S1/2 of NW1/4, SW1/4, NW1/4 of SE1/4
18) Block 6810, NE1/4, N1/2 of NW1/4, NE1/4 of SE1/4
19) Block 6811, N1/2, N1/2 of SW1/4, SE1/4
20) Block 6812, All of Block
21) Block 6813, N1/2, SW1/4
22) Block 6814, NW1/4 of NW1/4
23) Block 6862, N1/2, NW1/4 of SE1/4
24) Block 6863, NW1/4 of NW1/4

For the purposes of these calculations, a full Block is 2,304 hectares. The acreage of a hectare is 2.471043930.



Map of Lease OCS-A 0512

III. Renewable Energy Resource

Wind

IV. Description of the Project

A project to generate energy using wind turbine generators and any associated resource assessment activities, located on the OCS in the leased area, as well as associated offshore substation platforms, inner array cables, and subsea export cables.

V. Description of Project Easement(s)

Once approved, the Lessor will incorporate Lessee's project easement(s) in this lease as ADDENDUM "D."

U.S. DEPARTMENT OF THE INTERIOR
BUREAU OF OCEAN ENERGY MANAGEMENT

ADDENDUM "B"

LEASE TERM AND FINANCIAL SCHEDULE

Lease Number OCS-A 0512

I. Lease Term

The duration of each term of the lease is described below. The terms may be extended or otherwise modified in accordance with applicable regulations in 30 CFR Part 585.

Lease Term	Duration
Preliminary Term	1 year
Site Assessment Term	5 years
Operations Term	25 years

Schedule: ADDENDUM "C" includes a schedule and reporting requirements for conducting site characterization activities.

Renewal: The Lessee may request renewal of the operations term of this lease, in accordance with applicable regulations in 30 CFR Part 585. The Lessor, at its discretion, may approve a renewal request to conduct substantially similar activities as were originally authorized under this lease or in an approved plan. The Lessor will not approve a renewal request that involves development of a type of renewable energy not originally authorized in the lease. The Lessor may revise or adjust payment terms of the original lease as a condition of lease renewal.

II. Definitions

"Available for Commercial Operations" means the status of an individual wind generation turbine on or after the first day that it engages in Commercial Operations on the lease until the day when it is permanently decommissioned. These dates are determined by the COP.

"Commercial Operations" means the generation of electricity or other energy product for commercial use, sale, or distribution.

"Commercial Operation Date," or "COD," refers to the date on which the Lessee first begins Commercial Operations on the lease.

"Delivery Point" is the meter identified in the COP where the Lessee's facility interconnects with the electric grid to deliver electricity for sale.

"Lease Issuance Date" refers to the date on which this lease has been signed by *both* the Lessee and the Lessor.

"Effective Date" has the same meaning as "effective date" in BOEM regulations provided in 30 CFR 585.237.

"End Date" refers to the earlier of a) the last calendar day of the last month of the Operations Term; or b) the date on which the lease terminates in the event of a lease termination.

"Lease Anniversary" refers to the anniversary of the Effective Date of the lease.

III. Payments

Unless otherwise authorized by the Lessor in accordance with the applicable regulations in 30 CFR Part 585, the Lessee must make payments as described below.

(a) ***Rent.*** The Lessee must pay rent as described below:

Rent payments prior to the COD, or prior to the lease End Date in the event that the lease terminates prior to the COD, are calculated by multiplying the acres in the leased area by the rental rate per acre as follows:

Lease OCS-A 0512
- Acres in Leased Area: 79,350
- Annual Rental Rate: $3.00 per acre or fraction thereof
- Rental Fee for Entire Leased Area: $3.00 x 79,350 = $238,050

The first year's rent payment of $238,050 is due within 45 days of the date that the lease is received by the Lessee for execution, in accordance with 30 CFR 585.503. Rent for the entire leased area for the next year and for each subsequent year is due on or before each Lease Anniversary through the year in which the COD occurs. The rent for each year subsequent to the COD on the imputed portion of the lease not authorized for Commercial Operations is due on or before each Lease Anniversary. The imputed portion of the lease that is not authorized for Commercial Operations at each Lease Anniversary in year t, S_t, and the corresponding Adjusted Annual Rent Payment will be determined as follows:

(A) $S_t = \left(1 - \frac{M_t'}{MAX(M_t' : for\ all\ t \geq 2)}\right)$

(B) $Adjusted\ Annual\ Rent\ Payment = S_t * Rental\ Fee\ for\ Entire\ Leased\ Area$

Where:
S_t = Portion of the lease not authorized for Commercial Operations in year *t* based on the definition of *t* in Section III (b) (4) below.

M_t' = Actual Nameplate capacity expressed in megawatts (MW) rounded to the nearest second decimal in year t of Commercial Operations on the lease as defined in Section III (b)(4) below, prior to any adjustments as specified in the most recent approved COP for turbine maintenance, replacements, repowering, or decommissioning. For our purposes nameplate capacity is the maximum rated electric output the turbines of the wind farm facility under commercial operations can produce at their rated wind speed designated by the turbine's manufacturer.

$MAX(M_t')$ = Highest value of M_t' projected in the most recent approved version of the COP to be achieved in any year of Commercial Operations on the lease.

The Adjusted Annual Rent Payment calculated in Equation (A) herein, will be rounded up to the nearest dollar. The annual rent payments will be set forth in ADDENDUM "E" when the COP is initially approved or subsequently revised.

Consider an example of a 1,000 MW project on a lease with an Effective Date of January 1, 2017 and a COD of January 1, 2025 on a lease area consisting of 100,000 acres as follows:

Payment (Jan. 1st)	M_t' (MW)	$MAX(M_t')$ (MW)	$\left(1 - \frac{M_t'}{MAX(M_t')}\right)$	Rental Fee for Entire Area	Payment Amount
2017	0	1,000	1.0	$300,000	$300,000
...	...		...		...
2024	0		1.0		$300,000
2025	500		0.5		$150,000
2026	500		0.5		$150,000
2027	500		0.5		$150,000
2028	800		0.2		$60,000
2029	800		0.2		$60,000
2030	800		0.2		$60,000
2031	1,000		0.0		$0

In the event a revised COP is approved by BOEM with an alternative installation schedule that differs from the previously-approved COP, the Lessee must make subsequent payments based on the revised installation schedule. In addition, the Lessee must make a payment equal to the sum of any incremental annual rent payments that would have been due at the Lease Anniversary of prior years based on the differences between the Initial Installation Schedules specified in the previously-approved COP and the revised COP, plus interest on the annual balances, in accordance with 30 CFR 1218.54.

Consider an example whereby the initial COP specified an installation schedule with all 1,000 MW online at the COD, i.e., M_t' is 1,000 MW at COD. The following table demonstrates how the back rent payments would be calculated if the project was initially scheduled as a single phase, but then later determined to be the three-phase project as shown in the previous example in a revised COP approved prior to the payment due on January 1, 2026.

Payment (Jan. 1st)	Initial M_t^I (MW)	Revised M_t^I (MW)	Single-Phase Payment Amount	Three-Phase Payment Amount	Back Rent Payment Amount	Subsequent Rent Payment Amount
2017	0	0	$300,000	$300,000	$0	$0
...	...	...	...	...	...	...
2024	0	0	$300,000	$300,000	$0	$0
2025	1,000	500	$0	$150,000	$150,000	$0
2026	1,000	500	$0	$150,000	$0	$150,000
2027	1,000	500	$0	$150,000	$0	$150,000
2028	1,000	800	$0	$60,000	$0	$60,000
2029	1,000	800	$0	$60,000	$0	$60,000
2030	1,000	800	$0	$60,000	$0	$60,000
2031	1,000	1,000	$0	0	$0	$0

The last rent payment prior to Commercial Operations being authorized on the entire lease area, i.e., the year in which the value of S_t is equal to zero, or prior to the lease End Date, in the event that the lease terminates prior to Commercial Operations being authorized on the entire lease area, will represent the final rent payment, unless a revised COP identifying an alternative maximum initial capacity is approved by BOEM. All rent payments, including the last rent payment, are payable for the full year and will not be prorated to the COD or other installation milestones. The COD is equivalent to the authorization date for the first phase of development on the lease, to be updated based on the initial or revised approved COP documentation. The schedule of rent payments on the lease is defined in ADDENDUM "E". All rent payments must be made as required in 30 CFR 1218.51. Late rent payments will be charged interest in accordance with 30 CFR 1218.54.

(1) ***Project Easement.***

Rent for any project easement(s) is described in ADDENDUM "D".

(2) ***Relinquishment.***

If the Lessee submits an application for relinquishment of a portion of the leased area within the first 45 calendar days following the date that the lease is received by the Lessee for execution, and the Lessor approves that application, no rent payment will be due on that relinquished portion of the leased area. Later relinquishments of any leased area will reduce the Lessee's rent payments due the year following the Lessor's approval of the relinquishment, through a reduction in the Acres in Leased Area, the corresponding Rental Fee for the Entire Leased Area, and any related Adjusted Annual Rent Payments.

(b) ***Operating Fee.*** The Lessee must pay an operating fee as described below:

(1) **Initial Operating Fee Payment.**

The Lessee must pay an initial prorated operating fee within 45 calendar days after the COD. The initial operating fee payment covers the first year of Commercial Operations on the lease and will be calculated in accordance with the following subsection (4), using an operating fee rate of 0.02 and a capacity factor of 0.4.

(2) **Annual Operating Fee Payments.**

The Lessee must pay the operating fee for each subsequent year of Commercial Operations on or before each Lease Anniversary following the formula in subsection (4). The Lessee must calculate each operating fee annually subsequent to the initial operating fee payment using an operating fee rate of 0.02 through the twenty-five year operations term of the lease. The capacity factor of 0.4 will remain in effect until the Lease Anniversary of the year in which the Lessor adjusts the capacity factor.

(3) **Final Operating Fee Payment.**

The final operating fee payment is due on the Lease Anniversary prior to the End Date. The final operating fee payment covers the last year of Commercial Operations on the lease and will be calculated in accordance with the formula in subsection (4) as follows.

(4) **The formula for calculating the operating fee in year *t*.**

F_t	=	M_t	*	H	*	c_p	*	P_t	*	r_t
(annual operating fee)		(nameplate capacity)		(hours per year)		(capacity factor)		(power price)		(operating fee rate)

Where:

t =	the year of Commercial Operations on the lease starting from each Lease Anniversary, where *t* equals 1 represents the year beginning on the Lease Anniversary prior to, or on, the COD.
F_t =	the dollar amount of the annual operating fee in year *t*.
M_t =	the nameplate capacity expressed in megawatts (MW) rounded to the nearest second decimal place in year *t* of Commercial Operations on the lease. The value of M_t, reflecting the availability of turbines, will be determined based on the COP. This value will be adjusted to reflect any modifications to the COP approved by BOEM as of the date each operating fee payment is due, in accordance with the calculation in Equation 1, for each year of Commercial Operations on the lease. (1) $M_t = \sum_{w=1}^{W_t}\left(N_w * \left[\frac{\left(\sum_{d=1}^{D} E_{w,t,d}\right)}{D}\right]\right)$ Where:

W_t = Number of individual wind generation turbines, *w*, that will be available for Commercial Operations during any day of the year, *t*, per the COP.

N_w = Nameplate capacity of individual wind generation turbine, *w*, per the COP expressed in MW.

$E_{w,t,d}$ = Indicates whether individual wind generation turbine, *w*, will be available for Commercial Operations on day *d* of year *t*. The value is set to 1 for any day in year *t* for which the condition is true, i.e., the wind turbine will be available for Commercial Operations, and zero for any day in year *t* for which the condition is false, i.e., the wind turbine will not be available for Commercial Operations. The month of February is always assumed to have 28 days for purposes of this calculation, where March 1st will be counted as the first day of Commercial Operations if Commercial Operations commence on February 29th of a leap year.

D = Days in the year set equal to 365 in all years for purposes of this calculation.

M_t may be reduced only in the event that installed capacity is permanently decommissioned per the COP. M_t will not be changed in response to routine or unplanned maintenance of units, including the temporary removal of a nacelle for off-site repair or replacement with a similar unit.

EXAMPLE: Assume that the Lease Anniversary is January 1st, the COD is July 1, 2025, that the facility will ultimately have 100 individual wind generation turbines with a nameplate capacity of 5.0 MW each, and that the COP specifies the following, cumulative installation schedule for wind turbines to become available for Commercial Operations:

- July 1, 2025 (COD): 20 turbines (20 new units);
- October 1, 2025: 45 turbines (25 new units);
- January 1, 2026: 50 turbines (5 new units);
- July 1, 2026: 65 turbines (15 new units);
- January 1, 2027: 95 turbines (30 new units);
- February 29, 2027: 100 turbines (5 new units).

Further assume that the COP calls for 50 of the turbines to be decommissioned after September 30, 2046 (t = 22), and that the remaining turbines are decommissioned at the End Date of March 15, 2047 (t = 23).

The value of M_t would be estimated as demonstrated in Table 1a for each year of Commercial Operations on the lease in this example.

Table 1a: Example of M_t Calculations for Installation and Decommissioning

t	Turbines	MW	Commercial Operations Period	Comm. Ops. Days	Days in Year	Share of Days	MW	M_t
1	20	100	Jul. 1st to Dec. 31st	184	365	50.41%	50.41	81.92
	25	125	Oct. 1st to Dec. 31st	92		25.21%	31.51	
2	50	250	Jan. 1st to Dec. 31st	365		100.00%	250.00	287.81
	15	75	Jul. 1st to Dec. 31st	184		50.41%	37.81	
3	95	475	Jan. 1st to Dec. 31st	365		100.00%	475.00	495.96
	5	25	Mar. 1st to Dec. 31st	306		83.84%	20.96	
4	100	500	Jan. 1st to Dec. 31st	365		100.00%	500.00	500.00
...	...	...	...	...		...	...	...
21	100	500	Jan. 1st to Dec. 31st	365		100.00%	500.00	500.00
22	50	250	Jan. 1st to Dec. 31st	365		100.00%	250.00	436.98
	50	250	Jan. 1st to Sep. 30th	273		74.79%	186.98	
23	50	250	Jan. 1st to Mar. 15th	74		20.27%	50.68	50.68

To illustrate the impact of decommissioning a portion of the individual wind generation turbines and replacing them with units of greater capacity on the calculation of M_t, assume that at the end of March 31, 2029, 10 units are to be made unavailable due to decommissioning, and that the incremental units have a capacity of 7.0 MW and are expected to be made available for Commercial Operations on September 15, 2029. The impact on M_t in 2029 and in subsequent years starting in 2030 and continuing until decommissioning is illustrated in Table 1b.

Table 1b: Example of M_t Calculations for Repowering

t	Turbines	MW	Commercial Operations Period	Comm. Ops. Days	Days in Year	Share of Days	MW	M_t
5	90 (5.0)	450	Jan. 1st to Dec. 31st	365	365	100.00%	450.00	483.04
	10 (5.0)	50	Jan. 1st. to Mar. 31st	90		24.66%	12.33	
	10 (7.0)	70	Sep. 15th to Dec. 31st	108		29.59%	20.71	
6	90 (5.0)	450	Jan. 1st to Dec. 31st	365		100.00%	450.00	520.00
	10 (7.0)	70	Jan. 1st to Dec. 31st	365		100.00%	70.00	

H = the number of hours in the year for billing purposes which is equal to 8,760 for all years of Commercial Operations on the lease.

c_p = the "Capacity Factor" in Performance Period p, which represents the share of anticipated generation of the facility that is delivered to where the Lessee's facility interconnects with the electric grid (i.e. the Delivery Point) relative to its generation at continuous full power operation at the nameplate capacity, expressed as a decimal between zero and one.

The initial Capacity Factor (c_0) will be set to 0.4.

The Capacity Factor will be subject to adjustment at the end of each Performance Period. After the sixth year of Commercial Operations on the lease has concluded, the Lessee will utilize data gathered from years two through six of Commercial Operations on the lease and propose a revised Capacity Factor to be used to calculate subsequent annual payments, as provided for in Table 2 below. A similar process will be conducted at the conclusion of each five-year Performance Period, thereafter.

Table 2: Definition of Performance Periods

Performance Period (p)	Commercial Operation Years (t)	Payments Affected by Adjustment	Capacity Factor (c)	Date End Year (n)
0 (COD)	Not Applicable	Payments 1 to 7	c_0=0.4	--
1	t = 2 to 6	Payments 8 to 12	c_1	n_1=6
2	t = 7 to 11	Payments 13 to 17	c_2	n_2=11
3	t = 12 to 16	Payments 18 to 22	c_3	n_3=16
4	t = 17 to 21	Payments 23 to End Date	c_4	n_4=21

Adjustments to the Capacity Factor

The Actual 5-year Average Capacity Factor (Xp) is calculated for each Performance Period after COD ($p > 0$) per Equation 2 below. Xp represents the sum of actual, metered electricity generation in megawatt-hours (MWh) at the Delivery Point to the electric grid (A_t) divided by the amount of electricity generation in MWh that would have been produced if the facility operated continuously at its full, stated capacity (M_t) in all of the hours (h_t) in each year, t, of the corresponding five-year period.

$$\textbf{(2)}\quad X_p = \frac{\sum_{t=n-4}^{n} A_t}{\left(\sum_{t=n-4}^{n} M_t * h_t\right)}$$

Where:

M_t = Nameplate Capacity as defined above.

n = "Date End Year" value for the Performance Period, p, as defined in Table 2.

p = Performance Period as defined in Table 2.

A_t = Actual generation in MWh associated with each year of Commercial Operations, t, on the lease that is transferred at the Delivery Point; Delivery Point meter data supporting the values submitted for annual actual generation must be recorded, preserved, and timely provided to the Lessor upon request. In the event the Lessor requires the assistance of the Lessee in obtaining information useful in verifying such information, for example by waiving confidentiality with respect to data held by a third party, such assistance must be timely provided.

h_t = Hours in the year on which the Actual Generation associated with each year of Commercial Operations, t, on the lease is based; this definition of "hours in the year" differs from the definition of H in the operating fee equation above. The hours in the year for purposes of calculating the capacity factor must take into account the actual number of hours, including those in leap years.

The value of the Capacity Factor at the outset of Commercial Operations ($p = 0$) is set

	to 0.4 as stated in equation 3: **(3)** $c_0 = 0.4$ The value of the Capacity Factor corresponding to each Performance Period (c_p) is set according to equations 4A, 4B, and 4C as follows for each value of p greater than zero. The Capacity Factor is set equal to the Actual 5-Year Average Capacity Factor provided that the value falls within a range of plus or minus 10 percent of the previous Performance Period's capacity factor. **(4A)** $c_p = X_p$ for $c_{p-1} * 0.90 \leq X_p \leq c_{p-1} * 1.10$ **(4B)** $c_p = c_{p-1} * 0.90$ for $X_p < c_{p-1} * 0.90$ **(4C)** $c_p = c_{p-1} * 1.10$ for $X_p > c_{p-1} * 1.10$ All values for c_p must be rounded to the nearest third decimal place.
P_t =	a measure of the annual average wholesale electric power price expressed in dollars per MW hour. The Lessee must calculate P_t at the time each operating fee payment is due, subject to approval by the Lessor. The Base Price (P_b) must equal the weighted average of the peak and off-peak spot price indices for the selected electric region for the most recent year of data available as reported by the selected source for this information. As part of its COP approval, BOEM will designate both the electric region and the source of the information to be used in determining the Base Price. The electric region will be the region associated with the location(s) where the transmission cable for the project makes landfall. A region may consist of a location (e.g., transmission hub), zone, state or other area. If the cable makes landfall in Zone J of New York, for example, the electric region could be Zone J or the entire New York control area, but not Zone K. The peak and off-peak price indices must be weighted 52.0% and 48.0%, respectively, for purposes of estimating the weighted index value for the Base Price. For example, in the March 12, 2012 State of the Markets Report the peak price index for 2011 was $51.99/MWh and the corresponding off-peak price index for 2011 was $33.94/MWh, resulting in a weighted index value for the Base Price for 2011 (P_{2011}) of $43.33/MWh (=52.0% * $51.99 / MWh + 48.0% *$33.94 / MWh). The calculation of P_b must be rounded up to the nearest, second decimal place. The Base Price must be adjusted for inflation from the year associated with the published spot prices to the year in which the operating fee is to be paid as shown in equations (5A) and (5B):

$$\textbf{(5A)}\quad P_t = P_b * \left(\frac{GDP_g}{GDP_{g-1}}\right)^{y-g} * \left(\frac{GDP_g}{GDP_b}\right) \text{ for } g \geq b$$

$$\textbf{(5B)}\quad P_t = P_b * \left(\frac{GDP_g}{GDP_{g-1}}\right)^{y-b} \quad \text{for } g < b$$

Where:

GDP = Annual Implicit Price Deflators for Gross Domestic Product (GDP deflator index) from Table 1.1.9, line 1, in the Survey of Current Business published by the U.S. Bureau of Economic Analysis (BEA) in the specified period; the latest version of this data is currently available at:

http://bea.gov/iTable/iTable.cfm?ReqID=9&step=1

If BEA stops publishing the data required for this calculation, or the specified location of the data changes over time, the Lessor will specify an alternative source of data and methodology that it considers approximately equivalent.

b = The most recent year for which BOEM's identified source reports the appropriate electricity spot price data expressed as the year, e.g., 2009, as in the illustrative example below.

g = The most recent year for which GDP deflator indices are available from BEA expressed as the year, e.g., 2011, as in the illustrative example below.

y = The year the annual payment is due expressed as the year corresponding to the value of t described above, e.g., 2013, as in the illustrative example below.

The second term on the right-hand side of equation (5A) represents a projected annual change in the index of inflation employing the last year of data available from BEA, while the third term represents the cumulative change in the index of inflation up to the previous year.

Example:

The following hypothetical example is provided to illustrate the methodology using Equation (5A) and the illustrative values provided for b, g, and y above, applied to historical GDP deflator data. If the actual price indices are based on 2009 data and the GDP deflator indices are available for 2011, the inflation-adjusted price index value would be determined from equation (5A) as follows for a payment occurring in y = 2013:

	$P_{t(2013)} = P_{2009} * \left(\frac{GDP_{2011}}{GDP_{2010}}\right)^{2013-2011} * \left(\frac{GDP_{2011}}{GDP_{2009}}\right) = \frac{\$40.69}{MWh} * \left(\frac{113.361}{110.992}\right)^{2} * \left(\frac{113.361}{109.729}\right) = \frac{\$43.85}{MWh}$ Note: The current GDP deflator index is 113.361 for 2011, 110.992 for 2010, and 109.729 for 2009 (last revised by BEA on April 27, 2012); the FERC index price for the year 2009 is \$38.40/MWh (On-peak: \$44.60/MWh; Off-peak: \$31.68/MWh; last revised March 12, 2012). Although 2011 FERC prices are available, the 2009 prices are used in the example to illustrate the concept. The Lessor and the Lessee will use the latest FERC price indices and revised BEA GDP deflator index values at the time the pricing adjustments are made. The source of data used in the calculations must be noted in the Lessee's documentation supporting their estimate of the value of P_t each year for review and approval by the Lessor.
r_t =	the operating fee rate of 0.02 (2%).

(c) ***Reporting, Validation, Audits, and Late Payments.***

The Lessee must submit the values used in the operating fee formula to the Lessor at the time the annual payment based on these values is made. Submission of this and other reporting, validation, audit and late payment information as requested by the Lessor must be sent to the Lessor using the contact information indicated in ADDENDUM "A", unless the Lessor directs otherwise. Failure to submit the estimated values and the associated documentation on time to the Lessor may result in penalties as specified in applicable regulations.

Within 60 calendar days of the submission by the Lessee of the annual payment, the Lessor will review the data submitted and validate that the operating fee formula was applied correctly. If the Lessor validation results in a different operating fee amount, the amount of the annual operating fee payment will be revised to the amount determined by the Lessor.

The Lessor also reserves the right to audit the meter data upon which the Actual 5-year Average Capacity Factor is based at any time during the lease term. If, as a result of such audit, the Lessor determines that any annual operating fee payment was calculated incorrectly, the Lessor has the right to correct any errors and collect the correct annual operating fee payment amount.

If the annual operating fee is revised downward as a result of the Lessee's calculations, as validated by the Lessor, or an audit of meter data conducted by the Lessee or Lessor, the Lessee will be refunded the difference between the amount of the payment received and the amount of the revised annual operating fee, without interest. Similarly, if the payment amount is revised upward, the Lessee is required to pay the difference between the amount of the payment received and the amount of the revised annual operating fee, plus interest on the balance, in accordance with 30 CFR § 1218.54.

Late operating fee payments will be charged interest in accordance with 30 CFR § 1218.54.

IV. Financial Assurance

The Lessor will base the determination for the amounts of all SAP, COP, and decommissioning financial assurance requirements on estimates of the cost to meet all accrued lease obligations. The Lessor determines the amount of supplemental and decommissioning financial assurance requirements on a case-by-case basis. The amount of financial assurance required to meet all lease obligations includes:

- The projected amount of rent and other payments due the Lessor over the next 12 months;
- Any past due rent and other payments;
- Other monetary obligations (e.g., fines, liens); and
- The estimated cost of facility decommissioning.

(a) **Initial Financial Assurance Due Prior to Lease Issuance Date.** In accordance with 30 CFR 585.515, the Lessee must provide an initial lease-specific bond, or other approved means of meeting the Lessor's initial financial assurance requirements in an amount equal to $100,000.

(b) **Additional Financial Assurance.** In addition to the initial lease-specific financial assurance previously discussed and as set forth in 30 CFR 585.516-.517, the Lessee is also required to provide additional supplemental bonds associated with the SAP and COP, or other form of financial assurances and a decommissioning bond or other approved means of meeting the Lessee's decommissioning obligations.

(1) Prior to the Lessor's approval of a SAP, the Lessor will require an additional supplemental bond or other form of financial assurance in an amount determined by the Lessor based on the complexity, number, and location of all facilities involved in the site assessment activities planned in the SAP, and estimates of the costs to meet all accrued obligations, in accordance with applicable BOEM regulations (30 CFR 585.515-537). The supplemental financial assurance requirement is in addition to the initial lease-specific financial assurance in the amount of $100,000. The Lessee may meet these obligations by providing a new bond or other acceptable form of financial assurance, or increasing the amount of its existing bond or other form of financial assurance.

(2) Prior to the Lessor's approval of a COP, the Lessor may require an additional supplemental bond or other form of financial assurance in an amount determined by the Lessor based on the complexity, number, location of all facilities, activities and Commercial Operations planned in the COP, and estimates of the costs to meet

all accrued obligations, in accordance with applicable BOEM regulations (30 CFR 585.515-537). The supplemental financial assurance requirement is in addition to the initial lease-specific financial assurance in the amount of $100,000, and any additional supplemental bond or other form of financial assurance required with the SAP. The Lessee may meet these obligations by providing a new bond or other acceptable form of financial assurance, or increasing the amount of its existing bond or other form of financial assurance.

(3) The Lessor will require a decommissioning bond or other form of financial assurance based on the anticipated decommissioning costs in accordance with applicable BOEM regulations (30 CFR 585.515-537). The decommissioning obligation must be guaranteed through an acceptable form of financial assurance, and will be due on a schedule to be approved by BOEM in accordance with the number of facilities installed or being installed.

(c) **Adjustments to Financial Assurance Amounts.** The Lessor reserves the right to adjust the amount of any financial assurance requirement (initial, supplemental, or decommissioning) associated with this lease and/or reassess the Lessee's cumulative lease obligations, including decommissioning obligations, at any time. If the Lessee's cumulative lease obligations and/or liabilities increase or decrease, the Lessor will notify the Lessee of any intended adjustment to the financial assurance requirements and provide the Lessee an opportunity to comment in accordance with applicable BOEM regulations.

U.S. DEPARTMENT OF THE INTERIOR
BUREAU OF OCEAN ENERGY MANAGEMENT

ADDENDUM "C"

LEASE-SPECIFIC TERMS, CONDITIONS, AND STIPULATIONS

Lease Number OCS-A 0512

The Lessee's rights to conduct activities on the leased area are subject to the following terms, conditions, and stipulations. The Lessor reserves the right to impose additional terms and conditions incident to the future approval or approval with modifications of plans, such as a Site Assessment Plan (SAP) or Construction and Operations Plan (COP).

1 DEFINITIONS

1.1 Definition of "Archaeological Resource": The term "archaeological resource" has the same meaning as "archaeological resource" in BOEM regulations provided in 30 CFR 585.112.

1.2 Definition of "Dynamic Management Area (DMA)": The term "DMA" refers to a temporary area designated by the National Oceanic and Atmospheric Administration (NOAA) National Marine Fisheries Service (NMFS) and a circle around a confirmed North Atlantic right whale sighting. The radius of this circle expands incrementally with the number of whales sighted, and a buffer is included beyond the core area, as designated by NMFS, to allow for whale movement. NOAA NMFS may apply mandatory or voluntary speed restrictions. Information regarding the location and status of applicable DMAs is available from the NMFS Office of Protected Resources.

1.3 Definition of "Effective Date": The term "Effective Date" has the same meaning as "effective date" in BOEM regulations provided in 30 CFR 585.237.

1.4 Definition of "Geological and Geophysical Survey (G&G Survey)": The term "G&G Survey" serves as a collective term for surveys that collect data on the geology of the seafloor and landforms below the seafloor. High resolution geophysical surveys and geotechnical (sub-bottom) exploration are components of G&G surveys.

1.5 Definition of "Geotechnical Exploration": The term "Geotechnical Exploration" is used to refer to the process by which site-specific sediment and underlying geologic data are acquired from the seafloor and the sub-bottom and includes geotechnical surveys utilizing borings, vibracores, and cone penetration tests.

1.6 Definition of "High Resolution Geophysical Survey (HRG Survey)": The term "HRG Survey" means a marine remote-sensing survey using, but not limited to, such equipment as side-scan sonar, magnetometer, shallow and medium (seismic) penetration sub-bottom profiler systems, narrow beam or multibeam echo sounder, or other such equipment employed for the purposes of providing data on geological conditions, identifying shallow hazards, identifying archaeological resources, charting bathymetry, and gathering other site characterization information.

1.7 Definition of "Listed Species": The term "listed species," also referred to in adjective form as "listed," means any species of fish, wildlife, or plant that has been determined to be endangered or threatened under Section 4 of the Endangered Species Act. Listed species are provided in 50 CFR 17.11-17.12.

1.8 Definition of "Plan": The term "plan" means a Site Assessment Plan (SAP) and/or a Construction and Operations Plan (COP).

1.9 Definition of "Protected-Species Observer": The term "protected-species observer" or "PSO" means an individual who is trained in the shipboard identification and behavior of protected species. Protected species include marine mammals (those protected under the Endangered Species Act and those protected under the Marine Mammal Protection Act) and sea turtles.

1.10 Definition of "Ramp-up": The term "ramp-up" means the process of incrementally increasing the acoustic source level of the survey equipment when conducting HRG surveys until it reaches the operational setting.

1.11 Definition of "Site Assessment Activities": The term "site assessment activities" or "site assessment," has the same meaning as "site assessment activities" in 30 CFR 585.112.

1.12 Definition of "Qualified Marine Archaeologist": The term "qualified marine archaeologist" means a person retained by the Lessee who meets the Secretary of the Interior's Professional Qualifications Standards for Archaeology (48 FR 44738-44739), and has experience analyzing marine geophysical data.

1.13 Definition of "Take": The terms "Takes," "Taken," and "Taking" have the same meaning as the term "take" as defined in 16 U.S.C. § 1532(19).

2 SCHEDULE

2.1 Site Characterization

2.1.1 Survey Plan(s). Prior to conducting survey activities in support of the submission of a plan, the Lessee must submit to the Lessor at least one complete survey plan. Each distinct survey effort (e.g., mobilization) must be addressed by a survey plan, although a single survey plan may cover more than one effort. Each survey plan must include details and timelines of the survey activities to be conducted on this lease necessary to support the submission of a plan (i.e., necessary to satisfy the information requirements in the applicable regulations, including but not limited to 30 CFR 585.606, 610, 611, 621, 626, 627). Each survey plan must include a description of historic property identification surveys that will be conducted to gather the information required by BOEM to complete review of a plan under the National Historic Preservation Act (e.g., offshore and onshore archaeological surveys and surveys within the viewshed of proposed renewable energy structures). Each survey plan must be consistent with the Lessee's Fisheries Communication Plan (see 4.1.5) and include a description of the Lessee's intentions to coordinate with the U.S. Coast Guard to prepare a Notice to Mariners for the specific survey activities described in the survey plan.

The Lessee must submit each survey plan to the Lessor at least 30 calendar days prior to the date of the required pre-survey meeting with the Lessor (See 2.1.2). Prior to the commencement of any survey activities described in the survey plan, the Lessee must modify each survey plan to address any comments the Lessor submits to the Lessee on the contents of the survey plan in a manner deemed satisfactory by the Lessor.

2.1.2 Pre-Survey Meeting(s) with the Lessor. At least 60 days prior to the initiation of survey activities in support of the submission of a plan, the Lessee must hold a pre-survey meeting with the Lessor to discuss the applicable proposed survey plan and timelines. The Lessee must ensure the presence at this meeting of a Qualified Marine Archaeologist and/or other relevant subject matter experts (e.g., terrestrial archaeologists, architectural historians) related to the proposed historic property identification surveys described in the survey plan. The Lessor may request the presence of other relevant subject matter experts at this meeting.

2.2 Progress Reporting

2.2.1 Semi-Annual Progress Report. The Lessee must submit to the Lessor a semi-annual (i.e., every six months) progress report through the duration of the site assessment term that includes a brief narrative of the overall progress since the last progress report, or – in the case of the first report – since the Effective Date. The progress report must include an update regarding progress in executing the activities included in the survey plan(s), and include as an enclosure an updated survey plan(s) accounting for any modifications in schedule.

3 NATIONAL SECURITY AND MILITARY OPERATIONS

The Lessee must comply with the requirements specified in stipulations 3.1, 3.2, and 3.3 when conducting site characterization activities in support of plan submittal.

3.1 Hold and Save Harmless

The Lessee assumes all risks of damage or injury to persons or property that occurs in, on, or above the OCS, to any persons or to any property of any person or persons in connection with any activities being performed by the Lessee in, on, or above the OCS, if such injury or damage to such person or property occurs by reason of the activities of any agency of the United States Government, its contractors, or subcontractors, or any of its officers, agents or employees, being conducted as a part of, or in connection with, the programs or activities of the individual military command headquarters (hereinafter "the appropriate command headquarters") listed in the contact information provided as an Enclosure to this lease, whether compensation for such damage or injury might be due under a theory of strict or absolute liability or otherwise.

Notwithstanding any limitation of the Lessee's liability in Section 9 of the lease, the Lessee assumes this risk whether such injury or damage is caused in whole or in part by any act or omission, regardless of negligence or fault, of the United States, its contractors or subcontractors, or any of its officers, agents, or employees. The Lessee further agrees to indemnify and save harmless the United States against all claims for loss, damage, or injury in connection with the programs or activities of the command headquarters, whether the same be caused in whole or in part by the negligence or fault of the United States, its contractors, or subcontractors, or any of its officers, agents, or employees and whether such claims might be sustained under a theory of strict or absolute liability or otherwise.

3.2 Evacuation or Suspension of Activities

3.2.1 General. The Lessee hereby recognizes and agrees that the United States reserves and has the right to temporarily suspend operations and/or require evacuation on this lease in the interest of national security pursuant to Section 3(c) of this lease.

3.2.2 Notification. Every effort will be made by the appropriate military agency to provide as much advance notice as possible of the need to suspend operations and/or evacuate. Advance notice will normally be given before requiring a suspension or evacuation. Temporary suspension of operations may include but is not limited to the evacuation of personnel and appropriate sheltering of personnel not evacuated.

"Appropriate sheltering" means the protection of all Lessee personnel for the entire duration of any Department of Defense activity from flying or falling objects or substances, and will be implemented by an order (oral and/or written) from the BOEM Office of Renewable Energy Programs (OREP) Program Manager, after consultation with the appropriate command headquarters or other appropriate military agency or higher Federal authority. The appropriate command headquarters, military agency or higher authority will provide information to allow the Lessee to assess the degree of risk to, and provide sufficient protection for, the Lessee's personnel and property.

3.2.3 Duration. Suspensions or evacuations for national security reasons will not generally exceed 72 hours; however, any such suspension may be extended by order of the OREP Program Manager. During such periods, equipment may remain in place, but all operations, if any, must cease for the duration of the temporary suspension if so directed by the OREP Program Manager. Upon cessation of any temporary suspension, the OREP Program Manager will immediately notify the Lessee that such suspension has terminated and operations on the leased area can resume.

3.2.4 Lessee Point-of-Contact for Evacuation/Suspension Notifications. The Lessee must inform the Lessor of the persons/offices to be notified to implement the terms of 3.2.2 and 3.2.3.

3.2.5 Coordination with Command Headquarters. The Lessee must establish and maintain early contact and coordination with the appropriate command headquarters (see Contact Information for Reporting Requirements Enclosure), in order to avoid or minimize the potential to conflict with and minimize the potential effects of conflicts with military operations.

3.2.6 Reimbursement. The Lessee is not entitled to reimbursement for any costs or expenses associated with the suspension of operations or activities or the evacuation of property or personnel in fulfillment of the military mission in accordance with 3.2.1 through 3.2.5 above.

3.3 Electromagnetic Emissions

Prior to entry into any designated defense operating area, warning area, or water test area for the purpose of commencing survey activities undertaken to support plan submittal, the Lessee must enter into an agreement with the commander of the appropriate command headquarters to coordinate the electromagnetic emissions associated with such survey activities. The Lessee must ensure that all electromagnetic emissions associated with such survey activities are controlled as directed by the commander of the appropriate command headquarters.

4 STANDARD OPERATING CONDITIONS

4.1 General Requirements

4.1.1 Prior to the start of operations, the Lessee must hold a briefing to establish responsibilities of each involved party, define the chains of command, discuss communication procedures, provide an overview of monitoring procedures, and review operational procedures. This briefing must include all relevant personnel, crew members and PSOs. New personnel must be briefed as they join the work in progress.

4.1.2 The Lessee must ensure that all vessel operators and crew members, including PSOs, are familiar with, and understand, the requirements specified in ADDENDUM "C".

4.1.3 The Lessee must ensure that a copy of ADDENDUM "C" is made available on every project-related vessel.

4.1.4 Marine Trash and Debris Prevention. The Lessee must ensure that vessel operators, employees, and contractors actively engaged in activities in support of plan (i.e., SAP and COP) submittal are briefed on marine trash and debris awareness and elimination, as described in the Bureau of Safety and Environmental Enforcement (BSEE) Notice to Lessees and Operators (NTL) No. 2015-G03 ("Marine Trash and Debris Awareness and Elimination") or any NTL that supersedes this NTL, except that the Lessor will not require the Lessee, vessel operators, employees, and contractors to undergo formal training or post placards. The Lessee must ensure that these vessel operator employees and contractors are made aware of the environmental and socioeconomic impacts associated with marine trash and debris and their responsibilities for ensuring that trash and debris are not intentionally or accidentally discharged into the marine environment. The above-referenced NTL provides information the Lessee may use for this awareness briefing.

4.1.5 Fisheries Communications Plan (FCP) and Fisheries Liaison. The Lessee must develop a publicly available FCP that describes the strategies that the Lessee intends to use for communicating with fisheries stakeholders prior to and during activities in support of the submission of a plan. The FCP must include the contact information for an individual retained by the Lessee as its primary point of contact with fisheries stakeholders (i.e., Fisheries Liaison). If the Lessee develops a project website, the FCP must be posted on the Lessee's project website. If the Lessee does not develop a project website, the FCP must be made available to the Lessor and the public upon request.

4.2 Vessel Strike Avoidance Measures

4.2.1 The Lessee must ensure that all vessels conducting activities in support of plan submittal, including those transiting to and from local ports and the lease area, comply with the vessel-strike avoidance measures specified in Section 4.2, except under extraordinary circumstances when complying with these requirements would put the safety of the vessel or crew at risk.

4.2.2 The Lessee must ensure that vessel operators and crews maintain a vigilant watch for cetaceans, pinnipeds, and sea turtles and slow down or stop their vessel to avoid striking protected species.

4.2.3 The Lessee must ensure that all vessel operators comply with 10 knot (18.5 km/hr) speed restrictions in any DMA.

4.2.4 The Lessee must ensure that vessels 19.8 meters (65 ft) in length or greater, operating from November 1 through April 30, operate at speeds of 10 knots (18.5 km/hr) or less.

4.2.5 The Lessee must ensure that all vessel operators reduce vessel speed to 10 knots or less when mother/calf pairs, pods, or large assemblages of non-delphinoid cetaceans are observed near an underway vessel.

4.2.6 North Atlantic right whales.

4.2.6.1 The Lessee must ensure all vessels maintain a separation distance of 500 meters (1,640 ft) or greater from any sighted North Atlantic right whale.

4.2.6.2 The Lessee must ensure that the following avoidance measures are taken if a vessel comes within 500 meters (1,640 ft) of any North Atlantic right whale:

4.2.6.2.1 If underway, vessels must steer a course away from any sighted North Atlantic right whale at 10 knots (18.5 km/h) or less until the 500-meter (1,640 ft) minimum separation distance has been established (except as provided in 4.2.6.2.2).

4.2.6.2.2 If a North Atlantic right whale is sighted within 100 meters (328 ft) of an underway vessel, the vessel operator must immediately reduce speed and promptly shift the engine to neutral. The vessel operator must not engage engines until the North Atlantic right whale has moved outside the vessel's path and beyond 100 meters (328 ft), at which point the vessel operator must comply with 4.2.6.2.1.

4.2.6.2.3 If a vessel is stationary, the vessel must not engage engines until the North Atlantic right whale has moved beyond 100 meters (328 ft), at which point the Lessee must comply with 4.2.6.2.1.

4.2.7 Non-delphinoid cetaceans other than the North Atlantic right whale.

4.2.7.1 The Lessee must ensure all vessels maintain a separation distance of 100 meters (328 ft) or greater from any sighted non-delphinoid cetacean.

4.2.7.2 The Lessee must ensure that the following avoidance measures are taken if a vessel comes within 100 meters (328 ft) of any sighted non-delphinoid cetacean:

4.2.7.2.1 If any non-delphinoid cetacean is sighted, the vessel underway must reduce speed and shift the engine to neutral, and must not engage the engines until the non-delphinoid cetacean has moved beyond 100 meters (328 ft).

4.2.7.2.2 If a vessel is stationary, the vessel must not engage engines until the sighted non-delphinoid cetacean has moved beyond 100 meters (328 ft).

4.2.8 Delphinoid cetaceans and Pinnipeds.

4.2.8.1 The Lessee must ensure that all vessels underway do not divert to approach any delphinoid cetacean and/or pinniped.

4.2.8.2 The Lessee must ensure that if a delphinoid cetacean and/or pinniped approaches any vessel underway, the vessel underway must avoid excessive speed or abrupt changes in direction to avoid injury to the delphinoid cetacean and/or pinniped.

4.2.9 Sea Turtles.

4.2.9.1 The Lessee must ensure all vessels maintain a separation distance of 50 meters (164 ft) or greater from any sighted sea turtle.

4.3 Archaeological Survey Requirements

4.3.1 Archaeological Survey Required. The Lessee must provide the results of an archaeological survey with its plans.

4.3.2 Qualified Marine Archaeologist. The Lessee must ensure that the analysis of archaeological survey data collected in support of plan submittal and the preparation of archaeological reports in support of plan submittal are conducted by a Qualified Marine Archaeologist.

4.3.3 Tribal Pre-Survey Meeting. The Lessee must invite by certified mail the Shinnecock Indian Nation to a tribal pre-survey meeting. The purpose of this meeting will be for the Lessee and the Lessee's Qualified Marine Archaeologist to discuss the Lessee's survey plan and consider requests to monitor portions of the archaeological survey and the geotechnical exploration activities, including the visual logging and analysis of geotechnical samples (e.g., cores). This meeting must be held subsequent to the pre-survey meeting with the Lessor (see 2.1.2). Invitation to the tribal pre-survey meeting must be made at least 15 calendar days prior to the date of the proposed tribal pre-survey meeting. The meeting must be scheduled for a date at least 30 calendar days prior to the commencement of survey activities performed in support of plan submittal and at a location and time that affords the participants a reasonable opportunity to participate. The anticipated date for the meeting must be identified in the timeline of activities described in the applicable survey plan (see 2.1.1).

4.3.4 Geotechnical Exploration.

4.3.4.1 The Lessee may only conduct geotechnical exploration activities in support of plan submittal in locations where an archaeological analysis of the results of geophysical surveys has been completed. This analysis must include a determination by a Qualified Marine Archaeologist as to whether any potential archaeological resources are present in the area that could be impacted by bottom-disturbing activities.

4.3.4.2 Except as allowed by the Lessor under 4.3.6, the geotechnical exploration activities must avoid potential archaeological resources by a minimum of 50 meters, and the Qualified Marine Archaeologist must calculate the avoidance distance from the maximum discernible extent of the archaeological resource.

4.3.4.3 Upon completion of geotechnical exploration activities, a Qualified Marine Archaeologist must certify, in the Lessee's archaeological report(s) submitted with a plan, that such activities did not impact potential historic properties identified as a result of the HRG surveys performed in support of plan submittal, except as follows: in the event that the geotechnical exploration activities did impact potential historic properties identified in the archaeological surveys without the Lessor's prior approval, the Lessee and the Qualified Marine Archaeologist who prepared the report must instead provide a statement documenting the extent of these impacts.

4.3.5 Monitoring and Avoidance. The Lessee must inform the Qualified Marine Archaeologist that he or she is permitted to be present during HRG surveys and bottom-disturbing activities performed in support of plan submittal to ensure avoidance of potential archaeological resources, as determined by the Qualified Marine Archaeologist (including bathymetric, seismic, and magnetic anomalies; side scan sonar contacts; and other seafloor or sub-surface features that exhibit potential to represent or contain potential archaeological sites or other historic properties). In the event that the Qualified Marine Archaeologist indicates that he or she wishes to be present, the Lessee must facilitate the Qualified Marine Archaeologist's presence, as requested by the Qualified Marine Archaeologist, and provide the Qualified Marine Archaeologist the opportunity to inspect data quality.

4.3.6 No Impact without Approval. The Lessee must not knowingly impact a potential archaeological resource without the Lessor's prior approval.

4.3.7 Post-Review Discovery Clauses. If the Lessee, while conducting site characterization activities in support of plan submittal, discovers a potential archaeological resource, such as the presence of a shipwreck (e.g., a sonar image or visual confirmation of an iron, steel, or wooden hull, wooden timbers, anchors, concentrations of historic objects, piles of ballast rock) or pre-contact archaeological site (e.g., stone tools, pottery) within the project area, the Lessee must:

4.3.7.1 Immediately halt seafloor/bottom-disturbing activities within the area of discovery;

4.3.7.2 Notify the Lessor within 24 hours of discovery;

4.3.7.3 Notify the Lessor in writing via report to the Lessor within 72 hours of its discovery;

4.3.7.4 Keep the location of the discovery confidential and take no action that may adversely affect the archaeological resource until the Lessor conducts an evaluation and instructs the applicant on how to proceed; and

4.3.7.5 Conduct any additional investigations as directed by the Lessor to determine if the resource is eligible for listing in the National Register of Historic Places (30 CFR 585.802(b)). The Lessor will direct the Lessee to conduct such investigations if: (1) the site has been impacted by the Lessee's project activities; or (2) impacts to the site or to the area of potential effect cannot be avoided. If investigations indicate that the resource is potentially eligible for listing in the National Register of Historic Places, the Lessor will tell the Lessee how to protect the resource or how to mitigate adverse effects to the site. If the Lessor incurs costs in protecting the resource, under Section 110(g) of the National Historic Preservation Act, the Lessor may charge the Lessee reasonable costs for carrying out preservation responsibilities under the OCS Lands Act (30 CFR 585.802(c-d)).

4.4 Geological and Geophysical (G&G) Survey Requirements

4.4.1 The Lessee must ensure that all vessels conducting activity in support of a plan (i.e., SAP and COP) submittal comply with the G&G survey requirements specified in 4.4, except under extraordinary circumstances when complying with these requirements would put the safety of the vessel or crew at risk.

4.4.2 Visibility. The Lessee must not conduct G&G surveys in support of plan submittal at any time when lighting or weather conditions (e.g., darkness, rain, fog, sea state) prevent visual monitoring of the high-resolution geophysical (HRG) survey exclusion zone (see 4.4.6) or the geotechnical exploration exclusion zone (see 4.4.7), except as allowed under 4.4.3.

4.4.3 Modification of Visibility Requirement. If the Lessee intends to conduct G&G survey operations in support of plan submittal at night or when visual observation is otherwise impaired, the Lessee must submit to the Lessor an alternative monitoring plan detailing the alternative monitoring methodology (e.g., active or passive acoustic monitoring technologies). The alternative monitoring plan must demonstrate the effectiveness of the methodology proposed to the Lessor's satisfaction. The Lessor may, after consultation with NMFS, decide to allow the Lessee to conduct G&G surveys in support of plan submittal at night or when visual observation is otherwise impaired using the proposed alternative monitoring methodology.

4.4.4 Protected-Species Observer. The Lessee must ensure that the exclusion zone for all G&G surveys performed in support of plan submittal is monitored by NMFS-approved PSOs around the sound source. The number of PSOs must be sufficient to effectively monitor the exclusion zone at all times. In order to ensure effective monitoring, PSOs must be on watch for no more than 4 consecutive hours, with at least a 2-hour break after a 4-hour watch, unless otherwise accepted by the Lessor. PSOs must not work for more than 12 hours in a 24-hour period. PSO reporting requirements are provided in 4.5. Prior to the scheduled start of the surveys performed in support of plan submittal, the Lessee must provide to the Lessor a list of PSOs currently approved by NMFS for G&G surveys. For PSOs not currently approved by NMFS, the Lessee must provide to the Lessor PSO résumés, no later than 45 calendar days prior to the scheduled start of such surveys. If additional PSO approvals are required after this time, the Lessee must provide the additional PSO résumés to the Lessor at least 15 calendar days prior to each PSO's start date. The Lessor will send the PSO résumés to NMFS for approval.

4.4.5 Observation Location and Optical Device Availability. The Lessee must ensure that monitoring occurs from the highest available vantage point on the associated operational platform, allowing for 360-degree scanning. The Lessee must ensure that each PSO has access to reticle binoculars and other suitable equipment to adequately perceive and monitor protected species within the exclusion zone during surveys conducted in support of plan submittal.

4.4.6 High-Resolution Geophysical (HRG) Surveys. The following stipulations are specific to HRG surveys conducted in support of plan submittal where one or more acoustic sound source is operating at frequencies below 200 kilohertz (kHz):

4.4.6.1 Establishment of Default Exclusion Zone. The Lessee must ensure that a PSO monitors a 200-meter default exclusion zone for cetaceans, pinnipeds, and sea turtles. In the case of the North Atlantic right whale, the Lessee must observe a minimum separation distance of 500 meters (1,640 ft), as required under 4.2.6.1.

4.4.6.1.1 If the Lessor determines that the exclusion zone does not encompass the sound-exposure threshold for ear injury to protected species (Level A harassment) calculated for the acoustic source having the highest source level, the Lessor will consult with NMFS and may impose additional, relevant requirements on the Lessee, including, but not limited to, required expansion of this exclusion zone.

4.4.6.2 Field Verification of HRG Survey Exclusion Zone. The Lessee must submit to the Lessor the results of field verification to verify the exclusion zone for the HRG survey equipment operating below 200 kHz. If no applicable data are available, the Lessee must conduct field verification of the exclusion zone for HRG survey equipment operating below 200 kHz. As part of such field verification, the Lessee must take acoustic measurements at a minimum of two reference locations and in a manner that is sufficient to establish the following: source level (Peak, SEL, and RMS sound levels at 1 meter), pattern of spreading loss, and the sound-exposure distance for ear injury for each marine mammal hearing group, sea turtles, and fish. The distance to the 166, 160, and 150 dB RMS behavioral thresholds (Level B harassment) must also be reported. The first location must be at a distance of 200 m from the sound source, and the second location must be as close to the sound source as technically feasible. The Lessee must take these sound measurements at the reference locations at two depths (i.e., a depth at mid-water and a depth at approximately 1 meter (3.28 ft) above the seafloor). The Lessee must report the field verification results to the Lessor in the applicable survey plan(s), unless otherwise authorized by the Lessor.

4.4.6.3 Modification of Exclusion Zone Per Lessee Request. The Lessee may use the field verification results to request modification of the exclusion zone for the specific HRG survey equipment under consideration. The Lessee must base any proposed new exclusion zone radius on the largest safety zone configuration of the target Level A or Level B harassment sound-exposure thresholds as defined by NMFS. The Lessee must use this modified zone for all subsequent use of field-verified equipment. The Lessee may periodically reevaluate the modified zone using the field verification procedures described in 4.4.6.2. The Lessee must obtain Lessor approval of any new exclusion zone before it is implemented.

4.4.6.4 Clearance of Exclusion Zone. The Lessee must ensure that active acoustic sound sources are not activated until the PSO has reported the exclusion zone clear of all marine mammals and sea turtles for at least 60 minutes.

4.4.6.5 HRG Survey Mid-Atlantic Seasonal Management Areas Right Whale Monitoring. The Lessee must ensure that between November 1 and April 30, vessel operators monitor NMFS North Atlantic Right Whale reporting systems (e.g., the Early Warning System, Sighting Advisory System, and Mandatory Ship Reporting System) for the presence of North Atlantic right whales during HRG survey operations.

4.4.6.6 Dynamic Management Area Shutdown Requirement. The Lessee must ensure that vessels cease HRG survey activities within 24 hours of NMFS establishing a DMA in the Lessee's HRG survey area. The Lessee may resume HRG survey activities in the affected area as soon as the DMA has expired.

4.4.6.7 Electromechanical Survey Equipment Ramp-Up. The Lessee must ensure that, when technically feasible, a ramp-up of the electromechanical survey equipment occurs at the start or re-start of HRG survey activities. A ramp-up must begin with the power of the smallest acoustic equipment for the HRG survey at its lowest power output. The power output must be gradually increased and other acoustic sources added in such a way that the source level would rise in steps not exceeding 6 dB per 5-minute period.

4.4.6.8 Shutdown for Non-Delphinoid Cetaceans and Sea Turtles. If a non-delphinoid cetacean or sea turtle is sighted at or within the exclusion zone, the Lessee must immediately shut down all the electromechanical survey equipment. The Lessee must ensure that the vessel operator immediately complies with such a call by the PSO. Any disagreement or discussion must occur only after shutdown. Subsequent restart of the electromechanical survey equipment must use the ramp-up provisions described in 4.4.6.7 and must only occur following clearance of the exclusion zone of all marine mammals and sea turtles for at least 60 minutes as described in 4.4.6.4.

4.4.6.9 Power Down for Delphinoid Cetaceans and Pinnipeds. If a delphinoid cetacean or pinniped is sighted at or within the exclusion zone, the Lessee must immediately power down the electromechanical survey equipment to the lowest power output that is technically feasible. The Lessee must ensure that the vessel operator immediately complies with such a call by the PSO. Any disagreement or discussion must occur only after power-down. Subsequent restart of the electromechanical survey equipment must use the ramp-up procedures described in 4.4.6.7 and may occur only after (1) the exclusion zone is clear of delphinoid cetaceans and pinnipeds or (2) a determination by the PSO after a minimum of 10 minutes of observation that the delphinoid cetacean and/or pinniped is approaching the vessel or towed equipment at a speed and vector that indicates voluntary approach to bow-ride or chase towed equipment.

4.4.6.9.1 Pauses in Electromechanical Survey Sound Source. If the electromechanical sound source shuts down for reasons other than encroachment into the exclusion zone by a non-delphinoid cetacean or sea turtle, including, reasons such as, but not limited to, mechanical or electronic failure, resulting in the cessation of the sound source for a period greater than 20 minutes, the Lessee must ensure that restart of the electromechanical survey equipment commences only after clearance of the exclusion zone, as described in 4.4.6.4, and the implementation of ramp-up procedures, as described in 4.4.6.7. If the shutdown is less than 20 minutes, the equipment may be restarted as soon as practicable at its operational level as long as visual surveys were continued diligently throughout the silent period and the exclusion zone remained clear of marine mammals and sea turtles. If visual surveys were not continued diligently during a shutdown of 20 minutes or less, the Lessee must clear the exclusion zone, as described in 4.4.6.4, and implement ramp-up procedures, as described in 4.4.6.7, prior to restarting the electromechanical survey equipment.

4.4.7 Geotechnical (Sub-bottom) Exploration. Stipulations specific to geotechnical exploration limited to borings and vibracores conducted in support of plan submittal are provided in 4.4.7.1 through 4.4.7.6.

4.4.7.1 Establishment of Default Exclusion Zone. The Lessee must ensure that a PSO monitors a 200-meter (656 ft) default exclusion zone for all marine mammals and sea turtles around any vessel conducting geotechnical surveys.

4.4.7.2 Modification of Default Exclusion Zone Per Lessee Request. If the Lessee wishes to modify the 200 meter (656 ft) default exclusion zone for specific geotechnical exploration equipment, the Lessee must submit a plan for verifying the sound source levels of the specific geotechnical exploration equipment to the Lessor. The plan must demonstrate how the field verification activities will comply with the requirements of 4.4.7.3. The Lessor may require that the Lessee modify the plan to address any comments the Lessor submits to the Lessee on the contents of the plan in a manner deemed satisfactory to the Lessor prior to the commencement of field verification activities. Any new exclusion zone radius proposed by the Lessee must be based on the largest safety zone configuration of the target Level A or Level B harassment sound-exposure thresholds as defined by NMFS. The Lessee must use this modified zone for all subsequent use of field-verified equipment. The Lessee may periodically reevaluate the modified zone using the field verification procedures described in 4.4.7.3. The Lessee must obtain Lessor approval of any new exclusion zone before it is implemented.

4.4.7.3 Field Verification of Geotechnical Exclusion Zone. If the Lessee wishes to modify the existing exclusion zone, the Lessee must submit the results of field verification to verify the exclusion zone for the specific geotechnical exploration equipment being used. If no applicable data are available, the Lessee must conduct field verification of the exclusion zone for the specific geotechnical exploration equipment being used. As part of such field verification, the Lessee must take acoustic measurements at a minimum of two reference locations and in a manner that is sufficient to establish the following: source level (Peak, SEL, and RMS sound levels at 1 meter), pattern of spreading loss, and the sound exposure distance for ear injury for each marine mammal hearing group, sea turtles, and fish. The distance to the 166, 160, and 150 dB RMS behavioral thresholds must also be reported. The first location must be at a distance of 200 m from the sound source and the second location must be as close to the sound source as technically feasible. The Lessee must take these sound measurements at the reference locations at two depths (i.e., a depth at mid-water and a depth at approximately 1 meter above the seafloor). The Lessee must use the results to establish a new exclusion zone, which may be greater than or less than the 200 meter (656 ft) default exclusion zone.

4.4.7.4 Clearance of Exclusion Zone. The Lessee must ensure that the geotechnical sound source is not activated until the PSO has reported the exclusion zone clear of all marine mammals and sea turtles for 60 minutes.

4.4.7.5 Shutdown for Non-Delphinoid Cetaceans and Sea Turtles. If any non-delphinoid cetaceans or sea turtles are sighted at or within the exclusion zone, the Lessee must immediately shut down the geotechnical survey equipment. The vessel operator must comply immediately with such a call by the PSO. Any disagreement or discussion must occur only after shutdown. Subsequent restart of the geotechnical survey equipment must only occur following clearance of the exclusion zone as described in 4.4.7.4.

4.4.7.6 Pauses in Geotechnical Survey Sound Source. If the geotechnical sound source shuts down for reasons other than encroachment into the exclusion zone by a non-delphinoid cetacean or sea turtle, including, but not limited to, mechanical or electronic failure resulting in the cessation of the sound source for a period greater than 20 minutes, the Lessee must ensure that restart of the geotechnical survey equipment commences only after clearance of the exclusion zone, as described in 4.4.7.4. If the shutdown is less than 20 minutes, the equipment may be restarted as soon as practicable as long the Lessee has continued visual surveys diligently throughout the silent period and the exclusion zone remained clear of marine mammals and sea turtles. If visual surveys were not continued diligently during a shutdown of 20 minutes or less, the Lessee must clear the exclusion zone, as described in 4.4.7.4, prior to restarting the geotechnical survey equipment.

4.5 Protected-Species Reporting Requirements

The Lessee must ensure compliance with the following reporting requirements for site characterization activities performed in support of plan submittal, and, where appropriate, must fulfill these requirements using the contact information provided as an Enclosure to this lease, or updated contact information as provided by the Lessor:

4.5.1 Field Verification of Exclusion Zone Preliminary Report for HRG Survey Equipment. The Lessee must report the results of field verification to verify the exclusion zone for the HRG survey equipment operating below 200 kHz to the Lessor and NMFS prior to using the HRG equipment during survey activities conducted in support of plan submittal. The Lessee must include in its report a preliminary interpretation of the results for all sound sources, which will include details of the operating frequencies, SPLs (measured in Peak, SEL, and RMS), the distance to the ear injury and behavior thresholds, frequency bands measured, as well as associated latitude/longitude positions, ranges, depths and bearings between sound sources and receivers.

4.5.2 Reporting Injured or Dead Protected Species. The Lessee must ensure that sightings of any injured or dead protected species (e.g., marine mammals, sea turtles or sturgeon) are reported to the Lessor, NMFS and the NMFS Greater Atlantic (Northeast) Region's Stranding Hotline (866-755-6622 or current) within 24 hours of sighting, regardless of whether the injury or death is caused by a vessel. In addition, if the injury or death was caused by a collision with a project-related vessel, the Lessee must notify the Lessor of the strike within 24 hours. The Lessee must use the form provided in Appendix A to ADDENDUM "C" to report the sighting or incident. If the Lessee's activity is responsible for the injury or death, the Lessee must ensure that the vessel assists in any salvage effort as requested by NMFS.

4.5.3 Reporting Observed Impacts to Protected Species.

4.5.3.1 The Lessee must report any observed takes (as defined in 1.13) of listed marine mammals, sea turtles or sturgeon resulting in injury or mortality within 24 hours to the Lessor and NMFS.

4.5.3.2 The Lessee must report any observations concerning any impacts on Endangered Species Act listed marine mammals, sea turtles or sturgeon to the Lessor and NMFS Northeast Region's Stranding Hotline within 48 hours.

4.5.3.3 The Lessee must record injuries or mortalities using the form provided in Appendix A to ADDENDUM "C".

4.5.4 Protected Species Observer Reports. The Lessee must ensure that the PSO record all observations of protected species using standard marine mammal PSO data collection protocols. The list of required data elements for these reports is provided in Appendix B to ADDENDUM "C".

4.5.5 Reports of G&G Survey Activities and Observations. The Lessee must provide the Lessor and NMFS with reports every 90 calendar days following the commencement of HRG and/or geotechnical exploration activities, and a final report at the conclusion of the HRG and/or geotechnical exploration activities. Each report must include a summary of survey activities, all PSO and incident reports (See Appendices A and B), and an estimate of the number of listed marine mammals and sea turtles observed and/or taken during these survey activities. The final report must contain a detailed analysis and interpretation of the sound source verification data, if such data was collected by the Lessee.

4.5.6 Field Verification Plan for HRG Survey Exclusion Zone. No later than 45 calendar days prior to the commencement of any required field verification activities, the Lessee must submit a plan for verifying the sound source levels of any electromechanical survey equipment operating at frequencies below 200 kHz. The plan must demonstrate how the field verification activities will comply with the requirements of 4.4.6.2. Prior to the commencement of the field verification activities, the Lessor may require the Lessee to modify the plan to address any comments the Lessor submits to the Lessee on the contents of the plan in a manner deemed satisfactory to the Lessor.

4.5.7 Marine Mammal Protection Act Authorization(s). If the Lessee is required to obtain an authorization pursuant to section 101(a)(5) of the Marine Mammal Protection Act prior to conducting survey activities in support of plan submittal, the Lessee must provide to the Lessor a copy of the authorization prior to commencing these activities.

4.6 Avian and Bat Survey and Reporting Requirements

4.6.1 Lighting Requirements. When conducting survey activities in support of plan submittal, the Lessee must use lighting only when necessary, and the lighting must be hooded downward and directed when possible, to reduce upward illumination and illumination of adjacent waters.

4.6.2 Annual Report. The Lessee must provide an annual report to the Lessor and U.S. Fish and Wildlife Service using the contact information provided as an Enclosure to this lease, or updated contact information as provided by the Lessor. This report must document any dead or injured birds or bats found during activities conducted in support of plan submittal. The first report must be submitted within 6 months of the start of the first survey conducted in support of plan submittal, and subsequent reports must be submitted annually thereafter until all surveys in support of plan submittal have concluded and all such birds and bats have been reported. If surveys are not conducted in a given year, the annual report may consist of a simple statement to that effect. The report must contain the following information: the name of species, date found, location, a picture to confirm species identity (if possible), and any other relevant information. In addition to the Annual Report, the Lessee must report carcasses with Federal or research bands to the U.S. Geological Society Bird Band Laboratory, within 30 calendar days, using the following website: https://www.pwrc.usgs.gov/bbl/, or updated contact information as provided by the Lessor.

APPENDIX B TO ADDENDUM "C"

Lease Number OCS-A 0512

REQUIRED DATA ELEMENTS FOR PROTECTED SPECIES OBSERVER REPORTS

The Lessee must ensure that the PSO record all observations of protected species using standard marine mammal observer data collection protocols. The list of required data elements for these reports is provided below:

1. Vessel name;
2. PSOs' names and affiliations;
3. Date;
4. Time and latitude/longitude when daily visual survey began;
5. Time and latitude/longitude when daily visual survey ended; and
6. Average environmental conditions during visual surveys including:
    a. Wind speed and direction;
    b. Sea state (glassy, slight, choppy, rough, or Beaufort scale);
    c. Swell (low, medium, high, or swell height in meters); and
    d. Overall visibility (poor, moderate, good).
7. Species (or identification to lowest possible taxonomic level);
8. Certainty of identification (sure, most likely, best guess);
9. Total number of animals;
10. Number of juveniles;
11. Description (as many distinguishing features as possible of each individual seen, including length, shape, color and pattern, scars or marks, shape and size of dorsal fin, shape of head, and blow characteristics);
12. Direction of animal's travel relative to the vessel (preferably accompanied by a drawing);
13. Behavior (as explicit and detailed as possible, noting any observed changes in behavior);
14. Activity of vessel when sighting occurred.

ADDENDUM "D"

PROJECT EASEMENT(S)

Lease Number OCS-A 0512

This section includes a description of the Project Easement(s), if any, associated with this lease, and the financial terms associated with any such Project Easement(s).

I. <u>Rent</u>

The Lessee must begin submitting rent payments for any project easement associated with this lease commencing on the date that BOEM approves the Construction and Operations Plan (COP) or modification of the COP describing the project easement. Annual rent for a project easement 200 feet wide, centered on the transmission cable, is $70.00 per statute mile. For any additional acreage required, the Lessee must also pay the greater of $5.00 per acre per year or $450.00 per year.

U.S. DEPARTMENT OF THE INTERIOR
BUREAU OF OCEAN ENERGY MANAGEMENT

ADDENDUM "E"

RENT SCHEDULE

Lease Number OCS-A 0512

This section includes a description of the schedule for rent payments that will be determined after the Construction and Operations Plan (COP) has been approved or approved with modifications.

Unless otherwise authorized by the Lessor in accordance with the applicable regulations in 30 CFR Part 585, the Lessee must make rent payments as described below.

MESSAGE FROM CHAIR OF THE BOARD

DEAR FELLOW INVESTOR,

2017 has been a good year for Statoil, both operationally and financially. We have seen significant positive impacts from the improvements, and have benefitted from an upturn in the oil and gas market. And we have delivered on the sharpened strategy we launched in February 2017.

The 2017 net operating income ended positive with USD 13.8 billion, up from close to zero in 2016. Statoil continues to deliver on the improvement ambitions, and demonstrates strong operational performance. A free cash flow[1] of USD 3.1 billion made Statoil cash-flow neutral well below 50 USD per barrel.

Strong safety performance is essential to Statoil's license to operate. The serious incident frequency for 2017 improved compared to 2016, however, it is key to remember that safety results must be delivered every day. The board of directors is working closely with the administration to ensure that forceful safety efforts and continued leadership focus are maintained.

We have seen a gradual rebalancing of the oil market and recovering prices. However, we should still be prepared for volatility. Key influencing factors are; geopolitical developments, OPEC policies, US shale response and the price impact of short-term trading activities. For the board of directors, it is essential that Statoil is a robust and resilient company, well equipped for different scenarios.

Statoil remains committed to competitive capital distribution. For the fourth quarter 2017 we propose to the annual general meeting (AGM) a dividend of 0.23 USD per share, an increase of 4.5%. This is in line with the dividend policy of increasing the dividend in line with long-term underlying earnings. In addition, Statoil has ended its two-year scrip programme as planned. We also see an emerging scope for share buy-backs, dependent on macro outlook and portfolio developments. However, the near-term priority is to strengthen the balance sheet.

Statoil has increased its production guiding while at the same time reducing capital expenditures. The improvements delivered over the last years have materially improved the financial position and competitiveness. This is reflected in operations and the next generation portfolio with a break-even price of 21 USD per barrel.

Statoil made 14 discoveries from 28 wells drilled in 2017, and have secured access to attractive new acreage, like in Argentina and Turkey, and strengthened the portfolio with acquisitions like Carcará North, Roncador in Brazil and Martin Linge in Norway.

Statoil is striving to further develop a distinct and competitive portfolio, driven by the strategy always safe, high value, low carbon. Statoil will leverage industrial strengths; operational excellence, world class recovery, leading project delivery, premium market access and digital leader, to develop long-term value on the Norwegian continental shelf, develop new growth options internationally and increase value creation in the marketing and midstream business.

The company continues to build a material industrial position in new energy solutions. Within offshore wind Statoil is competitive and well positioned. Statoil is now the operator of three offshore wind farms, and has also entered its first solar project through the acquisitions of a 43.75% share in the Apodi asset in Brazil.

Responding to the climate challenge and preparing Statoil for a low carbon future is an integrated part of the strategy. Concrete actions to reduce greenhouse gas emissions in the operations have been implemented, and we are taking further steps to gradually build a more carbon resilient portfolio.

The board of directors believes the company is well prepared to deal with the current market situation and has the competence, capacity and leadership capabilities necessary to create new business opportunities and long-term value for our shareholders.

After the closing of the year, the board has decided to recommend to the AGM to change the company name from Statoil to Equinor. Our strategy remains firm, and the change is a natural follow up of the strategic development from a focused oil and gas to a broad energy company. The board sees the new name as a continuation of the company's proud history, and a commitment to value creation also in a low carbon future.

I would like to thank all employees for their dedication and commitment to Statoil and our shareholders for their continued investment.

Jon Erik Reinhardsen
Chair of the board

CHIEF EXECUTIVE LETTER

DEAR FELLOW SHAREHOLDER,

As we have started a new year with new opportunities, it is useful to reflect briefly on the past. In 2017, we presented our strategy: always safe, high value, low carbon, and we set clear ambitions for the future. We have delivered above and beyond our ambitious targets, and Statoil is now a stronger, more resilient and more competitive company.

The safety of our people and integrity of our operations remains our top priority. Over the past decade we have steadily improved our safety results. Following some negative developments in 2016, we reinforced our efforts, and last year we again saw a positive development. For the year as a whole, our serious incident frequency came in at 0.6. We will use this as inspiration and continue our efforts. The "I am safety"-program, launched across the company is an important part of these efforts.

We must always be prepared for volatility in our markets. Our improvement work started when prices were still high, and we have used the downturn to reset the company. Today we are a much more robust and resilient company. We have taken down the break-even price of our next generation portfolio by more than 20% during last year to USD 21 per barrel.

Last year we said we would be cash flow positive at USD 50 per barrel in 2017. We did even better, and were cash flow positive well below USD 50. At an average Brent oil price of 54 per barrel, we generated USD 3.1 billion in free cash flow[2]. We tripled our adjusted earnings to USD 12.6 billion, and our net operating income was up from close to zero in 2016 to USD 13.8 billion last year. A negative net income in 2016 is turned to a positive result of USD 4.6 billion.

The organic capital expenditures ended at USD 9.4 billion[3], well below the USD 11 billion initially guided. The reduction is mainly due to solid improvements and continued strict capital discipline.

We continue to transform our cost base and value creation potential. With USD 1.3 billion in additional improvements in 2017, Statoil has realised annual efficiencies of USD 4.5 billion from 2013. In 2017 we also achieved a record high reserve replacement ratio (RRR) of 150% and all time high production. Looking forward the potential is solid towards 2020, with expected increase in annual production of 3-4%, strong cash generation and growing returns.

We have used the down-turn well, but the real test is taking place now, as prices are recovering. I have seen how easy it is for an organisation to start relaxing when prices recover. In Statoil we are determined and will not allow that to happen. We intend to reduce drilling costs further and sustain the 2017 unit of production costs in 2020.

In Statoil we believe the winners in the energy transition will be the producers which can deliver at low cost and with low carbon emissions. We also believe there are attractive business opportunities in the transition to a low-carbon economy.

Co2-emissions from our oil and gas production were reduced with an additional 10% per barrel last year. In the fall 2017 we started production from Dudgeon, and the floating windfarm Hywind. Today, we operate three offshore wind projects in the UK, delivering competitive returns. Statoil will continue its journey from a focused oil and gas to a broad energy company.

I believe Statoil is set to increase returns and grow our cash flow in the years to come. We are delivering on our strategy, investing in high-return opportunities, strengthening our balance sheet - and have increased the capital distribution. I look forward to further developing Statoil in 2018.

This year's AGM will mark a historic moment for us. The board of directors recommends changing the company name from Statoil to Equinor. "Equi" is the starting point for words like equal, equality and equilibrium. "Nor" is signalling a company proud of its origin.

The name says something important about us as a company. What we stand for, where we come from and how we see the future. How we see people - and how we view energy.

The strategy we presented last year remains firm. And we think the name has potential to strengthen our attractiveness with investors, partners and not the least the new generation of talents we need to realise our strategy and reach our ambitions.

Eldar Sætre
President and Chief Executive Officer
Statoil ASA

Statoil at a glance

Our history

Statoil was founded as Den Norske Stats Oljeselskap AS, the Norwegian State Oil company in 1972. Statoil became listed on the Oslo Børs (Norway) and New York Stock Exchange (US) in June 2001. Statoil merged with Hydro's oil and gas division in October 2007. Statoil is an international energy company present in more than 30 countries around the world, including several of the world's most important oil and gas provinces. Our headquarter is located in Stavanger, Norway and we have 20.245 employees worldwide. We create value through safe and efficient operations, innovative solutions and technology. Statoil's competitiveness is founded on our values-based performance culture, with a strong commitment to transparency, collaboration and continuous efficiency improvements.

The board of directors of Statoil have proposed to change the name of the company to Equinor. The new name supports the company's strategy and development as a broad energy company. The suggested name change will be proposed to the shareholders in a resolution to the annual general meeting on 15 May 2018.

Our vision

Our vision rests on three pillars: Competitive at all times, transforming the oil and gas industry and providing energy for a low-carbon future.

Our strategy

Statoil is an energy company committed to long-term value creation in a low carbon future. Statoil will develop and maximise the value of its unique Norwegian continental shelf position, its international oil and gas business and its growing new energy business; focusing on safety, cost and carbon efficiency. Statoil is a values-based company where empowered people collaborate to shape the future of energy.

Our values

Our values embody the spirit and energy of Statoil at its best. They help us set direction and they guide our decisions, actions and the way we interact with others. Our values express the ideals we strive to live up to every day. Statoil's values are: Open, Collaborative, Courageous and Caring.

Our activities

Statoil is engaged in exploration, development and production of oil and gas in addition to renewables. We are the leading operator on the Norwegian continental shelf and have substantial international activities. We sell crude oil and is a major supplier of natural gas. Processing, refining, offshore wind and carbon capture and storage is also part of our operations. Our activities are managed through eight business areas, staffs and support divisions and we have operations in both North and South America, Africa, Asia, Europe and Oceania, as well as in Norway.

Our shareholders

The Norwegian State is the largest shareholder in Statoil, with a direct ownership interest of 67%. Its ownership interest is managed by the Ministry of Petroleum and Energy. US investors hold 11%, Norwegian private owners hold 8%, other European investors hold 8%, UK investors hold 3% and others hold 2%.

Statoil announces dividends on a quarterly basis. It is Statoil's ambition to grow the annual cash dividend, measured in USD per share, in line with long-term underlying earnings.

ABOUT THE REPORT

This document constitutes the Statutory annual report in accordance with Norwegian requirements and the Annual report on Form 20-F in accordance with the US Securities and Exchange Act of 1934 applicable to foreign private issuers, for Statoil ASA for the year ended 31 December 2017. A cross reference to the Form 20-F requirements are set out in section 5.10 in this report. The Annual report on Form 20-F and other related documents are filed with the US Securities and Exchange Commission (the SEC). The Annual report and Form 20-F are filed with the Norwegian Register of company accounts.

This report presents the

- Director's report (pages 3-121 and 235-269)
- Consolidated Financial Statements of the Statoil group (pages 125-193)
- Parent company financial statements of Statoil ASA (pages 207-234) according to the Norwegian Accounting Act of 1998
- Board Statement on Corp. Governance according to The Norwegian Code of Practice for Corporate Governance (NUES) (pages 85-121)
- Declaration on remuneration for Statoil's corporate executive committee (pages 111-119)
- Payments to governments report (pages 252-268)

Financial reporting terms used in this report are in accordance with International Financial Reporting Standards (IFRS) as adopted by the European union (EU) and with IFRS as issued by the International Accounting Standards Board (IASB), effective at 31 December 2017. This document should be read in conjunction with the cautionary statement in section 5.7 Forward-looking statement.

Specific requirements for Norway

Section 4.3 Parent company financial statements (pages 207-234), section 5.4 Payments to governments (pages 252-268), chapter 3 Board Statement on Corporate Governance according to The Norwegian Code of Practice for Corporate Governance (NUES)(pages 85-121), section 5.5 Statements on this report comprising the statement of the directors' responsibilities (pages 268-269), the recommendation of the Corporate assembly (page 270), the independent auditor's report issued in accordance with law, regulations and auditing standards and practices generally accepted in Norway (pages 125-130) and the going concern assumption (page 58), do not form part of Statoil's Annual report on Form 20-F as filed with the SEC.

In addition, the following sections of this report do not form part of Statoil's Annual report on Form 20-F as filed with the SEC: this section About this report (which has been modified for the purpose of Statoil's Annual report on Form 20-F), Nomination and elections in Statoil (page 87), disclosures regarding deviation from the code in chapter 3, Introduction within section 3.1 Implementation and reporting (page 88), section 3.2 Business (page 90), section 3.3 Equity and dividends (pages 90-91), section 3.4 Equal treatment of shareholders and transactions with close associates (pages 91-92), section 3.5 Freely negotiable shares (page 92), as indicated in the second paragraph of section 3.12 Remuneration to the corporate executive committee, section 3.13 Information and communications (page 119) and section 3.14 Take-overs (page 119-120).

The Statoil Annual report and Form 20-F may be downloaded from Statoil's website at [Statoil.com/annualreport2017]. References to this document or other documents on Statoil's website are included as an aid to their location and are not incorporated by reference into this document. All SEC filings made available electronically by Statoil may be obtained from the SEC at 100 F Street, N.E., Washington D.CC. 20549, United States or on the SEC's website at www.sec.gov.

Strategic report

Johan Sverdrup

2.1 STRATEGY AND MARKET OVERVIEW

STATOIL'S BUSINESS ENVIRONMENT

Market overview

In 2017 the world economy delivered the highest growth rate of the past six years. The world's major economies are growing close to historical trends or above, and the emerging economies are recovering from their economic deceleration in 2016. The US economy is on a strong footing, with GDP growth estimated at 2.2% in 2017. Consumer spending, supported by higher employment, is the main driver of US growth. The Eurozone also showed robust growth estimated at 2.5%, thanks to private consumption and low inflation. In the UK, growth decelerated, with expected GDP growth at 1.8% due to uncertainty around the Brexit process. Chinese GDP growth has been reported at 6.9% in 2017, based on strong government policy stimulus, delivering an improvement in the growth rate for the first time since 2010. The Japanese economy performed relatively well, with an estimated growth rate of 1.8%, driven by a tight labour market, corporate earnings and a conducive external environment. As a notable exception, India at 6.5% growth, delivered below expectations as the economy had to adapt to the Goods and Services Tax and still felt the effects of demonetisation. Reduced inflationary pressure and appreciating currencies in Russia and Brazil have allowed central banks to cut interest rates, contributing to the countries' economic recovery.

Looking forward, a robust demand picture and solid economic fundamentals should allow the expansion to continue. Among the risks that might affect such growth are geopolitical events and a too-fast monetary policy tightening from the central banks in key economies.

Global oil demand grew by 1.5 mmbbl per day in 2017 and global supply grew by 0.4 mmbbl per day. Decreasing oil prices in the first half of the year triggered both Opec and non-Opec countries to collectively honour their commitments to cut production. This resulted in stock draws and facilitated a gradual rebalancing of the market.

Overall, quarterly average European gas prices are up year-on-year throughout 2017. The first half of 2017 saw a downward trend in gas prices. However, in the second half of 2017, markets strengthened with demand growth in Asia leaving less LNG availability to serve a tight European market.

Oil prices and refining margins

A decreasing oil price in the first half of 2017 was followed by a strong second half with prices moving in an upward trajectory, closing the year at USD 66.5 per barrel. Refinery margins had a solid year fueled by strong demand in most products.

Oil prices

As in the previous two years, high volatility characterised the oil market. The average price for dated Brent crude in 2017 was USD 54.2 per barrel, up USD 10.5 per barrel from 2016. A relatively flat oil price fluctuating around USD 55 per barrel in the first couple of months was followed by a period of high volatility. Lingering worries about oversupply combined with surging output in Libya and Nigeria created a bearish sentiment with dated Brent bottoming out at USD 45 per barrel in late June. However, higher-than-expected demand and moderating global supply during the second half of 2017 put upward pressure on the commodity price. By the end of the third quarter, the price had reached almost USD 57 per barrel. Renewed buying interest in China and falling global stock piles facilitated continued rebalancing of the market throughout the fourth quarter. The upward pressure on the dated Brent oil price was strengthened even further by rising global geopolitical uncertainty, pushing prices to a two-year high of USD 62 per barrel in the first half of November. The Opec meeting in late November concluded with an agreement to extend oil supply cuts throughout 2018, with an option to review the deal in June. This gave support to the oil price through the last month of the year. Dated Brent was USD 66.5 per barrel on 31 December 2017. The futures market for Brent at the International Exchange Rate (ICE) was in contango until September before it shifted to backwardation and remained so for the rest of the year.

Over the course of 2017, global geopolitical unrest has been on the rise and received more attention as the market has become tighter.

US shale oil production has increased throughout 2017 due to continued productivity gains and cost reductions. The US is now delivering about 5 mmbbl per day of shale oil, with the Permian and Eagle Ford shale oil basins accounting for about two-thirds of the volumes. US crude oil exporters started to move cargoes toward high-growth markets in Asia as they capitalised on the favorable price differential. Development of Gulf Coast export capacity and crude price differentials are key determinants for future export levels.

Refining margins

Refining margins in Europe were strong in 2017. The moderate stock build in the first quarter of the year was followed by large draws in the next quarter due to strong demand. On the light end side, gasoline margins saw a moderate increase through the first half of the year. High demand and strong prices for LPG, driven by changes in China's energy mix, made the petrochemical industry take more naphtha, leaving less of the feedstock for making gasoline, eventually pushing prices. Stock draws in the US and strong demand in Europe supported diesel margins. The major impact of hurricane Harvey caused refining margins to peak by the end of the third quarter. A stronger physical crude oil market towards the end of the year put downward pressure on margins.

Natural gas prices

The upward trend in gas prices seen in the second half of 2016 continued into the first quarter of 2017, before taking a dip in second quarter 2017. The fourth quarter of 2017 experienced a robust price recovery.

Gas prices - Europe

NBP prices hit a decade low of USD 3 per mmBtu in August 2016, and increased towards an average of USD 5.7 per mmBtu in fourth quarter 2016. The climb continued into January 2017, averaging USD 6.6 per mmBtu, before falling throughout first and second quarter 2017 to USD 4.5 per mmBtu in June. Pipeline supply from the Norwegian Continental Shelf and Russia were at record highs of 117 bcm and 194 bcm respectively in 2017. However, the North-West Europe gas market has since late September 2017 been driven by a bullish combination of continued French nuclear outages, rallying coal prices, low hydro levels in Southern Europe and lower LNG availability in the Atlantic basin. The market tightened further due to the Rough storage shut-in and the new Groningen output ceiling, closing 2017 at USD 7.8 per mmBtu and resulting in an annual average of USD 5.8 per mmBtu.

Gas prices - North America
The Henry Hub price remained stable throughout 2017, averaging USD 3 per mmBtu for the year. Prices peaked early in the year at USD 3.3 per mmBtu on seasonal uplift, before warmer weather weakened the market. Storage inventories have been consistently lower than levels last year, a main driver as to why prices are up year-on-year. The lack of a significant mid-year cooling related to demand peak left summer prices lower than normal and lower than the spring prices. In fourth quarter 2017, robust production growth has limited upside price risks and put a premium on winter heating loads as the market weighs new pipeline takeaway capacity slowly coming online in the Northeast.

Global LNG prices
LNG prices in Asia ended 2016 at USD 9 per mmBtu. From here, monthly prices fell throughout first quarter 2017 and stabilised at USD 5.5 per mmBtu in second quarter 2017. The second half of the year experienced robust price recovery to an average of USD 9.4 per mmBtu in fourth quarter 2017, resulting in an annual average of USD 7.1 per mmBtu. Despite new LNG supply from Australia and the US, a marked pick-up in consumption across Asia has affected the market. Increased coal-to-gas switching to curb air pollution was seen in China. In South Korea and Taiwan gas stepped in for reduced nuclear capacity.

Statoil's corporate strategy

Statoil is an energy company committed to long-term value creation in a low carbon future. Statoil will develop and maximise the value of its unique Norwegian continental shelf (NCS) position, its international oil and gas business and its growing new energy business, focusing on safety, value and carbon efficiency. Statoil is a values-based company where empowered people collaborate to shape the future of energy.

Statoil's top priority in 2017 continued to be to conduct safe, secure and reliable operations with zero harm to people and the environment.

In 2017 Statoil launched its sharpened strategy. Geopolitical shifts, challenges in liquids resource replenishments, market cyclicality, structural changes to costs and increasing momentum towards low carbon implies uncertainty and volatility. To be prepared, Statoil is focusing on building a more resilient, diverse and option-rich portfolio, delivered by an agile organisation that embraces change and empowers its people. To deliver on the sharpened strategy, "always safe, high value, low carbon", Statoil will continue to build opportunities to optimise its portfolio around the following portfolio areas:

- **Norwegian continental shelf** - Build on unique position to maximise and develop long-term value
- **International oil & gas** - Deepen core areas and develop growth options
- **New energy solutions** - Create a material new industrial position
- **Midstream and marketing** - Secure premium market access and grow value creation through cycles

The following strategic principles guide Statoil in actively shaping its future portfolio:

- **Cash generation capacity at all times** - Generating positive cash flows from operations, even at low oil and gas prices, in order to sustain dividend and investment capacity through the economic cycles
- **Capex flexibility** - Having sufficient flexibility in organic capital expenditure to be able to respond to market downturns and avoid value destructive measures
- **Capture value from cycles** - Ensuring the ability and capacity to act counter-cyclically to capture value through the cycles
- **Low-carbon advantage** - Maintaining competitive advantage as a leading company in carbon efficient oil and gas production, while building a low-carbon business to capture new opportunities in the energy transition

In order to deliver on the strategy, Statoil has identified four key strategic enablers that will continue to support the business's needs:

- **Safe and secure operations**
- **Technology, digitalisation and innovation**
- **Empowered people**
- **Stakeholder engagement**

Statoil has a target to implement CO2 emission reduction measures equivalent to 3 million tonnes annually from its emissions between 2017 and 2030 and continues to make progress towards this goal. A significant portfolio of projects and initiatives has been established through 2017 with variable maturity to accomplish the 2030 commitments. Further communication on this can be found in Statoil's 2017 Sustainability Report.

Norwegian continental shelf - Build on unique position to maximise and develop long-term value
For more than 40 years, Statoil has explored, developed and produced oil and gas from the NCS. Statoil aims to deepen and prolong its position by accessing and maturing opportunities into valuable production. At the same time, Statoil plans to improve the efficiency, reliability, carbon emissions and lifespan of fields already in production. The NCS represents approximately two thirds of Statoil's equity production at 1,334 mboe per day in 2017.

Exploration: Statoil continues to be a committed NCS explorer across mature, growth and frontier areas. In 2017, Statoil participated in 17 exploration wells on the NCS, resulting in 10 commercial discoveries. Statoil was awarded 31 licences in mature areas in Norway's Awards for Predefined Areas (APA) 2017 round (result announced January 2018), 17 as operator and 14 as a non-operating partner

Development: Statoil has submitted five plans for development and operation in 2017: Njord, Bauge and Trestakk in the Norwegian Sea, Johan Castberg in the Barents Sea and Snorre Expansion Project in the North Sea. Johan Sverdrup Phase 1 is proceeding as scheduled and the pre-sanction for Johan Sverdrup Phase 2 was approved by the partners in the first quarter of 2017. The Aasta Hansteen project continued as planned and the Oseberg H Unmanned Wellhead Platform was installed in 2017.

Production: Gina Krog came on-stream in 2017. Statoil opened the Valemon onshore control room, enabling remote control.

Statoil will take over operatorship and equity in the Martin Linge field and Garantiana discovery. Two Cat J rigs, Askeladden and Askepott, were delivered to Statoil ready for digitalised operations at Gullfaks and Oseberg.

International oil and gas – Deepen core areas and develop growth options

International oil and gas production represented approximately one third of Statoil's equity production at 745 mboe per day in 2017. Statoil will continue to explore, develop, and produce oil and gas opportunities outside Norway as part of deepening its international core areas, the US onshore operations and Brazil, and developing future growth options.

Exploration: Statoil continues to explore internationally for oil and gas. Statoil participated in 11 exploration wells internationally, four of which were discoveries. Statoil added exploration acreage in Brazil, South Africa, UK, Suriname and the US Gulf of Mexico and entered one new country, Argentina.

Development: Statoil continued to strengthen its strategic partnership with Petrobras in Brazil, continuing construction on Peregrino Phase II and improving the project economics. Offshore UK, Mariner A has been installed and is currently in the hook-up and commissioning phase.

Production: Alongside operator BP and other partners, Statoil has signed the agreement for a licence extension by 25 years until 2049 for Azeri-Chirag Guneshli (ACG) with the Azerbaijan government and SOCAR. Statoil and BP, with Sonatrach, also extended the In Amenas Production Sharing Contract (PSC) by five years, from 2022 to 2027.

Statoil completed its divestment from the Canadian oil sands.

In Brazil, a 25% share in the producing Roncador field was acquired. Statoil also strengthened its position in the BM-S-8 licence, which includes the Carcara discovery, by acquiring QGEP's interest and successfully bidding on the open acreage to the North, before farming down to ExxonMobil and Petrogal.

In the United States, Statoil continued to focus on increasing and sustaining the profitability of existing assets in the portfolio, which led to continued progress towards the targets of lowering its US portfolio net operating income break-even to below USD 50 per barrel and increasing production by 50% from 2014 to 2018.

New energy solutions – Create a material new industrial position

Statoil's ambition is to maintain its advantage as a leading company in carbon efficient oil and gas production while building a low-carbon business to capture new opportunities in the energy transition. Statoil continues to explore new business opportunities in offshore wind, solar, carbon capture and storage (CCS) as well as other potential new energy markets. Statoil expects 15-20% of its investments to be directed towards new energy solutions by 2030.

Develop opportunities: Progress continues on the Arkona offshore wind farm operated by partner E.On. Statoil continues to evaluate a potential Norwegian carbon and capture storage as well as the feasibility of natural gas-to-hydrogen projects. In the United States, Statoil continues to mature the New York Wind Energy Area lease as "Empire Wind".

Operate assets: In 2017, Statoil completed and opened the Dudgeon Offshore Wind Park. Hywind Scotland, the world's first floating wind farm, also started production.

Statoil completed a re-organisation of the Dogger Bank consortium Forewind in the UK, splitting ownership of three of the four projects 50/50 with partner SSE and with Innogy (RWE) taking sole ownership of the remaining project. In December Statoil submitted a bid in the non-subsidy Dutch offshore wind tender for Hollanse Kust Zuid I & II. Statoil also initiated its first move into solar by acquiring 50% of the ongoing Apodi solar project in Brazil from Scatec Solar.

Midstream and marketing – Secure premium market access and grow value creation through cycles

The prime objective for Statoil's mid- and downstream activities is to process and transport its oil and gas production (including the Norwegian State's petroleum) competitively to premium markets, securing maximum value realisation. The main focus has been on:

- Safe, secure and efficient operations
- Minimising carbon emissions and intensity
- Securing flow assurance and premium market access for Statoil's equity production and the State's Direct Financial Interest (SDFI) volumes
- Building and maintaining resilience through asset backed trading, value chain positioning and counter-cyclical actions
- Focus on regional piped gas value chains and pursue selective trading positions in LNG

In 2017, Statoil chartered the ultra-large crude carrier (ULCC) TI Europe as part of its asset backed trading strategy. Statoil decided to phase out the Mongstad combined heat and power by end 2018 and commissioned the Polarled pipeline. Statoil continued work towards integrating digital solutions into decision making, shipping activities, and energy trading.

Strategy enablers

Safe and secure operations: Safety and security is Statoil's top priority. In 2017, Statoil initiated and continued several measures to reinforce safety work in all areas including continuous co-operation with partners and suppliers. The primary efforts launched in 2017 were focused on safety (I am Safety), security (2020 Security Roadmap), and IT security (New Information Technology Strategy) and are described in the chapter "Safeguarding people, the environment and assets: Safety and security."

Technology, digitalisation and innovation: Statoil's technology strategy provides long-term guidance for technology development and implementation. In 2017, Statoil launched its digital roadmap and established its Digital Centre of Excellence and Digital Academy. Statoil, in partnership with Techstars, established an energy-focused accelerator in Oslo.

Empowered people: Statoil promotes a culture of collaboration, innovation and safety, guided by its values. Statoil has continued to develop its employees and attract talents to deliver on the future-fit portfolio ambition.

Stakeholder engagement: Statoil engages with stakeholders to secure industrial legitimacy, its social contract, trust and strategic support from stakeholders. This engagement extends to internal and external collaboration, partnerships, and other co-operation with suppliers, partners, governments, NGOs and communities in which Statoil operates.

GROUP OUTLOOK

Statoil's plans address the current business environment while continuing to invest in high-quality projects. Statoil continues to reiterate its efforts and commitment to deliver on its priorities of high value creation, increased efficiency and competitive shareholder return.

- Organic capital expenditures[4] for 2018 are estimated at around USD 11 billion
- Statoil intends to continue to mature its large portfolio of exploration assets and estimates a total exploration activity level of around USD 1.5 billion for 2018, excluding signature bonuses
- Statoil's ambition is to keep the unit of production cost in the top quartile of its peer group
- For the period 2017 - 2020, production growth is expected to be around 3-4% CAGR (Compound Annual Growth Rate)
- Production for 2018 is estimated to be 1-2% above the 2017 level
- Scheduled maintenance activity is estimated to reduce equity production by around 30 mboe per day for the full year of 2018

These forward-looking statements reflect current views about future events and are, by their nature, subject to significant risks and uncertainties because they relate to events and depend on circumstances that will occur in the future. Deferral of production to create future value, gas off-take, timing of new capacity coming on stream, operational regularity, activity level, development in the prices of goods, raw materials and services that are used in the development and operation of oil and gas producing assets, contractor performance, as well as uncertainty around the closing of the announced transactions represent the most significant risks related to the foregoing guidance. For further information, see section 5.7 Forward-Looking Statements.

[4] See section 5.2 for non-GAAP measures

2.2 BUSINESS OVERVIEW

HISTORY

On 18 September 1972, Statoil was formed by a decision of the Norwegian parliament and incorporated as a limited liability company under the name Den norske stats oljeselskap AS. Being a company owned 100% by the Norwegian State, Statoil's initial role was to be the government's commercial instrument in the development of the oil and gas industry in Norway. Growing in parallel with the Norwegian oil and gas industry, Statoil's operations have primarily been focused on exploration, development and production of oil and gas on the Norwegian continental shelf (NCS).

During the 1980s, Statoil grew substantially through the development of the NCS. Statoil also became a major player in the European gas market by entering into large sales contracts for the development and operation of gas transport systems and terminals. During the same decade, Statoil was involved in manufacturing and marketing in Scandinavia and established a comprehensive network of service stations. This line of business was fully divested in 2012.

In 2001, Statoil was listed on the Oslo and New York stock exchanges and became a public limited company under the name Statoil ASA, 67% majority owned by the Norwegian State. Since then, substantial investments both on the NCS and internationally, have grown our business. The merger with Hydro's oil and gas division on 1 October 2007 further strengthened Statoil's ability to fully realise the potential of the NCS. Enhanced utilisation of expertise to design and manage operations in various environments have expanded our upstream activities outside our traditional area of offshore production. This includes the development of heavy oil and shale gas projects and projects that focus on other forms of energy, especially on offshore wind, but also on solar and carbon capture and storage.

The board of directors of Statoil have proposed to change the name of the company to Equinor. The new name supports the company's strategy and development as a broad energy company. The suggested name change will be proposed to the shareholders in a resolution to the annual general meeting on 15 May 2018.

ACTIVITIES

Statoil is an international energy company primarily engaged in oil and gas exploration and production activities, organised under the laws of Norway and subject to the provisions of the Norwegian Public Limited Liability Companies Act. In addition to being the leading operator on the NCS, Statoil has also substantial international activities and is present in several of the most important oil and gas provinces in the world. Our activities span operations in more than 30 countries and employs 20,245 employees worldwide.

Our access to crude oil in the form of equity, governmental and third-party volumes makes Statoil a large seller of crude oil, and Statoil is the second-largest supplier of natural gas to the European market. Processing, refining, offshore wind and carbon capture and storage is also part of our operations.

Statoil's registered office is at Forusbeen 50, 4035 Stavanger, Norway and the telephone number of its registered office is +47 51 99 00 00.

OUR COMPETITIVE POSITION

Key factors affecting competition in the oil and gas industry are oil and gas supply and demand, exploration and production costs, global production levels, alternative fuels, and environmental and governmental regulations. When acquiring assets and licences for exploration, development and production and in refining, marketing and trading of crude oil, natural gas and related products, Statoil competes with other integrated oil and gas companies.

Statoil's ability to remain competitive will depend, among other things, on continuous focus on reducing costs and improving efficiency. It will also depend on technological innovation to maintain long-term growth in reserves and production, the ability to seize opportunities in new areas and utilise new opportunities for digitalisation.

The information about Statoil's competitive position in the strategic report is based on a number of sources; e.g. investment analyst reports, independent market studies, and our internal assessments of our market share based on publicly available information about the financial results and performance of market players.

Continuous improvements

Statoil focus on continuously efficiency improvements as a response to the industrial challenge that has emerged over the recent years characterised by reducing prices for our products and declining returns. More specifically, the ambition is to realise positive production effects and capital expenditures and operating costs savings to improve financial results and cash-flows. In 2017, Statoil realised efficiency improvements of USD 1.3 billion on top of the already achieved USD 3.2 billon since 2013.

Establishment of Digital Centre of Excellence

In 2017 Statoil accelerated the digitalisation efforts by establishing a Digital Centre of Excellence and launching a digital road map. The goal is to significantly increase our utilisation of data, sophisticated analytics and robotics. In addition, Statoil aims to improve safety, reduce our carbon footprint and increase profitability. Statoil see potential by utilising data across IT applications and organisational boundaries. Combining data and learning across Statoil's disciplines could provide a better basis for decision-making, new business opportunities, and increased collaboration externally with our partners, suppliers and other lines of business.

CORPORATE STRUCTURE

Business areas

Statoil's operations are managed through the following eight business areas:

Development & Production Norway (DPN)

DPN manages Statoil's upstream activities on the NCS and explores for and extracts crude oil, natural gas and natural gas liquids. The business area's ambition is to continue Statoil's leading position on the NCS and ensure maximum value creation through continuously improved HSE and operational performance.

Development & Production International (DPI)
DPI manages Statoil's worldwide upstream activities excluding the DPN and Development & Production USA (DPUSA) business areas. It explores for and extracts crude oil, natural gas and natural gas liquids. DPI's ambition is to build a large and profitable international production portfolio comprising activities ranging from accessing new opportunities to delivering on profitable projects in a range of complex environments.

Development & Production USA (DPUSA)
DPUSA manages Statoil's upstream activities in the USA and Mexico. DPUSA's ambition is to develop a material and profitable position in the US and Mexico, including the deep-water regions of the Gulf of Mexico and unconventional oil and gas in the US.

Marketing, Midstream & Processing (MMP)
MMP manages Statoil's marketing and trading activities related to oil products and natural gas, transportation, processing and manufacturing, and the development of oil and gas. MMP seeks to maximise value creation in Statoil's midstream and marketing business.

Technology, Projects & Drilling (TPD)
TPD is responsible for the global project portfolio, well delivery, new technologies and sourcing across Statoil. TPD seeks to provide safe and secure, efficient and cost-competitive global well and project delivery, technological excellence, and research and development. Cost-competitive procurement is an important contributory factor for maximising value for Statoil.

Exploration (EXP)
EXP manages Statoil's worldwide exploration activities with the aim of positioning Statoil as one of the leading global exploration companies. This is achieved through accessing high potential new acreage in priority basins, globally prioritising and drilling more significant wells in growth and frontier basins, delivering near-field exploration on the NCS and other select areas, and achieving step-change improvements in performance.

New Energy Solutions (NES)
NES reflects Statoil's long-term goal to complement our oil and gas portfolio with profitable renewable energy and other low-carbon energy solutions. NES is responsible for wind farms and carbon capture and storage as well as other renewable energy and low-carbon energy solutions.

Global Strategy & Business Development (GSB)
GSB develops the corporate strategy and manages business development and merger and acquisition activities for Statoil. The ambition of the GSB business area is to closely link corporate strategy, business development and merger and acquisition activities to actively drive Statoil's corporate development.

Reporting segments

With effect as of the third quarter 2017, segment names have been changed for the reporting segments DPN and DPI. New names are Exploration & Production Norway (E&P Norway) and Exploration & Production International (E&P International), respectively. There are no changes to other reporting segments, and business area's names remain unchanged.

Statoil reports its business in the following reporting segments:

- E&P Norway reporting segment – Exploration & Production Norway – the DPN business area
- E&P International reporting segment – Exploration & Production International, which combines the DPI and the DPUSA business areas
- MMP reporting segment - Marketing, Midstream & Processing – the MMP business area
- Other – which includes activities in NES, TPD, GSB and Corporate and support functions

Activities relating to the EXP business area are fully allocated to - and presented in - the relevant exploration and production reporting segment. Activities relating to the TPD and GSB business areas are partly allocated to - and presented in - the relevant exploration and production reporting segments.

Presentation

In the following sections in the report, the operations are reported according to the reporting segment. Underlying activities or business clusters are presented according to how the reporting segment organises its operations. See note 3 Segments to the Consolidated financial statements for further details.

As required by the SEC, Statoil prepares its disclosures about oil and gas reserves and certain other supplementary oil and gas disclosures based on geographic areas. Statoil's geographical areas are defined by country and continent and consist of Norway, Eurasia excluding Norway, Africa, US and Americas excluding US.

SEGMENT REPORTING

Internal transactions in oil and gas volumes occur between our reporting segments before being sold in the market. The pricing policy for internal transfers is based on estimated market prices. For further information, see section 2.8 Operational performance under Production volumes and prices.

We eliminate intercompany sales when combining the results of reporting segments. Intercompany sales include transactions recorded in connection with our oil and natural gas production in the E&P Norway and the E&P International reporting segments, and also in connection with the sale, transportation or refining of our oil and natural gas production in the MMP reporting segment. Certain types of transportation costs are reported in both the MMP and the DPUSA business areas.

The DPN business area produces oil and natural gas which is sold internally to the MMP business area. A large share of the oil produced by the DPI and DPUSA business areas is also sold through the MMP business area. The remaining oil and gas from the DPI and the DPUSA business areas is sold directly in the market. For intercompany sales and purchases, Statoil has established a market-based transfer pricing methodology for the oil and natural gas that meets the requirements for applicable laws and regulations.

In 2017, the average transfer price for natural gas was USD 4.33 per mmbtu. The average transfer price was USD 3.42 per mmbtu in 2016 and USD 5.17 in 2015. For oil sold from DPN to MMP, the transfer price is the applicable market-reflective price minus a cost recovery rate.

The following table shows certain financial information for the four reporting segments, including intercompany eliminations for each of the years in the three-year period ending 31 December 2017. For additional information, see note 3 Segments to the Consolidated financial statements.

Segment performance (in USD million)	For the year ended 31 December 2017	2016	2015
Exploration & Production Norway			
Total revenues and other income	**17,692**	13,077	17,339
Net operating income/(loss)	**10,485**	4,451	7,161
Non-current segment assets[1]	**30,278**	27,816	27,706
Exploration & Production International			
Total revenues and other income	**9,256**	6,657	8,200
Net operating income/(loss)	**1,341**	(4,352)	(8,729)
Non-current segment assets[1]	**36,453**	36,181	37,475
Marketing, Midstream & Processing			
Total revenues and other income	**59,071**	44,979	58,106
Net operating income/(loss)	**2,243**	623	2,931
Non-current segment assets[1]	**5,137**	4,450	5,588
Other			
Total revenues and other income	**87**	39	354
Net operating income/(loss)	**(239)**	(423)	(129)
Non-current segment assets[1]	**390**	352	690
Eliminations[2]			
Total revenues and other income	**(24,919)**	(18,880)	(24,357)
Net operating income/(loss)	**(59)**	(219)	133
Non-current segment assets[1]	-	-	-
Statoil group			
Total revenues and other income	**61,187**	45,873	59,642
Net operating income/(loss)	**13,771**	80	1,366
Non-current segment assets[1]	**72,258**	68,799	71,458

1) Deferred tax assets, pension assets and non-current financial assets are not allocated to segments.

2) Includes elimination of inter-segment sales and related unrealised profits, mainly from the sale of crude oil and products. Inter-segment revenues are based upon estimated market prices.

The following tables show total revenues by country.

2017 Total revenues and other income by country (in USD million)	Crude oil	Natural gas	Natural gal liquids	Refined products	Other	Total sales
Norway	23,087	9,741	4,948	6,463	1,026	45,264

RESEARCH AND DEVELOPMENT

Statoil is a technology-intensive company and research and development is an integral part of our strategy. Our technology strategy is about prioritising technology for value creation that enables us to achieve growth and access, and sets the direction for technology development and implementation for the future. Our focus is on low cost, low carbon solutions and re-using standardised technologies.

We continuously research, develop and deploy innovative technologies to create opportunities and enhance the value of Statoil's current and future assets. Statoil's technology development activities aim to reduce field development, drilling and operating costs, and CO_2 and other greenhouse gas emissions. We utilise a range of tools for the development of new technologies:

- In-house research and development
- Cooperation with academia and research institutes
- Collaborative development projects with our major suppliers
- Project related development as part of our field development activities
- Direct investment in technology start-up companies through our Statoil Technology Invest venture activities
- Invitation to open innovation challenges as part of Statoil Innovate

Research and development expenditures were USD 307 million in 2017, USD 298 million in 2016 and USD 344 million in 2015,

2.3 E&P NORWAY
- EXPLORATION & PRODUCTION NORWAY

OVERVIEW

The Exploration & Production Norway (E&P Norway) reporting segment is responsible for exploration, field development and operations on the NCS which includes the North Sea, the Norwegian Sea and the Barents Sea. E&P Norway aims to ensure safe and efficient operations and to maximise the value potential from the NCS. For proved reserves development see Development of reserves in Proved oil and gas reserves in section 2.8 Operational performance.

For 2017, E&P Norway reports NCS production from 38 Statoil operated fields, 10 partner operated fields, and equity accounted production from Lundin Petroleum AB.

Key events and portfolio developments in 2017:

- In March, the decision was made to proceed with the **Johan Sverdrup phase 2** development, awarding FEED contracts. Investment decision and submission of Plan for Development and Operation is expected in the second half of 2018
- On 26 March, the **Flyndre** field came on stream with Maersk Oil UK Ltd as operator
- On 27 March, Statoil submitted the revised Plan for Development and Operation for the **Njord** field, and Plan for Development and Operation for the **Bauge** field. Both submitted plans were subsequently approved on 20 June 2017
- On 15 April, the Norwegian authorities approved the Plan for Development and Operation of the **Trestakk** discovery on the Halten Bank in the Norwegian Sea
- On 30 June, the **Gina Krog** field went on stream
- On 1 July, Statoil assumed operatorship of the **Sigyn** field in the North Sea
- In July, Statoil and partners decided to develop the **Snefrid Nord** gas discovery. The field will be tied back to Aasta Hansteen
- On 28 July, the **Byrding** field came on stream
- In September, Statoil achieved **NCS climate target** two years ahead of schedule
- In October, Barents drilling campaign concludes with the **Kayak** find of commercial size
- In November, opening of the **Valemon** control room, the first platform in Statoil's portfolio remotely-controlled from land
- On 27 November, Statoil announced the decision to buy Total's equity stakes and to assume the operatorships of the **Martin Linge** field and the **Garantiana** discovery. The transactions are expected to be finalised in late March 2018
- On 5 December, Statoil submitted the Plan for Development and Operation for the **Johan Castberg** field in the Barents Sea
- In December, **Cat J rigs** Askeladden and Askepott preparing arrival at the Gullfaks and Oseberg fields. Drilling is expected to start in early 2018
- On 21 December, Statoil submitted the Plan for Development and Operation of the **Snorre Expansion** project, increasing the recovery from the Snorre field by close to 200 million barrels

Fields in production on the NCS

The table below shows E&P Norway's average daily entitlement production for the years ending 31 December 2017, 2016 and 2015. Production in 2017 increased due to higher flex gas off-take, contributions from new fields and fewer turnarounds.

Average daily entitlement production	For the year ended 31 December								
	2017			2016			2015		
	Oil and NGL	Natural gas		Oil and NGL	Natural gas		Oil and NGL	Natural gas	
Area production	mbbl/day	mmcm/day	mboe/day	mbbl/day	mmcm/day	mboe/day	mbbl/day	mmcm/day	mboe/day
Statoil operated fields	505	100	1,136	511	86	1,049	545	88	1,100
Partner operated fields	70	17	179	70	17	177	50	13	132
Equity accounted production	19	-	19	8	-	8	-	-	-
Total	594	118	1,334	589	103	1,235	595	101	1,232

The following tables show the NCS entitlement production by fields in which Statoil was participating during the year ended 31 December 2017.

Average daily entitlement production Field	Geographical area	Statoil's equity interest in %	On stream	Licence expiry date	Average production in 2017 mboe/day
Statoil operated fields					
Troll Phase 1 (Gas)	The North Sea	30.58	1996	2030	200

11) PL212/262 expires in 2033 and PL159 expires in 2029.
12) PL001B, PL457BS and PL242 expire in 2036. PL 338BS expire in 2029.

MAIN PRODUCING FIELDS ON THE NCS

Statoil operated fields

Troll is the largest gas field on the NCS and a major oil field. The Troll field regions are connected to the Troll A, B and C platforms. Troll gas is mainly exported and produced at Troll A, while oil is mainly produced at Troll B and C. Fram, Fram H Nord and Byrding are tie-ins to Troll C.

The **Oseberg** area includes the Oseberg Field Centre, Oseberg C, Oseberg East and Oseberg South production platforms. Oil and gas from the satellites are transported to the Oseberg Field Centre for processing and transportation.

Gullfaks was developed with three platforms. Since production started on Gullfaks in 1986, several satellite fields have been developed with subsea wells that are remotely controlled from the Gullfaks A and C platforms.

The **Åsgard** field includes the Åsgard A production and storage ship for oil, the Åsgard B semi-submersible floating production platform for gas and condensate, and the Åsgard C storage vessel for oil and condensate. Åsgard C is also storage for oil produced at Kristin and Tyrihans. In 2015 Statoil started the world first subsea gas compressor train on Åsgard, and the second train was started in February 2016. Mikkel and Morvin are tie-ins to Åsgard. The Trestakk development will be a tie-in to Åsgard A with production start planned for 2019.

Visund is an oil and gas field that includes a floating drilling, production and living quarter unit and two subsea templates.

Kvitebjørn is a gas and condensate field developed with an integrated accommodation, drilling and processing facility with a steel jacket.

Partner-operated fields

Ormen Lange operated by A/S Norske Shell, is a deepwater gas field in the Norwegian Sea. The well stream is transported to an onshore processing and export plant at Nyhamna. Gassco AS became operator of Nyhamna JV from 1 October 2017, with Shell as technical service provider.

Skarv is an oil and gas field located in the Norwegian Sea, with Aker BP ASA as operator. The field development includes a floating production, storage and offloading vessel (FPSO) and five subsea multi-well installations.

Ivar Aasen is operated by Aker BP ASA. It is an oil and gas field located in the North Sea. The development includes a fixed steel jacket with partial processing and living quarters tied in as a satellite to Edvard Grieg for further processing and export.

Goliat is operated by Eni Norge AS. It is the first oil field developed in the Barents Sea. The field consists of subsea wells tied back to a circular floating production, storage and offloading vessel (FPSO). The oil is offloaded to shuttle tankers.

Ekofisk is operated by ConocoPhillips Skandinavia AS. It consists of the Ekofisk, Tor, Eldfisk and Embla fields.

Marulk is operated by Eni Norge AS. It is a gas- and condensate field developed as a tie-back to the Norne FPSO.

Exploration on the NCS

Statoil holds exploration acreage and actively explores for new resources in all three regions on the NCS, the Norwegian Sea, the North Sea and the Barents Sea.

Statoil was awarded 31 licences (17 as operator) in the **Awards for Predefined Areas (APA) round 2017** for mature areas and completed several farm-in transactions with other companies.

Throughout 2017, as part of the industry initiative **Barents Sea Exploration Collaboration** (BaSEC), Statoil and its partners have drilled 6 wells in the Barents Sea and are planning to continue drilling wells in the area also in 2018.

In 2017 Statoil and its partners completed 17 exploratory wells and made 10 commercial and 3 non-commercial discoveries in Norway. In 2018 Statoil expects to complete 25-30 exploration wells on the NCS, with exploration near existing infrastructure to be the core of the activity plan.

	Exploratory wells drilled[1]		
	2017	2016	2015

Statoil operated	5	2	5
Partner operated	0	0	1
Barents Sea			
Statoil operated	5	0	0
Partner operated	1	1	1
Total (gross)	**17**	**14**	**21**

1) Wells completed during the year, including appraisals of earlier discoveries.

Fields under development on the NCS

Statoil's major development projects on the NCS as of 31 December 2017:

Oseberg Vestflanken 2 (Statoil 49.3%, operator) is the development of the oil and gas structures Alfa, Gamma and Kappa. The well stream will be routed to the Oseberg field centre through a new pipeline. The discoveries will be developed using an unmanned wellhead platform. Production is expected to start in mid-2018.

Aasta Hansteen (Statoil 51%, operator) is a deep-water gas discovery in the Norwegian Sea. The field development includes three subsea templates tied in to a floating processing unit with gas export through a new pipeline, Polarled, to Nyhamna and further export through the Langeled pipeline. The Aasta Hansteen processing unit can also serve as a hub for other potential discoveries in the area. On 11 November 2017, the drilling of the first well of the **Aasta Hansteen** field development commenced. The topside and substructure were integrated in December 2017 in Norway. Production is expected to start in second half of 2018.

Johan Sverdrup (Statoil 40.03%, operator, with additional 4.54% indirect interest held through Lundin) is an oil discovery in the North Sea. Phase 1 of the development will consist of 35 production and water injection wells and a field centre with four platforms: A living quarter platform, a wellhead platform with permanent drilling facility, a processing platform and a riser and utility platform. Crude oil will be exported to Mongstad through a 274 km designated pipeline, and gas will be exported to the gas processing facility at Kårstø through a 156 km pipeline via a subsea connection to the Statpipe pipeline. As at the end of 2017, eight production wells and nine water injection wells have been drilled. Production is expected to start late fourth quarter 2019.

Utgard (Statoil 38.44% interest in the Norwegian and 38% in the UK sector, operator) is a gas and condensate discovery in the North Sea. The development includes two wells in a standard subsea concept, with one drilling target on each side of the UK-Norwegian maritime border. Gas and condensate will be piped through a new pipeline to the Sleipner field for processing and further transportation to market. **In** January 2017, the Plan for Development and Operation and the field development plan were approved by the Norwegian and UK authorities. Production is expected to start in fourth quarter 2019.

Trestakk (Statoil 59.1%, operator) is an oil discovery with associated gas on Haltenbanken. It will be developed as a subsea tie-back to Åsgard A, comprising one subsea template and one satellite with three producers and two injectors. In March 2017, the Plan for Development and Operation was approved by the Norwegian authorities. Production is expected to start in 2019.

Martin Linge (Statoil 19%, and upon consummation of the acquisition from Total, 70%) is an oil and gas field operated by Total, near the British sector of the North Sea. The reservoir is complex with gas under high pressure and high temperatures. In late November 2017, Statoil and Total announced that Statoil will purchase Total's interest (51%) and assume the operatorship of Martin Linge, with an effective date, upon consummation, of January 1, 2018. The transaction is subject to certain conditions and is expected to close in late March 2018. The development includes a fixed steel jacket platform with processing and export facilities, with electric power to be supplied from Kollsnes. Total, the current operator, expects production to start in 2019.

Njord future (Statoil 20%, operator) is a development to enable safe, reliable and efficient exploitation of the Njord and Hyme oil discoveries through to 2040. The development comprises an upgrade of the Njord A platform, an optimal oil export solution and drilling of 10 new wells. The Plan for Development and Operation was approved on 20 June 2017. Production is expected to start in late 2020.

Snorre expansion (Statoil 33.28%, operator) is a development to produce the remaining commercial oil reserves on the Snorre field. The Plan for Development and Operation of the field was submitted to the Norwegian authorities on 21 December 2017. The concept consists of six subsea templates, with four well slots each. Each slot will have the possibility for either production or injection. 24 wells will be drilled, 12 production wells and 12 injection wells. Production is expected to start in 2021.

Johan Castberg (Statoil 50%, operator) is the development of the three oil discoveries Skrugard, Havis and Drivis, located some 140 kilometres northwest of Hammerfest. The development includes a production vessel and a subsea development with 30 wells, ten subsea templates and two satellite structures. The Plan for Development and Operation of the field was submitted to the Norwegian authorities on 5 December 2017. Production is expected to start in 2022.

Decommissioning on the NCS

Under the Petroleum Act, the Norwegian government has imposed strict procedures for removal and disposal of offshore oil and gas installations. The Convention for the Protection of the Marine Environment of the Northeast Atlantic (OSPAR) stipulates similar procedures.

Huldra ceased production in September 2014, after 13 years in production. The permanent plugging and abandonment of wells was finalised in 2017, and removal of platform is planned for in 2019.

Volve ceased production in September 2016, after more than eight years in production. The permanent plugging of wells was finalised during 2016, and the removal of subsea facilities is expected to be completed in 2018.

During 2017, there were permanent plugging and abandonment operations at **Statfjord, Heidrun, Veslefrikk, Troll, Åsgard, Njord, Visund, Skuld** and **Tune**. The partner-operated fields **Ekofisk and Ormen Lange** also had ongoing plugging and abandonment activities.

For further information about decommissioning, see note 2 Significant accounting policies to the Consolidated financial statements.

2.4 E&P INTERNATIONAL – EXPLORATION & PRODUCTION INTERNATIONAL

E&P International overview

Statoil is present in several of the most important oil and gas provinces in the world. Exploration & Production International (E&P International) reporting segment covers development and production of oil and gas outside the Norwegian continental shelf (NCS).

E&P International is present in nearly 30 countries and had production in 12 countries in 2017. E&P International produced 36% of Statoil's total equity production of oil and gas in 2017. For information about proved reserves development see section 2.8 Operational performance under Proved oil and gas reserves.

The map shows the countries where E&P International has activity.

Key events and portfolio developments in 2017 and early 2018:

- In January 2017, the plan for development and operation for the **Utgard** field was approved by the Norwegian and UK authorities. The Utgard field spans the UK-Norway maritime border. For more information, see Fields under development on the NCS in section 2.3 E&P Norway
- In February, the **In Amenas Gas Compression project** in Algeria came into operation
- On 31 January, the transaction to divest Statoil's 100% owned **Kai Kos Dehseh (KKD)** oil sands projects in the Canadian province of Alberta to Athabasca Oil Corporation (AOC) was completed. The transaction covers the producing Leismer asset and the undeveloped Corner project, along with a number of contracts associated with Leismer's production. Following this transaction, Statoil no longer owns or operates any oil sands assets. As part of the transaction, Statoil will own just below 20% of AOC's shares, and this will be managed as a financial investment. For more information about the transaction see note 4 Acquisitions and divestments to the Consolidated financial statements
- In March, Statoil was awarded 13 leases in US Gulf of Mexico
- In March, Statoil was awarded six new licences, five as operator, in the 29th Offshore Licensing Round in UK
- In April, Statoil acquired an additional 14% working interest in existing Statoil-operated unconventional onshore assets in the **Appalachian** region from Northwood Energy Corporation.
- In April, the **Vito** (Statoil 37%, Shell operator) offshore discovery received approval for its concept development and selection
- In May, the **Stampede** (Statoil 25%, Hess operator) asset's offshore platform was successfully installed; and subsea work was completed and all three wells were ready at year end 2017. Production commenced with first oil in January 2018.
- In June, Statoil signed a swap agreement with BP regarding exploration permits in the Great Australian Bight and became operator and 100% equity interest holder in exploration permits **EPP39** and **EPP40** while Statoils equity interest in **EPP37** and **EPP38** were transferred to BP

- In July, Statoil and Queiroz Galvão Exploração e Produção (QGEP) signed an agreement for Statoil to acquire QGEP's 10% interest in the Statoil operated **BM-S-8** licence in Brazil, thereby increasing Statoil's interest in the licence to 76%. The transaction was completed in December. For more information about the transaction see note 4 Acquisitions and divestments to the Consolidated financial statements
- In September, Statoil completed transactions in South Africa for exploration rights, one with ExxonMobil Exploration and Production South Africa acquiring an interest in **Transkei Algoa** and one with OK Energy Ltd. to acquire interest and operatorship in **East Algoa**.
- In October, Statoil, as part of a consortium with ExxonMobil and Galp, presented the winning bid for the **Carcará North** block in the Santos basin in Brazil. The award closed in December 2017. Statoil is the operator and has 40% interest.
  In addition, Statoil, ExxonMobil and Galp have agreed on subsequent transactions in the adjacent BM-S-8 block to align equity interests across the two blocks that together comprise the Carcará oil discovery. Upon consummation and subject to government approval, Statoil will have a 36.5% interest in BM-S-8 and a 40% interest in Carcará North and will be the operator of the unitised Carcará field development. For more information about the transactions see note 4 Acquisitions and divestments to the Consolidated financial statements
- Statoil and the international partners in the **ACG** licence (Azeri-Chirag-Gunashli fields) in Azerbaijan have secured an extension of oil production of 25 years from 2024 under an extended and amended PSA, which was ratified by the Azeri Parliament on 31 October. As part of the agreement, Statoil's interest in the field has been adjusted from 8.56% to 7.27%, effective from 1 January 2017
- On 27 November, the **Hebron** oil field (Statoil 9%, ExxonMobil operator) offshore Canada started production
- In December, Statoil and Petrobras signed an agreement that Statoil will acquire a 25% interest in **Roncador**, a producing oil field in the Campos Basin in Brazil. Petrobras retains operatorship and a 75% interest. The field produced around 280 mboe per day in 2017. The effective date for the Roncador transaction is 1 January 2018. Closing is subject to government approval. For more information about the transactions see note 4 Acquisitions and divestments to the Consolidated financial statements
- In December, Statoil and the other partners BP and Sonatrach in the **In Amenas** licence in Algeria secured a licence extension of 5 years from 2022 through an amended and restated Production Sharing Agreement (PSA). Closing is subject to government approval

INTERNATIONAL PRODUCTION

Entitlement production volumes are Statoil's share of the volumes distributed to the partners according to production sharing agreement (PSA) (see section 5.6 Terms and abbreviations). For US assets entitlement production is expressed net of royalty interests. For all other countries royalties paid in-cash are included in entitlement production and royalties payable in-kind are excluded. Equity production represent volumes that correspond to Statoil's percentage ownership in a particular field and is larger than Statoil's entitlement production if the field is governed by a PSA.

Statoil's equity production outside Norway was 36% of Statoil's total equity production of oil and gas in 2017. Statoil's entitlement production outside Norway was about 31% of Statoil's total entitlement production in 2017.

The following table shows E&P International's average daily entitlement production of liquids and natural gas for the years ending 31 December 2017, 2016 and 2015.

Average daily entitlement production	For the year ended 31 December								
	2017			2016			2015		
Production area	Oil and NGL mboe/day	Natural gas mmcm/day	mboe/day	Oil and NGL mboe/day	Natural gas mmcm/day	mboe/day	Oil and NGL mboe/day	Natural gas mmcm/day	mboe/day

Equity accounted production						
Petrocedeño[7)]	Venezuela	9.67	Petrocedeño	2008	2033	4.9
Total E&P International including share of equity accounted production						745.3

1) Statoil's actual equity interest can vary depending on wells and area.
2) Appalachian basin contains Marcellus and Utica formations.
3) Held by Production (HBP): A company's right to own and operate an oil and gas lease is perpetuated beyond its original primary term, as long thereafter as oil and gas is produced in paying quantities. In the case of Canada, in addition to continuing to be in production, other regulatory requirements must be met.
4) Statoil's equity interests are 5.0% in Hibernia and 9.26% in Hibernia South Extension. Effective 1 May 2017, Statoil's interest in Hibernia South Extension increased from 9.03% to 9.26% due to an equity reset trigger defined in the joint operating agreement.
5) Licence expiry varies by field.
6) As of 1 November 2017, Statoil's share of ACG equity production has been adjusted from 8.56% to 7.27% due to ratified licence extension.
7) As of 30 June 2017, the 9.67% ownership share in the heavy oil project Petrocedeño in Venezuela was reclassified from an equity accounted investment to a non-current financial investment. Statoil has as of this date stopped including production and reserves from Petrocedeño in financial reporting. Petrocedeño project (former Sincor project) was established in 2008. Sincor project started production in 2001.

PUBLIC COPY - CONFIDENTIAL INFORMATION REMOVED

Americas

USA

Statoil has had strong growth in production and continues to optimise its portfolio within US shale, through acreage acquisition and divestments, since entering the first play in 2008. DPUSA contributed with 14% of Statoil's equity production in 2017.

Statoil entered the **Marcellus** shale gas play, located in the **Appalachian** region in north east US, in 2008 through a partnership with Chesapeake Energy Corporation. In 2012, Statoil became an operator in the Marcellus, through the purchase of additional acreage in the states of West Virginia and Ohio. In 2016, Statoil divested its operated assets in West Virginia. During 2017, Statoil has continued to develop its operatorship in the Appalachian basin assets in Ohio. Within the operated acreage in this basin, Statoil is developing two formations: **Marcellus** and **Utica**, with special focus on the latter. In addition, on April 2017, Statoil acquired an interest in existing Statoil operated assets in the Appalachian from Northwood Energy Corporation. Statoil's net acreage position in Appalachian at the end of 2017 was around 255,000 net acres.

Statoil entered the **Bakken** tight oil play through the acquisition of Brigham Exploration Company in December 2011. Statoil's net acreage position in **Bakken** and **Three Forks** shale formations at the end of 2017 was around 235,000 net acres. Statoil has a total working interest of approximately 70% in Bakken and is the asset's operator.

Statoil entered the **Eagle Ford** shale formation located in southwest Texas in 2010. In 2013, Statoil became operator for 50% of the Eagle Ford acreage. As part of a global transaction in December 2015 with Repsol, Statoil increased its working interest and became operator of all of the assets in the Eagle Ford Shale. As a result, Statoil has a total working interest of 63%. Our joint venture partner, Repsol, continues to hold 37% working interest. Statoil's net acreage position in Eagle Ford at the end of 2017 was around 70,000 net acres.

US gathering system

Statoil's participates in gathering and facilities for initial processing of oil and gas in the **Bakken**, **Eagle Ford** and **Appalachian Basin** assets in the US. This includes crude and natural gas gathering systems, fresh water supply systems, salt water gathering and disposal wells, oil and gas treatment and processing facilities to provide flow assurance for Statoil's upstream production. Midstream assets in Bakken are owned and operated 100% by Statoil. In Eagle Ford, Statoil is the operator for 100% of the midstream assets outside of the Oak, Karnes, DeWitt and Bee (KDB) area with a working interest of 63%. In the KDB area of Eagle Ford, Statoil has an ownership interest of 25.2% in Edwards Lime Gathering LLC, which is operated by Energy Transfer Partners L.P. For Appalachian Basin, Statoil has operated assets in Appalachian Basin South in Monroe Country Ohio to gather Marcellus production, while Utica production is gathered by Eureka Hunter, a third party. In the Appalachian Basin non-operated areas both in the North and South, Statoil's working interest ranges from 16.25% to 32.5% depending on gathering system and number of JV partners which include Williams Energy and Alta Gas.

In January 2016, the responsibility for the US gathering system was transferred from MMP to E&P International.

Statoil is, also, positioned in the US **Gulf of Mexico** for the following offshore developments:

The **Tahiti** oil field is located in the Green Canyon area and is produced through a floating spar facility. As of 31 December 2017, there were twelve production wells in operation, and additional wells will be phased in over time to fully develop the field.

The **Caesar Tonga** oil field is located in the Green Canyon area. As of 31 December 2017, there were seven producing wells tied back to the Anadarko-operated Constitution spar host, and additional production wells will be phased in over time.

The **Jack** and **St. Malo** oil fields are located in the Walker Ridge area. The fields are subsea tie-backs to the Chevron operated Walker Ridge Regional Host facility. As of 31 December 2017, there were five wells producing on Jack and eight wells producing for St. Malo. Additional production wells will be phased in over time.

The **Julia** oil field is located in the Walker Ridge area of the US Gulf of Mexico near Jack and St Malo. First oil was in April 2016 and four wells are currently online. Additional production wells may be drilled based on reservoir performance.

The **Heidelberg** oil field is located in the Green Canyon area and is produced through a floating spar facility. As of 31 December 2017, there were five producing wells in operation.

In addition to these fields, on December 2016, Statoil became operator of the **Titan** offshore platform, at the request of the U.S Bureau of Safety and Environmental Enforcement (BSEE), following the bankruptcy of Bennu Oil & Gas. In addition to the platform itself, Statoil also purchased the export pipelines with capacity to Shell's Mars system (oil) and William's Discovery Gas system (gas). Production has been shut in since November 2016; however, plans are currently in place to have the Titan platform re-instate production in 2018. Prior to being shut in, Titan was producing approximately 3,000 boepd from three nearby fields: Telemark (AT63), in which Statoil holds no interest; and Mirage (MC941) and Morgus (MC942), both of which Statoil now has operating rights and holds record title. Acquiring the platform and assets allows Statoil to effectively manage its abandonment obligations and capture value.

Canada

Statoil has interests in the Jeanne d'Arc Basin offshore the province of Newfoundland and Labrador in the partner operated producing oil fields **Terra Nova**, **Hebron**, **Hibernia** and **Hibernia Southern Extension**.

The **Hebron** field started production in November 2017. The Hebron field consists of a fixed gravity base structure (GBS) with drilling capabilities and storage for oil. Oil is off-loaded to shuttle tankers.

In January 2017, Statoil completed the transaction to fully divest to Athabasca Oil Corporation the assets and 123,200 net acres of oil sands leases in Alberta which form the **Kai Kos Dehseh** project.

Brazil

The **Peregrino** field is a heavy oil field located in the Campos Basin, about 85 kilometres off the coast of Rio de Janeiro. The oil is produced from two wellhead platforms with drilling capability and it is processed on the Peregrino FPSO and offloaded to shuttle tankers. Statoil holds a 60% ownership interest in the field and is operator.

Africa

Angola

The deep water **blocks 17, 15 and 31** contributed with 36% of Statoil's equity liquid production outside Norway in 2017. Each block is governed by a PSA which sets out the rights and obligations of the participants, including mechanisms for sharing of the production with the Angolan state oil company Sonangol.

Block 17 has production from four FPSOs; CLOV, Dalia, Girassol and Pazflor.

Block 15 has production from four FPSOs: Kizomba A, Kizomba B, Kizomba C-Mondo, and Kizomba C-Saxi Batuque.

Block 31 has production from the PSVM FPSO.

The FPSOs serve as production hubs and each receives oil from more than one field and a large number of wells. In 2017, new wells were added and set into production on blocks 15 and 17.

Nigeria

Statoil has a 20.2% interest in the **Agbami** deep water field which is located 110 km off the coast of the Central Niger Delta region. The field is developed with subsea wells connected to an FPSO. The Agbami field straddles the two licences OML 127 and OML 128 and is operated by Chevron under a Unit Agreement. Statoil has 53.85% interest in OML 128.

For information related to the Agbami redetermination process and the dispute between the Nigerian National Petroleum Corporation and the partners in Oil Mining Lease (OML) 128 concerning certain terms of the OML 128 Production Sharing Contract (PSC), see note 23 Other commitments, contingent liabilities and contingent assets to the Consolidated financial statements.

Algeria

The **In Salah** onshore gas development is a joint operatorship between Sonatrach, BP and Statoil. The Northern fields have been operating since 2004. The **Southern fields project**, which has been led by Statoil, started production from two fields (Garet el Befinat and Hassi Moumene) in March 2016. The remaining two fields (Gour Mahmoud and In Salah) started production in July and November 2017, respectively). The Southern fields are tied back into the Northern fields' existing facilities.

The **In Amenas** onshore development is a gas development which contains significant liquid volumes. The In Amenas infrastructure includes a gas processing plant with three trains. The production facility is connected to the Sonatrach distribution system. The facilities are operated through a joint operatorship between Sonatrach, BP and Statoil. The **In Amenas Gas Compression project**, which was led by BP, came into operation in February 2017. The compressors have made it possible to increase production and thereby utilise the capacity of all three trains.
In December, Statoil and the rest of the In Amenas partners secured a licence extension of 5 years beyond 2022. Extension is subject to government approval.

Separate PSAs including mechanisms for revenue sharing, govern the rights and obligations of the Parties and establish joint operatorships between Sonatrach, BP and Statoil for In Salah and In Amenas.

Eurasia

Production consists mainly of the output from the **Azeri-Chirag-Gunashli (ACG)** oil field in the Caspian Sea, the **Corrib** gas field off Ireland's northwest coast, and the **Kharyaga** oil field onshore in the Timan Pechora basin in north-west Russia.

The ACG licence has in 2017 been extended until the end of 2049 through an amended and restated PSA. The ACG New Platform project is an additional production platform in the ACG contract area and work is ongoing to optimise the chosen concept.

INTERNATIONAL EXPLORATION

Statoil reduced exploration drilling activity outside Norway in 2017 and prioritised new access efforts and prospect maturation to support an increased drilling activity in 2018 and onwards.

Brazil is one of Statoil's core exploration areas. In 2017 Statoil has strengthened its position in the Carcará oil discovery through portfolio transactions and through the second pre-salt offshore licensing round.

In 2017 Statoil has established a position onshore in **Argentina** in the Neuquén Basin through joint exploration venture with YPF regarding the Bajo del Toro block and through 5th bidding round for Bajo del Toro Este block.

In **South-Africa** in 2017 Statoil acquired participating interests in two additional offshore frontier blocks, including one operatorship through a transaction with ExxonMobil Exploration and Production South Africa.

Statoil was awarded 13 leases in US **Gulf of Mexico** in 2017 and is strengthening its position in the area.

In 2017 Statoil has signed agreements to enter two additional offshore exploration licences, Block 59 and 60, in the Guyana basin in **Suriname**. This is in line with our global exploration strategy of accessing early in basins with high exploration potential.

Statoil was awarded six licences, five as operator and one as partner, in the 29th Offshore Licensing Round on **the UK continental shelf**. These awards are a result of a strategic decision by Statoil to explore in prolific but mature basins. Statoil has drilled four exploration wells in the UK in 2017, resulting in one commercial discovery on Verbier.

After fulfilling the study period work program, Statoil has closed its office in Yangon in **Myanmar** and relinquished the AD-10 licence, as it now assesses the potential for commercially viable discovery to be low.

Including the four exploration wells drilled and one commercial discovery in the UK in 2017 Statoil and its partners completed 11 exploratory wells and made a total of four commercial discoveries internationally. In 2018 Statoil's international exploration drilling activity will comprise growth opportunities in basins where Statoil already is established with discoveries and producing fields in Brazil, Turkey and the UK, as well as new frontier opportunities such as

Argentina. Statoil expects to complete 8 to 10 exploration wells internationally in 2018.

1) Wells completed during the year, including appraisals of earlier discoveries.

FIELDS UNDER DEVELOPMENT INTERNATIONALLY

This section covers all the sanctioned projects.

Americas

USA

The **Stampede** oil field (Statoil 25%, Hess operator) is located in the Green Canyon area of the Gulf of Mexico. The development includes a tension-leg platform (TLP) with downhole gas lift and water injection from start of production. In May, the offshore platform was successfully installed. The preparations for start-up of production progressed: subsea work was completed and all three wells were ready at year end 2017. Production commenced with first oil in January 2018

TVEX (Statoil 25%, Chevron operator) is an extension to Tahiti field, targeting shallower reservoirs above the existing main Tahiti reservoir, which is located in the Green Canyon area of the Gulf of Mexico. Start of production is expected in the fourth quarter of 2018.

The **Big Foot** oil field (Statoil 27.5%, Chevron operator) is located in Walker Ridge area of the Gulf of Mexico. The development includes a dry tree TLP with a drilling rig. The **Big Foot** project's offshore installation was completed on March 2018. First oil estimated date is during the second half of 2018.

US Onshore operations use hydraulic fracturing to recover resources. Despite reduction in investment and activity level in recent years in shale plays **Bakken**, **Eagle Ford** and **Appalachian Basin (Marcellus** and **Utica)**, production growth continues. The increase in onshore production is mainly attributed to higher recovery per well due to enhanced completion and improved operational efficiency.

Brazil

Peregrino phase II (Statoil 60%, operator) includes the Peregrino South and Southwest discoveries. The development consists of one wellhead platform tied back to the existing floating production, storage and offloading vessel. Project execution started in April 2016. In September 2016, the plan for development was formally approved by the Brazilian national agency of petroleum, natural gas and biofuels (ANP). Production is expected to start in late 2020.

Eurasia

United Kingdom

Mariner (Statoil 65.11%, operator) is a heavy oil development in the UK. The field development includes a production, drilling and living quarter platform based on a steel jacket. Oil will be exported by offshore loading from a floating storage unit. The development includes a possible future subsea tie-in of Mariner East, a small heavy oil discovery. Mariner topsides were successfully installed in August 2017, and offshore hook-up and commissioning is currently ongoing. Production from Mariner is expected to start in second half of 2018.

DISCOVERIES WITH POTENTIAL DEVELOPMENT

This section covers selected pre-sanction projects.

Americas

USA

The **Vito** project (Statoil 37%, Shell operator) is a light weight semi-submersible platform with a single eight-well subsea manifold, in the Mississippi Canyon area of the Gulf of Mexico. The deep wells (32,000 feet) will have down hole gas lift to assist the production. Production is estimated to start by the end of the second quarter of 2021. In April 2017, its concept development and selection was approved.

Canada

Statoil has made oil discoveries in the Flemish Pass offshore Newfoundland comprising the **Bay du Nord** project (Statoil 65%, operator), and work is ongoing to assess options for developing Bay du Nord.

Brazil

Statoil is operator with 35% equity interest in **licence BM-C-33** in the Campos basin. We are evaluating options for developing the discoveries in the licence.

The pre-salt oil discovery **Carcará** straddles block BM-S-8 and the Carcara North block in the Santos basis. In 2017 Statoil obtained a 40% interest in Carcara North and Statoil has 76% interest in BM-S-8. Statoil has announced agreements to reduce its interest in BM-S-8 to 36.5% and Statoil will be the operator of both Carcara North and BM-S-8 for a unitised field development. Closing of these transactions and unitization of the field is subject to government approval. This, together with the announced agreement with Petrobras to acquire 25% in the producing oil field **Roncador** in the Campos basin, will strengthen our position in Brazil, one of Statoil's core areas due to its large resource base and excellent fit with our technology and capabilities.

Africa

Tanzania

Statoil has made several large gas discoveries in **Block 2** (Statoil 65%, operator) offshore Tanzania during 2012-2015. The licence is located in the Indian Ocean 100 km off the southern part of

Tanzania. Work is ongoing to assess options for developing the discoveries, including the construction of an onshore LNG plant jointly with the co-venturers in Blocks 1 and 4 which are operated by Shell Tanzania.

Eurasia

Russia

In September 2017, Rosneft and Statoil signed the shareholders and operating agreement (SOA) for the **North Komsomolskoye** project. The parties will establish a Russian limited joint venture company where Statoil will own 33.33%. North Komsomolskoye is a conventional, but complex viscous oil field located onshore Western Siberia in Russia. Statoil and Rosneft have agreed to start test production in North Komsomolskoye with the aim to better understand the reservoir and lay the ground for a potential future full field development decision. For information about risks related to our activity in Russia see section 2.11 Risk review under Risks related to our business.

2.5 MMP - MARKETING, MIDSTREAM & PROCESSING

MMP overview

The Marketing, Midstream & Processing (MMP) reporting segment is responsible for marketing, trading, processing and transporting of crude oil and condensate, natural gas, NGL and refined products, including operation of Statoil operated refineries, terminals and processing plants. In addition, MMP is responsible for power and emissions trading and for developing transportation solutions for natural gas, liquids and crude oil from Statoil assets including pipelines, shipping, trucking and rail. The business activities within MMP are organised in the following business clusters: Marketing and Trading, Asset Management and Processing and Manufacturing.

MMP handles Statoil's and the Norwegian state's direct financial interest (SDFI) equity production of crude oil and NGL, and third-party volumes. This represents approximately 50% of all Norwegian liquids exports. MMP is also responsible for marketing Statoil's and SDFI's gas together with third-party gas. This represents approximately 70% of all Norwegian gas exports. See the Norwegian state's participation and SDFI oil and gas marketing and sale in Applicable laws and regulations in section 2.7 Corporate.

Key events in 2017:

- The export of Statoil piped gas was record high at 41.0 bcm
- Decision to phase out combined heat and power plant at Mongstad was made in February
- Statoil awarded long-term contracts for two offshore loading shuttle tankers and two LPG carriers. The fuel efficiency features built into these vessels will reduce operational costs and climate emissions
- Polarled pipeline was commissioned in May and will transport gas from the NCS to the Nyhamna gas processing plant, which has been upgraded to process and export the new volumes

Marketing and trading of gas and LNG

Statoil's gas marketing and trading business is conducted from Norway and from offices in Belgium, the UK, Germany, the USA and Singapore.

Europe

The major export markets for gas from the NCS are Germany, France, the UK, Belgium, the Netherlands, Italy and Spain. LNG from the Snøhvit field, combined with third party LNG cargoes, allow Statoil to reach global gas markets. The majority of gas is sold to counterparties through bilateral sales agreements and the remaining volumes are sold over the trading desk through all the main European trading hubs. The bilateral sales are mainly carried out with large industrial customers, power producers and local distribution companies. A few of Statoil's long-term gas contracts contain contractual price review mechanisms that can be triggered by the buyer or seller as regulated by the contracts. For the ongoing price-reviews, Statoil provides in its financial statements for probable liabilities based on Statoil's best judgement. For further information, see Note 23 to the Consolidated financial statements.

Statoil is active on both physical and exchange markets such as the Intercontinental Exchange (ICE). Statoil expects to continue to optimise the market value of gas volumes through a mix of bilateral contracts and trading via its production and transportation systems and downstream assets.

USA

Statoil Natural Gas LLC (SNG), a wholly-owned subsidiary, has a gas marketing and trading organisation in Stamford, Connecticut that markets natural gas to local distribution companies, industrial customers and power generators. SNG also markets equity production volumes from the Gulf of Mexico, Eagle Ford and the Appalachian Basin and transports some of the Appalachian production to New York City and to Niagara, providing access to the greater Toronto area.

In addition, SNG has long-term capacity contracts at the Cove Point LNG re-gasification terminal, that enables sourcing of LNG from the Snøhvit LNG facility in Norway. Due to low gas prices in the US compared to global LNG prices over the last years, almost all of Statoil's LNG cargoes have been diverted away from the US and delivered into higher priced markets in Europe, South-America and Asia.

Marketing and trading of liquids

MMP is responsible for the sale of Statoil's and the SDFI's crude oil and NGL, in addition to commercial optimisation of the refineries and terminals. The liquids marketing and trading business is conducted from Norway, the UK, Singapore, the US and Canada. The main crude oil market for Statoil is northwest Europe.

MMP also markets equity volumes from E&P International assets located in Canada, the US, Brazil, Angola, Nigeria, Algeria, Azerbaijan and the UK, as well as third party volumes. Value is maximised through marketing, physical and financial trading and through optimisation of own and leased capacity such as refineries, processing, terminals, storages, pipelines, railcars and vessels.

Manufacturing

Statoil owns and is operator of the Mongstad refinery in Norway including the Mongstad Heat and Power Plant (MHPP). The refinery is a medium sized refinery built in 1975, with a crude oil and condensate distillation capacity of 226,000 barrels per day. The refinery is directly linked to offshore fields through two crude oil pipelines, to the crude oil terminal at Sture and the gas processing plant at Kollsnes through an NGL/condensate pipeline, and to Kollsnes by a gas pipeline. MHPP produces heat and power from gas received from Kollsnes and from the refinery. It has capacity of approximately 280 megawatts of electric power and 350 megawatts of process heat. Following termination of the existing gas agreement between the Troll licence and Statoil Refining Norway AS, the normal operation of the power plant will be phased out.

Statoil has an ownership interest of 34% in Vestprosess, which transports and processes NGL and condensate. The Vestprosess pipeline connects the Kollsnes and Sture plants to Mongstad. Operatorship of Vestprosess is transferred to Gassco 1 January 2018, with Statoil as technical service provider.

Statoil owns and is operator of the Kalundborg refinery in Denmark, which has a crude oil and condensate distillation capacity of

108,000 barrels per day. The refinery is connected via one gasoline and one gas oil pipeline to the terminal at Hedehusene near Copenhagen, and most of its products are sold locally.

Statoil has an ownership interest of 82% in the methanol plant at Tjeldbergodden. It receives natural gas from the Norwegian Sea through the Haltenpipe pipeline. In addition, Statoil holds a 50.9% ownership interest in the air separation unit Tjeldbergodden Luftgassfabrikk DA.

The following table shows operating statistics for the plants at Mongstad, Kalundborg and Tjeldbergodden.

	Throughput[1)]			Distillation capacity[2)]			On stream factor %[3)]			Utilisation rate %[4)]		
Refinery	2017	2016	2015	2017	2016	2015	2017	2016	2015	2017	2016	2015
Mongstad	12.1	9.8	11.9	9.3	9.3	9.3	97.5	94.4	97.6	94.7	93.9	93.4
Kalundborg	5.5	5.0	5.2	5.4	5.4	5.4	99.7	98.0	98.5	90.4	91.0	91.0
Tjeldbergodden	0.94	0.76	0.92	0.95	0.95	0.95	99.4	94.8	98.5	99.4	94.8	98.5

1) Actual throughput of crude oils, condensates, NGL, feed and blendstock, measured in million tonnes.
Throughput may be higher than distillation capacity for plants because volumes of fuel oil, NGL, kero, naphta, gasoil and bio-diesel additive may not go through the crude-/condensate distillation unit.

2) Nominal crude oil and condensate distillation capacity, and methanol production capacity, measured in million tonnes.

3) Composite reliability factor for all processing units, excluding turnarounds.

4) Composite utilisation rate for all processing units, based on throughput and capacity.

Terminals and storage

Statoil has a 65% ownership interest in Mongstad crude oil terminal. Crude oil is landed at Mongstad through pipelines from the NCS and by crude tankers from the market. The Mongstad terminal has a storage capacity of 9.4 million barrels of crude oil.

The Sture crude oil terminal receives crude oil through pipelines from the North Sea. The terminal is part of the Oseberg Transportation System (Statoil interest 36.2%). The processing facilities at Sture stabilise Oseberg crude oil and recover LPG mix (propane and butane) and naphtha.

Statoil operates the South Riding Point Terminal, which is located on Grand Bahamas Island and consists of two shipping berths and ten storage tanks, with a storage capacity of 6.75 million barrels of crude oil. The terminal has facilities to blend crude oils, including heavy oils. The South Riding Point terminal was hit by Hurricane Matthew in 2016 with extensive damage to the Sea Island and the offshore berth unloading/loading facility. The reconstruction work is expected to be finalised in 2018.

Statoil UK holds one third share of the interests in the Aldbrough Gas Storage in UK, which is operated by SSE Hornsea Ltd.

Statoil Deutschland Storage GmbH holds a 23.7% stake in the Etzel Gas Lager in the northern part of Germany which has a total of 19 caverns and secures regularity for gas deliveries from the NCS.

Statoil UK holds a 27.3% stake in the Teesside terminal, which stabilises unstable oil from the Ekofisk area and several other Norwegian and UK fields and recovers NGL.

Pipelines

Statoil is a significant shipper in the NCS gas pipeline system. Most gas pipelines on the NCS that are accessed by third-party customers are owned by a single joint venture, Gassled, with regulated third-party access. The Gassled system is operated by the independent system operator Gassco AS, which is wholly owned by the Norwegian state. Statoil's current ownership share in Gassled is 5%. See Gas sales and transportation from the NCS in section 2.7 Corporate for further information.

Statoil is the technical service provider (TSP) for the Kårstø and Kollsnes gas processing plants in accordance with the technical service agreement between Statoil and Gassco AS, included as Exhibit 4(a)(i) to Form 20-F. Statoil also performs the TSP role for the majority of the Gassco operated gas pipeline infrastructure.

In addition, MMP manages Statoil's ownership in the following pipelines in the Norwegian gas transportation system: Oseberg oil transportation system, Grane oil pipeline, Kvitebjørn oil pipeline, Troll oil pipeline I and II, Edvard Grieg oil pipeline, Utsira High gas pipeline, Valemon rich gas pipeline and the Haltenpipe, Norpipe and Mongstad gas pipeline.

Statoil holds 30.1% interest in the Nyhamna gas processing plant in Aukra via the recently established Nyhamna Joint Venture. The venture is operated by Gassco.

The Polarled pipeline connects fields in the Norwegian Sea with the Nyhamna gas processing plant. Transportation through the pipeline will commence at Aasta Hansteen production start. Statoil transferred the operatorship for the Polarled pipeline to Gassco on 1 May 2017.

The Johan Sverdrup oil and gas export pipelines are under construction and will provide export from the Johan Sverdrup field.

2.6 OTHER GROUP

The Other reporting segment includes activities in New Energy Solutions (NES), Global Strategy & Business Development (GSB), Technology, Projects & Drilling (TPD) and corporate staffs and support functions.

New Energy Solutions (NES)

The NES business area reflects Statoil's aspirations to gradually complement its oil and gas portfolio with profitable renewable energy and other low-carbon energy solutions. Offshore wind, solar and carbon capture and storage have been key strategic focus areas in 2017.

As per end of 2017, Statoil's share of the offshore wind production capacity is around 290 megawatt (MW) in production and around 190 MW under development.

Key events in 2017:

- Construction completed with full capacity for wind production from **Dudgeon wind farm** and **Hywind Scotland** during fourth quarter of 2017.
- Increased UK presence through increasing ownership in the **Dogger Bank** offshore wind projects.
- Assumed role as operator for the **Sheringham Shoal wind farm** in April 2017.
- Acquired 43.75% of the Apodi solar asset in Brazil, operated by Scatec. The acquisition was made through a 40% share from Scatec Solar and 3.75% from ApodiPar. The Apodi solar project started construction during fourth quarter of 2017.
- Awarded the role as operator of the **Carbon capture and storage** project for the FEED study. Partners Shell and Total have 33.33% each.
- The existing 5-year agreement for the **Technology Centre Mongstad** for testing of different CO_2 capture technologies expired in August 2017. Statoil, Total, Shell and Gassnova (Norwegian State-owned entity) have agreed to continue operations for three years. Statoil's equity share has been reduced from 20% to 7.5% (in line with other industrial partners).

The **Sheringham Shoal offshore wind farm** (Statoil 40%, operator) located off the coast of Norfolk, UK, was formally opened in September 2012. The wind farm is in full production with 88 turbines and an installed capacity of 317 MW. The wind farm's annual production is approximately 1.1 terawatt hours (TWh) and it has the capacity to provide power to approximately 220,000 households. Statoil took over the role as operator of Sheringham Shoal from the second quarter of 2017.

The **Dudgeon offshore wind farm** (Statoil 35%, operator) is located in the Greater Wash area off the English east coast, a short distance from Sheringham Shoal. A final investment decision for the 402 MW project was made in July 2014 and the project was inaugurated in November 2017. The wind farm is expected to produce 1.7 TWh yearly from 67 turbines, with the capacity to provide power for around 410,000 households.

Dudgeon Offshore Wind.
Photo: Ole Jørgen Bratland

The **Dogger Bank area** has a total consented capacity of 4.8 GW and is potentially the largest offshore wind farm development in the world. In February and August 2015, the consortium received consent from the UK authorities for four projects, each with a capacity of 1200 MW. Statoil and Statkraft, together with RWE and SSE, were partners in the Forewind consortium, each with a 25% equity stake. The consortium has gone through a major reorganisation during 2017. Statoil and SSE bought Statkraft's shares in March 2017 and a project split followed in August 2017, Innogy (RWE) now owns Project 3 (Teesside B) 100%, and Statoil and SSE have entered into a shareholders' agreement for Projects 1, 2 and 4 with a 50/50 ownership of the Creyke Beck A and B, and Teesside A projects.

The **Arkona offshore wind farm** (Statoil 50%, operated by e.on) is being developed in the German part of the Baltic Sea, and the operations and maintenance base will be located in Sassnitz on the island of Rügen. A final investment decision for the up to 385 MW project was made in April 2016. During 2017 the installation of the substructures was completed, and Arkona is expected to be in full operation in 2019. The wind farm is expected to provide power to approximately 400,000 German households from 60 turbines.

The **Hywind Scotland pilot wind park** (Statoil 75%, operator) is a floating wind pilot park using the Hywind concept, developed and owned by Statoil. The project is located at Buchan Deep, approximately 25 km off Peterhead on the east coast of Scotland. Statoil completed the project during 2017 and has installed 5

Siemens 6 MW turbines. Production is expected to be 0.14 TWh/year, powering around 20,000 households. This is the next step in Statoil's strategy towards deployment of the first utility large scale floating wind farms.

Statoil was the winner of the **New York Wind energy area lease**, following the December 2016 BOEM lease sale, with a winning bid of USD 42.5 million. The lease is 321 km^2, large enough to support one or more offshore wind developments with a total capacity of more than 1 GW. The lease is located approximately 20 km directly south of Long Island. The project has been named "Empire Wind" and is being further matured towards a plan for development during 2018.

Since 1996, Statoil has proven experience in **carbon capture and storage** (CCS) and has continued to develop competence through research engagement at Technology Centre Mongstad, the world's largest facility for testing and improving CO_2 capture. In addition, our offshore oil and gas operations at Sleipner and Snøhvit represent two of the world's largest CCS units. Statoil will seek to deploy its competence and experience in other CCS projects, both to reduce carbon dioxide emissions and to drive new opportunities, including enhanced oil recovery (EOR) possibilities and carbon neutral value chains based on hydrogen. Statoil has, on behalf of the Norwegian Ministry of Petroleum and Energy, performed a feasibility study for establishing a CO_2 storage facility in the Norwegian Sea. In 2017 the Ministry of Petroleum and Energy awarded Statoil the lead role to assess a full CCS value chain project covering both storage and transportation from three industrial sources in Norway. Statoil, Shell and Total are partners in the project with equal shares of one-third each.

In February 2016, Statoil launched the **Statoil Energy ventures fund**, a new energy investment fund dedicated to investing in attractive and ambitious growth companies in low carbon energy, supporting Statoil's strategy of growth in new energy solutions. The Statoil Energy Ventures Fund will invest up to USD 200 million over a period of four to seven years.

As of the date of this report, the fund has utilised less than a quarter of the total Statoil venture fund through four direct investments in four different segments, and is a limited partner in one financial venture capital fund.

Global Strategy & Business Development (GSB)

The Global Strategy & Business Development (GSB) business area is Statoil's functional centre for strategy and business development. GSB is responsible for Statoil's global strategy processes and identifies and delivers inorganic business development opportunities, including corporate mergers and acquisitions. This is achieved through close collaboration across geographic locations and business areas. Statoil's strategy forms the basis for guiding the company's business development focus.

GSB also hosts several corporate functions, including Statoil's Corporate Sustainability function, which is shaping the company's strategic response to sustainability issues and reporting on Statoil's sustainability performance.

Corporate staffs and support functions

Corporate Staffs and support functions comprise the non-operating activities supporting Statoil, and include headquarters and central functions that provide business support such as finance and control, corporate communication, safety, audit, legal services and people and leadership.

Technology, Projects & Drilling (TPD)

The **Technology, Projects & Drilling (TPD)** business area is responsible for global project development, well delivery, technology development and procurement in Statoil.

Research & Technology (R&T) is responsible for research and technology development to meet Statoil's business needs on short and long term, for delivering technical expertise to business development, projects and assets, and for implementing new technologies.

Project development (PRD) is responsible for planning and executing major facilities development, brownfield and field decommissioning projects where Statoil is the operator.

Drilling and Well (D&W) is responsible for providing cost-efficient well delivery and well operations, fit-for-purpose drilling facilities and providing expertise and advice to Statoil's global drilling and well operations.

Procurement and Supplier Relations (PSR) is responsible for global procurement aligned with Statoil's business needs.

PUBLIC COPY - CONFIDENTIAL INFORMATION REMOVED

The table below displays major projects operated by Statoil, as well as projects operated by Statoil's licence partners. More information about ongoing projects are given in the E&P Norway, E&P International, MMP and NES sections. In our world-class portfolio, an additional 35-40 projects are in the early phase, maturing towards sanction.

Project startups and completions 2017	Statoil's interest	Operator	Area	Type
Hebron	9.01%	ExxonMobil	Jeanne d'Arc Basin, off coast of Newfoundland and Labrador, Canada	Oil
In Salah Southern fields	31.85%	Sonatrach/BP/Statoil	Algeria	Oil and gas

2.7 CORPORATE

APPLICABLE LAWS AND REGULATIONS

Statoil operates in more than 30 countries and is exposed to, and committed to compliance with, a number of laws and regulations globally.

This article focuses primarily on Norwegian laws specific for Statoil`s core activities, taking into account that the majority of Statoil's production is produced on the NCS, the ownership structure of the company and that Statoil is registered and has its headquarters in Norway.

Norwegian petroleum laws and licensing system

The principal laws governing Statoil's petroleum activities in Norway are the Norwegian Petroleum Act and the Norwegian Petroleum Taxation Act.

Norway is not a member of the European Union (EU), but Norway is a member of the European Free Trade Association (EFTA). The EU and the EFTA Member States have entered into the Agreement on the European Economic Area, referred to as the EEA Agreement, which provides for the inclusion of EU legislation in the national law of the EFTA Member States (except Switzerland). Statoil's business activities are subject to both the EFTA Convention and EU laws and regulations adopted pursuant to the EEA Agreement.

For further information about the jurisdictions in which Statoil operates, see sections 2.2 Business overview and 2.11 Risk review.

Under the Petroleum Act, the Norwegian Ministry of Petroleum and Energy ("MPE") is responsible for resource management and for administering petroleum activities on the NCS. The main task of the MPE is to ensure that petroleum activities are conducted in accordance with the applicable legislation, the policies adopted by the Norwegian Parliament (the Storting) and relevant decisions of the Norwegian State.

The Storting's role in relation to major policy issues in the petroleum sector can affect Statoil in two ways: firstly, when the Norwegian State acts in its capacity as majority owner of Statoil shares and, secondly, when the Norwegian State acts in its capacity as regulator:

- The Norwegian State's shareholding in Statoil is managed by the Ministry of Petroleum and Energy. The MPE will normally decide how the Norwegian State will vote on proposals submitted to general meetings of the shareholders. However, in certain exceptional cases, it may be necessary for the Norwegian State to seek approval from the Storting before voting on a certain proposal. This will normally be the case if Statoil issues additional shares and such issuance would significantly dilute the Norwegian State's holding, or if such issuance would require a capital contribution from the Norwegian State in excess of government mandates. A decision by the Norwegian State to vote against a proposal on Statoil's part to issue additional shares would prevent Statoil from raising additional capital in this manner and could adversely affect Statoil's ability to pursue business opportunities. For more information about the Norwegian State's ownership, see Risks related to state ownership in section 2.11 Risk review and Major shareholders in section 5.1 Shareholder information
- The Norwegian State exercises important regulatory powers over Statoil, as well as over other companies and corporations on the NCS. As part of its business, Statoil or the partnerships to which Statoil is a party, frequently need to apply for licences and other approval of various kinds from the Norwegian State. Although Statoil is majority-owned by the Norwegian State, it does not receive preferential treatment with respect to licences granted by or under any other regulatory rules enforced by the Norwegian State

The principal laws governing Statoil's petroleum activities in Norway and on the NCS are the Norwegian Petroleum Act of 29 November 1996 (the "Petroleum Act") and the regulations issued thereunder, and the Norwegian Petroleum Taxation Act of 13 June 1975 (the "Petroleum Taxation Act"). The Petroleum Act sets out the principle that the Norwegian State is the owner of all subsea petroleum on the NCS, that exclusive right to resource management is vested in the Norwegian State and that the Norwegian State alone is authorised to award licences for petroleum activities as well as determine its terms. Licensees are required to submit a plan for development and operation (PDO) to the MPE for approval. For fields of a certain size, the Storting has to accept the PDO before it is formally approved by the MPE. Statoil is dependent on the Norwegian State for approval of its NCS exploration and development projects and its applications for production rates for individual fields.

Production licences are the most important type of licence awarded under the Petroleum Act and are normally awarded for an initial exploration period, which is typically six years, but which can be shorter. The maximum period is ten years. During this exploration period, the licensees must meet a specified work obligation set out in the licence. If the licensees fulfil the obligations set out in the initial licence period, they are entitled to require that the licence be prolonged for a period specified at the time when the licence is awarded, typically 30 years.

The terms of the production licences are decided by the Ministry of Petroleum and Energy. A production licence grants the holder an exclusive right to explore for and produce petroleum within a specified geographical area. The licensees become the owners of the petroleum produced from the field covered by the licence. Production licences are awarded to group of companies forming a joint venture at the Ministry's discretion. The members of the joint venture are jointly and severally responsible to the Norwegian State for obligations arising from petroleum operations carried out under the licence. The Ministry of Petroleum and Energy decides the form of the joint operating agreements and accounting agreements.

The governing body of the joint venture is the management committee. In licences awarded since 1996 where the state's direct financial interest (SDFI) holds an interest, the Norwegian State, acting through Petoro AS, may veto decisions made by the joint venture management committee, which, in the opinion of the Norwegian State, would not be in compliance with the obligations of the licence with respect to the Norwegian State's exploitation policies or financial interests. This power of veto has never been used.

Interests in production licences may be transferred directly or indirectly subject to the consent of the MPE and the approval of the Ministry of Finance of a corresponding tax treatment position. In most licences, there are no pre-emption rights in favour of the other licensees. However, the SDFI, or the Norwegian State, as appropriate, still holds pre-emption rights in all licences.

The day-to-day management of a field is the responsibility of an operator appointed by the MPE. The operator is in practice always a member of the joint venture holding the production licence, although this is not legally required. The terms of engagement of the operator are set out in the joint operating agreement.

If important public interests are at stake, the Norwegian State may instruct Statoil and other licensees on the NCS to reduce the production of petroleum. The last time the Norwegian State instructed a reduction in oil production was in 2002.

A licence from the MPE is also required in order to establish facilities for the transportation and utilisation of petroleum. Ownership of most facilities for the transportation and utilisation of petroleum in Norway and on the NCS is organised in the form of joint ventures. The participants' agreements are similar to joint operating agreements for production.

Licensees are required to prepare a decommissioning plan before a production licence or a licence to establish and use facilities for the transportation and utilisation of petroleum expires or is relinquished, or the use of a facility ceases. On the basis of the decommissioning plan, the Ministry of Petroleum and Energy makes a decision as to the disposal of the facilities.

For an overview of Statoil's activities and shares in Statoil's production licences on the NCS, see section 2.3 E&P Norway.

Gas sales and transportation from the NCS

Statoil markets gas from the NCS on its own behalf and on the Norwegian State's behalf. Gas is transported through the Gassled pipeline network to customers in the UK and mainland Europe.

Most of Statoil's and the Norwegian State's gas produced on the NCS is sold under gas contracts to customers in the European Union (EU), and changes in EU legislation may affect Statoil's marketing of gas.

The Norwegian gas transport system, consisting of the pipelines and terminals through which licensees on the NCS transport their gas, is owned by a joint venture called Gassled. The Norwegian Petroleum Act of 29 November 1996 and the pertaining Petroleum Regulation establish the basis for non- discriminatory third-party access to the Gassled transport system.

The tariffs for the use of capacity in the transport system are determined by applying a formula set out in separate tariff regulations stipulated by the Ministry of Petroleum and Energy. The tariffs are paid on the basis of booked capacity, not on the basis of the volumes actually transported.

For further information, see section 2.5 MMP - Marketing, Midstream and Processing under Pipelines.

The Norwegian State's participation

The Norwegian State's policy as a shareholder in Statoil has been and continues to be to ensure that petroleum activities create the highest possible value for the Norwegian State.

In 1985, the Norwegian State established the State's direct financial interest (SDFI) through which the Norwegian State has direct participating interests in licences and petroleum facilities on the NCS. As a result, the Norwegian State holds interests in a number of licences and petroleum facilities in which Statoil also hold interests. Petoro AS, a company wholly owned by the Norwegian State, was formed in 2001 to manage the SDFI assets.

SDFI oil and gas marketing and sale

Statoil markets and sells the Norwegian State's oil and gas together with Statoil's own production. The arrangement has been implemented by the Norwegian State.

At an extraordinary general meeting held on 25 May 2001, the Norwegian State, as sole shareholder, approved an instruction to Statoil setting out specific terms for the marketing and sale of the Norwegian State's oil and gas. This resolution is referred to as the Owner's instruction.

Statoil is obliged under the Owner's instruction to jointly market and sell the Norwegian State's oil and gas as well as Statoil's own oil and gas. The overall objective of the marketing arrangement is to obtain the highest possible total value for Statoil's oil and gas and the Norwegian State's oil and gas, and to ensure an equitable distribution of the total value creation between the Norwegian State and Statoil.

The Norwegian State may at any time utilise its position as majority shareholder of Statoil to withdraw or amend the marketing instruction

HSE regulation

Statoil's petroleum operations are subject to extensive laws and regulations relating to health, safety and the environment (HSE).

With business operations in more than 30 countries, Statoil is subject to a wide variety of HSE laws and regulations concerning its products, operations and activities. Laws and regulations may be jurisdiction specific, but also international regulations, conventions or treaties, as well as EU directives and regulations, are relevant.

Statoil continues to monitor and respond to the Trump Administration's ongoing reorganization of regulatory bodies, including potentially the Department of Interior (DOI), an effort which is designed to streamline processes and reduce duplications. Potential implications on Statoil's operations in the US will be assessed as this regulatory review process develops. At this time, Statoil does not consider any of these potential changes to have a material impact on its US activities. Similarly, the effects from implementing the EU offshore Safety Directive in EU-member states' legislation will affect operations in relevant EU member countries. See also section 2.11 Risk review under Risk factors.

Taxation of Statoil

Statoil is subject to ordinary Norwegian corporate income tax and to a special petroleum tax relating to its offshore activities in Norway. Statoil's profits, both from offshore oil and natural gas activities and from onshore activities, are subject to Norwegian corporate income tax. The standard corporate income tax rate has been reduced from 24% in 2017 to 23% in 2018. In addition, a special petroleum tax is levied on profits from petroleum production and pipeline transportation on the NCS. The special petroleum tax rate has been increased from 54% in 2017 to 55% in 2018. The special petroleum tax rate is applied to relevant income in addition to the standard income tax rate, resulting in a 78% marginal tax rate on income subject to the special petroleum tax. For further information, see note 9 Income taxes to the Consolidated financial statements.

Statoil's international petroleum activities are subject to tax pursuant to local legislation. Fiscal regulation of Statoil's upstream operations is generally based on corporate income tax regimes and/or PSAs.

Statoil expects the impact of the recently enacted US tax reform to be favourable to Statoil and its US operations, primarily due to the reduction in the US corporate income tax rate from 35% to 21%. This change in US tax legislation (effective 1 January 2018) will have no impact on Statoil's deferred tax balance as Statoil has not recognised any net deferred tax asset or liability related to our US operations as of 31 December 2017. See note 9 Income taxes and note 10 Property, plant and equipment to the Consolidated financial statements.

SUBSIDIARIES AND PROPERTIES

Significant subsidiaries

The following table shows significant subsidiaries and equity accounted companies within Statoil group as of 31 December 2017.

Name	in %	Country of incorporation	Name	in %	Country of incorporation
Statholding AS (Group)	100	Norway	Statoil Natural Gas LLC	100	USA
Statoil Angola Block 15 AS	100	Norway	Statoil New Energy (Group)	100	Norway
Statoil Angola Block 17 AS	100	Norway	Statoil Nigeria AS	100	Norway

Statoil Murzuq AS	100	Norway			

1) Equity accounted entities.

Property, plant and equipment

Statoil has interests in real estate in many countries throughout the world. However, no individual property is significant. The largest office buildings are the Statoil's head office located at Forusbeen 50, NO-4035, Stavanger, Norway which comprises approximately 135,000 square meters of office space, and the 65,500 square metre office building located at Fornebu on the outskirts of Norway's capital Oslo. Both office buildings are leased.

For a description of our significant reserves and sources of oil and natural gas, see Proved oil and gas reserves in section 2.8 Operational performance and section 4.2 Supplementary oil and gas information (unaudited) later in this report. For a description of our operational refineries, terminals and processing plants, see section 2.5 MMP - Marketing, Midstream and Processing.

Related party transactions

See note 24 Related parties to the Consolidated financial statements. See also section 3.4 Equal treatment of shareholders and transactions with close associates.

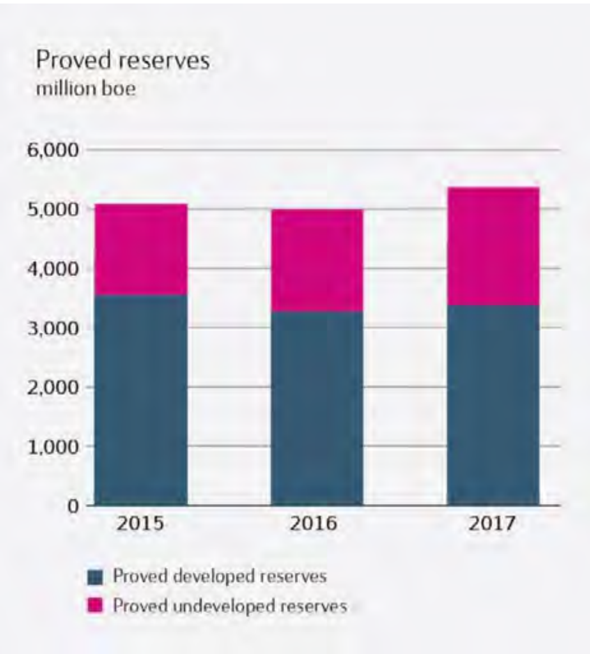
Insurance

Statoil maintains insurance coverage that includes coverage for physical damage to its oil and gas properties, third-party liability, workers' compensation and employers' liability, general liability, sudden pollution and other coverage. See also section 2.11 Risk review under Risk factors.

2.8 OPERATIONAL PERFORMANCE

PROVED OIL AND GAS RESERVES

Proved oil and gas reserves were estimated to be 5,367mmboe at year end 2017, compared to 5,013 mmboe at the end of 2016.



Statoil's proved reserves are estimated and presented in accordance with the Securities and Exchange Commission (SEC) Rule 4-10 (a) of Regulation S-X, revised as of January 2009, and relevant Compliance and Disclosure Interpretations (C&DI) and Staff Accounting Bulletins, as issued by the SEC staff. For additional information, see Proved oil and gas reserves in note 2 Significant accounting policies to the Consolidated financial statements. For further details on proved reserves, see also section 4.2 Supplementary oil and gas information.

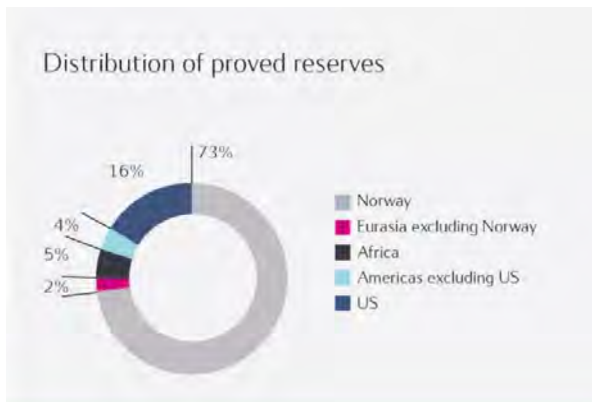
Changes in proved reserves estimates are most commonly the result of revisions of estimates due to observed production performance, extensions of proved areas through drilling activities or the inclusion of proved reserves in new discoveries through the sanctioning of new development projects. These are sources of additions to proved reserves that are the result of continuous business processes and can be expected to continue to add reserves in the future.

Proved reserves can also be added or subtracted through the acquisition or disposal of assets. Changes in proved reserves can also be due to factors outside management control, such as changes in oil and gas prices. Lower oil and gas prices normally allow less oil and gas to be recovered from the accumulations. However, for fields with PSAs and similar contracts, a reduced oil price may result in higher entitlement to the produced volume. These changes are included in the revisions category in the table below.

The principles for booking proved gas reserves are limited to contracted gas sales or gas with access to a robust gas market.

In Norway, the UK and Ireland, Statoil recognises reserves as proved when a development plan is submitted, as there is reasonable certainty that such a plan will be approved by the regulatory authorities. Outside these territories, reserves are generally booked as proved when regulatory approval is received, or when such approval is imminent. Reserves from new discoveries, upward revisions of reserves and purchases of proved reserves are expected to contribute to maintaining proved reserves in future years. Undrilled well locations US onshore are generally booked as proved undeveloped reserves when a development plan has been adopted and the well locations are scheduled to be drilled within five years.

Approximately 91% of our proved reserves are located in OECD countries. Norway is by far the most important contributor in this category, followed by the United States (US), Canada and Ireland. Of Statoil's total proved reserves, 6% are related to PSAs in non-OECD countries such as Azerbaijan, Angola, Algeria, Nigeria, Libya and Russia. Other non-OECD reserves are related to concessions in Brazil, representing 3% of Statoil's total proved reserves. These are included in proved reserves in the Americas.



Significant changes in our proved reserves in 2017 were:

- Revisions of previously booked reserves, including the effect of improved recovery, increased the proved reserves by 605 million boe in 2017. Many producing fields have significant positive revisions due to better performance, maturing of new wells and improved recovery projects, as well as reduced uncertainty due to further drilling and production experience. The effect of the increased commodity prices, increasing the proved reserves by approximately 200 million boe through extended economic life time on several fields, is also included in this. The largest revisions are seen in Norway, where many of the larger offshore fields continue to decline less than assumed for the proved reserves, and in the US where continued drilling and production from the onshore plays in the Appalachian basin (Marcellus and Utica), Bakken and Eagle Ford has increased the proved reserves.
- A total of 441 million boe of new proved reserves are added through extensions and new discoveries booking proved reserves for the first time. New field developments in Norway, such as Johan Castberg, Ærfugl and Bauge, and Peregrino Phase 2 in Brazil all contribute to this with a total of 260 million boe. Extensions of the proved areas in the US onshore plays

contribute with167 million boe. The remaining 14 million boe come from other minor extensions on producing fields where new wells have been drilled in previously unproven areas. New discoveries with proved reserves booked in 2017 are all expected to start production within a period of five years.

- A total of 50 million boe of new proved reserves were purchased in 2017 (the Azeri-Chirag-Gunashli PSA extension and transfer of certain ownership shares in the Appalachian basin from Northwood Energy).
- Sale of 38 million boe of proved reserves from the Leismer oil sands development in Canada which was finalised in 2017.
- The 2017 entitlement production was 705 million boe, an increase of 4.7% compared to 2016.

	Proved reserves

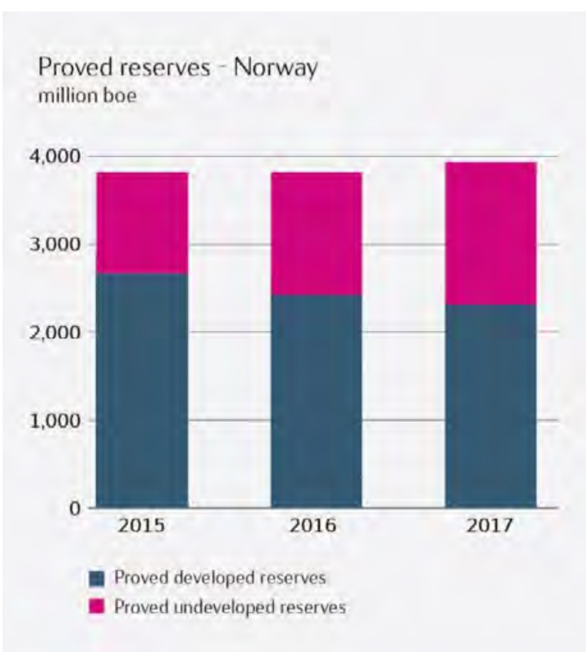
Total proved reserves	2,302	379	15,073	5,367



Proved reserves in Norway

A total of 3,913 million boe is recognised as proved reserves in 64 fields and field development projects on the NCS, representing 73% of Statoil's total proved reserves. Of these, 53 fields and field areas are currently in production, 42 of which are operated by Statoil.

Four new field development projects added reserves categorised as extensions and discoveries during 2017, Johan Castberg, Bauge, Ærfugl and Alun-Epidot. Production experience, further drilling and improved recovery on several of Statoil's producing fields in Norway also contributed positively to the revisions of the proved reserves in 2017.

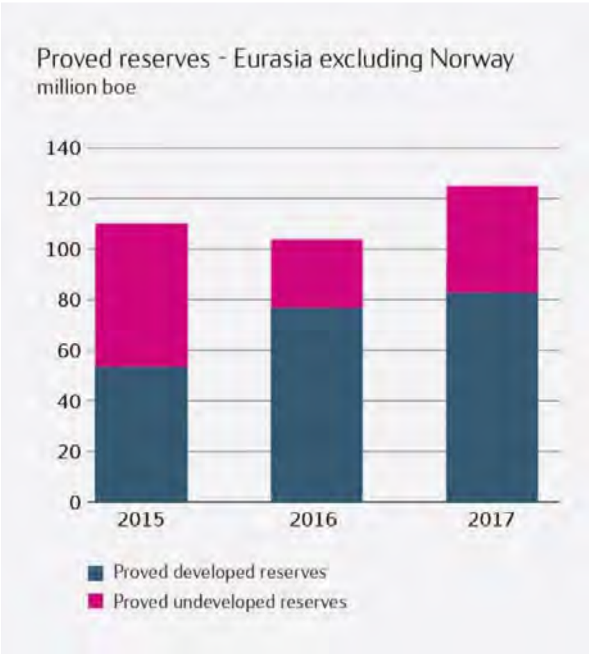
Proved reserves in equity accounted companies in Norway represent Statoil's relative share of Lundin's share in fields carrying proved reserves, only where Statoil as a shareholder has sufficient access to data to be able to estimate proved reserves with reasonable certainty.

Of the proved reserves on the NCS, 2,290 million boe, or 59%, are proved developed reserves. Of the total proved reserves in this area, 56% are gas reserves related to large offshore gas fields such as Troll, Snøhvit, Oseberg, Ormen Lange, Visund, Aasta Hansteen, Åsgard and Tyrihans, and 44% are liquid reserves.

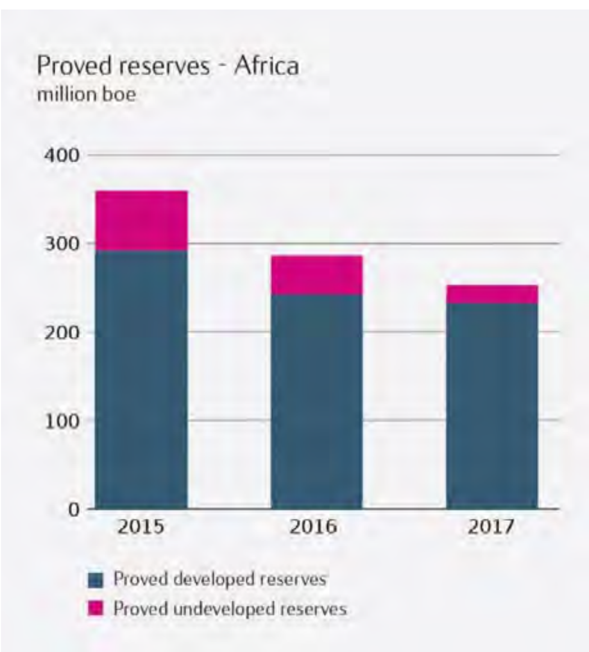
Proved reserves in Eurasia, excluding Norway

In this area, Statoil has proved reserves of 125 million boe related to four fields in Azerbaijan, Ireland, United Kingdom and Russia. Eurasia excluding Norway represents 2% of Statoil's total proved reserves, Azerbaijan being the main contributor with the Azeri-Chirag-Gunashli fields. All fields are producing. Of the proved reserves in Eurasia, 83 million boe or 67% are proved developed reserves.

Of the total proved reserves in this area, 77% are liquid reserves and 23% are gas reserves.



Proved reserves in Africa
Statoil recognises proved reserves of 250 million boe related to 28 fields and field developments in several West and North African countries, including Algeria, Angola, Libya and Nigeria. Africa represents 5% of Statoil's total proved reserves. Angola is the primary contributor to the proved reserves in this area, with 24 of the 28 fields.



In Angola, Statoil has proved reserves in Block 15, Block 17 and Block 31, with production from all three blocks.

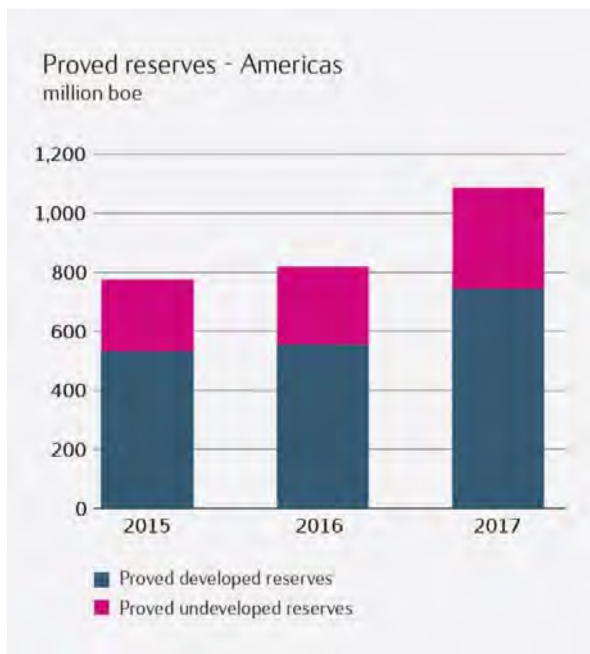
In Algeria and Nigeria, all fields are in production. In Libya, Murzuq started producing again in 2017.

The Agbami equity redetermination in Nigeria implies a reduction of 5.17 percentage points in Statoil's equity interest in the field. Statoil has proceeded to the court of appeal to have the arbitration award set aside. Final approval in the licence was pending at year end 2017, hence the negative effect on the proved reserves, which is estimated to be less than 10 million boe, is not yet included.

In Algeria, an agreement has been signed which will amend the In Amenas Production Sharing Contract by five years, from 2022 to 2027. The effect on the proved reserves will be included once the amended PSA is approved by the authorities and the effect is known.

Most of the fields in Africa are mature and many are on decline or approaching the expiration date of the current PSA. High production in 2017 combined with limited positive revisions and few IOR projects being sanctioned, resulted in further reduction of the proved reserves in this area.

Of the total proved reserves in Africa, 231 million boe, or 93%, are proved developed reserves. Of the total proved reserves in this area, 78% are liquid reserves and 22% are gas reserves.



Proved reserves in the Americas
In North and South America, Statoil has proved reserves equal to 1,079 million boe in a total of 16 fields and field development projects. This represents 20% of Statoil's total proved reserves. Eleven of these fields are located in the US, eight of which are offshore field developments in the Gulf of Mexico and three are onshore tight reservoir assets. Four are located in Canada and one in South America.

As of 30 June 2017, the 9.67% ownership share in the heavy oil project Petrocedeño in Venezuela was reclassified from an equity accounted investment to a non-current financial investment. This has reduced the proved reserves in the Americas by 28 million boe.

In the US, six of the eight fields in the Gulf of Mexico are producing. At year end 2017 field development was still ongoing at Big Foot, and at Stampede which started production in January 2018. The onshore tight reservoir assets in the Appalachian basin, Eagle Ford and Bakken are all in production.

In Canada, proved reserves are related to offshore field developments only.

The increase in proved reserves in this area is mainly due to extensions of the proved areas in the US onshore plays which has added 167 million boe of new proved reserves, positive revisions due to improved operational performance in several assets in the US, and the Peregrino Phase 2 development adding new proved reserves in South America. Proved reserves in the US now represent 16% of total proved reserves and is disclosed as a separate geographic area in the tables.

Of the total proved reserves in the Americas, 737 million boe, or 68%, are proved developed reserves. Of the total proved reserves in this area, 63% are liquid reserves and 37% gas reserves.

Reserves replacement

The reserves replacement ratio is defined as the sum of additions and revisions of proved reserves divided by produced volumes in any given period. The following table presents the changes in reserves including equity accounted entities in each category relating to the reserve replacement ratio for the years 2017, 2016 and 2015. The 2017 reserves replacement ratio excluding equity accounted entities was 1.56 and the corresponding three-year average 1.00. For additional information regarding changes in proved reserves, see section 4.2 Supplementary oil and gas information.

The usefulness of the reserves replacement ratio is limited by the volatility of oil prices, the influence of oil and gas prices on PSA reserve booking, sensitivity related to the timing of project sanctions and the time lag between exploration expenditure and the booking of reserves.

Reserves replacement ratio (including purchases and sales)	For the year ended 31 December 2017	2016	2015
Annual	**1.50**	0.93	0.55
Three-year-average	**1.00**	0.70	0.81

Development of reserves

The total volume of proved reserves increased by 354 million boe in 2017. Positive revisions including improved recovery totalled 605 million boe.

Extensions and discoveries added 441 million boe of new proved reserves in 2017, mainly as undeveloped proved reserves. New development projects such as Bauge, Johan Castberg, Peregrino (Phase 2) and Ærfugl, in addition to several minor extensions on developed assets, added a total of 274 million boe of proved reserves. Further drilling in the Appalachian basin, Bakken and Eagle Ford onshore plays in the US increased the proved areas in these assets and added 167 million boe of new proved reserves.

The net effect of purchases and sales completed in 2017, increased the proved reserves by 12 million boe.

Change in proved reserves (million boe)	For the year ended 31 December 2017	2016	2015
Revisions and improved recovery	**605**	409	(42)
Extensions and discoveries	**441**	179	627
Purchase of petroleum-in-place	**50**	65	13
Sales of petroleum-in-place	**(38)**	(27)	(235)
Total reserve additions	**1,059**	626	363
Production	**(705)**	(673)	(662)
Net change in proved reserves	**354**	(47)	(299)

Development of reserves in 2017 (million boe)	Total	Developed	Undeveloped
At 31 December 2016	5,013	3,268	1,746
Revisions and improved recovery	605	420	185
Extensions and discoveries	441	95	346
Purchase of reserves-in-place	50	26	24
Sales of reserves-in-place	(38)	(33)	(5)
Production	(705)	(705)	-
Moved from undeveloped to developed	-	271	(271)
At 31 December 2017	5,367	3,342	2,025

In 2017, approximately 271 million boe were converted from proved undeveloped to proved developed reserves. The start-up of production from Flyndre and Gina Krog in Norway and Hebron in Canada increased the proved developed reserves by 66 million boe during 2017. The remaining 205 million boe of the converted volume is related to activities on developed assets. Over the last 5 years Statoil has converted 1,931 million boe of proved undeveloped reserves to proved developed reserves.

Net proved developed and undeveloped reserves (million boe)		Oil and Condensate (mmboe)	NGL (mmboe)	Natural gas (bcf)	Total (mmboe)
2017	**Proved reserves end of year**	**2,302**	**379**	**15,073**	**5,367**
	Developed	1,112	278	10,958	3,342
	Undeveloped	1,191	101	4,115	2,025
2016	**Proved reserves end of year**	**2,033**	**372**	**14,637**	**5,013**
	Developed	1,105	277	10,584	3,268
	Undeveloped	928	95	4,054	1,746
2015	**Proved reserves end of year**	**2,091**	**364**	**14,624**	**5,060**
	Developed	1,104	290	11,901	3,515
	Undeveloped	987	74	2,723	1,546

As of 31 December 2017, the total proved undeveloped reserves amounted to 2,025 million boe, 80% of which are related to fields in Norway. The Troll and Snøhvit fields, which have continuous development activities, together with fields not yet in production, such as Johan Sverdrup, Johan Castberg and Aasta Hansteen have the largest proved undeveloped reserves in Norway. The largest assets with respect to proved undeveloped reserves outside Norway are Peregrino in Brazil, ACG in Azerbaijan and the Appalachian basin and Bakken in the US.

All these fields are either producing, or will start production within the next five years. For fields with proved reserves where production has not yet started, investment decisions have already been sanctioned and investments in infrastructure and facilities have commenced. Some development activities will take place more than five years from the disclosure date, but these are mainly related to incremental type of spending, such as drilling of additional wells from existing facilities, in order to secure continued production. There are no material development projects, which would require a separate future investment decision by management, included in our proved reserves. For our onshore plays in the US, the Appalachian basin, Eagle Ford and Bakken, all proved undeveloped reserves are limited to wells that are scheduled to be drilled within five years.

In 2017, Statoil incurred USD 7,729 million in development costs relating to assets carrying proved reserves, USD 5,685 million of which was related to proved undeveloped reserves.

Additional information about proved oil and gas reserves is provided in section 4.2 Supplementary oil and gas information.

Preparation of reserves estimates

Statoil's annual reporting process for proved reserves is coordinated by a central corporate reserves management (CRM) team consisting of qualified professionals in geosciences, reservoir and production technology and financial evaluation. The team has an average of more than 25 years' experience in the oil and gas industry. CRM reports to the vice president of finance and control in the Technology, Projects & Drilling business area and is thus independent of the Development & Production business areas in Norway, North America and International. All the reserves estimates have been prepared by Statoil's technical staff.

Although the CRM team reviews the information centrally, each asset team is responsible for ensuring that it is in compliance with the requirements of the SEC and Statoil's corporate standards. Information about proved oil and gas reserves, standardised measures of discounted net cash flows related to proved oil and gas reserves and other information related to proved oil and gas reserves, is collected from the local asset teams and checked by CRM for consistency and conformity with applicable standards. The final numbers for each asset are quality-controlled and approved by the responsible asset manager, before aggregation to the required reporting level by CRM.

The aggregated results are submitted for approval to the relevant business area management teams and the corporate executive committee.

The person with primary responsibility for overseeing the preparation of the reserves estimates is the manager of the CRM team. The person who presently holds this position has a bachelor's degree in earth sciences from the University of Gothenburg, and a master's degree in petroleum exploration and exploitation from Chalmers University of Technology in Gothenburg, Sweden. She has 32 years' experience in the oil and gas industry, 31 of them with Statoil. She is a member of the Society of Petroleum Engineering (SPE) and vice-chair of the UNECE Expert Group on Resource Classification (EGRC).

DeGolyer and MacNaughton report

Petroleum engineering consultants DeGolyer and MacNaughton have carried out an independent evaluation of Statoil's proved reserves as of 31 December 2017 using data provided by Statoil. The evaluation accounts for 100% of Statoil's proved reserves including equity accounted entities. The aggregated net proved reserves estimates prepared by DeGolyer and MacNaughton do not differ materially from those prepared by Statoil when compared on the basis of net equivalent barrels.

Net proved reserves at 31 December 2017	Oil and Condensate (mmbbls)	NGL/LPG (mmbbl)	Natural Gas (bcf)	Oil Equivalent (mmboe)
Estimated by Statoil	2,302	379	15,073	5,367
Estimated by DeGolyer and MacNaughton	2,363	347	14,404	5,276

A reserves audit report summarising this evaluation is included as Exhibit 15 (a)(iii).

Operational statistics

Developed and undeveloped acreage

The table below shows the total gross and net developed and undeveloped oil and gas acreage, in which Statoil had interests at 31 December 2017.

A gross value reflects the number of wells or acreage in which Statoil owns a working interest. The net value corresponds to the sum of the fractional working interests owned in the same gross wells or acres.

Developed and undeveloped oil and gas acreage at 31 December 2017 (in thousands of acres)		Norway	Eurasia excluding Norway	Africa	US	Americas excluding US	Oceania	Total
Acreage developed	- gross	927	73	796	689	73	-	2,558
	- net	345	16	264	170	19	-	814
Acreage undeveloped	- gross	13,708	40,526	24,958	1,574	37,567	11,749	130,082
	- net	6,016	18,159	9,544	799	15,577	6,928	57,023

The largest concentrations of developed acreage in Norway are in the Troll, Skarv, Oseberg area, Snøhvit and Ormen Lange. In Africa, the Algerian gas development projects In Amenas and In Salah represent the largest concentrations of developed acreage (gross and net). Bakken (onshore US) has the largest developed acreage in Americas.

Statoil's largest undeveloped acreage concentration is in Russia with 15% of the total acreage and 48% of the total acreage in Eurasia excluding Norway. A large part of the net acreage in Russia represents Statoil's share of a joint venture with Rosneft. The largest concentration of undeveloped acreage in the Americas excluding US is Canada, with 25% of the total for this geographic area. In Africa, the largest acreage concentration is in South Africa, representing 69% of the total for this geographic area. In Oceania Statoil holds undeveloped acreage in Australia and New Zealand.

Statoil holds acreage in numerous concessions, blocks and leases. The terms and conditions regarding expiration dates vary significantly from property to property. Work programmes are designed to ensure that the exploration potential of any property is fully evaluated before expiration.

Acreage related to several of these concessions, blocks and leases are scheduled to expire within the next three years. Any acreage which has already been evaluated to be non-profitable may be relinquished prior to the current expiration date. In other cases, Statoil may decide to apply for an extension if more time is needed in order to fully evaluate the potential of the properties. Historically, Statoil has generally been successful in obtaining such extensions.

Most of the undeveloped acreage that will expire within the next three years is related to early exploration activities where no production is expected in the foreseeable future. The expiration of these leases, blocks and concessions will therefore not have any material impact on our reserves.

Productive oil and gas wells

The number of gross and net productive oil and gas wells, in which Statoil had interests at 31 December 2017, are shown in the table below. The total number of productive oil wells in the Americas excluding US has been significantly reduced due to the reclassification of the heavy oil project Petrocdeño from an equity accounted entity to a financial investment.

Number of productive oil and gas wells at 31 December 2017		Norway	Eurasia excluding Norway	Africa	US	Americas excluding US	Total
Oil wells	- gross	874	188	423	2,422	99	4,006
	- net	292.7	27.3	66.4	613.8	29.0	1,029.2
Gas wells	- gross	201	6	104	2,213	-	2,524
	- net	86.7	2.2	40.1	550.0	-	679.0

The total gross number of productive wells as of end 2017 includes 392 oil wells and 11 gas wells with multiple completions or wells with more than one branch.

Net productive and dry oil and gas wells drilled

The following tables show the net productive and dry exploratory and development oil and gas wells completed or abandoned by Statoil in the past three years. Productive wells include exploratory wells in which hydrocarbons were discovered, and where drilling or completion has been suspended pending further evaluation. A dry well is one found to be incapable of producing sufficient quantities to justify completion as an oil or gas well.

Net productive and dry oil and gas wells drilled	Norway	Eurasia excluding Norway	Africa	US	Americas excluding US	Total
Year 2017						
Net productive and dry exploratory wells drilled	8.1	2.6	-	0.7	1.9	13.3
- Net dry exploratory wells drilled	3.5	2.1	-	-	1.9	7.5
- Net productive exploratory wells drilled	4.6	0.5	-	0.7	-	5.8
Net productive and dry development wells drilled	37.5	5.0	4.3	103.2	2.3	152.2
- Net dry development wells drilled	10.1	-	0.1	-	0.1	10.3
- Net productive development wells drilled	27.4	5.0	4.2	103.2	2.2	142.0
Year 2016						
Net productive and dry exploratory wells drilled	5.5	0.7	-	1.6	4.8	12.6
- Net dry exploratory wells drilled	1.4	0.7	-	-	1.9	3.9
- Net productive exploratory wells drilled	4.1	-	-	1.6	3.0	8.7
Net productive and dry development wells drilled	47.4	1.6	5.2	116.6	17.0	187.8
- Net dry development wells drilled	4.2	0.2	0.2	-	-	4.6
- Net productive development wells drilled	43.3	1.5	4.9	116.6	17.0	183.2
Year 2015						
Net productive and dry exploratory wells drilled	10.2	1.0	2.5	1.5	1.1	16.3
- Net dry exploratory wells drilled	4.6	0.4	0.5	0.5	0.4	6.4
- Net productive exploratory wells drilled	5.6	0.7	2.0	1.0	0.7	9.9
Net productive and dry development wells drilled	32.1	4.1	10.6	216.3	12.5	275.6
- Net dry development wells drilled	3.6	-	4.3	0.3	-	8.2
- Net productive development wells drilled	28.6	4.1	6.3	215.9	12.5	267.4

Exploratory and development drilling in process

The following table shows the number of exploratory and development oil and gas wells in the process of being drilled by Statoil at 31 December 2017.

Number of wells in progress at 31 December 2017		Norway	Eurasia excluding Norway	Africa	US	Americas excluding US	Total
Development wells[1]	- gross	39	7	10	362	2	420
	- net	14.2	0.8	2.9	144.7	0.1	162.7
Exploratory wells	- gross	2	3	-	1	-	6
	- net	0.8	1.5	-	0.2	-	2.4

1) Mainly wells related to US onshore developments

Delivery commitments

On behalf of the Norwegian State's direct financial interest (SDFI), Statoil is responsible for managing, transporting and selling the Norwegian state's oil and gas from the Norwegian continental shelf (NCS). These reserves are sold in conjunction with Statoil's own reserves. As part of this arrangement, Statoil delivers gas to customers under various types of sales contracts. In order to meet the commitments, we utilise a field supply schedule that ensures the highest possible total value for Statoil and SDFI's joint portfolio of oil and gas.

The majority of our gas volumes in Norway are sold under long-term contracts with take-or-pay clauses. Statoil's and SDFI's annual delivery commitments under these agreements are expressed as the sum of the expected off-take under these contracts. As of 31 December 2017, the long-term commitments from NCS for the Statoil/SDFI arrangement totaled approximately 278 bcm.

Statoil's total bilateral obligations have been reduced over the past year, as a result of delivering more on existing contracts ending in 2017 than sold on new contracts starting in 2017. This has been a trend in later years. Thus, given a steady gas production in the years to come, Statoil will sell more gas in the spot-market than before.

Statoil and SDFI's delivery commitments, expressed as the sum of expected off-take for the calendar years 2018, 2019, 2020 and 2021, are 47.1, 40.1, 37.9 and 34.9 bcm, respectively. Any remaining volumes after covering our bilateral agreements, will be sold by trading activities at the hubs.

Statoil's currently developed gas reserves in Norway are more than sufficient to meet our share of these commitments for the next four years.

PRODUCTION VOLUMES AND PRICES

The business overview is in accordance with our segment's operations as of 31 December 2017, whereas certain disclosures on oil and gas reserves are based on geographical areas as required by the Securities and Exchange Commission (SEC). For further information about extractive activities, see sections 2.3 E&P Norway and 2.4 E&P International.

Statoil prepares its disclosures for oil and gas reserves and certain other supplemental oil and gas disclosures by geographical area, as required by the SEC. The geographical areas are defined by country and continent. They are Norway, Eurasia excluding Norway, Africa and the Americas.

For further information about disclosures concerning oil and gas reserves and certain other supplemental disclosures based on geographical areas as required by the SEC, see section 4.2 Supplementary oil and gas information (unaudited).

Entitlement production

The following table shows Statoil's Norwegian and international entitlement production of oil and natural gas for the periods indicated. The stated production volumes are the volumes to which Statoil is entitled, pursuant to conditions laid down in licence agreements and production-sharing agreements. The production volumes are net of royalty oil paid in kind, and of gas used for fuel and flaring. Our production is based on our proportionate participation in fields with multiple owners and does not include production of the Norwegian State's oil and natural gas. Production of an immaterial quantity of bitumen is included as oil production. NGL includes both LPG and naphtha. For further information on production volumes see section 5.6 Terms and abbreviations.

Entitlement production (million boe)	Consolidated companies: Norway	Eurasia excluding Norway	Africa	US	Americas excluding US	Subtotal	Equity accounted: Norway	Eurasia excluding Norway	Americas excluding US	Subtotal	Total
Oil and Condensate (mmbbls)											
2015	174	13	75	31	27	319	-	-	4	4	324
2016	169	12	72	34	26	313	2	0	4	6	320
2017	165	10	68	38	21	302	6	0	2	8	310
NGL (mmbbls)											
2015	44	-	3	7	-	54	-	-	-	-	54
2016	46	-	2	9	-	58	0	-	-	0	58
2017	48	-	4	9	0	61	-	-	-	-	61
Natural gas (bcf)											
2015	1,306	16	63	215	0	1,600	-	-	-	-	1,600
2016	1,338	34	60	226	0	1,659	1	0	-	2	1,661
2017	1,515	41	72	240	0	1,868	4	0	-	5	1,873
Combined oil, condensate, NGL and gas (mmboe)											
2015	450	16	88	76	27	658	-	-	4	4	662
2016	454	18	85	83	26	666	3	0	4	7	673
2017	483	17	85	90	21	696	6	0	2	9	705

The only field containing more than 15% of total proved reserves based on oil equivalent barrels is the Troll field.

Entitlement production	2017	2016	2015
Troll field [1)]			
Oil and Condensate (mmbbls)	14	15	14
NGL (mmbbls)	2	2	2
Natural gas (bcf)	384	321	386
Combined oil, condensate, NGL and gas (mmboe)	85	74	85

1) Note that Troll is also included in Norway stated above.

Operational data	For the year ended 31 December 2017	2016	2015	17-16 change	16-15 change
Prices					
Average Brent oil price (USD/bbl)	54.2	43.7	52.4	24%	(17%)
E&P Norway average liquids price (USD/bbl)	50.2	39.4	48.2	27%	(18%)

Total liquids and gas liftings	1,948	1,842	1,837	6%	0%
MMP sales volumes					
Crude oil sales volumes (mmbbl)	817	811	829	1%	(2%)
Natural gas sales Statoil entitlement (bcm)	52.0	44.3	44.0	18%	1%
Natural gas sales third-party volumes (bcm)	6.4	8.6	8.6	(26%)	0%
Production cost (USD/boe)					
Production cost entitlement volumes	5.2	5.4	6.5	(3%)	(17%)
Production cost equity volumes	4.8	5.0	5.9	(3%)	(17%)

Sales prices

The following tables present realised sales prices.

Realised sales prices	Norway	Eurasia excluding Norway	Africa	Americas
Year ended 31 December 2017				
Average sales price oil and condensate in USD per bbl	54.0	53.6	53.5	46.0
Average sales price NGL in USD per bbl	35.8	-	33.2	20.9
Average sales price natural gas in USD per mmBtu	5.6	5.3	5.2	2.7
Year ended 31 December 2016				
Average sales price oil and condensate in USD per bbl	43.1	42.0	41.4	32.9
Average sales price NGL in USD per bbl	24.4	-	21.9	13.1
Average sales price natural gas in USD per mmBtu	5.2	4.8	4.0	2.1
Year ended 31 December 2015				
Average sales price oil and condensate in USD per bbl	52.2	50.7	49.4	39.4
Average sales price NGL in USD per bbl	30.1	-	26.2	12.5
Average sales price natural gas in USD per mmBtu	7.1	4.6	5.6	2.6

Sales volumes

Sales volumes include lifted entitlement volumes, the sale of SDFI volumes and marketing of third-party volumes. In addition to Statoil's own volumes, we market and sell oil and gas owned by the Norwegian State through the Norwegian State's share in production licences. This is known as the State's Direct Financial Interest or SDFI. For additional information, see section 2.7 Corporate under SDFI oil and gas marketing and sale.

The following table shows the SDFI and Statoil sales volume information on crude oil and natural gas for the periods indicated. The Statoil natural gas sales volumes include equity volumes sold by the MMP segment, natural gas volumes sold by the E&P International segment and ethane volumes.

Sales Volumes	For the year ended 31 December 2017	2016	2015
Statoil[1]			
Crude oil (mmbbls)[2]	**369**	372	378
Natural gas (bcm)	**54.3**	48.0	46.6
Combined oil and gas (mmboe)	**711**	674	671
Third party volumes[3]			
Crude oil (mmbbls)[2]	**302**	294	290
Natural gas (bcm)	**6.4**	8.6	8.6
Combined oil and gas (mmboe)	**342**	348	344
SDFI assets owned by the Norwegian State[4]			
Crude oil (mmbbls)[2]	**147**	148	149
Natural gas (bcm)	**44.0**	39.8	41.8
Combined oil and gas (mmboe)	**424**	398	412
Total			
Crude oil (mmbbls)[2]	**819**	814	816
Natural gas (bcm)	**104.7**	96.4	97.0
Combined oil and gas (mmboe)	**1,477**	1,420	1,427

1) The Statoil volumes included in the table above are based on the assumption that volumes sold were equal to lifted volumes in the relevant year. Volumes lifted by E&P International but not sold by MMP, and volumes lifted by E&P Norway or E&P International and still in inventory or in transit may cause these volumes to differ from the sales volumes reported elsewhere in this report by MMP.

2) Sales volumes of crude oil include NGL and condensate. All sales volumes reported in the table above include internal deliveries to our manufacturing facilities

3) Third party volumes of crude oil include both volumes purchased from partners in our upstream operations and other cargos purchased in the market. The third party volumes are purchased either for sale to third parties or for our own use. Third party volumes of natural gas include third party LNG volumes related to our activities at the Cove Point regasification terminal in the US.

4) The line item SDFI assets owned by the Norwegian State includes sales of both equity production and third party.

2.9 FINANCIAL REVIEW

GROUP FINANCIAL PERFORMANCE

In 2016 and 2015, our **results** were heavily influenced by low oil and gas prices, leading to lower earnings and impairment losses. In 2017, prices have been recovering and we are seeing better results. Operational performance has been solid and production is up by 5% in 2017. Cost discipline and efficiency improvements have contributed to the reduced operating costs. Supported by increasing prices and better operational performance, several previous impairments have been reversed. A negative net income in 2016 of USD 2.9 billion is turned into positive net income of USD 4.6 billion in 2017.

Total equity liquids and gas production was 2,080 mboe, 1,978 mboe, 1,971 mboe per day in 2017, 2016 and 2015, respectively.

The 5% increase in total equity production from 2016 to 2017 was primarily due to start-up and ramp-up on various fields and higher flexible gas offtake on the NCS, partially offset by expected natural decline and divestments.

From 2015 to 2016, the average daily total equity production level was maintained. Increased production from new fields coming on stream, ramp-up on various existing fields and high operational performance, was offset by reduced ownership shares due to divestments, expected natural decline at mature fields and operational challenges.

Total entitlement liquids and gas production was 1,922 mboe per day in 2017 compared to 1,827 mboe in 2016 and 1,812 mboe per day in 2015. In 2017, the total entitlement liquids and gas production was up 5% for the reasons as described above, partially offset by higher negative effect from production sharing agreements (PSA effect) and US royalties, mainly driven by higher prices.

From 2015 to 2016, the total entitlement production was up 1% the reasons as described above. The benefit of a lower effect from production sharing agreements (PSA effect) mainly driven by the reduction in prices, added to the slight increase in entitlement production.

The combined effect of **production sharing agreements (PSA effect) and US royalties** was 158 mboe, 151 mboe and 159 mboe per day in 2017, 2016 and 2015, respectively. Over time, the volumes lifted and sold will equal the entitlement production, but they may be higher or lower in any period due to differences between the capacity and timing of the vessels lifting our volumes and the actual entitlement production during the period.

Income statement under IFRS (in USD million)	For the year ended 31 December 2017	2016	2015	17-16 change	16-15 change
Revenues	**60,971**	45,688	57,900	33%	(21%)
Net income/(loss) from equity accounted investments	**188**	(119)	(29)	N/A	>(100%)
Other income	**27**	304	1,770	(91%)	(83%)
Total revenues and other income	**61,187**	45,873	59,642	33%	(23%)
Purchases [net of inventory variation]	**(28,212)**	(21,505)	(26,254)	31%	(18%)
Operating, selling, general and administrative expenses	**(9,501)**	(9,787)	(11,433)	(3%)	(14%)
Depreciation, amortisation and net impairment losses	**(8,644)**	(11,550)	(16,715)	(25%)	(31%)
Exploration expenses	**(1,059)**	(2,952)	(3,872)	(64%)	(24%)
Net operating income/(loss)	**13,771**	80	1,366	>100%	(94%)
Net financial items	**(351)**	(258)	(1,311)	(36%)	80%
Income/(loss) before tax	**13,420**	(178)	55	N/A	N/A
Income tax	**(8,822)**	(2,724)	(5,225)	>100%	(48%)
Net income/(loss)	**4,598**	(2,902)	(5,169)	N/A	44%

Total revenues and other income amounted to USD 61,187 million in 2017 compared to USD 45,873 million in 2016 and USD 59,642 million in 2015.

Revenues are generated from both the sale of lifted crude oil, natural gas and refined products produced and marketed by Statoil, and from the sale of liquids and gas purchased from third parties. In addition, we market and sell the Norwegian State's share of liquids from the NCS. All purchases and sales of the Norwegian State's production of liquids are recorded as purchases [net of inventory variations] and revenues, respectively, while sales of the Norwegian State's share of gas from the NCS are recorded net. For additional information regarding sales, see the Sales volume table in section 2.8 above in this report.

Revenues were USD 60,971 million in 2017, up 33% compared to 2016. The increase was mainly due to increased prices both for liquids and gas, and increased gas volumes sold. The 21% decrease in revenues from 2015 to 2016 was mainly due to the significant decrease in liquids and gas prices, lower refinery margins and increased losses from reflecting the changes in fair value of derivatives and market value of storage and physical contracts and a reversal of provisions related to our operations in Angola of USD 754 million. For further information, see note 23 Other commitments, contingent liabilities and contingent assets to the Consolidated financial statements.

Net income from equity accounted investments was USD 188 million in 2017, up from a loss in 2016 of USD 119 million due to increased profit from the investment in Lundin Petroleum AB. In 2015, net income from equity accounted investments was a loss of USD 29 million. For further information, please see note 12 Equity accounted investments to the Consolidated financial statements.

Other income was USD 27 million in 2017 compared to USD 304 million in 2016 and USD 1,770 million in 2015. In 2017, other income was insignificant and mainly related to proceeds from minor insurance claims. In 2016, other income was mainly related to gain from sale of the Edvard Grieg field on the NCS and proceeds from an insurance settlement. In 2015, other income mainly consisted of gain from the two step divestments of the ownership interest in the Shah Deniz project in Azerbaijan.

Because of the factors explained above, **total revenue and other income** was up by 33% in 2017. In 2016 and 2015, total revenues and other income decreased by 23% and 40%, respectively.

Purchases [net of inventory variation] include the cost of liquids purchased from the Norwegian State, which is pursuant to the Owner's instruction, and the cost of liquids and gas purchased from third parties. See SDFI oil and gas marketing and sale in section 2.7 Corporate for more details.

Purchases [net of inventory variation] amounted to USD 28,212 million in 2017 compared to USD 21,505 million in 2016 and USD 26,254 million in 2015. The 31% increase in 2017 was mainly related to the increase in prices. The 18% decrease from 2015 to 2016 was mainly related to the decrease in liquids and gas prices.

Operating, selling, general and administrative expenses amounted to USD 9,501 million in 2017 compared to USD 9,787 million in 2016 and USD 11,433 million in 2015. The 3% decrease from 2016 to 2017 was mainly due to divestments and reduced asset retirement provisions, partially offset by net losses from sale of assets and increased costs from new fields coming on stream. Ramp-up on various fields and higher royalty costs also offset the decrease. The 14% decrease from 2015 to 2016 was mainly due to cost improvement initiatives and the NOK/USD exchange rate development. Lower operation and maintenance costs and reduced transportation costs added to the decrease.

Depreciation, amortisation and net impairment losses amounted to USD 8,644 million compared to USD 11,550 million in 2016 and USD 16,715 million in 2015.

The 25% decrease in depreciation, amortisation and net impairment losses in 2017 was mainly due to lower net impairment of assets in 2017 (discussed below), net increased proved reserves estimates on several fields and a lower depreciation basis due to impairments of assets in previous periods. Start-up and ramp-up of production on new fields partially offset the reduction.

Included in the total for 2017 were net impairment reversals of USD 1,055 million, of which impairment reversals amounted to USD 1,972 million mainly related to increased production estimates, cost reductions and increased prices, operational improvements and updated calculation assumptions due to changes in the US tax legislation. The impairment reversals were partially offset by impairment losses of USD 917 million, mainly related to decreased production estimates.

The 31% decrease in 2016 compared to 2015, was mainly due to lower impairment of assets in 2016 and reduced depreciation on mature fields. Higher proved reserves estimate and the NOK/USD exchange rate development in 2016 added to the decrease, partially offset by start-up and ramp-up of production on several fields.

Included in the total for 2016 and 2015, were net impairment losses of USD 1,301 million and USD 5,526 million, respectively, primarily triggered by the reduction in commodity price assumptions and commodity forward prices. The net impairment losses of USD 1,301 million in 2016 were mainly related to impairment of unconventional onshore assets in the USA. The net impairment losses of USD 5,526 million in 2015 were mainly related to both unconventional onshore assets and conventional offshore assets in the E&P International reporting segment, and conventional offshore assets in the development phase in E&P Norway reporting segment.

For further information, please see note 3 Segments and note 10 Property, plant and equipment to the Consolidated financial statements.

Exploration expenses (in USD million)	For the year ended 31 December 2017	2016	2015	17-16 change	16-15 change
Exploration expenditures (activity)	**1,234**	1,437	2,860	(14%)	(50%)
Expensed, previously capitalised exploration expenditures	**73**	808	213	(91%)	>100%
Capitalised share of current period's exploration activity	**(167)**	(285)	(1,151)	(41%)	(75%)
Net impairments / (reversals)	**(81)**	992	1,951	N/A	(49%)
Exploration expenses	**1,059**	2,952	3,872	(64%)	(24%)

In 2017, **exploration expenses** were USD 1,059 million, a 64% decrease compared to 2016 when exploration expenses were USD 2,952 million. Exploration expenses were USD 3,872 million in 2015.

The 64% decrease in exploration expenses in 2017 was mainly due to a lower portion of expenditures capitalised in previous years being expensed in 2017 compared to 2016. Exploration activity was higher in 2017. However, as the exploration wells drilled in 2017 were less expensive due to improved drilling efficiency, exploration expenditures were reduced in 2017 compared to 2016. Net impairment reversals of exploration prospects and signature bonuses in 2017 compared to net impairment charges in 2016, added to the decrease. The decrease was partially offset by a lower capitalisation rate on exploration expenditures incurred in 2017 compared to 2016.

In 2016, exploration expenses were down 24% compared to 2015 mainly due to lower net impairment of exploration prospects and signature bonuses, lower drilling activity and less expensive wells being drilled. The decrease was partially offset by a higher portion of expenditures capitalised in previous years being expensed in 2016 and a lower capitalisation rate on exploration expenditures incurred in 2016 compared to 2015.

Net operating income was USD 13,771 million in 2017 compared to USD 80 million in 2016 and USD 1,366 million in 2015.

With reference to the development in revenues and costs as discussed above, the significant increase in 2017 was primarily driven by higher prices for both liquids and gas, increased gas volumes, significant net impairments reversals in 2017 compared to net impairment charges in 2016 and the reversal of provisions related to our operations in Angola. Reduced depreciation and exploration expenses added to the increase. The decrease in 2016 compared to 2015 was mainly driven by the drop in liquids and gas prices, lower refinery margins and lower gains on sale of assets. Lower net impairment charges in 2016 compared to 2015 and a reduction in operating, depreciation and exploration costs partially offset the decrease.

Net financial items amounted to a loss of USD 351 million in 2017. In 2016 and 2015, net financial items were also a loss of USD 258 million and USD 1,311 million, respectively.

The increased loss of USD 93 million in 2017 was mainly due to loss on derivatives due to increase in EUR and USD interest rates related to our long-term debt portfolio of USD 61 million for 2017, compared to a gain of USD 470 million for 2016, partially offset by a reversal of interest expense of USD 319 million in 2017 previously provided for related to a resolved dispute regarding Statoil's participation offshore Angola in the period 2002 to 2016. For further information, see note 23 Other commitments, contingent liabilities and contingent assets to the Consolidated financial statements.

The reduced loss of USD 1,053 million in 2016 was mainly due to gain on derivatives due to decrease in EUR and GBP interest rates related to our long-term debt portfolio of USD 470 million for 2016, compared to a loss of USD 491 million for 2015.

Income taxes were USD 8,822 million in 2017, equivalent to an effective tax rate of 65.7%, compared to USD 2,724 million in 2016, equivalent to an effective tax rate of more than 100%.In 2015, income taxes were USD 5,225 million, equivalent to an effective tax rate of more than 100%.

The **effective tax rate** in 2017 was primarily influenced by the agreement with the Angolan Ministry of Finance related to Statoil's participation in several blocks offshore Angola. For further information, see note 9 Income taxes to the Consolidated financial statements.

In 2016 and 2015, income before tax was a loss of USD 178 million in 2016 and a profit of USD 55 million in 2015, which both were a combination of large profits in territories with higher statutory tax rates (taking account of Norwegian Petroleum Tax including uplift) and approximately the same amount of losses in territories with lower statutory tax rates. Hence, our effective tax rate is distorted. In addition, the "weighted average statutory tax rate", calculate before taking into account the Norwegian petroleum tax including uplift for comparability, was also distorted.

In 2016, the effective rate of tax on profit earned by E&P Norway, approximated the statutory tax rate (taking account of Norwegian Petroleum Tax including uplift). However, the effective tax rate on E&P International losses was negative due to the inability to currently recognise tax losses and other deferred tax assets arising from losses, primarily in the USA. Overall, this results in a significant income tax charge on a relatively small group loss before tax.

The effective tax rate in 2015 was primarily influenced by losses, mainly caused by impairments recognised in countries where deferred tax assets could not be recognised, partially offset by tax exempted gains on sale of assets including Statoil's interest in the Shah Deniz project. The effective tax rate in 2015 was also influenced by the de-recognition of deferred tax assets within the E&P International segment due to uncertainty related to future taxable income.

The effective tax rate is calculated as income taxes divided by income before taxes. Fluctuations in the effective tax rates from year to year are principally the result of non-taxable items (permanent differences) and changes in the relative composition of income between Norwegian oil and gas production, taxed at a marginal rate of 78%, and income from other tax jurisdictions. Other Norwegian income, including the onshore portion of net financial items, is taxed at 24% (25% in 2016 and 27% in 2015), and income in other countries is taxed at the applicable income tax rates in the various countries.

In 2017, **net income** was USD 4,598 million compared to negative USD 2,902 million in 2016 and negative USD 5,169 million in 2015.

The significant increase in 2017 was mainly a result of the increase in net operating income, partially offset by the increase income taxes and higher loss on net financial items, as explained above. The increase from 2015 to 2016 was mainly due to lower income taxes and lower loss on net financial items, partially offset by the decrease in net operating income.

The board of directors proposes to the annual general meeting (AGM) to increase the dividend by 4.5% to USD 0.23 per ordinary share for the fourth quarter of 2017. The two-year scrip dividend programme ended as planned with the third quarter 2017-dividend.

The **Annual ordinary dividends** for 2017 amounted to an aggregate total of USD 1,586 million, net after scrip dividend of USD 1,357 million. Considering the proposed dividend, USD 2,371 million will be allocated to retained earnings in the parent company.

For 2016 and 2015, annual ordinary dividends amounted to an aggregate total of USD 1,934 million, net after scrip dividend of USD 904 million and USD 2,860 million, respectively.

For further information, see note 17 Shareholders' equity and dividends to the Consolidated financial statements.

In accordance with §3-3a of the Norwegian Accounting Act, the board of directors confirms that the going concern assumption on which the financial statements have been prepared, is appropriate.

SEGMENTS FINANCIAL PERFORMANCE

E&P Norway profit and loss analysis

Net operating income in 2017 was USD 10,485 million, compared to USD 4,451 million in 2016 and USD 7,161 million in 2015. The USD 6,034 million increase from 2016 to 2017 was mainly due to higher liquids and gas prices, and net impairment reversals of USD 905 million in 2017 compared to impairment of USD 829 million in 2016. The USD 2,710 million decrease from 2015 to 2016 was mainly due to lower prices on liquids and gas, partially offset by reduced operating expenses, decreased depreciation and net impairment losses.

The average daily production of liquids and gas was 1,334 mboe, 1,235 mboe and 1,232 mboe per day in 2017, 2016 and 2015, respectively.

The average daily total production level was increased from 2016 to 2017 mainly due to higher flex gas off-take from Troll and Oseberg, contributions from new fields Ivar Aasen and Gina Krog, and fewer turnarounds.

The average daily total production of liquids and gas maintained from 2015 to 2016, mainly due to high operational performance, new fields on stream and new wells from existing fields.

Over time, the volumes lifted and sold will equal entitlement production, but may be higher or lower in any period due to differences between the capacities and timing of the vessels lifting the volumes and the actual entitlement production during the period.

Income statement under IFRS (in USD million)	For the year ended 31 December 2017	2016	2015	17-16 change	16-15 change
Revenues	**17,558**	13,036	17,170	35%	(24%)
Net income/(loss) from equity accounted investments	**129**	(78)	3	N/A	N/A
Other income	**5**	119	166	(96%)	(28%)
Total revenues and other income	**17,692**	13,077	17,339	35%	(25%)
Operating, selling, general and administrative expenses	**(2,954)**	(2,547)	(3,223)	16%	(21%)
Depreciation, amortisation and net impairment losses	**(3,874)**	(5,698)	(6,379)	(32%)	(11%)
Exploration expenses	**(379)**	(383)	(576)	(1%)	(34%)
Net operating income/(loss)	**10,485**	4,451	7,161	>100%	(38%)

Total revenues and other income were USD 17,692 million in 2017, USD 13,077 million in 2016 and USD 17,339 million in 2015.

The 35% increase in revenues from 2016 to 2017 was mainly due to increased liquids and gas prices, and increased gas volumes. The 25% decrease in revenues from 2015 to 2016 was mainly due to reduced liquids and gas prices.

Other income was immaterial in 2017. Other income in 2016 was impacted by gain from sale of Edvard Grieg of USD 114 million. Other income in 2015 was impacted by gain from the sale of certain ownership interests on the NCS to Repsol of USD 142 million.

Operating expenses and selling, general and administrative expenses were USD 2,954 million in 2017, compared to USD 2,547 million in 2016 and USD 3,223 million in 2015. In 2017, expenses increased compared to 2016 mainly due to change in the internal allocation of gas transportation costs between E&P Norway and MMP. The change in internal allocation also increased the revenues due to a higher transfer price. In 2016, expenses decreased compared to 2015 mainly due to cost improvements and exchange rate development (NOK/USD).

Depreciation, amortisation and net impairment losses were USD 3,874 million in 2017, compared to USD 5,698 million in 2016 and USD 6,379 million in 2015. The decrease of 32% from 2016 to 2017 was mainly due to reversal of impairments in 2017 and impairments in 2016. The decrease of 11% from 2015 to 2016 was mainly due to reduced net impairments, exchange rate development (NOK/USD) and increased proved reserves, partially offset by ramp up of new fields in 2016.

Exploration expenses were USD 379 million in 2017, compared to USD 383 million in 2016 and USD 576 million in 2015. The reduction from 2016 to 2017 was mainly due to lower field development activity and lower portion of previously capitalised exploration expenditures being expensed in 2017, partially offset by a lower portion of current exploration expenditures being capitalised. The reduction from 2015 to 2016 was mainly due to lower drilling activity and more expensive wells being drilled in 2015, partially offset by a lower portion of current exploration expenditures being capitalised.

E&P International profit and loss analysis

Net operating income in 2017 was positive USD 1,341 million, compared to negative USD 4,352 million in 2016 and negative USD 8,729 million in 2015. The positive development from 2016 to 2017 was caused primarily by higher oil and gas prices, and by net reversal of impairments in 2017 compared to net impairment losses in 2016. The positive development from 2015 to 2016 was caused primarily by less impairment losses, and also by lower operating expenses.

The average daily equity liquids and gas production (see section 5.6 Terms and abbreviations) was 745 mboe per day in 2017, compared to 743 mboe per day in 2016 and 739 mboe per day in 2015. The minor increase from 2016 to 2017 was due to new wells in the US, particularly at Appalachian, as well as the effect of ramp-up of fields, mainly in Ireland and Algeria. The increase was partially offset by the divestment of Kai Kos Dehseh oil sands and natural decline, primarily at mature fields in Angola. The increase of 0.5% from 2015 to 2016 was driven primarily by the effect of the ramp-up of fields, mainly in Ireland, Algeria, and the US. The increase was partially offset by the divestment of Shah Deniz (Azerbaijan) and natural decline.

The average daily entitlement liquids and gas production (see section 5.6 Terms and abbreviations) was 588 mboe per day in 2017, compared to 592 mboe per day in 2016, and 580 mboe per day in 2015. Entitlement production in 2017 was down by 1% due to higher negative effect from production sharing agreements (PSA effect) and US royalties, mainly driven by higher prices. Entitlement production in 2016 was up by 2% due to the increased equity production as described above and a relatively lower PSA effect. The combined effect of production sharing agreements (PSA effect) and US royalties was 158 mboe, 151 mboe and 159 mboe per day in 2017, 2016 and 2015, respectively.

Over time, the volumes lifted and sold will equal our entitlement production, but they may be higher or lower in any period due to differences between the capacity and timing of the vessels lifting our volumes and the actual entitlement production during the period. See section 5.6 Terms and abbreviations for more information.

Income statement under IFRS (in USD million)	For the year ended 31 December 2017	2016	2015	17-16 change	16-15 change
Revenues	**9,219**	6,623	7,135	39%	(7%)
Net income/(loss) from equity accounted investments	**22**	(100)	(91)	N/A	(10%)
Other income	**14**	134	1,156	(90%)	(88%)
Total revenues and other income	**9,256**	6,657	8,200	39%	(19%)
Purchases [net of inventory]	**(7)**	(7)	(10)	2%	(28%)
Operating, selling, general and administrative expenses	**(2,804)**	(2,923)	(3,391)	(4%)	(14%)
Depreciation, amortisation and net impairment losses	**(4,423)**	(5,510)	(10,231)	(20%)	(46%)
Exploration expenses	**(681)**	(2,569)	(3,296)	(74%)	(22%)
Net operating income/(loss)	**1,341**	(4,352)	(8,729)	N/A	50%

E&P International generated **total revenues and other income** of USD 9,256 million in 2017, compared to USD 6,657 million in 2016 and USD 8,200 million in 2015.

Revenues in 2017 were positively impacted primarily by higher realised liquids and gas prices, in addition to positive effects from reversal of provisions related to our operations in Angola of USD 754 million. The decrease from 2015 to 2016 was mainly caused by lower realised liquids and gas prices, partially offset by lower provisions relating to commercial disputes in 2016 compared to 2015. For information related to the reversal of provisions and disputes, see note 23 Other commitments, contingent liabilities and contingent assets to the Consolidated financial statements.

Other income was USD 14 million in 2017, compared to USD 134 million in 2016 and USD 1,156 million in 2015. In 2017, other income was mainly related to proceeds from minor insurance claims. In 2016, other income was mainly related to proceeds from an insurance settlement. In 2015, other income consisted of gains from sales of assets, related primarily to the sale of ownership interest in the Shah Deniz project and the South Caucasus Pipeline.

As a result of the factors explained above, **total revenues and other income** increased by 39% in 2017. In 2016, total revenues and other income decreased by 19%.

Operating expenses and selling, general and administrative expenses were USD 2,804 million in 2017, compared to USD 2,923 million in 2016 and USD 3,391 million in 2015. The 4% decrease from 2016 to 2017 was mainly due to portfolio changes and reduced provisions related to asset retirement. The decreases were partially offset by net losses from sale of assets in 2017, and higher royalties, costs related to preparation for operation for new fields and transportation expenses. The 14% decrease from 2015 to 2016 was mainly due to lower operating and maintenance costs for various fields, in addition to lower diluent expenses. The decreases were partially offset by operating and transportation costs for the new fields coming on stream.

Depreciation, amortisation and net impairment losses were USD 4,423 million in 2017, compared to USD 5,510 million in 2016 and USD 10,231 million in 2015. The 20% decrease from 2016 to 2017 was caused primarily by net reversal of impairments in 2017, compared to net impairment losses in 2016. Net reversal of impairments amounted to USD 102 million in 2017, with the reversal of impairment related to an unconventional onshore asset in North America, caused by changes in US tax legislation, operational improvements and increased recovery rate, as the main contributor. In addition, depreciations decreased due to higher reserves estimates and effects from previous periods' impairments, partially offset by production ramp-up from new fields.

The 46% decrease from 2015 to 2016 was primarily caused by lower net impairment losses in 2016 compared to 2015. Net impairment losses amounted to USD 541 million in 2016 and resulted mainly from reduced long-term price assumptions with the largest effect being on the unconventional onshore assets in North America. Net impairment losses amounted to USD 5,416 million in 2015, and were mainly related to unconventional onshore assets in North America and certain conventional upstream assets. The impairment losses resulted primarily from reduced short-term forward prices in combination with reduced long-term oil price forecasts. In addition, depreciations decreased due to higher reserves estimates. The decreases were partially offset by start-up and ramp-up of production from new fields.

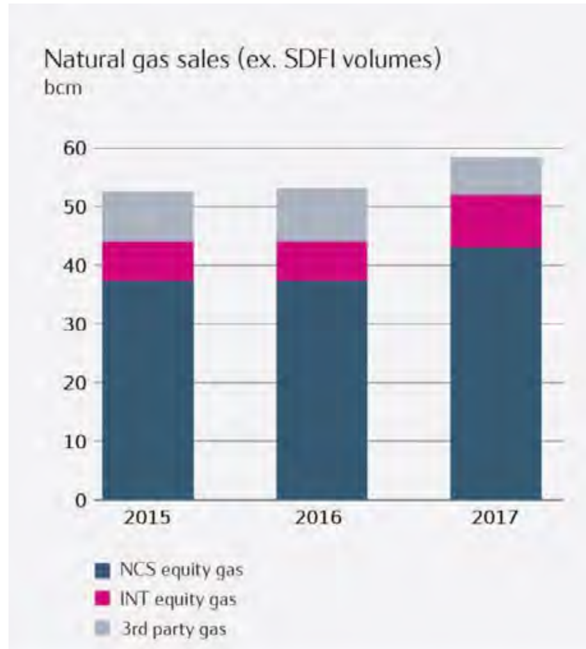
Exploration expenses were USD 681 million in 2017, compared to USD 2,569 million in 2016 and USD 3,296 million in 2015. The reduction from 2016 to 2017 was mainly due to net impairment of exploration prospects and signature bonuses in 2016 of USD 992 million compared with USD 82 million in 2017. Lower portion of capitalised expenditures from earlier years being expensed in 2017 of USD 60 million compared with USD 785 million in 2016 contributed to the reduction, in addition to less expensive wells drilled in 2017 despite higher exploration activity. This was partially offset by lower capitalization rate in 2017. The 22% reduction from 2015 to 2016 was mainly due to lower impairments, lower drilling activity and lower well costs in 2016. Higher portion of wells capitalised in previous periods being expensed this year and a lower capitalisation rate in 2016 partially offset the decrease.

MMP profit and loss analysis

Net operating income was USD 2,243 million, USD 623 million and USD 2,931 million in 2017, 2016 and 2015, respectively. In 2017 net operating income was positively impacted by changes in fair value of derivatives and periodisation of inventory hedging effect of USD 365 million compared to negative impact of USD 1,072 million in 2016. Higher refinery margins and increased production from processing plants added to the total increase of USD 1,620 million from 2016 to 2017.

The decrease of USD 2,308 million from 2015 to 2016 was mainly due to lower fair value of derivatives and periodisation of inventory hedging effect of USD 1,072 million in 2016 compared to negative USD 21 million in 2015. Lower margins from processing and turnarounds in 2016 added to the decrease. The decrease is also impacted by the net reversal of impairment charges of USD 421 million in 2015.

Total natural gas sales volumes were 58.4 bcm in 2017, 52.9 bcm in 2016 and 52.6 bcm in 2015. The 10% increase in total gas volumes sold from 2016 to 2017 was related to higher entitlement production on the NCS and internationally, partially offset by lower sales of third party gas. The chart does not include any volumes sold on behalf of the Norwegian State's direct financial interest (SDFI).

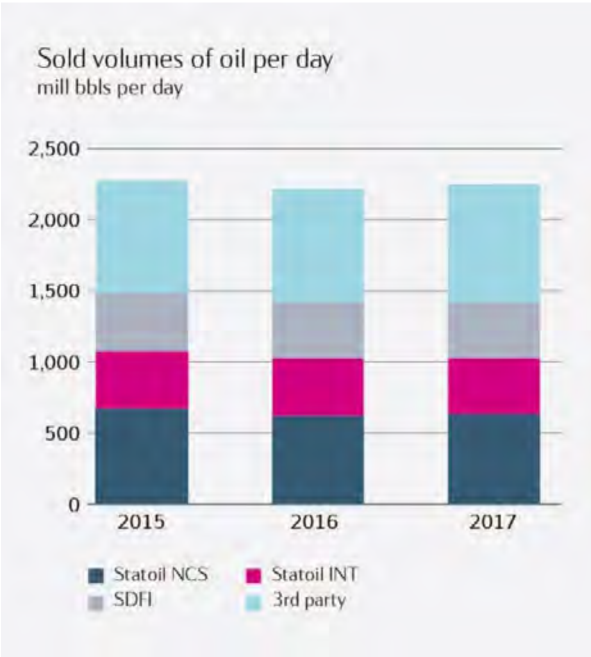


In 2017, the average invoiced natural gas sales price in Europe was USD 5.55 per mmBtu, up 7% from 2016 (USD 5.17 per mmBtu). The 2016 average invoiced natural gas price in Europe was down 27% from 2015 (USD 7.08 per mmBtu).

In 2017, the average invoiced natural gas sales price in North Americas was USD 2.73 per mmBtu, up 28% from 2016 (USD 2.12 per mmBtu). The 2016 average invoiced natural gas sales price in North Americas was down 19% from 2015 (USD 2.62 per mmBtu).

All of Statoil's gas produced on the NCS is sold by MMP, purchased from E&P Norway at the fields' lifting point at a market-based internal price with deduction for the cost of bringing gas from the field to market and a marketing fee element. Our NCS transfer price for gas was USD 4.33 per mmBtu in 2017, an increase of 27% compared to USD 3.42 per mmBtu in 2016. The 2016 NCS transfer price was down 34% from 2015 (USD 5.17 per mmBtu).

Average crude, condensate and NGL sales were 2.2 mmbbl per day in 2017 of which approximately 1.01 mmbbl were sales of our equity volumes, 0.83 mmbbl sales of third-party volumes and 0.40 mmbbl sales of volumes purchased from SDFI. Our average sales volumes were 2.2 and 2.3 mmbbl per day in 2016 and 2015. The average daily third-party volumes sold were 0.80 and 0.79 mmbbl in 2016 and 2015



MMPs refining margins were higher in 2017 than in 2016, and results were also impacted by higher production from the refineries. Statoil's refining reference margin was 6.3 USD/bbl in 2017, compared to 4.8 USD/bbl in 2016, an increase of 31%. The refining reference margin was 8.0 USD/bbl in 2015.

Income statement under IFRS (in USD million)	For the year ended 31 December 2017	2016	2015	17-16 change	16-15 change
Revenues	**59,017**	44,847	57,873	32%	(23%)
Net income/(loss) from equity accounted investments	**53**	61	55	(14%)	12%
Other income	**1**	72	178	(98%)	(60%)
Total revenues and other income	**59,071**	44,979	58,106	31%	(23%)
Purchases [net of inventory]	**(52,647)**	(39,696)	(50,547)	33%	(21%)
Operating, selling, general and administrative expenses	**(3,925)**	(4,439)	(4,664)	(12%)	(5%)
Depreciation, amortisation and net impairment losses	**(256)**	(221)	37	16%	N/A
Net operating income/(loss)	**2,243**	623	2,931	>100%	(79%)

Total revenues and other income were USD 59,071 million in 2017, compared to USD 44,979 million in 2016 and USD 58,106 million in 2015.

The increase in **revenues** from 2016 to 2017 was mainly due to increase in prices for all products. The average crude price in USD increased by approximately 25% in 2017 compared to 2016.

The decrease in revenues from 2015 to 2016 was mainly due to decrease in crude and gas prices. The average crude price in USD declined by approximately 17% in 2016 compared to 2015. Revenues in 2016 were negatively impacted by loss from derivatives, mainly due to significant increase in the forward curve in the oil and gas market.

Other income in 2017 was negligible. In 2016, other income was positively impacted by gain on sale of assets of USD 72 million, and in 2015 other income was positively impacted by gain on sale of assets of USD 178 million.

Because of the factors explained above, **total revenues and other income** increased by 31% from 2016 to 2017 and decreased by 23% from 2015 to 2016.

Purchases [net of inventory] were USD 52,647 million in 2017, compared to USD 39,696 million in 2016 and USD 50,547 million in 2015. The increase from 2016 to 2017 was mainly due to increase in price for all products. The decrease from 2015 to 2016 was mainly due to decrease in gas and crude prices.

Operating expenses and selling, general and administrative expenses were USD 3,925 million in 2017, compared to USD 4,439 million in 2016 and USD 4,664 million in 2015. The decrease from 2016 to 2017 was mainly due to a change in the internal allocation of gas transportation cost between MMP and E&P Norway, partially offset by higher maintenance cost on plants. The decrease from 2015 to 2016 was mainly due to lower transportation cost and cost reduction initiatives in 2016.

Depreciation, amortisation and net impairment losses amounted to a loss of USD 256 million in 2017, and a loss of USD 221 million in 2016 compared to an income of USD 37 million in 2015. The increase in depreciation, amortisation and net impairment losses from 2016 to 2017 was mainly caused by lower reversal of impairments in 2017 compared to 2016. Net reversal of impairments in 2017 was mainly related to refinery assets, impacted by expected lower cost base in the future cash flows. The increase in depreciation, amortisation and net impairment losses from 2015 to 2016 was mainly caused by net reversal of impairment charges of USD 421 million in 2015, related to our refineries.

Other operations

The Other reporting segment includes activities within New Energy Solutions; Global Strategy & Business Development; Technology, Projects & Drilling; and Corporate staffs and support functions.

In 2017, the Other reporting segment recorded a net operating loss of USD 239 million compared to a net operating loss of USD 423 million in 2016 and a net operating loss of USD 129 million in 2015.

2.10 LIQUIDITY AND CAPITAL RESOURCES

REVIEW OF CASH FLOWS

Statoil`s cash flow generation in 2017 was strong across the business and total cash flows increased by USD 2,234 compared to 2016.

CONDENSED CONSOLIDATED STATEMENT OF CASH FLOWS

	Full year		
(in USD million)	2017	2016	2015
Cash flows provided by operating activities	14,363	9,034	13,628
Cash flows used in investing activities	(9,678)	(10,446)	(14,501)
Cash flows provided by (used in) financing activities	(5,822)	(1,959)	(729)
Net increase (decrease) in cash and cash equivalents	(1,137)	(3,371)	(1,602)

Cash flows provided by operating activities
The most significant drivers of cash flows provided by operations were the level of production and prices for liquids and natural gas that impact revenues, purchases [net of inventory], taxes paid and changes in working capital items.

In 2017, cash flows provided by operating activities were increased by USD 5,329 million compared to 2016. The increase was mainly due to increased liquids and gas prices, combined with higher production and a reduction in working capital, partially offset by increased tax payments.

In 2016, cash flows provided by operating activities were reduced by USD 4,594 million compared to 2015. The decrease was mainly due to reduced liquids and gas prices, partially offset by lower taxes paid.

Cash flows used in investing activities
In 2017, cash flows used in investing activities were reduced by USD 768 million compared to 2016. The decrease was due to decreased capital expenditures, partially offset by reduced proceeds from sale of assets and increased financial investments.

In 2016, cash flows used in investing were reduced by USD 4,055 million compared to 2015. The decrease was due to significantly lower capital expenditures, lower financial investments and reduced proceeds from sale of assets.

Cash flows provided by (used in) financing activities
In 2017, cash flows used in financing activities were increased by USD 3,863 million compared to 2016. The cash outflow was mainly due to repayment of finance debt, partially offset by increased cash flow from collateral related to derivatives.

In 2016, cash flows used in financing activities increased by USD 1,230 million compared to 2015. The change is mainly due to reduced cash flow from finance debt, partially offset by reduced cash dividend due to the scrip dividend.

FINANCIAL ASSETS AND DEBT

Statoil's financial position is strong. The net debt to capital employed ratio before adjustments at year end decreased from 34.4% in 2016 to 27.9% in 2017. See section 5.2 for non-GAAP measures for net debt ratio. Net interest-bearing debt decreased from USD 18.4 billion to USD 15.4 billion. During 2017 Statoil's total equity increased from USD 35.1 billion to USD 39.9 billion, mainly due to a positive net income in 2017. Cash flows provided by operating activities increased in 2017 mainly due to increased prices. Cash flows used in investing activities were reduced in 2017, while cash flows used in financing activities increased. Statoil has paid out four quarterly dividends in 2017. For the fourth quarter of 2017 the board of directors will propose to the annual general meeting (AGM) to increase the dividend from USD 0.2201 to USD 0.23 per share. The two-year scrip dividend programme ended as planned with the third quarter 2017 dividend. For further information, see note 17 Shareholders equity and dividends to the Consolidated financial statements.

Statoil believes that, given its current liquidity reserves, including committed credit facilities of USD 5.0 billion and its access to various capital markets, Statoil has sufficient funds available to meet its liquidity needs, including working capital.

Funding needs arise as a result of Statoil's general business activities. Statoil generally seeks to establish financing at the corporate (top company) level. Project financing may also be used in cases involving joint ventures with other companies. Statoil aims to have access to a variety of funding sources in respect of markets and instruments at all times, as well as maintaining relationships with a core group of international banks that provide a wide range of banking services.

Moody's and Standard & Poor's (S&P) provide credit ratings on Statoil. Statoil's current long-term ratings are A+ with a positive outlook and Aa3 with a stable outlook from S&P and Moody's, respectively. The outlook from S&P was revised from "Stable" to "Positive" on 14 November 2017 based on stronger than expected cash flow generation year to date. The short-term ratings are P-1 from Moody's and A-1 from S&P. In order to maintain financial flexibility going forward, Statoil intend to keep key financial ratios at levels consistent with our objective of maintaining Statoil's long-term credit rating at least within the single A category on a stand-alone basis.

The management of financial assets and liabilities takes into consideration funding sources, the maturity profile of non-current debt, interest rate risk, currency risk and available liquid assets. Statoil's borrowings are denominated in various currencies and normally swapped into USD. In addition, interest rate derivatives, primarily interest rate swaps, are used to manage the interest rate risk of our long-term debt portfolio. Statoil's funding and liquidity activities are handled centrally.

Statoil has diversified its cash investments across a range of financial instruments and counterparties to avoid concentrating risk in any one type of investment or any single country. As of 31 December 2017, approximately 21% of Statoil's liquid assets were held in USD-denominated assets, 21% in NOK, 32% in EUR, 10% in DKK and 15% in SEK, before the effect of currency swaps and forward contracts. Approximately 49% of Statoil's liquid assets were held in treasury bills and commercial paper, 42% in time deposits, 3% in money market funds and 2% in bank deposits. As of 31 December 2017, approximately 3.8% of Statoil's liquid assets were classified as restricted cash (including collateral deposits).

Statoil's general policy is to keep a liquidity reserve in the form of cash and cash equivalents or other current financial investments in Statoil's balance sheet, as well as committed, unused credit facilities and credit lines in order to ensure that Statoil has sufficient financial resources to meet short-term requirements.

Long-term funding is raised when a need is identified for such financing based on Statoil's business activities, cash flows and required financial flexibility or when market conditions are considered to be favourable.

The Group's borrowing needs are usually covered through the issuance of short-, medium- and long-term securities, including utilisation of a US Commercial Paper Programme (programme limit USD 5.0 billion) and a Shelf Registration Statement (unlimited) filed with the Securities and Exchange Commission (SEC) in the USA as well as through issues under a Euro Medium-Term Note (EMTN) Programme listed on the London Stock Exchange. Committed credit facilities and credit lines may also be utilised. After the effect of currency swaps, the major part of Statoil's borrowings is in USD.

Effective 14 December 2017, Statoil bought back USD 2.25 billion of issued bonds. During 2017, Statoil issued no new bonds, while in 2016 new debt securities equivalent to USD 1.3 billion and in 2015 equivalent to USD 4.3 billion were issued. All the bonds are unconditionally guaranteed by Statoil Petroleum AS. For more information, see note 18 Finance debt to the Consolidated financial statements.

FINANCIAL INDICATORS

FINANCIAL INDICATORS (in USD million)	For the year ended 31 December 2017	2016	2015
Gross interest-bearing debt [1)]	**28,274**	31,673	32,291
Net interest-bearing debt before adjustments	**15,437**	18,372	13,852
Net debt to capital employed ratio [2)]	**27.9%**	34.4%	25.6%
Net debt to capital employed ratio adjusted [3)]	**29.0%**	35.6%	26.8%
Cash and cash equivalents	**4,390**	5,090	8,623
Current financial investments	**8,448**	8,211	9,817
Ratio of earnings to fixed charges [4)]	**6.8**	0.9	1.0

1) Defined as non-current and current finance debt.

2) As calculated according to IFRS. Net debt to capital employed ratio is the net debt divided by capital employed. Net debt is interest-bearing debt less cash and cash equivalents and current financial investments. Capital employed is net debt, shareholders' equity and minority interest.

3) In order to calculate the net debt to capital employed ratio adjusted, Statoil makes adjustments to capital employed as it would be reported under IFRS. Restricted funds held as financial investments in Statoil Forsikting AS and Collateral deposits has been added to the net debt whilst the SDFI part of the financial lease in the Snøhvit vessel has been taken out of the net debt. See section 5.2 Net debt to capital employed ratio for a reconciliation of capital employed and a description of why Statoil considers this measure to be useful.

4) For the purpose of these ratios, earnings consist of the income before (i) tax, (ii) minority interest, (iii) amortisation of capitalised interest and (iv) fixed charges (which have been adjusted for capitalised interest) and after adjustment for unremitted earnings from equity accounted entities. Fixed charges consist of interest (including capitalised interest) and estimated interest within operating leases.

Gross interest-bearing debt

Gross interest-bearing debt was USD 28.3 billion, USD 31.7 billion and USD 32.3 billion at 31 December 2017, 2016 and 2015, respectively. The USD 3.4 billion net decrease from 2016 to 2017 was due to a decrease in non-current finance debt of USD 3.8 billion, offset by an increase in current finance debt of USD 0.4 billion. The USD 0.6 billion net decrease from 2015 to 2016 was due to a decrease in non-current finance debt of USD 2.0 billion offset by an increase in current finance debt of USD 1.4 billion. Our weighted average annual interest rate was 3.50%, 3.41% and 3.39% at 31 December 2017, 2016 and 2015, respectively. Statoil's weighted average maturity on finance debt was nine years at 31 December 2017, nine years at 31 December 2016 and nine years at 31 December 2015.

Net interest-bearing debt
Net interest-bearing debt before adjustments were USD 15.4 billion, USD 18.4 billion and USD 13.9 billion at 31 December 2017, 2016 and 2015, respectively. The decrease of USD 2.9 billion from 2016 to 2017 was mainly related to a decrease in gross interest-bearing debt of USD 3.4 billion, an increase of current financial investments of USD 0.2 billion offset by a USD 0.7 billion decrease in cash and cash equivalents. The increase of USD 4.5 billion from 2015 to 2016 was mainly related to a decrease in cash and cash equivalents of USD 3.5 billion, a decrease of current financial investments of USD 1.6 billion offset by a USD 0.6 billion decrease in gross interest-bearing debt.

The net debt to capital employed ratio
The net debt to capital employed ratio before adjustments was 27.9%, 34.4% and 25.6% in 2017, 2016 and 2015 respectively.

The net debt to capital employed ratio adjusted (non-GAAP financial measure, see footnote three above) was 29.0%, 35.6% and 26.8% in 2017, 2016, and 2015, respectively.

The 6.5 percentage points decrease in net debt to capital employed ratio before adjustments from 2016 to 2017 was related to the decrease in net interest-bearing debt of USD 2.9 billion in combination with an increase in capital employed of USD 1.9 billion. The 8.8 percentage points increase in net debt to capital employed ratio before adjustments from 2015 to 2016 was related to the increase in net interest-bearing debt of USD 4.5 billion in combination with a decrease in capital employed of USD 0.7 billion.

The 6.6 percentage points decrease in net debt to capital employed ratio adjusted from 2016 to 2017 was related to the decrease in net interest-bearing debt adjusted of USD 3.1 billion in combination with an increase in capital employed adjusted of USD 1.7 billion. The 8.8 percentage points increase in net debt to capital employed ratio adjusted from 2015 to 2016 was related to the increase in net interest-bearing debt adjusted of USD 4.6 billion in combination with a decrease in capital employed adjusted of USD 0.6 billion.

Cash, cash equivalents and current financial investments
Cash and cash equivalents were USD 4.4 billion, USD 5.1 billion and USD 8.6 billion at 31 December 2017, 2016 and 2015 respectively. See note 16 Cash and cash equivalents to the Consolidated financial statements for information concerning restricted cash. Current financial investments, which are part of Statoil's liquidity management, amounted to USD 8.4 billion, USD 8.2 billion and USD 9.8 billion at 31 December 2017, 2016 and 2015, respectively.

INVESTMENTS

In 2017, capital expenditures, defined as additions to property, plant and equipment (including capitalised financial leases), capitalised exploration expenditures, intangible assets, long-term share investments and investments in equity accounted companies, amounted to USD 10.8 billion, of which USD 9.4 billion were organic capital expenditures.[5]

In 2016, capital expenditures were USD 14.1 billion, of which organic capital expenditures amounted to USD 10.1 billion.

In Norway, a substantial proportion of our 2018 capital expenditures will be spent on ongoing development projects such as Johan Sverdrup, Johan Castberg, Martin Linge and Aasta Hansteen, in addition to various extensions, modifications and improvements on currently producing fields like Gullfaks, Oseberg and Troll.

Internationally, we currently estimate that a substantial proportion of our 2018 capital expenditure will be spent on the following ongoing and planned development projects: Mariner in the UK, Peregrino in Brazil, and onshore activity in the US.

Within renewable energy, a substantial proportion of our 2018 capital expenditure is expected to be spent on the Arkona offshore wind project in Germany.

Statoil finances its capital expenditures both internally and externally. For more information, see Financial assets and debt earlier in this section.

As illustrated in section Principal contractual obligations later in this report, Statoil has committed to certain investments in the future. The further into the future, the more flexibility we will have to revise expenditure. This flexibility is partly dependent on the expenditure our partners in joint ventures agree to commit to. A large part of the capital expenditure for 2018 is committed.

Statoil may alter the amount, timing or segmental or project allocation of our capital expenditures in anticipation of, or as a result of a number of factors outside our control.

PRINCIPAL CONTRACTUAL OBLIGATIONS

The table summarises our principal contractual obligations, excluding derivatives and other hedging instruments, as well as, asset retirement obligations, which for the most part are expected to lead to cash disbursements more than five years in the future.

Non-current finance debt in the table represents principal payment obligations, including interest obligation. Obligations related to an ownership interest and the transport capacity cost for a pipeline and exceeding Statoil ownership in unconsolidated equity affiliates are included as part of the other long-term commitments.

[5] See section 5.2 for non-GAAP measures

Principal contractual obligations (in USD million)	As at 31 December 2017 Payment due by period [1] Less than 1 year	1-3 years	3-5 years	More than 5 years	Total
Undiscounted finance debt- principal and interest[2]	3,763	5,165	4,521	22,925	36,375
Minimum operating lease payments[3]	1,961	2,477	1,649	2,014	8,101
Nominal minimum other long-term commitments[4]	1,548	2,727	2,043	5,563	11,881
Total contractual obligations	7,273	10,370	8,213	30,502	56,357

1) "Less than 1 year" represents 2018; "1-3 years" represents 2019 and 2020, "3-5 years" represents 2021 and 2022, while "More than 5 years" includes amounts for later periods.

2) See note 18 Finance debt to the Consolidated financial statements. The main differences between the table and the note is interest.

3) See note 22 Leases to the Consolidated financial statements.

4) See note 23 Other commitments and contingencies to the Consolidated financial statements.

Statoil had contractual commitments of USD 6,012 million at 31 December 2017. The contractual commitments reflect Statoil's share and mainly comprise construction and acquisition of property, plant and equipment.

Statoil's projected pension benefit obligation was USD 8,286 million, and the fair value of plan assets amounted to USD 5,687 million as of 31 December 2017. Company contributions are mainly related to employees in Norway. See note 19 Pensions to the Consolidated financial statements for more information.

OFF BALANCE SHEET ARRANGEMENTS

Statoil is party to various agreements, such as operational leases and transportation and processing capacity contracts, that are not recognised in the balance sheet. For more information, see Principal contractual obligations in section 2.10 Liquidity and capital resources, and note 22 Leases to the Consolidated financial statements. Statoil is also party to certain guarantees, commitments and contingencies that, pursuant to IFRS, are not necessarily recognised in the balance sheet as liabilities. See note 23 Other commitments and contingencies to the Consolidated financial statements for more information.

2.11 RISK REVIEW

RISK FACTORS

Statoil is exposed to a number of risks that could affect its operational and financial performance. In this section, some of the key risk factors are addressed.

Risks related to our business

This section describes the most significant potential risks relating to Statoil's business:

Oil and natural gas prices risks

A prolonged period of low oil and/or natural gas prices would have a material adverse effect on Statoil

The prices of oil and natural gas have fluctuated greatly in response to changes in many factors. We have experienced a situation where oil and natural gas prices declined substantially compared to levels seen over the last few years. There are several reasons for this decline, but fundamental market forces beyond the control of Statoil or other similar market participants have impacted and can continue to impact oil and natural gas prices in the future. Recently, as a consequence of agreements within Opec and also between Opec and some non-Opec countries, oil prices have increased due to expectations of an earlier tightening of market balances. However, the uncertainty about future developments still prevails.

Generally, Statoil does not and will not have control over the factors that affect the prices of oil and natural gas. These factors include:

- economic and political developments in resource-producing regions
- global and regional supply and demand
- the ability of the Organisation of the Petroleum Exporting Countries (Opec) and/or other producing nations to influence global production levels and prices
- prices of alternative fuels that affect the prices realised under Statoil's long-term gas sales contracts
- government regulations and actions; including changes in energy and climate policies
- global economic conditions
- war or other international conflicts
- changes in population growth and consumer preferences
- the price and availability of new technology and
- weather conditions

It is impossible to predict future price movements for oil and/or natural gas with certainty. A prolonged period of low oil and natural gas prices will adversely affect Statoil's business, the results of operations, financial condition, liquidity and Statoil's ability to finance planned capital expenditure, including possible reductions in capital expenditures which could lead to reduced reserve replacement. In addition to the adverse effect on revenues, margins and profitability from any fall in oil and natural gas prices, a prolonged period of low prices or other indicators could, if deemed to have longer term impact, lead to further reviews for impairment of the group's oil and natural gas properties. Such reviews would reflect the management's view of long-term oil and natural gas prices and could result in a charge for impairment that could have a significant effect on the results of Statoil's operations in the period in which it occurs.

Changes in management's view on long-term oil and/or natural gas prices or further material reductions in oil, gas and/or product prices could have an adverse impact on the economic viability of projects that are planned or in development.

Proved reserves and expected reserves calculation risks

Statoil's crude oil and natural gas reserves are only estimates and Statoil's future production, revenues and expenditures with respect to its reserves may differ materially from these estimates. The reliability of proved reserve estimates depends on:

- the quality and quantity of Statoil's geological, technical and economic data
- the production performance of Statoil's reservoirs
- extensive engineering judgments and
- whether the prevailing tax rules and other government regulations, contracts and oil, gas and other prices will remain the same as on the date estimates are made

Proved reserves are calculated based on the U.S. Securities and Exchange Commission (SEC) requirements and may therefore differ substantially from Statoil's view on expected reserves.

Many of the factors, assumptions and variables involved in estimating reserves are beyond Statoil's control and may prove to be incorrect over time. The results of drilling, testing and production after the date of the estimates may require substantial upward or downward revisions in Statoil's reserve data. The prices used for proved reserves are defined by the SEC and are calculated based on a 12 month un-weighted arithmetic average of the first day of the month price for each month during the reporting year, leading to a forward price strongly linked to last year's price environment. Fluctuations in oil and gas prices will have a direct impact on Statoil's proved reserves. For fields governed by production sharing agreements (PSAs), a lower price may lead to higher entitlement to the production and increased reserves for those fields. Adversely, a lower price environment may also lead to lower activity resulting in reduced reserves. For PSAs these two effects may to some degree offset each other. In addition a low price environment may result in earlier shutdown due to uneconomic production. This will affect both PSAs and fields with concession types of agreement.

Technical, commercial and country specific risks

Statoil is engaged in global exploration activities that involve a number of technical, commercial and country specific risks.

General risks are technical risks related to Statoil's ability to conduct its seismic and drilling operations in a safe and efficient manner and to encounter commercially productive oil and gas reservoirs and commercial risks related to Statoil's ability to secure access to new acreage in an uncertain global competitive and political environment and competent personnel to perform exploration activities and mature resources along the value-chain. Country specific risks are related to security threats and compliance with and understanding of local laws or licence agreements. These risks may adversely affect Statoil's current operations and financial results, and its long-term replacement of reserves.

Decline reserves risks

If Statoil fails to acquire or discover and develop additional reserves, its reserves and production will decline materially from their current levels

Successful implementation of Statoil's group strategy for value growth is critically dependent on sustaining its long-term reserve replacement. If upstream resources are not progressed to proved reserves in a timely manner, Statoil's reserve base and thereby future production will gradually decline and future revenue will be reduced.

Statoil's future production is highly dependent on its success in acquiring or finding and developing additional reserves adding value. If unsuccessful, future total proved reserves and production will decline.

If a low price environment continues for a substantial time, this may result in undeveloped acreage not being considered economically viable and consequently discovered resources not being matured to reserves. This may also lead to exploration areas not being explored for new resources and subsequently not being matured for development resulting in less future proved reserves.

In a number of resource-rich countries, national oil companies control a significant proportion of oil and gas reserves that remain to be developed. To the extent that national oil companies choose to develop their oil and gas resources without the participation of international oil companies, or if Statoil is unable to develop partnerships with national oil companies, its ability to find and acquire or develop additional reserves will be more limited.

Statoil's US onshore portfolio contains significant amount of undeveloped resources that depend on Statoil's ability to develop these successfully. If commodity prices are low over a sustained period of time, this may result in Statoil deciding not to develop these resources or at least deferring development awaiting improved prices. Additionally, the development of these resources is subject to Statoil ability to continue to deliver on its US onshore strategy to enhance value and create robust developments.

Health, safety and environmental risks

Statoil is exposed to a wide range of health, safety and environmental risks that could result in significant losses.

Exploration, development, production, processing and transportation related to oil and natural gas, as well as development and operation of renewable energy production, can be hazardous. Technical integrity failures, operational failures, natural disasters or other occurrences can result in: loss of life, oil spills, gas leaks, loss of containment of hazardous materials, water contamination, blowouts, cratering, fires and equipment failure, among other things.

The risks associated with Statoil's activities are affected by the difficult geographies, climate zones and environmentally sensitive regions in which Statoil operates. All modes of transportation of hydrocarbons - including road, rail, sea or pipeline - are particularly susceptible to a loss of containment of hydrocarbons and other hazardous materials, and, given the high volumes involved, these could represent a significant risk to people and the environment. Offshore operations and transportation are subject to marine perils, including severe storms and other adverse weather conditions and vessel collisions. Onshore operations and transportation are subject to adverse weather conditions and incidents. Both onshore and offshore operations and transportation are subject to interruptions, restrictions or termination by government authorities based on safety, environmental or other considerations.

The transition to a lower carbon economy risks

The transition to a lower carbon economy, and the physical effects of climate change, could impact Statoil's business.

The transition to a low-carbon energy future poses fundamental strategic challenges for the oil and gas industry. The company review and monitor climate change-related business risks and opportunities, whether political, regulatory, market, physical or related to reputation impact. To assess climate-related business risk, Statoil uses tools such as internal carbon pricing, scenario planning and stress testing of the project portfolio against various oil and gas price assumptions. Statoil monitors technology developments and changes in regulation and assesses how these might impact the oil and gas price, the cost of developing new assets and the demand for oil and gas and opportunities in renewable energy and low carbon solutions.

Regulatory and climate policy risk: Statoil expects and is preparing for regulatory changes and policy measures targeted at reducing greenhouse gas emissions. Stricter climate regulations and climate policies could impact Statoil's financial outlook, whether directly through changes in taxation and regulation, or indirectly through changes in consumer behaviour. The Paris Agreement on climate change entered into force in November 2016. Norway, collectively with the European Union, intends to deliver 40% reductions in greenhouse gas emissions by 2030. The national targets are intended to be strengthened every five years. Additionally, Norway has set an ambition to achieve close to net zero emissions by 2050. The implications for the industry are not clear, however requirements to reduce emissions could result in increased costs. Statoil's operations in Norway are subject to emissions taxes as well as emissions allowances granted for Statoil's larger European operations under the EU Emissions Trading System. The agreed strengthening of the European Union's emission trading scheme may result in higher costs for installations at the NCS as the price of the EU ETS emissions allowances is expected to increase significantly towards 2030.

Globally, Statoil expects greenhouse gas emission costs to increase from current levels beyond 2020 and to have a wider geographical range than today. To be prepared for a potential increased carbon price, Statoil uses an internal carbon price of minimum USD 50 for all projects after 2020 as part of the investment analysis and as a basis for investment decisions. In countries where a higher carbon price is used and/or predicted, a higher price is used in the investment analysis. Other regulatory risks related to climate change include potential direct regulations, for example measures to improve energy efficiency such as fuel efficiency standards (e.g. in the EU) and requirements to assess the use of power from shore for new offshore developments at the Norwegian Continental Shelf. This could impact Statoil's operational costs. Climate-related policy changes may also reduce access to prospective geographical areas for exploration and production in the future, which could impact Statoil's ability to replace reserves.

Market-related risk: There is continuing uncertainty over demand for oil and gas after 2030, due to factors such as technology development, climate policies, changing consumer behaviour and demographic changes. Statoil uses scenario analysis to outline different possible energy futures. Technology development and increased cost-competitiveness of renewable energy and low-carbon technologies represent both threats and opportunities for Statoil. As an example, the development of battery technologies could allow more intermittent renewables to be used in the power sector. This could impact Statoil's gas sales, particularly if subsidies of renewable energy in Europe were to increase and/or costs of renewable energy were to significantly decrease. On the other hand, Statoil's renewable energy business could be impacted if such subsidies were reduced or withdrawn. As such, there is significant uncertainty regarding the long-term implications to costs and opportunities for Statoil in the transition to a lower-carbon economy.

Reputational impact: Increased concern over climate change could lead to increased litigation against fossil fuel producers, as well as a more negative perception of the oil and gas industry. The latter could impact talent attraction and retention.

Physical climate risk factors: Changes in physical climate parameters could impact Statoil's operations, for example through restrained water availability, rising sea level, changes in sea currents and increasing frequency of extreme weather events. Although Statoil's facilities are designed to withstand extreme weather events, there is significant uncertainty regarding the magnitude of impact and time horizon for the occurrence of physical impacts of climate change, which leads to considerable uncertainty regarding the potential impact on Statoil. As most of Statoil's physical assets are located offshore, the most relevant potential physical climate impact is expected to be rising sea level.

Portfolio sensitivity test: To assess energy transition-related risks, Statoil has analysed the sensitivity with changing the oil and gas prices and keeping other parameters constant, of its project portfolio (equity production and expected production from accessed exploration acreage) against the assumptions regarding commodity and carbon prices in the International Energy Agency's (IEA) energy scenarios, as laid out in their "World Economic Outlook 2017" report. The sensitivity analysis demonstrated a positive impact of around 20% on Statoil's net present value (NPV) when replacing Statoil's price assumptions as of 1 December 2017 with the price assumptions in the IEA's New Policies Scenario, a positive impact of 42% when using the price assumptions in the Current Policies Scenario, and a negative NPV impact of approximately 13% when using the price assumptions in the Sustainable Development Scenario. This sensitivity analysis is based on Statoil's and the IEA's energy scenario assumptions which may not be accurate and which are likely to develop over time as new information becomes available. Scenarios should not be mistaken for forecasts or predictions. Accordingly, there can be no assurance that the assessment, which is presented in more detail in Statoil ASA's 2017 Sustainability report, is a reliable indicator of the actual impact of climate change on Statoil's portfolio.

Hydraulic fracturing risk

Statoil is exposed to risks as a result of its hydraulic fracturing usage

Statoil's US operations use hydraulic fracturing which is subject to a range of applicable federal, state and local laws, including those discussed under the heading "Legal and Regulatory Risks". Fracturing is an important and common practice that is used to stimulate production of crude oil and/or natural gas from dense subsurface rock formations. Statoil's hydraulic fracturing and fluid handling operations are designed and operated to minimise the risk, if any, of subsurface migration of hydraulic fracturing fluids and spillage or mishandling of hydraulic fracturing fluids. However, a case of subsurface migration of hydraulic fracturing fluids or a case of spillage or mishandling of hydraulic fracturing fluids during these activities could potentially subject Statoil to civil and/or criminal liability and the possibility of substantial costs, including environmental remediation, depending on the circumstances of the underground migration, spillage, or mishandling, the nature and scope of the underground migration, spillage, or mishandling, and the applicable laws and regulations.

In addition, various states and local governments have implemented, or are considering, increased regulatory oversight of hydraulic fracturing through additional permit requirements, operational restrictions, disclosure requirements and temporary or permanent bans. New or further changes in laws and regulations imposing reporting obligations on, or otherwise banning or limiting, the hydraulic fracturing process could make it more difficult to complete oil and natural gas wells in shale formations, cause operational delays, increase costs of regulatory compliance or in exploration and production, which could adversely affect Statoil's US onshore business and the demand for fracturing services.

Security threats and Cyber-attacks risks

Statoil is exposed to security threats that could have a materially adverse effect on Statoil's results of operations and financial condition

Security threats such as acts of terrorism and cyber-attacks against Statoil's production and exploration facilities, offices, pipelines, means of transportation or computer systems or breaches of Statoil's security system, could result in losses. No assurances can be made that such attacks will not occur in the future and adversely impact its operations. Failure to manage the foregoing risks could result in injury or loss of life, damage to the environment, damage to or the destruction of wells and production facilities, pipelines and other property. Statoil could face, among other things, regulatory action, legal liability, damage to its reputation, a significant reduction in revenues, an increase in costs, a shutdown of operations and a loss of its investments in affected areas.

Statoil is exposed to security threats on its information systems and digital infrastructure that could harm its assets and operations.

Statoil's security barriers are intended to protect its information systems and digital infrastructure from being compromised by unauthorised parties. Failure to maintain and develop these barriers may affect the confidentiality, integrity and availability of its information systems and digital infrastructure, including those critical to Statoil's operations. Threats to Statoil's information systems could result in significant financial damage to Statoil. Threats to Statoil's industrial control systems are not limited by geography as Statoil's digital infrastructure is accessible globally, and incidents in the industry in recent years have shown that parties who are able to circumvent barriers aimed at securing industrial control systems are capable and willing to perform attacks that destroy, disrupt or otherwise compromise operations. Such attacks could result in material losses or loss of life with consequent financial implications.

Crisis management systems risks

Statoil's crisis management systems may prove inadequate

Statoil has plans and capability to deal with crisis and emergencies at every level of its operations (ie; plant fires, terror, well instability etc). If Statoil does not respond or is perceived not to have responded in an appropriate manner to either an external or internal crisis, or if its plans to carry on or recover operations following a disruption or incident are not effected quickly enough, its business, operations and reputation could be severely affected. Inability to restore or replace critical capacity to an agreed level within an agreed time frame could prolong the impact of any disruption and could severely affect Statoil's business and operations.

Increased competition risks

Statoil encounters competition from other oil and gas companies in all areas of its operations

Statoil may experience increased competition from larger players with stronger financial resources and smaller ones with increased agility and flexibility. Gaining access to commercial resources via licence acquisition, exploration, or development of existing assets is key to ensuring the long-term economic viability of the business and failure to address this could negatively impact future performance.

Technology is a key competitive advantage in Statoil's industry and our competition may be able to invest more in developing or acquiring intellectual property rights to technology that Statoil may require to remain competitive. Should Statoil's innovation and digitalisation lag behind the industry, its performance could be impeded.

Project development and production activities risks

Statoil's development projects and production activities involve many uncertainties and operating risks that can prevent Statoil from realising profits and cause substantial losses

Oil and gas projects may be curtailed, delayed or cancelled for many reasons, including equipment shortages or failures, natural hazards, unexpected drilling conditions or reservoir characteristics, irregularities in geological formations, accidents, mechanical and technical difficulties or challenges due to new technology. This is particularly relevant because of the physical environments in which some of Statoil's projects are situated. Many of Statoil's development and production projects are located in deep waters or other harsh environments or have challenging field characteristics. In US onshore, low regional prices may cause certain areas to be unprofitable and the company may curtail production until prices recover. There is therefore a risk that prolonged low oil and gas prices, combined with the relatively high levels of tax and government take in several jurisdictions, could erode the profitability of some of Statoil's projects.

Strategic objective risks

Statoil faces challenges in achieving its strategic objective of successfully exploiting profitable growth opportunities

Statoil intends to continue to nurture attractive commercial opportunities in order to sustain future growth. This may involve acquisition of new businesses or properties to expand the existing portfolio or to move into new markets. This challenge will grow as global competition for access to new opportunities rises.

Statoil's ability to increase this optionality depends on several factors; including the ability to:

- maintain and impart Statoil's zero-harm safety culture
- identify suitable opportunities
- negotiate favourable terms
- develop new market opportunities or acquire properties or businesses in an agile and efficient way
- effectively integrate acquired properties or businesses into Statoil's operations
- arrange financing, if necessary and
- comply with legal regulations

Statoil anticipates significant investments and costs as it cultivates business opportunities in new and existing markets, and this process may incur or assume unanticipated liabilities, losses or costs associated with assets or businesses acquired. Failure by Statoil to successfully pursue and exploit new business opportunities could result in financial losses and inhibit growth. New projects may have different risk profiles than Statoil's existing portfolio. These and other effects of such acquisitions could result in Statoil having to revise its forecasts either or both with respect to unit production costs and production.

In addition, the pursuit of acquisitions or new business opportunities could divert financial and management resources away from Statoil's day-to-day operations to the integration of acquired operations or properties. Statoil may require additional debt or equity financing to undertake or consummate future acquisitions or projects, and such financing may not be available on terms satisfactory to Statoil, if at all, and it may, in the case of equity, be dilutive to Statoil's earnings per share.

Limited transportation infrastructure risks

The profitability of Statoil's oil and gas production may be affected by limited transportation infrastructure when a field is in a remote location

Statoil's ability to exploit economically any discovered petroleum resources beyond its proved reserves will depend, among other factors, on the availability of the infrastructure required to transport oil and gas to potential buyers at a commercially acceptable price. Oil is transported by vessels, rail or pipelines to refineries, and natural gas is usually transported by pipeline or by vessels (for liquid natural gas) to processing plants and end users. Statoil may not be successful in its efforts to secure transportation and markets for all of its potential production.

International political, social and economic risks

Some of Statoil's international interests are located in regions where political, social and economic instability could adversely impact Statoil's business

Statoil has assets and operations located in diverse regions globally where potentially negative economic, social, and political developments could occur. These political risks and security threats require continuous monitoring. Adverse and hostile actions against Statoil's staff, its facilities, its transportation systems and its digital infrastructure (cybersecurity) may cause harm to people and disrupt Statoil's operations and further business opportunities in these or other regions, lead to a decline in production and otherwise adversely affect Statoil's business. This could have a materially adverse effect on Statoil's operations' results and its financial condition.

International governmental and regulatory framework risks

Statoil's operations are subject to dynamic political and legal factors in the countries in which it operates

Statoil has assets in a number of countries with emerging or transitioning economies that, in part or in whole, lack well-functioning and reliable legal systems, where the enforcement of contractual rights is uncertain or where the governmental and regulatory framework is subject to unexpected change. Statoil's exploration and production activities in these countries are often undertaken together with national oil companies and are subject to a significant degree of state control. In recent years, governments and national oil companies in some regions have begun to exercise greater authority and to impose more stringent conditions on companies engaged in exploration and production activities. Intervention by governments in such countries can take a wide variety of forms, including:

- restrictions on exploration, production, imports and exports
- the awarding or denial of exploration and production interests
- the imposition of specific seismic and/or drilling obligations
- price and exchange controls
- tax or royalty increases, including retroactive claims
- nationalisation or expropriation of Statoil's assets
- unilateral cancellation or modification of Statoil's licence or contractual rights
- the renegotiation of contracts
- payment delays and
- currency exchange restrictions or currency devaluation

The likelihood of these occurrences and their overall effect on Statoil vary greatly from country to country and are hard to predict. If such risks materialise, they could cause Statoil to incur material costs and/or cause Statoil's production to decrease, potentially having a materially adverse effect on Statoil's operations or financial condition.

International tax regimes risks

Statoil is exposed to potentially adverse changes in the tax regimes of each jurisdiction in which Statoil operates

Statoil has business operations in many countries around the world. Changes in the tax laws of the countries in which Statoil operates could have a material adverse effect on its liquidity and results of operations.

Foreign exchange risks

Statoil faces foreign exchange risks that could adversely affect the results of Statoil's operations

Statoil's business faces foreign exchange risks. Statoil has a large percentage of its revenues and cash receipts denominated in USD and sales of gas and refined products are mainly denominated in EUR and GBP. Further, Statoil pays a large portion of its income taxes, and a share of our operating expenses and capital expenditures, in NOK. The majority of Statoil's long term debt has USD exposure.

Trading and supply activities risks

Statoil is exposed to risks relating to trading and supply activities

Statoil is engaged in trading and commercial activities in the physical markets. Statoil also uses financial instruments such as futures, options, over-the-counter (OTC) forward contracts, market swaps and contracts for differences related to crude oil, petroleum products, natural gas and electricity in order to manage price volatility. Statoil also uses financial instruments to manage foreign exchange and interest rate risk. Trading activities involve elements of forecasting, and Statoil bears the risk of market movements, the risk of losses if prices develop contrary to expectations, and the risk of default by counterparties.

Failure to comply with anti-corruption, anti-bribery laws and Statoil Code of Conduct risks

Non-compliance with anti-bribery, anti-corruption and other applicable laws, including failure to meet Statoil's ethical requirements, exposes Statoil to legal liability and damage to its reputation, business and shareholder value

Statoil has activities in countries which present corruption risks and which may have weak legal institutions, lack of control and transparency. In addition, governments play a significant role in the oil and gas sector, through ownership of resources, participation, licensing and local content which leads to a high level of interaction with public officials. Statoil is, through its international activities, subject to anti-corruption and bribery laws in multiple jurisdictions, including the Norwegian Penal code, the US Foreign Corrupt Practices Act and the UK Bribery Act. A violation of any applicable anti-corruption and bribery laws could expose Statoil to investigations from multiple authorities, and any violations of laws may lead to criminal and/or civil liability with substantial fines. Incidents of non-compliance with applicable anti-corruption and bribery laws and regulations and the Statoil Code of Conduct could be damaging to Statoil's reputation, competitiveness and shareholder value.

Inadequate insurance coverage risk

Statoil's insurance coverage may not provide adequate protection

Statoil maintains insurance coverage that includes coverage for physical damage to its oil and gas properties, third-party liability, workers' compensation and employers' liability, general liability, sudden pollution and other coverage. Statoil's insurance coverage includes deductibles that must be met prior to recovery. Statoil's external insurance is subject to caps, exclusions and limitations, and there is no assurance that such coverage will adequately protect Statoil against liability from all potential consequences and damages.

Inefficient operations and lack of new technology risks

Statoil's future performance depends on efficient operations and the ability to develop and deploy new technologies and new products

Our ability to remain efficient, to develop and adapt to new technology, to seek profitable renewable energy and other low-carbon energy solutions, are key success factors for future business. There is a possibility of Statoil not being able to define and implement the necessary changes due to the organisation's capability, external competition or underestimated cost of implementing new technology. Any of these factors may have an adverse effect on Statoil's future business goals.

Failure to secure capable and competent workforce risk

Statoil may fail to secure the right level of workforce competence and capacity over the short and medium term

The uncertainty of the future of the oil industry in light of reduced oil and natural gas prices and climate policy changes, creates a risk in ensuring a robust workforce through industry cycles. The oil industry is a long term business and needs to take a long term perspective on workforce capacity and competence. Given the current extensive change agenda there is a risk that Statoil will fail to secure the right level of workforce competence and capacity.

International sanctions and trade restrictions risks

Statoil's activities may be affected by international sanctions and trade restrictions

Statoil, like other major international energy companies, has a diverse portfolio of projects which may expose its business and financial affairs to political and economic risks, including operations in areas subject to sanctions and international trade restrictions.

Sanctions and trade restrictions are often complex and changes in these laws and regulations can come about on short notice and be hard to predict. For example in 2017 there have been trade sanctions targeting certain activity in Venezuela where Statoil has activities.

While this remains the case, Statoil's business portfolio is evolving and will constantly be subject to review.

New or additional trade sanctions could be imposed on countries where we have business activities. Statoil could in the future decide to take part in new and additional business activity where sanctions and trade restrictions are particularly relevant.

While Statoil remains committed to do business in compliance with sanctions and trade restrictions, there can be no assurance that no Statoil entity, officer, director, employee or agent is not in violation of such laws. Any such violation of applicable laws could result in substantial civil and/or criminal penalties and could materially adversely affect Statoil's business and results of operations or financial condition.

Statoil holds an interest in several on- and offshore oil and gas projects in Russia. Most of these projects result from a strategic cooperation with Rosneft Oil Company (Rosneft) initiated in 2012. In each of these projects, Rosneft holds the majority interest. A minority of the projects are in Arctic offshore and/or deep-water areas. The Norwegian, EU and U.S. sanctions adopted on Russia target several sectors - including the financial and energy sector. Accordingly, certain Russian energy companies have been particularly targeted under the sanctions - including Rosneft. This being the case, the sanctions in place affect the way Statoil conducts its business in the country. Moreover, Statoil's ability to continue to progress its projects in Russia is in part relying on government authorizations as well as the future of sanctions and trade controls. While Statoil continues to pursue its business in Russia within existing sanctions and trade controls, possible future developments could impact Statoil's ability to continue and conclude these projects as earlier envisaged.

In Venezuela, Statoil is a 9,67% shareholder in the mixed company Petrocedeno majority owned by Venezuelan national oil company PDVSA. In addition, Statoil holds a 51% interest in a gas licence offshore Venezuela. During 2017, various sanctions and trade controls have been adopted targeting certain Venezuelan individuals as well as the Government of Venezuela and PDVSA. The sanctions and trade controls in place restrict the way in which Statoil can conduct its business in the country. The current sanctions and trade restrictions, alone or in combination with other factors, could in the future further negatively impact Statoil's position and ability to continue its business projects in Venezuela.

Disclosure Pursuant to Section 13 (r) of the Exchange Act

Statoil is providing the following disclosure pursuant to Section 13(r) of the Exchange Act.

Statoil is a party to agreements with the National Iranian Oil Company (NIOC), namely, a Development Service Contract for South Pars Gas Phases 6, 7 & 8 (offshore part), an Exploration Service Contract for the Anaran Block and an Exploration Service Contract for the Khorramabad Block, which are located in Iran. Statoil's operational obligations under these agreements have terminated and the licences have been abandoned. The cost recovery programme for these contracts was completed in 2012, except for the recovery of tax and obligations to the Social Security Organisation (SSO).

Since 2013, after closing Statoil's office in Iran, Statoil's activity was focused on a final settlement with the Iranian tax and SSO authorities relating to the above-mentioned agreements.

During 2017 Statoil paid the equivalent of USD 0.01 million in tax to Iranian authorities. Also during 2017 Statoil paid the equivalent of USD 713 in stamp duty to Iran Tax Organisation. All payments were made in local currency (Iranian Rials). The funds utilised for these purposes were held by Statoil in EN Bank (Iran). Additionally, NIOC, on behalf of Statoil, in 2017 paid a tax obligation of USD 5.13 million equivalent in Iranian Rial to the local tax authorities. The amount was settled towards historical recoverable costs from NIOC to Statoil.

Statoil has provided information about its Iran related activity to the US State Department as well as to the Norwegian Ministry of Foreign Affairs.

In a letter from the US State Department of 1 November 2010, Statoil was informed that the company was not considered to be a company of concern based on its previous Iran-related activities.

Statoil earned no net profit from the aforementioned 2017 activities. Payments of the above-mentioned nature may also be made in 2018, in relation to Statoil's continued efforts to settle all remaining obligations.

Legal and regulatory risks

Health, safety and environmental laws and regulations risks

Compliance with health, safety and environmental laws and regulations that apply to Statoil's operations could materially increase Statoil's costs. The enactment of such laws and regulations in the future is uncertain.

Statoil incurs, and expects to continue to incur, substantial capital, operating, maintenance and remediation costs relating to compliance with increasingly complex laws and regulations for the protection of the environment and human health and safety, including:

- higher price on greenhouse gas emissions
- costs of preventing, controlling, eliminating or reducing certain types of emissions to air and discharges to the sea
- remedying of environmental contamination and adverse impacts caused by Statoil's activities
- decommissioning obligations and related costs
- compensation of cost related to persons and/or entities claiming damages as a result of Statoil's activities

Statoil`s activity is increasingly subject to statutory strict liability in respect of losses or damage suffered as a result of pollution caused by spills or discharges of petroleum from petroleum facilities.

Compliance with laws, regulations and obligations relating to climate change and other environmental regulations could result in substantial capital expenditure, reduced profitability as a result of changes in operating costs, and adverse effects on revenue generation and strategic growth opportunities. However, more stringent climate change regulations could also represent business opportunities for Statoil. For more information about climate change related legal and regulatory risks, see the risks described under the heading "The transition to a lower carbon economy, and the physical effects of climate change, could impact Statoil's business" in Risks related to our business in Risk Factors in this section 2.7 Corporate.

Statoil's investments in US onshore producing assets will be subject to evolving regulations that could affect these operations and their profitability. In the United States, Federal agencies have taken steps to rescind, delay, or revise regulations seen as overly burdensome to the upstream oil and gas sector, including methane emission controls. Statoil supports Federal regulation of methane emissions and is operating in compliance with all current requirements. To the extent new or revised regulations impose additional compliance or data gathering requirements, Statoil could incur higher operating costs. Statoil has also joined voluntary emission reduction programs (One Future and API's Environmental Partnership) and implemented a climate roadmap to reduce CO2 and methane emissions.

Supervision, regulatory reviews, and financial reporting risks

Statoil conducts business in many countries and its products are marketed and traded worldwide. Statoil is exposed to risk of supervision, review and sanctions for violations of laws and regulations at the supranational, national and local level. These include, among others, laws and regulations relating to financial reporting, taxation, bribery and corruption, securities and commodities trading, fraud, competition and antitrust, safety and the environment, and labour and employment practices. Statoil is exposed to changes in those laws and regulations and to the outcome of any investigations conducted by regulatory and supervisory authorities. Violations of the applicable laws and regulations may lead to legal liability, substantial fines and other sanctions for noncompliance.

Statoil is also exposed to financial review from financial supervisory authorities such as the Norwegian Financial Supervisory Authority (FSA) and the US Securities and Exchange Commission (the SEC). Reviews performed by these authorities could result in changes to previously published financial statements and future accounting practices. In addition, failure in our external reporting to report data accurately and in compliance with applicable standards could result in regulatory action, legal liability and damage to our reputation.

Statoil is listed on both the Oslo Børs and New York Stock Exchange (NYSE), and is registered with the SEC. Statoil is required to comply with the continuing obligations of these regulatory authorities, and violation of these obligations may result in legal liability, the imposition of fines and other sanctions.

The Norwegian Petroleum Supervisor (PSA) supervises all aspects of Statoil's operations, from exploration drilling through development and operation, to cessation and removal. Its regulatory authority covers the whole NCS as well as petroleum-related plants on land in Norway. Statoil is exposed to supervision from PSA, and as its business grows internationally other regulators, and such supervision could result in audit reports, orders and investigations.

The EU-wide quantity of carbon allowances issued each year under the Emission Trading Scheme (ETS) for greenhouse gas emission allowances began to decrease in a linear manner in 2013. The ETS can have a positive or negative impact on Statoil, depending on the price of carbon, which will consequently have an impact on the development of gas-fired power generation in the EU. Until now, the carbon price has been too low to replace coal with gas fired generation capacity. This effect has been worsened by heavy subsidising of renewables which has caused gas fired power plants to shut down. Current EU climate and energy policies do not address this problem, but there is a tendency towards more market based subsidies in the new guidelines on environment and energy aid.

Failure to remediate a material weakness relating to operational effectiveness in our Internal Control over Financial Reporting could cause our internal control over financial reporting to be ineffective again in the future.

Management and external auditor have concluded that Statoil's internal control over financial reporting as of 31 December 2017 was not effective due to the existence of a material weakness in our controls and procedures for the identification, assessment and timely and appropriate communication to the Board Audit Committee of questions or concerns (including allegations of misconduct) raised by employees in connection with termination of their employment relating to issues that could potentially have a material impact on our Consolidated financial statements and internal controls over financial reporting (otherwise than through Statoil's external Ethics help line established by the Board Audit Committee). The allegations were subject to thorough investigations with external advisors, and no material misstatements were identified. There has been no effect on the 2017 Consolidated financial statements, or earlier periods, related to this matter.

Failure to remediate the material weakness could cause our internal control over financial reporting to be ineffective again in the future and could cause investors to lose confidence in our reported financial information and potentially impact our share price. See section 3.10 Controls and procedures.

Political and economic policies of the Norwegian State risks

Political and economic policies of the Norwegian State could affect Statoil's business

The Norwegian State plays an active role in the management of NCS hydrocarbon resources. In addition to its direct participation in petroleum activities through the State's direct financial interest (SDFI) and its indirect impact through legislation, such as tax and environmental laws and regulations, the Norwegian State, among other things, awards licences for exploration, production and transportation, approves exploration and development projects and applications for production rates for individual fields and may, if important public interests are at stake, also instruct Statoil and other oil companies to reduce petroleum production. Furthermore, in the production licences in which the SDFI holds an interest, the Norwegian State has the power to direct petroleum licences' actions in certain circumstances.

If the Norwegian State were to take additional action under its activities on the NCS or to change laws, regulations, policies or practices relating to the oil and gas industry, Statoil's NCS exploration, development and production activities and the results of its operations could be affected.

Risks related to state ownership

This section discusses some of the potential risks relating to Statoil's business that could derive from the Norwegian State's majority ownership and from Statoil's involvement in the SDFI.

Statoil's shareholder alignment risks

The interests of Statoil's majority shareholder, the Norwegian State, may not always be aligned with the interests of Statoil's other shareholders, and this may affect Statoil's decisions relating to the NCS

The Norwegian Parliament, known as the Storting, and the Norwegian State have resolved that the Norwegian State's shares in Statoil and the SDFI's interest in NCS licences must be managed in accordance with a coordinated ownership strategy for the Norwegian State's oil and gas interests. Under this strategy, the Norwegian State has required Statoil to continue to market the Norwegian State's oil and gas together with Statoil's own oil and gas as a single economic unit.

Pursuant to this coordinated ownership strategy, the Norwegian State requires Statoil, in its activities on the NCS, to take account of the Norwegian State's interests in all decisions that may affect the development and marketing of Statoil's own and the Norwegian State's oil and gas.

The Norwegian State directly held 67% of Statoil's ordinary shares as of 31 December 2017. Based on the Norwegian Public Limited Companies Act, the Norwegian State effectively has the power to influence the outcome of any vote of shareholders due to the percentage of Statoil's shares it owns, including amending its articles of association and electing all non-employee members of the corporate assembly. The employees are entitled to be represented by up to one-third of the members of the board of directors and one third of the corporate assembly.

The corporate assembly is responsible for electing Statoil's board of directors. It also makes recommendations to the general meeting concerning the board of directors' proposals relating to the company's annual accounts, balance sheet, allocation of profit and coverage of loss. The interests of the Norwegian State in deciding these and other matters and the factors it considers when casting its votes, especially under the coordinated ownership strategy for the SDFI and Statoil's shares held by the Norwegian State, could be different from the interests of Statoil's other shareholders.
If the Norwegian State's coordinated ownership strategy is not implemented and pursued in the future, then Statoil's mandate to continue to sell the Norwegian State's oil and gas together with its own oil and gas as a single economic unit is likely to be prejudiced. Loss of the mandate to sell the SDFI's oil and gas could have an adverse effect on Statoil's position in the markets in which it operates.

For further information about the mandate to sell the Norwegian State's oil and gas, see SDFI oil and gas marketing and sale in section 2.7 Corporate.

RISK MANAGEMENT

Statoil's overall risk management includes identifying, evaluating and managing risk in all its activities to ensure safe operations and to achieve Statoil's corporate goals.

Statoil bases its risk management on an enterprise risk management (ERM) approach in order to achieve optimal corporate solutions. This includes identifying, evaluating and managing risk in all its activities. Risk is defined as a deviation from a specified reference value and the uncertainty associated with it. A positive deviation is an upside risk, while a negative deviation is a downside risk. The reference value is most commonly a forecast, percentile or target. In Statoil's ERM approach:

- focus is on the value impact for Statoil
- risk is managed to make sure that Statoil's operations are safe and in compliance with Statoil's requirements and

Risk is managed in the business line and is an integral part of any manager's responsibility. However, to ensure optimal corporate solutions, some risks are managed at corporate level. This includes oil and natural gas price risks, interest and currency risks, risk dimension in the strategy work, prioritisation processes and capital structure discussions.

Statoil's corporate risk committee, which is headed by the chief financial officer and includes representatives from the principal business segments, is responsible for defining, developing and reviewing Statoil's risk policies and methodology. The chief financial officer, assisted by the committee, is also responsible for overseeing and developing Statoil's Enterprise Risk Management and proposing appropriate measures to adjust risk at the corporate level.

Managing operational risk

Statoil manages risk in order to ensure safe operations and to achieve its corporate goals in compliance with its requirements

- All risks related to activities in Statoil's value chain, which denotes the value that is added in each step - from access, maturing, project execution and operation to market. In addition to the economic impact these risks could have on Statoil's cash flows, Statoil has a strong focus on avoiding HSE and integrity-related incidents (such as accidents, fraud and corruption). Most of the risks are managed by the principal business area line managers. Some operational risks are insurable and insured by Statoil's captive insurance company operating in the Norwegian and international insurance markets
- Statoil's risk management process is based on ISO31000 Risk management – principles and guidelines. The process provides a standardised framework and methodology for assessing and managing risk. A standardisation of the process across Statoil ASA and its subsidiaries allows for comparable risk levels and efficiency in decisions and it enables the organisation to create sustainable value while seeking to avoid incidents. The process seeks to ensure

that risks are identified, analysed, evaluated and managed. Risk adjusting actions are subject to a cost benefit evaluation (except certain safety related risks which could be subject to specific regulations)

Managing financial risk

The following section describes how Statoil manages the market risks to which it is exposed.

Statoil's business activities expose the group to financial risk. Using a holistic approach, correlations between the most important market risks and the natural hedges inherent in Statoil's portfolio are taken into account. This approach allows Statoil to reduce the number of risk management transactions and avoid sub-optimisation.

Statoil's activities expose the company to financial risks such as market risks (including commodity price risk, interest rate risk and currency risk), liquidity risk and credit risk. For a discussion of financial risk management see note 5 Financial risk management in the Consolidated financial statements.

Statoil has developed policies aimed at managing the financial volatility inherent in some of the business exposures. In accordance with these policies, Statoil enters into various financial and commodity-based transactions (derivatives). The business areas for marketing and trading commodities are responsible for managing commodity-based price risks within mandates. Interest, liquidity, liability and credit risks are managed by the company's central finance department. All major strategic transactions are required to be coordinated at corporate level.

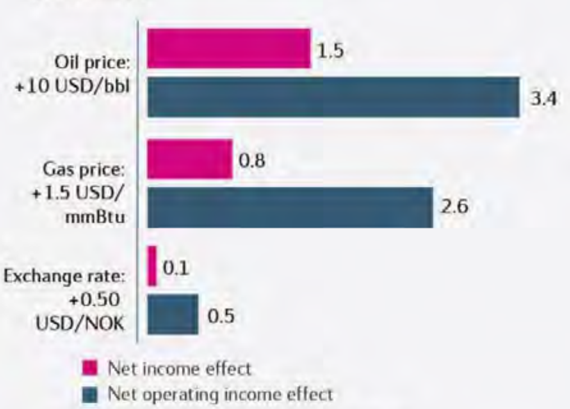
The main factors influencing Statoil's operational and financial results include: the level of crude oil and natural gas prices, trends in the exchange rates between mainly the USD, EUR, GBP and NOK; Statoil's oil and natural gas production volumes, which in turn depend on entitlement volumes under PSAs and available petroleum reserves, and Statoil's own, as well as partners' expertise and cooperation in recovering oil and natural gas from those reserves; and changes in Statoil's portfolio of assets due to acquisitions and disposals.

Statoil's operational and financial results will also be affected by trends in the international oil industry, including possible actions by governments and other regulatory authorities in the jurisdictions in which Statoil operates, or possible or continued actions by members of the Organization of Petroleum Exporting Countries (OPEC) and/or other producing nations that affect price levels and volumes, refining margins, the cost of oilfield services, supplies and equipment, competition for exploration opportunities and operatorships, and deregulation of the natural gas markets, all of which may cause substantial changes to existing market structures and to the overall level and volatility of prices and price differentials.

The following table shows the yearly averages for quoted Brent Blend crude oil prices, natural gas average sales prices, refining reference margins and the USD/NOK exchange rates for 2017, 2016 and 2015.

Yearly average	2017	2016	2015
Average Brent oil price (USD/bbl)	54.2	43.7	52.4
Average invoiced gas prices - Europe (USD/mmBtu)	5.6	5.2	7.1
Refining reference margin (USD/bbl)	6.3	4.8	8.0
USD/NOK average daily exchange rate	8.3	8.4	8.1

Indicative effects on 2018 results *
(USD billion)



* *Based on USD/NOK exchange rate of 8.25*

The sensitivity analysis shows the estimated 12-month effects on net operating income and net income from change in parameters. The sensitivities do not have the same probability.

The illustration shows the indicative full-year effect on the financial result for 2018 given certain changes in the crude oil price, natural gas contract prices and the USD/NOK exchange rate. The estimated price sensitivity of Statoil's financial results to each of the factors has been estimated based on the assumption that all other factors remain unchanged. The estimated indicative effects of the negative changes in these factors are not expected to be materially asymmetric to the effects shown in the illustration.

Significant downward adjustments of Statoil's commodity price assumptions could result in impairments on certain producing and development assets in the portfolio. See note 10 Property, plant and equipment to the Consolidated financial statements for sensitivity analysis related to impairments.

Statoil assesses oil and gas price hedging opportunities on a regular basis as a tool to increase financial robustness and strengthen flexibility.

Fluctuating foreign exchange rates can also have a significant impact on the operating results. Statoil's revenues and cash flows are mainly denominated in or driven by USD, while a large portion of the operating expenses, capital expenditures and income taxes payable accrue in NOK. Statoil seeks to manage this currency mismatch by issuing or swapping non-current financial debt in USD. This long-term funding policy is an integrated part of our total risk management programme. Statoil also engages in foreign currency management in order to cover the non-USD needs, which are primarily in NOK. In general, an increase in the value of USD in relation to NOK can be expected to increase Statoil's reported earnings.

Historically, Statoil's revenues have largely been generated by the production of oil and natural gas on the NCS. Norway imposes a 78% marginal tax rate on income from offshore oil and natural gas activities (a symmetrical tax system). For further information, see section 2.7 Corporate under Taxation of Statoil.

Statoil's earnings volatility is moderated as a result of the significant proportion of its Norwegian offshore income that is subject to a 78% tax rate in profitable periods, and the significant tax assets generated by its Norwegian offshore operations in any loss-making periods. The basis for taxation is 3% of the dividend received, which is subject to the standard income tax rate (reduced from 24% in 2017 to 23% in 2018). Dividends received from Norwegian companies and from similar companies resident in the EEA for tax purposes, in which the recipient holds more than 90% of the shares and votes, are fully exempt from tax. Dividends from companies resident in the EEA that are not similar to Norwegian companies, companies in low-tax countries and portfolio investments outside the EEA will, under certain circumstances, be subject to the standard income tax rate (reduced from 24% in 2017 to 23% in 2018) based on the full amounts received.

Disclosures about market risk

Statoil uses financial instruments to manage commodity price risks, interest rate risks, currency risks and liquidity risks. Significant amounts of assets and liabilities are accounted for as financial instruments.

See note 25 Financial instruments: fair value measurement and sensitivity analysis of market risk in the Consolidated financial statements, for details of the nature and extent of such positions, and for qualitative and quantitative disclosures of the risks associated with these instruments.

2.12 SAFETY, SECURITY AND SUSTAINABILITY

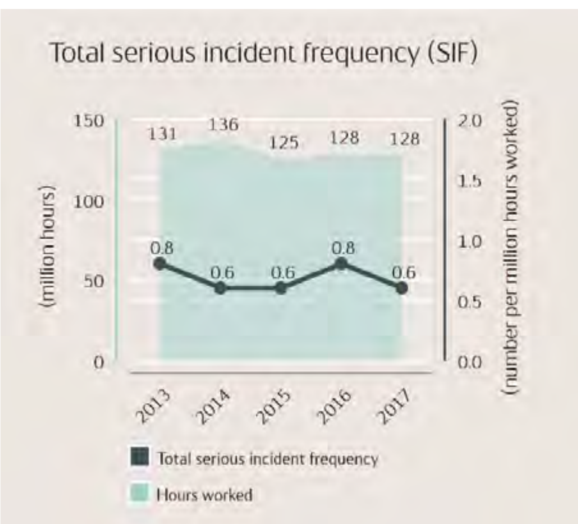
Safety and security

Safety and security risks are particularly relevant for the oil and gas industry, because our core activities involve the risk of accidents and incidents. We work with flammable hydrocarbons at high pressure, often in harsh offshore environments and at height or depths. Oil spills are a major risk we need to handle in both our offshore and onshore oil and gas operations. To this end we have established a global oil spill response system, which includes close collaboration with industry peers and national and local communities.

We focus on identifying safety and security risks and having in place procedures and work processes to control them. Our ambition is to be an industry leader in ensuring safe and secure operations that protect our people, the environment, the communities we work with and our assets.

Our total serious incident frequency (SIF), including both actual and potential incidents, was 0.6 incidents per million hours worked, a decrease compared to 0.8 in 2016. We had no serious incidents with major accident potential in 2017.

Total recordable injuries per million hours worked (TRIF) was 2.8 in 2017, compared to 2.7[6] in 2016.



In 2017, the total number of serious oil and gas leakages (with a leakage rate above 0.1 kg per second) was 16, down from 18 in 2016. None of the serious oil and gas leakages ignited. We experienced a 50% reduction (i.e. from 6 to 3) in the number oil and gas leakages in our onshore operations in Norway and Denmark compared to 2016. The number outside of Norway and Denmark remained at a similar level in 2017 as for 2016.

For the period 2012 to 2016 our performance showed a reduction in the number of oil spills per year. For 2017 the number of oil spills increased to 206 compared to 146 in 2016. The main contributor to this increase was our onshore activities in the US. Three initiatives have been mounted to reduce the number of leaks and spills: a programme to proactively identify and prevent leaks and spills; enhanced control of technical integrity before start-up/restart at facilities; and strengthening of suppliers' commitment through training and follow-up.

The total volume of oil spills decreased from 61 m³ in 2016 to 34 m³ in 2017. The largest spill was an 8 m³ leak of gasoil from a pressure relief valve at the Kalundborg refinery in Denmark of which 5 m³ were collected by secondary barriers.

Security is an important consideration for the energy industry and we assess security threats and risks on a continuous basis to achieve effective and proportionate security risk management. We had no serious security incidents in 2017.

In 2017, we launched the "I am Safety" programme to further strengthen safety and security performance. The focus is on strengthening personal commitment by increasing engagement, visibility and awareness of individually relevant safety and security factors.

Health and work environment

Statoil is committed to providing a healthy working environment for its employees. Systematic efforts are made to design and improve working conditions in order to prevent occupational injuries, work-related illness and sickness absence, due to both physical and psychosocial risk factors.

The most significant risk factors related to the work environment are noise, ergonomics, chemical risk as well as psychosocial conditions.

The sickness absence rate for Statoil ASA employees increased slightly from 4.3% in 2016 to 4.6% in 2017.

Climate change

Statoil supports the ambition set by the Paris Climate Agreement of December 2015 to limit the average global temperature rise to well below two degrees Celsius compared to pre-industrial levels by 2100.

The transition towards a lower carbon economy is underway. During 2017, Statoil embedded our response to climate change into our sharpened business strategy. Statoil aims to develop a high value, lower carbon portfolio that will be robust to future fluctuations in energy prices and potentially higher carbon costs.

Statoil's Climate roadmap, launched in March 2017, explains how Statoil expects to deliver on the strategic ambition to create a low carbon advantage and develop the business by 2030 in support of the ambitions in the Paris climate agreement and of the United Nations Sustainable Development Goals 7 (Ensure access to affordable, reliable sustainable energy for all) and 13 (Take urgent action to combat climate change and its impacts).

To implement the Climate roadmap, Statoil focuses on three broad areas:

- realising a lower carbon oil and gas portfolio
- building an industrial position in new energy
- stress testing and transparent reporting

[6] The TRIF for 2016 has been restated due to misreporting of man hours worked. It was previously reported as 2.9

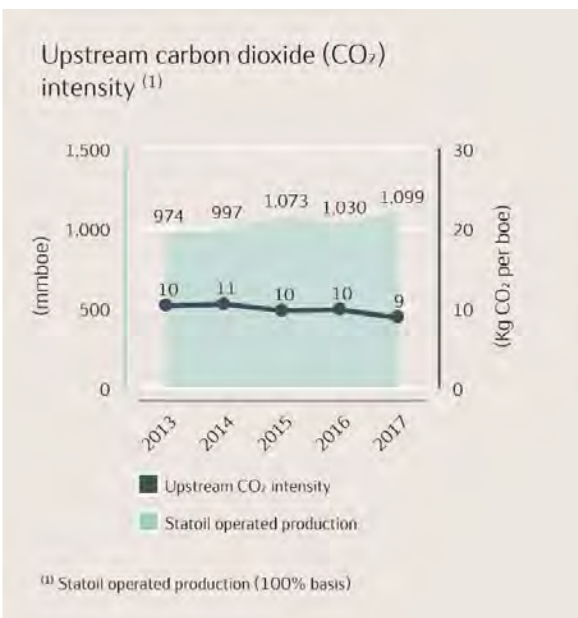
Statoil applies an internal carbon price of minimum USD 50 per tonne carbon dioxide equivalents from 2020 to all potential projects and investments. In countries where the actual carbon price is higher than USD 50 (e.g. in Norway), Statoil uses the actual price and predicted future carbon price in the investment analysis.

During 2017, climate principles were further embedded into the decision-making process by including a corporate-wide requirement for the assessment of the carbon intensity and emission reduction opportunities for all potential projects and investments.

The work to reduce CO_2 emissions and emission intensity from Statoil-operated assets continued, and a plan of action for international partner operated activities was initiated.

Statoil aims to achieve, by 2030, annual carbon dioxide (CO_2) emissions reductions of 3 million tonnes compared to emission levels at the start of 2017[7] through continued energy efficiency measures and use of low carbon energy sources.

2017 performance
Statoil's upstream CO_2 intensity improved from 10kg/boe in 2016 to 9kg/boe in 2017, mainly due to our exit from our activity in the Canadian oils sands and increased export of gas from the electrified Troll field. Total CO_2 emissions increased slightly from 14.8 million tonnes in 2016 to 14.9 million tonnes in 2017.



Direct greenhouse gas emissions (so called Scope 1 emissions) remained at the same level in 2017 as for 2016, at 15.4 million tonnes CO_2 equivalents. Greenhouse gas emissions include carbon CO_2 and methane (CH_4), where CO_2 constitutes the largest part. Methane (CH_4) emissions decreased from 24.2 thousand tonnes in 2016 to 22.2 thousand tonnes in 2017.

[7] Statoil is aiming to achieve, by 2030, annual CO2 emissions that are 3 million tonnes less than they would have been, had no reduction measures been implemented between 2017 and 2030.

Several CO_2 emission reduction initiatives were implemented in 2017, amounting to a total of around 360,000 tonnes of CO_2. The largest contributor was energy efficiency measurements at Hammerfest LNG.

Growth opportunities for Statoil within renewables and new energy solutions include both commercial investments and research and development (R&D). Statoil is engaged in offshore wind projects, carbon capture and storage, solar and hydrogen projects. Statoil's capital expenditure in new energy solutions during 2017 was in line with our ambition. In 2017 approximately 18% of Statoil's expenditure on R&D efforts addressed energy efficiency, carbon capture and renewables.

Climate-related risk and disclosure: The Task Force on Climate-related Financial Disclosures
The Climate roadmap serves to enhance our disclosure on climate-related business risks, in line with the recommendations put forward by the Financial Stability Board's Task Force on Climate-related Financial Disclosure (TCFD), which is supported by Statoil. In 2017, we joined the TCFD Preparer Forum for oil and gas companies to engage with the Task Force on efficient and feasible ways to implement the TCFD recommendation for disclosure.

Executing the company's climate ambition is a line responsibility. However, the Corporate Sustainability Unit is responsible for monitoring progress on the Climate roadmap and reporting on sustainability and climate risk issues and performance at group level, to the corporate executive committee and the board of directors.

Statoil regularly assesses climate-related business risk, whether political, regulatory, market, physical or related to reputation, as part of the enterprise risk management process. This includes assessment of both upsides and downsides. Statoil uses tools such as internal carbon pricing, scenario analysis and sensitivity analysis of the project portfolio against various oil and gas price assumptions. We monitor technology developments and changes in regulation and assess how these might impact the oil and gas price, the cost of developing new assets and the demand for oil and gas and opportunities in renewable energy and low carbon solutions.

A detailed overview of climate-related risk factors, and the results of stress testing our portfolio against the International Energy Agency (IEA) scenarios, are provided in section 2.11 Risk review under Risk Factors in this report.

On a regular basis, the corporate executive committee and board of directors review and monitor climate change-related business risks and opportunities. In 2017, the board discussed climate-related issues in four out of eight meetings (including one risk update), and the safety, sustainability and ethics committee discussed climate-related issues in all of the five committee meetings held.

Stakeholder engagement and collaboration
Climate change is complex and requires global and cross sector cooperation. We are committed to working with our suppliers, customers, governments and peers to find innovative and commercially viable ways to reduce emissions across the oil and gas value chain. We are members of the CEO-led Oil and Gas Climate Initiative. Through our participation in the government-led Climate and Clean Air Coalition's Oil and Gas Methane Partnership we continued our efforts to systematically address methane emissions and report on annual progress.

We work with governments and other organisations to support climate and energy policies that encourage fuel switching from coal to gas, growth in renewables, the deployment of carbon capture usage and storage and other low carbon solutions, and efficient production, distribution and use of energy globally. We have also teamed up with global peers through OGCI to help shape the industry's climate response.

Through the World Bank led Carbon Pricing Leadership Coalition and our membership of the International Emission Trading Association we continued our advocacy for a price on carbon during 2017. And through our membership in the OGCI and World Business Council for Sustainable Development we expressed our continued support for the ambitions of the Paris climate agreement. Statoil is an endorser of the World Bank Global Gas Flaring Reduction Partnership and we have made a commitment to contribute to stopping routine flaring by 2030 through the World Bank Zero Routine Flaring by 2030 initiative.

Environmental impact and resource efficiency
Statoil is committed to using resources efficiently and responsible management of waste, emissions to air and impacts on ecosystems. This reduces the impact on the local environment and can also save costs.

Responsible water management is important for Statoil. Total fresh water withdrawal increased from 13.5 million cubic metres in 2016 to 14.8 million cubic metres in 2017. The main contributor to this increase was the higher number of wells fracked, relative to 2016, in our US onshore shale and tight oil assets. We work actively to improve water efficiency in our onshore activities in North America, through means such as water recycling and substituting fresh water with brackish water.

Nitrogen oxide emissions were 40 thousand tonnes in 2017, up from 39 thousand tonnes in 2016. The increased drilling and well stimulation activity was the main contributor to this increase. Sulphur oxide emissions were 1.7 thousand tonnes, down from 1.8 thousand tonnes in 2016. The main contributor to this reduction was the exit, during 2017, from our Canadian oil sands projects activities. Total emissions of non-methane volatile organic compounds remained at the same level in 2017 as in 2016, at 49 thousand tonnes.

Statoil is concerned with valuing and protecting biodiversity and ecosystems and follows precautionary principles to minimise potential negative effects of the company's activities. Statoil supports research programmes to increase knowledge about ecosystems and biodiversity and collaborates with industry peers to share knowledge and develop tools for biodiversity management. In addition, Statoil works with our suppliers to minimise invasive aquatic species and reduce risks pertaining to accidental spills related to shipping transportation.

During 2017 we saw a 32% reduction in the volume of hazardous waste generated, from 438 thousand tonnes in 2016 to 296 thousand tonnes in 2017. The main contributor to this volume decrease was less drilling and well start-up activities, on the Norwegian continental shelf, at locations without treatment facilities for oil contaminated water. As such less untreated oil contaminated water was sent to shore for treatment. The hazardous waste recovery rate was slightly lower in 2017, at 83% compared to 84% in 2016.

For our US onshore operations in 2017, 105 thousand tonnes of drill cuttings and solid waste were sent to landfill, and around 4.7 million cubic meters of produced and flow back water was directed to deep well disposal. These waste types are exempt from US hazardous waste regulations.

In 2017 the volume of non-hazardous waste generated for all Statoil operated assets was 34 thousand tonnes, compared to 50 tonnes in 2016. The recovery rate was 71% in 2017 compared to 56% in 2016. The decrease in the volume generated and the increase in the recovery rate is mainly attributed to the divestment of our oil sands projects in Canada.

Regular discharges of oil to water were 1.2 thousand tonnes in 2017, compared to 1.4 in 2016. This reduction is attributed to a combination of turnaround activity during 2017, reducing production levels, and operational measures at several assets that have reduced the volume of produced water discharged to sea, and reduced the oil in water content of the discharged water.

Working with suppliers
Statoil is committed to using suppliers who operate in accordance with Statoil's values and who maintain high standards of safety, security and sustainability. These aspects are incorporated in all phases of the procurement process. Potential suppliers must meet Statoil's minimum requirements to qualify as a supplier, including those related to safety, security and sustainability.

Statoil expect our suppliers to comply with applicable laws, respect internationally recognised human rights and adhere to ethical standards which are consistent with our ethical requirements, when working for Statoil. During 2017 a new compliance annex, covering human rights and anti-corruption standards for suppliers, was introduced for use in new contracts. Potential suppliers for contracts valued at more than USD 800 thousand are, in addition, required to sign Statoil's Supplier Declaration, which establishes minimum requirements for ethics, anti-corruption, environment, health, safety, respect for human rights, and for further promoting these requirements among their own suppliers. Potential suppliers are also screened for integrity risk, in accordance with our procedures for integrity due diligence.

Human rights
Statoil seeks to conduct its business in a way that is consistent with the UN Guiding Principles on Business and Human Rights (the UN Guiding Principles), the ten UN Global Compact principles and the Voluntary Principles on Security and Human Rights. Statoil is committed to respecting internationally recognised human rights as laid out in the International Bill of Human Rights, the International Labour Organization's 1998 Declaration on Fundamental Rights and Principles at Work, and applicable standards of international humanitarian law.

Labour rights and working conditions for our workforce and suppliers, human rights of individuals in communities and human rights in security arrangements are the three broad focus areas for human rights for Statoil's activities.

Human rights aspects are integrated into relevant internal management processes, tools and training. On-going activities, business relationships and new business opportunities are assessed for potential human rights impacts and aspects, following a risk-based approach.

During 2017, Statoil continued to focus on strengthening our health and safety performance. Statoil also continued efforts to strengthen the diversity of its workforce, taking into account gender, nationality, background, ethnicity, competence, age and preferences. Work also continued on the strengthening of Statoil's centralised governance of remuneration and benefits to ensure they are both fair and attractive.

In 2017, Statoil continued the strengthening of its processes for managing human rights in our supply chain and on raising awareness through training. We conducted 41 verifications across 16 countries in 2017. Over 260 employees attended classroom training on human rights in the supply chain. A compliance appendix, covering human rights and anti-corruption standards for suppliers, was introduced for use in new contracts. Work was started on supporting guidance that will be introduced in 2018.

In 2017, Statoil's Human Rights Steering Committee (HRSC), responsible for overseeing the development and implementation of Statoil's human rights policy, closely followed the ongoing implementation efforts and provided guidance on human rights related reporting requirements.

Statoil recognises that a company-wide commitment to respect human rights requires continuous training and awareness raising in order to embed good practices throughout the organisation. Over 500 staff and consultants registered for the human rights e-learning awareness training during 2017. Other training initiatives, during 2017, included human rights focus sessions on the agenda of various management meetings, reaching a total of 42 leaders across the company. Statoil also started the development, during 2017, of a human rights training course to be used company-wide, that can be tailored for use with specific target groups.

The context of Statoil's operations requires that security services are engaged to safeguard Statoil's people and property. Particular focus is needed to ensure respect for human rights in security arrangements, in jurisdictions where security services are not well regulated or security personnel are not adequately trained. Statoil follows international standards of good practices in security and human rights. Statoil's commitment to the Voluntary Principles on Security and Human Rights is reflected in policies and procedures for risk assessment, deployment, training and follow-up of private and public security providers.

Transparency, ethics and anti-corruption

Transparency is a cornerstone of good governance. It is embodied in our corporate values. Transparency allows business to prosper in a predictable and competitive environment and enables society to hold governments and businesses accountable. Statoil supports and promotes effective, transparent and accountable management of wealth derived from the extractives industries.

Statoil supports and engages in global transparency initiatives through its membership in the Extractive Industries Transparency Initiative (EITI), the United Nations Global Compact Anti-Corruption Working Group and the World Economic Forum's Partnering Against Corruption Initiative (PACI), and supports Transparency International Norway. In 2017 Statoil actively participated in the Norwegian national EITI multi-stakeholder group and on the international EITI board through its board member. Statoil also engaged with local and national organisations in other EITI implementing countries, and provided USD 60,000 in financial support to the international EITI. Statoil also participated in a multi-stakeholder working group organised by Transparency International in preparation of the report Ten Anti-corruption principles for state-owned enterprises, published in November 2017.

Statoil believes that doing business in an ethical and transparent manner is a prerequisite for sustainable business. Statoil has a zero-tolerance policy towards all forms of corruption. This policy is embedded across the company through Statoil's values, the Code of Conduct and the Anti-corruption compliance programme. The Code of Conduct (the Code) prohibits all forms of corruption and bribery, including facilitation payments.

The Code reflects Statoil's values and its commitment to high ethical standards in business activities. It describes the company's requirements in areas such as anti-corruption, anti-money laundering, fair competition, human rights and a non-discriminatory working environment with equal opportunities. It applies to all Statoil employees, board members, hired personnel and those performing services for or on behalf of Statoil.

Statoil seeks to work with others who share the company's commitment to business integrity and who have codes of conduct consistent with the Code. Before entering into a new business relationship, or extending an existing one, the relationship has to satisfy Statoil's integrity due diligence requirements. Statoil's due diligence vetting process is risk-based, allowing us to dedicate resources where we see potential concerns. In joint ventures and business partnerships that are not controlled by Statoil, Statoil encourages the adoption of ethics and anti-corruption policies, procedures and controls that are consistent with Statoil's own standards.

All Statoil employees have to confirm annually that they understand and will comply with the Code. The purpose of such confirmation is to remind each individual employee about the duty to comply with Statoil's values and ethical requirements. Failure to comply with the Code may be met with disciplinary measures, including termination of the contractual relationship with Statoil.

Statoil's Anti-Corruption Compliance Programme summarises the standards, requirements and procedures implemented to comply with applicable laws and regulations and to uphold our high standard of doing business ethically. A global network of compliance officers is integrated into our business activities to ensure that appropriate consideration is given to ethics and anti-corruption in Statoil's business activities, regardless of where they take place.

We expect and encourage anyone who becomes aware of a possible violation of the Code, Statoil policies or applicable law, to report their concerns in a prompt and responsible manner. Indeed, concerns can be reported through internal channels or through the publicly available Ethics Helpline, which allows for anonymous reporting. The number and types of cases from the helpline is reported quarterly to the board of directors. In 2017, we received 107 cases through the Ethics Helpline, compared to 51 in 2016.

Other relevant reports

More information about Statoil's policies and approach taken to manage safety and sustainability performance is available in Statoil ASA's 2017 Sustainability report.

2.13 OUR PEOPLE

In Statoil we work together to shape the future of energy in a partnership between the organisation and the individual. We all apply our skills and personal commitment to help Statoil towards achieving our vision.

Statoil aims to offer challenging and meaningful job opportunities that attract and retain the right people. Through our engagement, creativity and collaboration, we aim to build a better Statoil for tomorrow. We are committed to creating a caring and collaborative working environment, promoting diversity, inclusion and equal opportunities for all employees.

Empowered people are a key enabler for realising Statoil's sharpened strategy. In 2017, we started to implement our new people and leadership strategy designed to ensure we have the right skills and capabilities in place going forward. The foundation for the strategy's guiding principles is our commitment to safety supported by our people processes; a consistent presence in talent markets; a company culture which embraces digitalisation; building flexibility within the workforce and growing diversity.

In 2017, we enhanced our performance management approach to further develop a performance development culture at Statoil. Our main goal is to build a stronger culture of continuous feedback, coaching and development. Instead of focusing on backward looking annual ratings, we are focused on continuous real-time feedback, strength based development and reward and talent outcomes based on multiple inputs. People@Statoil is our common process for people development, deployment, performance, and reward. It is an integrated part of performance development and applies to all employees.

Learning and development is at the core of Statoil. We encourage our employees to take responsibility for their own learning and development, continuously build new skills and share knowledge. Our focus on people development has continued throughout 2017 and the activity level has been closely monitored in our people development key performance indicator (KPI) at both corporate and business area levels. This KPI sets the ambition level for both our corporate university and internal job market.

Our corporate university is our platform for learning. It enables the company to build the capabilities needed to deliver on its strategy, continuously improve, and take the lead in developing leadership and technology. Recognising that digitalisation and automation will transform the way we work in the coming years we established a new digital academy, in our corporate university, to build digital skills across the organisation. In addition, our platform for learning and content delivery has been upgraded with the implementation of a new learning management system, supporting our ambition of making engaging and virtual learning available for all. The average training days for employees in 2017 increased to 3.9 (from 3.2 in 2016) for formal learning. Our ambition is to increase the learning activity level further to support the development of our people.

1) Contractor personnel, defined as third-party service providers who work at our onshore and offshore operations, are not included. These were roughly estimated to be around 30,000 in 2017.

EMPLOYEES IN STATOIL

The Statoil group employs 20,245 employees. Of these, approximately 17,600 are employed in Norway and approximately 2,600 outside Norway.

Statoil works systematically to build a diverse workforce by attracting, recruiting, developing and retaining people of every gender and different nationalities and age groups across all types of positions. In 2017, 19% of employees and 23% of our managerial staff held nationalities other than Norwegian. Outside Norway, Statoil aims to increase the number of people and managers who are locally recruited and to reduce the long-term use of expats in business operations. In 2017, 71% of new hires in Statoil were non-Norwegians and 27% were women.

We believe that the global competition for talent in key development areas will grow over the coming years. We remain the employer of choice for engineering students and professionals in Norway, according to the annual Norwegian Universum Employer Attractiveness ranking.

During 2017 we continued to strengthen our entry level talent programmes. Our corporate graduate programme was revised into a two-year accelerated development programme spanning all geographies and professions, encompassing an introduction programme, networking activities, learning events and field trips, rotations and mentoring. This programme accelerates the development of young professionals and builds a strong understanding of Statoil's value chains. In 2017, we recruited 69 graduates (of which 26 were women). At the end of 2017 we had 143 graduates (including 57 women) in Statoil.

In addition, our company-wide annual intake of apprentices reflects our long-term commitment to the education and training of young technicians and operators in our industry. In 2017, we awarded 139 apprenticeships, of which 45 were to women. The total number of apprentices at year end was 291 (including 85 women). In 2017, Statoil launched a subsurface internship programme pilot. This offers 30 newly graduated candidates a one year stay with us to build experience and help the transition from studies to working life.

Our annual Global People Survey (GPS), which addresses issues relevant to employee's well-being and performance had a noticeably high response rate of 88% in 2017. Employees' responses reflected continued engagement for working with Statoil[8], with a score of 75 out of 100, compared to 72 out of 100 in 2016.[9] This score exceeded the corporate engagement KPI target. Employees reported an overall score of 71 out of 100 for competence and people development which is a good score. Our ambition is to strengthen this even further in 2018.

Our people performance data relates to permanent employees in our direct employment. Statoil defines consultants as contracted personnel that are mainly based in our offices. Temporary employees and contractor personnel, defined as third party service providers to our onshore and offshore operations, are not included in the table. These were roughly estimated to be around 30,000 in 2017. The information about people policies applies to Statoil ASA and its subsidiaries.

Equal opportunities

We are committed to building a workplace that promotes diversity and aspire for Statoil to be an inclusive workplace where all individuals can share their perspectives, be themselves and develop and thrive in a safe working environment.

During 2017, we continued to analyse the diversity of our pipeline, at all levels and in all locations, to ensure continued improvement in our representation. In 2017, the overall percentage of women in the company was 30%. The percentage of women in the board of directors is 40% (33% among the employee representatives and 43% among members elected by the shareholders). In the corporate executive committee, the female representation remained at 27%. The percentage of women in leadership positions was 28% in 2017.

[8] The overall people engagement scoring reflects employee satisfaction, enthusiasm and pride associated with working for Statoil. The scoring is based on feedback received through an annual survey sent out to all employees.

[9] During 2017 the Global People Survey (GPS) questionnaire scale was changed from 1-6 to 1-10 and the reporting index was changed to 0-100. Historical data have therefore been converted to enable trend reporting.

We continue to pay close attention to male-dominated positions and discipline areas, and in 2017 the proportion of female engineers remained stable at 27% in Statoil ASA. We will work actively to increase these numbers in 2018 through our development programmes, such as the local talent programme, as part of a broader diversity and inclusion agenda.

Unions and representatives

We believe in involving our people and their appropriate representatives in the development of the company. We respect our employees' right to freedom of association and thereby their right to negotiate and cooperate through relevant representative bodies. The specific ways in which we involve our employees and/or their appropriate representatives in business and organisational issues may vary according to local laws and practices in specific geographical locations.

In Statoil ASA, 73% of the employees in the parent company are members of a trade union. Work councils and working environment committees are established where required by law or agreement.

In Norway, the formal basis for collaboration with labour unions is established in the Basic Agreements between the Confederation of Norwegian Enterprise (NHO) and the corresponding respective national labour confederations (unions). We have local collective wage agreements with five trade unions in Statoil ASA.

The European Works Council continues to be an important forum for collaboration between the company and our European employees.

Statoil promotes good employee and industrial relations practices through various networks and forums, including IndustriALL Global Union.

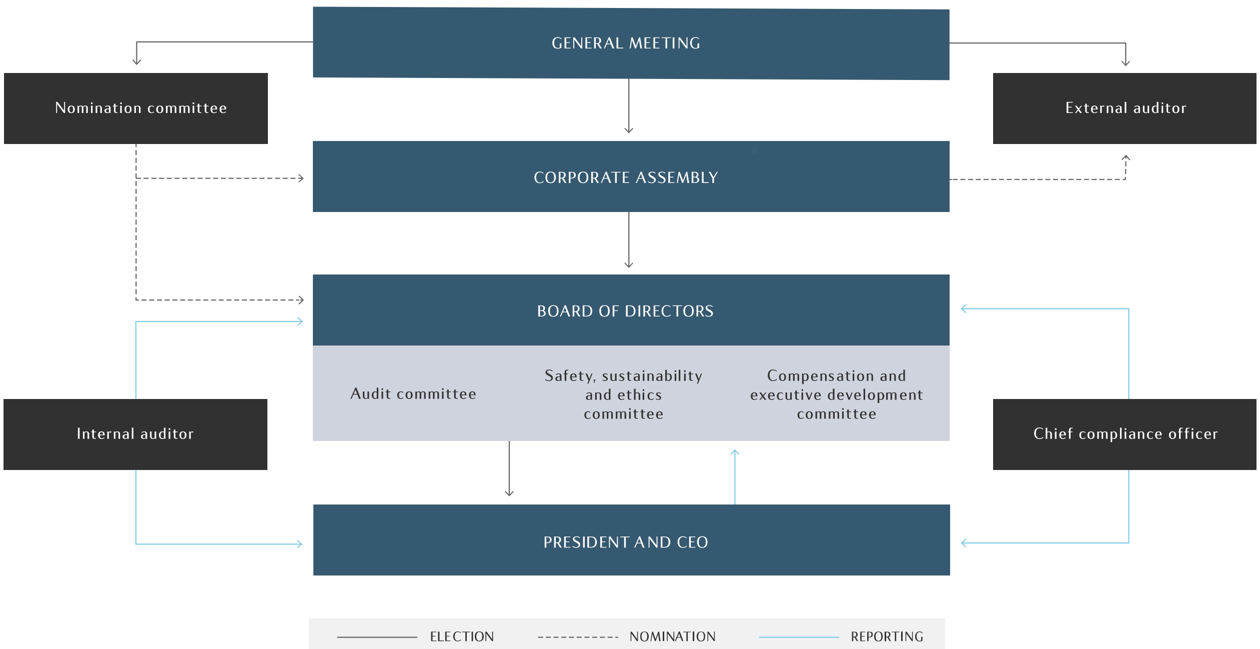
In 2017, we continued to have close cooperation with employee representatives in Norway discussing strategic matters such as changes to our people performance evaluation, organisational changes and ongoing safety improvement work. Such dialogues provide valuable perspectives and better decisions.

More information about Statoil's people is available in the 2017 Sustainability Report.

Governance

BOARD STATEMENT ON CORPORATE GOVERNANCE

Nomination and elections in Statoil ASA



Statoil's board of directors actively adheres to good corporate governance standards and will at all times ensure that Statoil either complies with the Norwegian Code of Practice for Corporate Governance (the "Code") or explains possible deviations from the Code. The topic of corporate governance is subject to regular assessment and discussion by the board, which has also considered the text of this chapter at a board meeting. The Code can be found at www.nues.no.

The Code covers 15 topics, and the board statement covers each of these topics and describes Statoil's adherence to the Code. The statement describes the foundation and principles for Statoil's corporate governance structure. More detailed factual information can be found on our website, in our Annual Report on Form 20-F and in our Sustainability Report.

The information concerning corporate governance required to be disclosed according to the Norwegian Accounting Act Section 3-3b is included in this statement as follows:

1. "An overview of the recommendations and regulations concerning corporate governance that the enterprise is subject to or otherwise chooses to comply with": Described in this introduction as well as in section 3.1 Implementation and reporting below.
2. "Information on where the recommendations and regulations mentioned in no 1 are available to the public": Described in this introduction.
3. "Reasons for any non-conformance with recommendations and regulations mentioned in no 1"; There are two deviations from the Code's recommendations, one in section 3.6 General meeting of shareholders and the other in section 3.14 Take-overs. The reasons for these deviations are described under the respective sections of this statement.
4. "A description of the main elements in the enterprise's, and for entities that prepare Consolidated financial statements, also the Group's (if relevant) internal control and risk management systems linked to the financial reporting process": Described in section 3.10 Risk management and internal control.
5. "Articles of Association which entirely or partly expand or depart from provisions of Chapter 5 of the Public Limited Liability Companies Act": Described in section 3.6 General meeting of shareholders.
6. "The composition of the board of directors, the Corporate Assembly, the Committee of Shareholders' Representatives and the Control Committee and any working committees related to these bodies, as well as a description of the main instructions and guidelines that apply to the work of the bodies and any committees": Described in section 3.8 Corporate assembly, board of directors and management and section 3.9 The work of the board of directors.
7. "Articles of Association governing the appointment and replacement of Directors": Described in section 3.8 Corporate assembly, board of directors and management under the sub-heading Board of directors.
8. "Articles of Association and authorisations empowering the board of directors to decide that the enterprise is to buy back or issue its own shares or equity certificates": Described in section 3.3 Equity and dividends.

3.1 IMPLEMENTATION AND REPORTING

Introduction

Statoil ASA is a Norwegian-registered public limited liability company with its primary listing on Oslo Børs, and the foundation for the Statoil group's governance structure is Norwegian law. Our American Depositary Receipts representing our ordinary shares are also listed on the New York Stock Exchange (NYSE), and we are subject to the listing requirements of NYSE and the requirements of the US Securities and Exchange Commission.

The board of directors focuses on maintaining a high standard of corporate governance in line with Norwegian and international standards of best practice. Good corporate governance is a prerequisite for a sound and sustainable company, and our corporate governance is based on openness and equal treatment of our shareholders. Our governing structures and controls help to ensure that we run our business in a justifiable and profitable manner for the benefit of our employees, shareholders, partners, customers and society. We continuously consider prevailing international standards of best practice when defining and implementing company policies, as we believe that there is a clear link between high-quality governance and the creation of shareholder value.

At Statoil, the way we deliver is as important as what we deliver. The Statoil Book, which addresses all Statoil employees, sets the standards for our behaviour, our delivery and our leadership.

Our values guide the behaviour of all Statoil employees. Our corporate values are "courageous", "open", "collaborative" and "caring". Both our values and ethics are treated as an integral part of our business activities. Our Code of Conduct is further described under the heading Risk management and internal control.

We also focus on managing the impacts of our activities on people, society and the environment, in line with our corporate policies for health, safety, security, human rights, ethics and sustainability, including corporate social responsibility (CSR). Areas covered by these policies include labour standards, transparency and anti-corruption, local hiring and procurement, health and safety, the working environment, security and broader environmental issues.

Our governance and management system is further elaborated on our website at www.statoil.com/cg, where shareholders and other stakeholders can explore any topic of particular interest in more detail and easily navigate to related documentation.

Statoil's objective and principles

Statoil's objective is to create long-term value for its shareholders through the exploration for and production, transportation, refining and marketing of petroleum and petroleum-derived products and other forms of energy.

In pursuing its corporate objective, Statoil is committed to the highest standard of governance and to cultivating a values-based performance culture that rewards exemplary ethical practices, respect for the environment and personal and corporate integrity. Statoil believes that there is a link between high-quality governance and the creation of shareholder value.

The work of the board of directors is based on the existence of a clearly defined division of roles and responsibilities between the shareholders, the board of directors and the company's management.

Statoil's governing structures and controls help to ensure that Statoil runs its business in a profitable manner for the benefit of shareholders, employees and other stakeholders in the societies in which Statoil operates.

The following principles underline Statoil's approach to corporate governance:

- All shareholders will be treated equally
- Statoil will ensure that all shareholders have access to up-to-date, reliable and relevant information about its activities
- Statoil will have a board of directors that is independent (as defined by Norwegian standards) of the group's management. The board focuses on preventing conflicts of interest between shareholders, the board of directors and the company's management
- The board of directors will base its work on the principles for good corporate governance applicable at all times

Corporate governance in Statoil is subject to regular review and discussion by the board of directors.

Articles of association

Statoil's current articles of association were adopted at the annual general meeting of shareholders on 14 May 2013, and last changed on 6 February 2018 following a share capital increase in connection to Statoil's scrip dividend programme.

Summary of Statoil's articles of association:

Name of the company
The registered name is Statoil ASA. Statoil is a Norwegian public limited company.

Registered office
Statoil's registered office is in Stavanger, Norway, registered with the Norwegian Register of Business Enterprises under number 923 609 016.

Objective of the company
The objective of Statoil is, either by itself or through participation in or together with other companies, to engage in the exploration, production, transportation, refining and marketing of petroleum and petroleum-derived products, and other forms of energy, as well as other business.

Share capital
Statoil's share capital is NOK 8,346,653,047.50 divided into 3,338,661,219 ordinary shares.

Nominal value of shares
The nominal value of each ordinary share is NOK 2.50.

Board of directors
Statoil's articles of association provide that the board of directors shall consist of nine to 11 directors. The board, including the chair and the deputy chair, shall be elected by the corporate assembly for a period of up to two years.

Corporate assembly
Statoil has a corporate assembly comprising 18 members who are normally elected for a term of two years. The general meeting elects 12 members with four deputy members, and six members with deputy members are elected by and among the employees.

General meetings of shareholders
Statoil's annual general meeting is held no later than 30 June each year. The meeting will consider the annual report and accounts, including the distribution of any dividend, and any other matters required by law or the articles of association.

Documents relating to matters to be dealt with at general meetings do not need to be sent to all shareholders if the documents are accessible on Statoil's website. A shareholder may nevertheless request that such documents be sent to him/her.

Shareholders may vote in writing, including through electronic communication, for a period before the general meeting. In order to practise advance voting, the board of directors must stipulate applicable guidelines. Statoil's board of directors adopted guidelines for such advance voting in March 2012, and these guidelines are described in the notices of the annual general meetings.

Marketing of petroleum on behalf of the Norwegian State
Statoil's articles of association provide that Statoil is responsible for marketing and selling petroleum produced under the SDFI's shares in production licences on the Norwegian continental shelf as well as petroleum received by the Norwegian State paid as royalty together with its own production. Statoil's general meeting adopted an instruction in respect of such marketing on 25 May 2001, as most recently amended by authorisation of the annual general meeting on 11 May 2017.

Nomination committee
The tasks of the nomination committee are to make recommendations to the general meeting for the election of shareholder-elected members and deputy members of the corporate assembly, the remuneration of members of the corporate assembly, the election and remuneration of the nomination committee, and to make recommendations to the corporate assembly for the election of shareholder-elected members of the board of directors and remuneration of the members of the board of directors and the election of the chair and deputy chair of the corporate assembly. The general meeting may adopt instructions for the nomination committee.

The articles of association are available at www.statoil.com/articlesofassociation.

Compliance with NYSE listing rules

Statoil's primary listing is on the Oslo Børs, but Statoil is also registered as a foreign private issuer with the US Securities and Exchange Commission and listed on the New York Stock Exchange.

American Depositary Receipts represent the company's ordinary shares listed on the New York Stock Exchange (NYSE). While Statoil's corporate governance practices follow the requirements of Norwegian law, Statoil is also subject to the NYSE's listing rules.

As a foreign private issuer, Statoil is exempted from most of the NYSE corporate governance standards that domestic US companies must comply with. However, Statoil is required to disclose any significant ways in which its corporate governance practices differ from those applicable to domestic US companies under the NYSE rules. A statement of differences is set out below:

Corporate governance guidelines
The NYSE rules require domestic US companies to adopt and disclose corporate governance guidelines. Statoil's corporate governance principles are developed by the management and the board of directors, in accordance with the Norwegian Code of Practice for Corporate Governance and applicable law. Oversight of the board of directors and management is exercised by the corporate assembly.

Director independence
The NYSE rules require domestic US companies to have a majority of "independent directors". The NYSE definition of an "independent director" sets out five specific tests of independence and also requires an affirmative determination by the board of directors that the director has no material relationship with the company.

Pursuant to Norwegian company law, Statoil's board of directors consists of members elected by shareholders and employees. Statoil's board of directors has determined that, in its judgment, all of the shareholder-elected directors are independent. In making its determinations of independence, the board focuses inter alia on there not being any conflicts of interest between shareholders, the board of directors and the company's management. It does not strictly make its determination based on the NYSE's five specific tests, but take into consideration all relevant circumstances which may in the board's view affect the directors' independence. The directors elected from among Statoil's employees would not be considered independent under the NYSE rules because they are employees of Statoil. None of the employee-elected directors are an executive officer of the company.

For further information about the board of directors, see 3.8 Corporate assembly, board of directors and management.

Board committees
Pursuant to Norwegian company law, managing the company is the responsibility of the board of directors. Statoil has an audit committee, a safety, sustainability and ethics committee and a compensation and executive development committee. They are responsible for preparing certain matters for the board of directors. The audit committee and the compensation and executive development committee operate pursuant to charters that are broadly comparable to the form required by the NYSE rules. They report on a regular basis to, and are subject to, continuous oversight by the board of directors. For further information about the board's sub-committees, see the section The work of the board of directors.

Statoil complies with the NYSE rule regarding the obligation to have an audit committee that meets the requirements of Rule 10A-3 of the US Securities Exchange Act of 1934.

The members of Statoil's audit committee include an employee-elected director. Statoil relies on the exemption provided for in Rule 10A-3(b)(1)(iv)(C) from the independence requirements of the US Securities Exchange Act of 1934 with respect to the employee-elected director. Statoil does not believe that its reliance on this exemption will materially adversely affect the ability of the audit committee to act independently or to satisfy the other requirements of Rule 10A-3 relating to audit committees. The other members of the audit committee meet the independence requirements under Rule 10A-3.

Among other things, the audit committee evaluates the qualifications and independence of the company's external auditor. However, in accordance with Norwegian law, the auditor is elected by the annual general meeting of the company's shareholders.

Statoil does not have a nominating/corporate governance sub-committee formed from its board of directors. Instead, the roles prescribed for a nominating/corporate governance committee under the NYSE rules are principally carried out by the corporate assembly and the nomination committee which are elected by the general meeting of shareholders. NYSE rules require the compensation committee of US companies to comprise independent directors under the NYSE rules, recommend senior management remuneration and make a determination on the independence of advisors when engaging them. Statoil, as foreign private issuer, is exempt from complying with these rules and is permitted to follow its home country regulations. Statoil considers all its compensation committee members to be independent (under Statoil's framework which, as discussed above, is not identical to that of NYSE). Statoil's compensation committee makes recommendations to the board about management remuneration, including that of the CEO. The compensation committee assesses its own performance and has the authority to hire external advisors. The nomination committee, which is elected by the general meeting of shareholders, recommends to the corporate assembly the candidates and remuneration of the board of directors. Also, the nomination committee recommends to the general meeting of shareholders the candidates and remuneration of the corporate assembly and the nomination committee.

Shareholder approval of equity compensation plans
The NYSE rules require that, with limited exemptions, all equity compensation plans must be subject to a shareholder vote. Under Norwegian company law, although the issuance of shares and authority to buy back company shares must be approved by Statoil's annual general meeting of shareholders, the approval of equity compensation plans is normally reserved for the board of directors.

Deviations from the Code: None

3.2 BUSINESS

Statoil is an international energy company headquartered in Stavanger, Norway. The company has business operations in more than 30 countries and 20,245 employees worldwide. Statoil ASA is a public limited liability company organised under the laws of Norway and subject to the provisions of the Norwegian Public Limited Liability Companies Act. The Norwegian State is the largest shareholder in Statoil ASA, with a direct ownership interest of 67%. Statoil is the leading operator on the NCS and is also expanding its international activities.

Statoil is among the world's largest net sellers of crude oil and condensate and is the second-largest supplier of natural gas to the European market. Statoil also has substantial processing and refining operations, contributes to the development of new energy resources, has on-going offshore wind activities internationally and is at the forefront of the implementation of technology for carbon capture and storage (CCS).

Statoil's objective is defined in the articles of association (www.statoil.com/articlesofassociation). We shall, either on our own or through participation in or together with other companies, engage in exploration, production, transportation, refining and marketing of petroleum and petroleum-derived products, and other forms of energy, as well as other business.

Statoil's vision is to "shape the future of energy". The board and the administration have formulated a corporate strategy to deliver on this vision. It has been translated into concrete objectives and targets to align strategy execution across the company.

To succeed going forward in turning our vision into reality, Statoil pursues a strategy around the following pillars:

- Norwegian continental shelf - Build on unique position to maximise and develop long-term value
- International Oil & Gas - Deepen core areas and develop growth options
- New Energy Solutions - Create a material new industrial position
- Midstream and Marketing - Secure premium market access and grow value creation through cycles

To enable successful execution of the strategy, safe and secure operations always comes first. Statoil will deliver through empowered people leveraging technology, digitalisation and innovation. Through stakeholder engagement, Statoil will build trust and respond actively to challenges and opportunities. In pursuing our vision and strategy, we are committed to the highest standard of governance and to cultivating a values-based performance culture that rewards exemplary ethical practices, respect for the environment and personal and corporate integrity. We believe that there is a link between high-quality governance and the creation of shareholder value.

Deviations from the Code: None

3.3 EQUITY AND DIVIDENDS

Shareholders' equity
The company's shareholders' equity at 31 December 2017 amounted to USD 39,861 million (excluding USD 24 million in non-controlling interest, minority interest), equivalent to 35.9% of the company's total assets. The board of directors considers this to be satisfactory given the company's requirement for financial robustness in relation to its expressed goals, strategy and risk profile.

Any increase of the company's share capital must be mandated by the general meeting. If a mandate was to be granted to the board of directors to increase the company's share capital, such mandate would be restricted to a defined purpose. If the general meeting is to consider mandates to the board of directors for the issue of shares for different purposes, each mandate would be considered separately by the general meeting.

Dividend policy
It is Statoil's ambition to grow the annual cash dividend, measured in USD per share, in line with long-term underlying earnings. Statoil announces dividends on a quarterly basis. The board approves first to

third quarter interim dividends based on an authorisation from the general meeting, while the annual general meeting approves the fourth quarter (and total annual) dividend based on a proposal from the board. When deciding the interim dividends and recommending the total annual dividend level, the board will take into consideration expected cash flow, capital expenditure plans, financing requirements and appropriate financial flexibility. In addition to cash dividend, Statoil might buy back shares as part of total distribution of capital to the shareholders.

The shareholders at the AGM may vote to reduce, but may not increase, the fourth quarter dividend proposed by the board of directors. Statoil announces dividend payments in connection with quarterly results. Payment of quarterly dividends is expected to take place approximately four months after the announcement of each quarterly dividend.

Statoil declares dividends in USD. Dividends in NOK per share will be calculated and communicated four business days after record date for shareholders at Oslo Børs.

The board of directors will propose to the annual general meeting a dividend of USD 0.23 per share for the fourth quarter of 2017.

Buy-back of own shares for subsequent annulment
In addition to a cash dividend, Statoil may buy back shares as part of the total distribution of capital to the shareholders. In order to be able to buy back shares the board of directors will need an authorisation from the general meeting. Such authorisation must be renewed on an annual basis. At the annual general meeting on 11 May 2017, the board of directors was authorised to acquire in the market, on behalf of the company, Statoil ASA shares with a nominal value of up to NOK 187,500,000. Within minimum and maximum prices of NOK 50 and NOK 500, respectively, the board of directors were authorised to decide at what price and at what time such acquisition should take place. Own shares acquired pursuant to this authorisation could only be used for annulment through a reduction of the company's share capital, pursuant to the Public Limited Companies Act section 12-1. It was also a precondition for the repurchase and the annulment of own shares that the Norwegian state's ownership interest in Statoil ASA was not changed. In order to achieve this, a proposal for the redemption of a proportion of the state's shares, so that the state's ownership interest in the company remains unchanged, would also be put forward at the later general meeting which was to decide the annulment of the repurchased shares. The authorisation remains valid until the next annual general meeting, but no longer than until 30 June 2018. As of 14 March 2018, the board of directors has not used this authorisation to buy back own shares for subsequent annulment.

Purchase of own shares for use in the share savings programme
Since 2004, Statoil has had a share savings plan for its employees. The purpose of this plan is to strengthen the business culture and encourage loyalty through employees becoming part-owners of the company. The annual general meeting annually authorises the board of directors to acquire Statoil shares in the market in order to continue implementation of the employees share savings plan. The authorisation remains valid until the next annual general meeting, but no longer than until 30 June the following year.

On 11 May 2017, the board was authorised on behalf of the company to acquire Statoil ASA shares for a total nominal value of up to NOK 35,000,000 for use in the share savings plan. This authorisation remains valid until the next general meeting, but not beyond 30 June 2018.

Deviations from the Code: None

3.4 EQUAL TREATMENT OF SHAREHOLDERS AND TRANSACTIONS WITH CLOSE ASSOCIATES

Equal treatment of all shareholders is a core governance principle in Statoil. Statoil has one class of shares, and each share confers one vote at the general meeting. The articles of association contain no restrictions on voting rights and all shares have equal rights. The nominal value of each share is NOK 2.50. The repurchase of own shares for use in the share savings programme for employees (or, if applicable, for subsequent cancellation) is carried out through the Oslo Børs.

The Norwegian State as majority owner
The Norwegian State is the majority shareholder of Statoil and also holds major investments in other Norwegian companies. As of 31 December 2017 the Norwegian State had an ownership interest in Statoil of 67% (excluding Folketrygdfondet's (Norwegian national insurance fund) ownership interest of 3.3%). This ownership structure means that Statoil participates in transactions with many parties that are under a common ownership structure and therefore meet the definition of a related party. All transactions are considered to be on an arm's length basis. The State's ownership interest in Statoil is managed by the Norwegian Ministry of Petroleum and Energy.

The Norwegian State's ownership policy is that the principles in the Norwegian Code of Practice for Corporate Governance will apply to state ownership and the Government has stated that it expects companies in which the State has ownership interests to adhere to the Code. The principles are presented in the State's annual ownership reports.

Contact between the State as owner and Statoil takes place in the same manner as for other institutional investors. In all matters in which the State acts in its capacity as shareholder, exchanges with the company are based on information that is available to all shareholders. We ensure that, in any interaction between the Norwegian State and Statoil, a distinction is drawn between the State's different roles.

The State has no appointed board members or members of the corporate assembly in Statoil. As majority shareholder, the State has appointed a member of Statoil's nomination committee.

Sale of the State's oil and gas
Pursuant to Statoil's articles of association, Statoil markets and sells the Norwegian State's share of oil and gas production from the Norwegian continental shelf together with its own production. The Norwegian State has a common ownership strategy aimed at maximising the total value of its ownership interests in Statoil and its own oil and gas interests. This is incorporated in the marketing instruction, which obliges Statoil, in its activities on the Norwegian continental shelf, to emphasise these overall interests in decisions

that may be of significance to the implementation of the sales arrangements.

The state-owned company Petoro AS handles commercial matters relating to the Norwegian State's direct involvement in petroleum activities on the Norwegian continental shelf and pertaining activities.

Other transactions
In relation to its ordinary business operations such as pipeline transport, gas storage and processing of petroleum products, Statoil also has regular transactions with certain entities in which Statoil has ownership interests. Such transactions are carried out on an arm's length basis.

Requirements for board members and management
It follows from our Code of Conduct, which applies to both management, employees and board members, that individuals must behave impartially in all business dealings and not give other companies, organisations or individuals improper advantages. The importance of openness is underlined, and any situations that might lead to an actual or perceived conflict of interest should be discussed with the individual's leader. All external directorships or other material assignments held or carried out by Statoil employees must be approved by Statoil.

The board's rules of procedures state that members of the board and the chief executive officer may not participate in the discussion or decision of issues which are of special personal importance to them, or to any closely-related party, so that the individual must be regarded as having a major personal or special financial interest in the matter. Each board member and the chief executive officer are individually responsible for ensuring that they are not disqualified from discussing any particular matter. Members of the board are obliged to disclose any interests they themselves or their closely-related parties may have in the outcome of a particular issue. The board must approve any agreement between the company and a member of the board or the chief executive officer. The board must also approve any agreement between the company and a third party in which a member of the board or the chief executive officer may have a special interest. Each member of the board shall also continually assess whether there are circumstances which could undermine the general confidence in the board member's independence. It is incumbent on each board member to be especially vigilant when making such assessments in connection with the board's handling of transactions, investments and strategic decisions. The board member shall immediately notify the chair of the board if such circumstances are present or arise and the chair of the board will determine how the matter will be dealt with.

Deviations from the Code: None

3.5 FREELY NEGOTIABLE SHARES

Statoil's primary listing is on the Oslo Børs. Our American Depositary Receipts (ADRs) are traded on the New York Stock Exchange. Each Statoil ADR represents one underlying ordinary share.

Statoil's articles of association contain no form of restriction on the negotiability of its shares and the shares and ADRs are freely negotiable.

Deviations from the Code: None

3.6 GENERAL MEETING OF SHAREHOLDERS

The general meeting of shareholders is Statoil's supreme corporate body. It serves as a democratic and effective forum for interaction between the company's shareholders, board of directors and management.

The next annual general meeting (AGM) is scheduled for 15 May 2018 in Stavanger, Norway, with simultaneous transmission by webcast through our website. The AGM is conducted in Norwegian, with simultaneous English translation during the webcast. At Statoil's AGM on 11 May 2017, 76.80% of the share capital was represented either by advance voting, in person or by proxy.

The main framework for convening and holding Statoil's AGM is as follows:
Pursuant to Statoil's articles of association, the AGM must be held by the end of June each year. Notice of the meeting and documents relating to the AGM are published on Statoil's website and notice is sent to all shareholders with known addresses at least 21 days prior to the meeting. All shareholders who are registered in the Norwegian Central Securities Depository (VPS) will receive an invitation to the AGM. Other documents relating to Statoil's AGMs will be made available on Statoil's website. A shareholder may nevertheless request that documents that relate to matters to be dealt with at the AGM be sent to him/her.

Shareholders are entitled to have their proposals dealt with at the AGM if the proposal has been submitted in writing to the board of directors in sufficient time to enable it to be included in the notice of meeting, i.e. no later than 28 days before the meeting. Shareholders who are unable to attend may vote by proxy.

As described in the notice of the general meeting, shareholders may vote in writing, including through electronic communication, for a period before the general meeting.

The AGM is normally opened and chaired by the chair of the corporate assembly. If there is a dispute concerning individual matters and the chair of the corporate assembly belongs to one of the disputing parties, or is for some other reason not perceived as being impartial, another person will be appointed to chair the AGM. This is in order to ensure impartiality in relation to the matters to be considered. As Statoil has a large number of shareholders with a wide geographic distribution, Statoil offers shareholders the opportunity to follow the AGM by webcast.

The following matters are decided at the AGM:

- Approval of the board of directors' report, the financial statements and any dividend proposed by the board of directors and recommended by the corporate assembly
- Election of the shareholders' representatives to the corporate assembly and approval of the corporate assembly's fees
- Election of the nomination committee and approval of the nomination committee's fees
- Election of the external auditor and approval of the auditor's fee
- Any other matters listed in the notice convening the AGM

All shares carry an equal right to vote at general meetings. Resolutions at general meetings are normally passed by simple majority. However, Norwegian company law requires a qualified majority for certain resolutions, including resolutions to waive preferential rights in connection with any share issue, approval of a merger or demerger, amendment of the articles of association or authorisation to increase or reduce the share capital. Such matters require the approval of at least two-thirds of the aggregate number of votes cast as well as two-thirds of the share capital represented at the general meeting.

If shares are registered by a nominee in the Norwegian Central Securities Depositary (VPS), cf. section 4-10 of the Norwegian Public Limited Liability Companies Act, and the beneficial shareholder wants to vote for their shares, the beneficial shareholder must re-register the shares in a separate VPS account in their own name prior to the general meeting. If the holder can prove that such steps have been taken and that the holder has a de facto shareholder interest in the company, the company will allow the shareholder to vote for the shares. Decisions regarding voting rights for shareholders and proxy holders are made by the person opening the meeting, whose decisions may be reversed by the general meeting by simple majority vote.

The minutes of the AGM are made available on Statoil's website immediately after the AGM.

As regards to extraordinary general meetings (EGM), an EGM will be held in order to consider and decide a specific matter if demanded by the corporate assembly, the chair of the corporate assembly, the auditor or shareholders representing at least 5% of the share capital. The board must ensure that an EGM is held within a month of such demand being submitted.

In the following, certain types of resolutions by the general meeting of shareholders are outlined:

New share issues

If Statoil issues any new shares, including bonus shares, the articles of association must be amended. This requires the same majority as other amendments to the articles of association. In addition, under Norwegian law, the shareholders have a preferential right to subscribe for new shares issued by Statoil. The preferential right to subscribe for an issue may be waived by a resolution of a general meeting passed by the same percentage majority as required to approve amendments to the articles of association. The general meeting may, with a majority as described above, authorise the board of directors to issue new shares, and to waive the preferential rights of shareholders in connection with such share issues. Such authorisation may be effective for a maximum of two years, and the par value of the shares to be issued may not exceed 50% of the nominal share capital when the authorisation was granted.

The issuing of shares through the exercise of preferential rights to holders who are citizens or residents of the USA may require Statoil to file a registration statement in the USA under US securities laws. If Statoil decides not to file a registration statement, these holders may not be able to exercise their preferential rights.

Right of redemption and repurchase of shares

Statoil's articles of association do not authorise the redemption of shares. In the absence of authorisation, the redemption of shares may nonetheless be decided upon by a general meeting of shareholders by a two-thirds majority on certain conditions. However, such share redemption would, for all practical purposes, depend on the consent of all shareholders whose shares are redeemed.

A Norwegian company may purchase its own shares if authorisation to do so has been granted by a general meeting with the approval of at least two-thirds of the aggregate number of votes cast as well as two-thirds of the share capital represented at the general meeting. The aggregate par value of such treasury shares held by the company must not exceed 10% of the company's share capital, and treasury shares may only be acquired if, according to the most recently adopted balance sheet, the company's distributable equity exceeds the consideration to be paid for the shares. Pursuant to Norwegian law, authorisation by the general meeting cannot be granted for a period exceeding 18 months.

Distribution of assets on liquidation

Under Norwegian law, a company may be wound up by a resolution of the company's shareholders at a general meeting passed by both a two-thirds majority of the aggregate votes cast and a two-thirds majority of the aggregate share capital represented at the general meeting. The shares are ranked equally in the event of a return on capital by the company upon winding up or otherwise.

Deviations from the Code:

The Code recommends that the board of directors, the nomination committee and the company's auditor are present at the general meetings. Statoil has not deemed it necessary to require the presence of all members of the board of directors and the nomination committee. The chair of the board, our external auditor, the chair of the nomination committee, as well as the chair of the corporate assembly, the CEO and other members of management, are, however, always present at general meetings.

3.7 NOMINATION COMMITTEE

Pursuant to Statoil's articles of association, the nomination committee shall consist of four members who are shareholders or representatives of shareholders. The duties of the nomination committee are set forth in the articles of association, and the instructions for the committee are adopted by the general meeting of shareholders.

The duties of the nomination committee are to submit recommendations to:

- The annual general meeting for the election of shareholder-elected members and deputy members of the corporate assembly, and the remuneration of members of the corporate assembly
- The annual general meeting for the election and remuneration of members of the nomination committee
- The corporate assembly for the election of shareholder-elected members of the board of directors and remuneration of the members of the board of directors and
- The corporate assembly for the election of the chair and deputy chair of the corporate assembly

The nomination committee would like to ensure that the shareholders' views are taken into consideration when candidates to the governing bodies of Statoil ASA are proposed. The nomination committee invites in writing Statoil's largest shareholders to propose shareholder-elected candidates of the corporate assembly and the board of directors, as well as members of the nomination committee. The shareholders are also invited to provide input to the nomination committee in respect of the composition and competence of Statoil's governing bodies in light of Statoil's strategies and challenges going forward. The deadline for providing input is normally set to early January in order to secure that the response is taken into account in the upcoming nominations. In addition, all shareholders have an opportunity to submit proposals through an electronic mailbox as described on Statoil's website. In the board nomination process, the board shares with the nomination committee the results from the annual, normally externally facilitated board evaluation with input from both management and the board. Separate meetings are held between the nomination committee and each board member, including employee-elected board members. The chair of the board and the chief executive officer are invited, without having the right to vote, to attend at least one meeting of the nomination committee before it makes its final recommendations. The committee regularly utilises external expertise in its work.

The members of the nomination committee are elected by the annual general meeting. The chair of the nomination committee and one other member are elected from among the shareholder-elected members of the corporate assembly. Members of the nomination committee are normally elected for a term of two years.

Personal deputy members for one or more of the nomination committee's members may be elected in accordance with the same criteria as described above. A deputy member normally only meets for the permanent member if the appointment of that member terminates before the term of office has expired.

Statoil's nomination committee consists of the following members as per 31 December 2017 and are elected for the period up to the annual general meeting in 2018:

- Tone Lunde Bakker (chair), General Manager, Swedbank Norge (also chair of Statoil's corporate assembly)
- Tom Rathke, Advisor to the CEO of DNB ASA
- Elisabeth Berge, Secretary General, Norwegian Ministry of Petroleum and Energy (personal deputy for Elisabeth Berge is Bjørn Ståle Haavik, Director, Department of Economic and Administrative Affairs, at the Norwegian Ministry of Petroleum and Energy)
- Jarle Roth, CEO of Arendals Fossekompani ASA (also a member of Statoil's corporate assembly)

The board considers all members of the nomination committee to be independent of Statoil's management and board of directors. The general meeting decides the remuneration of the nomination committee.

The nomination committee held 14 ordinary meetings and 2 telephone meetings in 2017.

The instructions for the nomination committee are available at www.statoil.com/nominationcommittee.

Deviations from the Code: None

3.8 CORPORATE ASSEMBLY, BOARD OF DIRECTORS AND MANAGEMENT

Corporate assembly

Pursuant to the Norwegian Public Limited Liability Companies Act, companies with more than 200 employees must elect a corporate assembly unless otherwise agreed between the company and a majority of its employees.

In accordance with Statoil's articles of association, the corporate assembly normally consists of 18 members, 12 of whom (with four deputy members) are nominated by the nomination committee and elected by the annual general meeting. They represent a broad cross-section of the company's shareholders and stakeholders. Six members, with deputy members, and three observers are elected by and among our employees. Such employees are non-executive personnel. The corporate assembly elects its own chair and deputy chair from and among its members.

Members of the corporate assembly are normally elected for a term of two years. Members of the board of directors and management cannot be members of the corporate assembly, but they are entitled to attend and to speak at meetings of the corporate assembly unless the corporate assembly decides otherwise in individual cases. All members of the corporate assembly live in Norway. Members of the corporate assembly do not have service contracts with the company or its subsidiaries providing for benefits upon termination of office.

An overview of the members and observers of the corporate assembly as of 31 December 2017 follows below.

Total						30,839	33,029		

An election of the employee-elected members of the corporate assembly was held early 2017. As of 26 April 2017, Terje Enes and Lars Olav Grøvik were elected as new members. Dag-Rune Dale became a new member and Dag Unnar Mongstad became a new observer in June 2017 replacing former corporate assembly member Per Martin Labråten who was elected as a new board member. Tove Bjordal, Peter B. Sabel, Thor-Ole Vågene, Mina Helene Aase, Kine Merethe Pedersen, Katrine Knarvik-Skogstø and Jan-Eirik Feste (Feste from the former position as member) were elected as new deputy members.

The number of deputy members for the employee-elected members of the corporate assembly was also reduced from 11 to 10 as a result of Per Martin Labråten's election to the board of directors.

The duties of the corporate assembly are defined in section 6-37 of the Norwegian Public Limited Liability Companies Act. The corporate assembly elects the board of directors and the chair of the board and can vote separately on each nominated candidate. Its responsibilities also include overseeing the board and the CEO's management of the company, making decisions on investments of considerable magnitude in relation to the company's resources, and making decisions involving the rationalisation or reorganisation of operations that will entail major changes in or reallocation of the workforce.

Statoil's corporate assembly held four ordinary meetings in 2017. The chair of the board participated at all four meetings, and the CEO at three meetings (with the CFO acting on his behalf at one meeting). Other members of management were also present at the meetings.

The procedure for the work of the corporate assembly, as well as an updated overview of its members, is available at www.statoil.com/corporateassembly.

Board of directors

Pursuant to Statoil's articles of association, the board of directors consists of between nine and 11 members elected by the corporate assembly. The chair of the board and the deputy chair of the board are also elected by the corporate assembly. At present, Statoil's board of directors consists of 10 members. As required by Norwegian company law, the company's employees are represented by three board members.

The employee-elected board members, but not the shareholder-elected board members, have three deputy members who attend board meetings in the event an employee-elected member of the board is unable to attend. The management is not represented on the board of directors. Members of the board are elected for a term of up to two years, normally for one year at a time. There are no board member service contracts that provide for benefits upon termination of office.

The board considers its composition to be diverse and competent with respect to the expertise, capacity and diversity appropriate to attend to the company's goals, main challenges, and the common interest of all shareholders. The board also deems its composition to be made up of individuals who are willing and able to work as a team, resulting in the board working effectively as a collegiate body. At least one board member qualifies as "audit committee financial expert", as defined in the US Securities and Exchange Commission requirements. Statoil's board of directors has determined that, in its judgment, all the shareholder representatives on the board are considered independent. Four board members are women and three board members are non-Norwegians resident outside of Norway.

The board held eight ordinary board meetings and three extraordinary meetings in 2017. Average attendance at these board meetings was 95,41%.

Further information about the members of the board and its sub-committees, including information about expertise, experience, other directorships, independence, share ownership and loans, is available below as well as on our website at www.statoil.com/board which is regularly updated.

Members of the board of directors as of 31 December 2017:

Jon Erik Reinhardsen
Born: 1956
Position: Shareholder-elected chair of the board and chair of the board's compensation and executive development committee.
Term of office: Chair of the board of Statoil ASA since 1 September 2017. Up for election in 2018.

Other matters: In 2017 Reinhardsen participated in three ordinary board meetings, two extraordinary board meetings, two meetings of

the compensation and executive development committee and one meeting of the audit committee. Reinhardsen is a Norwegian citizen and resident in Norway.

Roy Franklin
Born: 1953
Position: Shareholder-elected deputy chair of the board, chair of the board's safety, sustainability and ethics committee and member of the board's audit committee.
Term of office: Board member and deputy chair of the board of Statoil ASA since 1 July 2015. Franklin was also previously a member of the board of StatoilHydro from October 2007 and Statoil from November 2009 until June 2013. Chair of the board's safety, sustainability and ethics committee and member of the board's audit committee. Up for election in 2018.
Independent: Yes
Other directorships: Non-executive chair of the boards of Premier Oil plc, Cuadrilla Resources Holdings Limited, a privately held UK company focusing on unconventional energy sources and Eregean Israel Ltd., a private company focused on gas development offshore Israel. Board member of the private equity firm Kerogen Capital Ltd and the Aberdeen-based international engineering company Wood plc.
Number of shares in Statoil ASA as of 31 December 2017: None
Loans from Statoil ASA: None
Experience: Franklin has broad oil and gas experience from management positions in several countries, including positions with BP, Paladin Resources plc and Clyde Petroleum plc.
Education: Franklin has a Bachelor of Science in Geology from the University of Southampton, UK.
Family relations: No family relations to other members of the board, members of the corporate executive committee or the corporate assembly.
Other matters: In 2017, Franklin participated in eight ordinary board meetings, two extraordinary board meetings, one meeting in the compensation and executive development committee, six meetings of the audit committee and five meetings of the safety, sustainability and ethics committee. Franklin is a UK citizen and resident in UK.

Bjørn Tore Godal
Born: 1945
Position: Shareholder-elected member of the board, the board's compensation and executive development committee and the board's safety, sustainability and ethics committee.
Term of office: Member of the board of Statoil ASA since 1 September 2010. Up for election in 2018.
Independent: Yes
Other directorships: Vice chair of the board of the Fridtjof Nansen Institute (FNI).
Number of shares in Statoil ASA as of 31 December 2017: None
Loans from Statoil ASA: None
Experience: Godal was a member of the Norwegian parliament for 15 years during the period 1986-2001. At various times, he served as minister for trade and shipping, minister for defense and minister of foreign affairs for a total of eight years between 1991 and 2001. From 2007-2010, Godal was special adviser for international energy and climate issues at the Norwegian Ministry of Foreign Affairs. From 2003-2007, Godal was Norway's ambassador to Germany and from 2002-2003 he was senior adviser at the department of political science at the University of Oslo. From 2014-2016, Godal led a government-appointed committee responsible for the evaluation of the civil and military contribution from Norway in Afghanistan in the period 2001 - 2014.
Education: Godal has a bachelor of arts degree in political science, history and sociology from the University of Oslo.
Family relations: No family relations to other members of the board, members of the corporate executive committee or the corporate assembly.
Other matters: In 2017, Godal participated in eight ordinary board meetings, three extraordinary board meetings, six meetings of the compensation and executive development committee and five meetings of the safety, sustainability and ethics committee. Godal is a Norwegian citizen and resident in Norway.

Maria Johanna Oudeman
Born: 1958
Position: Shareholder-elected member of the board and member of the board's compensation and executive development committee.
Term of office: Member of the board of Statoil ASA since 15 September 2012. Up for election in 2018.
Independent: Yes
Other directorships: Oudeman is a member of the boards of Het Concertgebouw, Rijksmuseum, Solvay SA, SHV Holdings NV and Aalberts Industries NV.
Number of shares in Statoil ASA as of 31 December 2017: None
Loans from Statoil: None
Experience: Oudeman was the President of Utrecht University in the Netherlands, one of Europe's leading universities, until June 2017. From 2010 to 2013, Oudeman was a member of the Executive Committee of Akzo Nobel, responsible for HR and Organisational Development. Akzo Nobel is the world's largest paint and coatings company and major producer of specialty chemicals, with operations in more than 80 countries. Before joining Akzo Nobel, she was Executive Director Strip Products Division at Corus Group, now Tata Steel Europe. Oudeman has extensive experience as a line manager in the steel industry and considerable international business experience.
Education: Oudeman has a law degree from Rijksuniversiteit Groningen in the Netherlands and an MBA in business administration from the University of Rochester, New York, USA and Erasmus University, Rotterdam, the Netherlands.
Family relations: No family relations to other members of the board, members of the corporate executive committee or the corporate assembly.
Other matters: In 2017, Oudeman participated in eight ordinary board meetings, three extraordinary board meetings and six meetings of the compensation and executive development committee. Oudeman is a Dutch citizen and resident in the Netherlands.

Rebekka Glasser Herlofsen
Born: 1970
Position: Shareholder-elected member of the board and the board's audit committee.
Term of office: Member of the board of Statoil ASA since 19 March 2015. Up for election in 2018.
Independent: Yes
Other directorships: None
Number of shares in Statoil ASA as of 31 December 2017: None
Loans from Statoil: None
Experience: In April 2017 Herlofsen took on a new position as Chief Financial Officer in Wallenius Willhelmsen Logistics ASA, an international shipping company. Before joining WWL ASA she was the Chief Financial Officer in the shipping company Torvald Klaveness since 2012. She has broad financial and strategic experience from several corporations and board directorships. Herlofsen's professional career began in the Nordic Investment Bank, Enskilda Securities, where she worked with corporate finance from 1995 to 1999 in Oslo and London. During the next ten years Herlofsen worked in the Norwegian shipping company Bergesen d.y. ASA (later BW Group). During her period with Bergesen d.y. ASA/BW Group Herlofsen held leading positions within M&A, strategy and corporate planning and was part of the group management team.
Education: MSc in Economics and Business Administration (Siviløkonom) and Certified Financial Analyst Programme (AFA), the Norwegian School of Economics (NHH). Breakthrough Programme for Top Executives at IMD business school, Switzerland.
Family relations: No family relations to other members of the board, members of the corporate executive committee or the corporate assembly.
Other matters: In 2017, Herlofsen participated in eight ordinary board meetings, three extraordinary board meeting and six meetings of the audit committee. Herlofsen is a Norwegian citizen and resident in Norway.

Wenche Agerup
Born: 1964
Position: Shareholder-elected member of the board, the board's compensation and executive development committee and the board's safety, sustainability and ethics committee.
Term of office: Member of the board of Statoil ASA since 21 August 2015. Up for election in 2018.
Independent: Yes
Other directorships: Agerup is a member of the board of the seismic company TGS ASA and a member of Det Norske Veritas Council and its nomination committee.
Number of shares in Statoil ASA as of 31 December 2017: 2,650
Loans from Statoil: None
Experience: Agerup is an Executive Vice President (Corporate Affairs) and General Counsel in Telenor ASA. Agerup was the Executive Vice President for Corporate Staffs and the General Counsel of Norsk Hydro ASA from 2010 to 31 December 2014. She has held various executive roles in Hydro since 1997, including within the company's M&A-activities, the business area Alumina, Bauxite and Energy, as a plant manager at Hydro's metal plant in Årdal and as a project director for a Joint Venture in Australia where Hydro cooperated with the Australian listed company UMC.
Education: MA in Law from the University of Oslo, Norway (1989) and a Master of Business Administration from Babson College, USA (1991).
Family relations: No family relations to other members of the board, members of the corporate executive committee or the corporate assembly.
Other matters: In 2017, Agerup participated in eight ordinary board meetings, three extraordinary board meetings, six meetings of the compensation and executive development committee and four meetings of the safety, sustainability and ethics committee. Agerup is a Norwegian citizen and resident in Norway.

Jeroen van der Veer
Born: 1947
Position: Shareholder-elected member of the board and chair of the board's audit committee.
Term of office: Member of the board of Statoil ASA since 18 March 2016. Up for election in 2018.
Independent: Yes
Other directorships: van der Veer is the chair of the supervisory boards of ING Bank NV and Royal Philips Electronics, chair of the supervisory council of Technical University of Delft and Platform Beta Techniek, chair of the advisory board of the Rotterdam Climate Initiative as well as a board member in Boskalis Westminster Groep NV and Het Concertgebouw.
Number of shares in Statoil ASA as of 31 December 2017: None
Loans from Statoil: None
Experience: van der Veer was the Chief Executive Officer in the international oil and gas company Royal Dutch Shell Plc (Shell) in the period 2004 to 2009 when he retired. van der Veer thereafter continued as a non-executive director on the board of Shell until 2013. He started to work for Shell in 1971 and has experience within all sectors of the business and has significant competence within corporate governance.
Education: van der Veer has a degree in Mechanical Engineering (MSc) from Delft University of Technology, Netherlands and a degree in Economics (MSc) from Erasmus University, Rotterdam, Netherlands. Since 2005 he holds an honorary doctorate from the University of Port Harcourt, Nigeria.
Family relations: No family relations to other members of the board, members of the corporate executive committee or the corporate assembly.
Other matters: In 2017, van der Veer participated in seven ordinary board meetings, two extraordinary board meetings and six meetings of the audit committee. van der Veer is a Dutch citizen and resident in the Netherlands

Per Martin Labråten
Born: 1961
Position: Employee-elected member of the board and member of the board's safety, sustainability and ethics committee.
Term of office: Member of the board of Statoil ASA since 8 June 2017. Up for election in 2019.
Independent: No
Other directorships: Labråten is a member of the executive committee of the Industry Energy (IE) trade union and holds a number of offices as a result of this.
Number of shares in Statoil ASA as of 31 December 2017: 1,343
Loans from Statoil: None
Experience: Labråten has worked as a process technician at the petrochemical plant on Oseberg field in the North Sea. Labråten is now a full-time employee representative as the leader of IE Statoil branch.
Education: Labråten has a craft certificate as a process/chemistry worker.
Family relations: No family relations to other members of the board, members of the corporate executive committee or the corporate assembly.

Other matters: In 2017, Labråten participated in four ordinary board meetings, one extraordinary board meeting and one meeting of the safety, sustainability and ethics committee. Labråten is a Norwegian citizen and resident in Norway.

Ingrid Elisabeth di Valerio
Born: 1964
Position: Employee-elected member of the board and member of the board's audit committee.
Term of office: Member of the board of Statoil ASA since 1 July 2013. Up for election in 2019.
Independent: No
Other directorships: Board member of Tekna's central nomination committee.
Number of shares held in Statoil ASA as of 31 December 2017: 4,471
Loans from Statoil: None
Experience: di Valerio has been employed by Statoil since 2005, and works within materials discipline for Technology, Projects & Drilling. di Valerio was the union Tekna's main representative in Statoil from 2008 to 2013. She also sat on Tekna's central committee from 2005 to 2013.
Education: Chartered engineer (mathematics and physics) from the Norwegian University of Science and Technology in Trondheim (NTNU).
Familiy relations: No family relationships to other board members, members of the corporate executive committee or the corporate assembly.
Other matters: In 2017, di Valerio participated in eight ordinary board meetings, three extraordinary board meetings and six meetings of the audit committee. di Valerio is a Norwegian citizen and resident in Norway.

Stig Lægreid
Born: 1963
Position: Employee-elected member of the board and member of the board's safety, sustainability and ethics committee.
Term of office: Member of the board of Statoil ASA since 1 July 2013. Up for election in 2019.
Independent: No
Other directorships: Member of The Norwegian society for Engineers and Technologists' (NITO) negotiation committee for private sector.
Number of shares held in Statoil ASA as of 31 December 2017: 1,975
Loans from Statoil: None
Experience: Employed in ÅSV and Norsk Hydro since 1985. Mainly occupied as project engineer and constructor for production of primary metals until 2005 and from 2005 as weight estimator for platform design. He is now a full-time employee representative as the leader of the union NITO, Statoil.
Education: Bachelor degree, mechanical construction from OIH.
Family relations: No family relationships to other board members, members of the corporate executive committee or the corporate assembly.
Other matters: In 2017, Lægreid participated in eight ordinary board meetings, three extraordinary board meetings and five meetings of the safety, sustainability and ethics committee. Lægreid is a Norwegian citizen and resident in Norway.

The most recent changes to the composition of the board of directors was the election of Jon Erik Reinhardsen as the new shareholder-elected chair effective as of 1 September 2017 after the former shareholder-elected chair Øystein Løseth resigned effective as of 30 June 2017. Deputy chair Roy Franklin acted as chair of the board between 1 July and 31 August 2017. Employee-elected member Per Martin Labråten was elected as of 8 June 2017, replacing Lill Heidi Bakkerud. Reinhardsen replaced Løseth as chair of the board's compensation and executive development committee as per 5 September 2017.

Management

The president and CEO has overall responsibility for day-to-day operations in Statoil and appoints the corporate executive committee (CEC). The president and CEO is responsible for developing Statoil's business strategy and presenting it to the board of directors for decision, for the execution of the business strategy and for cultivating a performance-driven, values-based culture.

Members of the CEC have a collective duty to safeguard and promote Statoil's corporate interests and to provide the president and CEO with the best possible basis for deciding the company's direction, making decisions and executing and following up business activities. In addition, each of the CEC members is head of a separate business area or staff function.

Members of Statoil's corporate executive committee as of 31 December 2017:

Eldar Sætre,
President and CEO

Eldar Sætre
Born: 1956
Position: President and chief executive officer (CEO) of Statoil ASA since 15 October 2014.
External offices: Member of the board of Strømberg Gruppen AS and Trucknor AS.
Number of shares in Statoil ASA as of 31 December 2017: 56,896
Loans from Statoil: None
Experience: Sætre joined Statoil in 1980. Executive vice president and CFO from October 2003 until December 2010. Executive vice president for Marketing, Midstream and Processing (MMP) from 2011 until 2014.
Education: MA in business economics from the Norwegian School of Economics and Business Administration (NHH).
Family relations: No family relations to other members of the corporate executive committee, members of the board or the corporate assembly.
Other matters: Sætre is a Norwegian citizen and resident in Norway.

Hans Jakob Hegge,
Chief financial
officer (CFO)

Hans Jakob Hegge
Born: 1969
Position: Executive vice president and chief financial officer (CFO) of Statoil ASA since 1 August 2015.
External offices: None
Number of shares in Statoil ASA as of 31 December 2017: 32,104
Loans from Statoil: None
Experience: Hegge has held several managerial positions in Statoil, including senior vice president (SVP) for Operations North in Development & Production Norway (DPN) (2013-2015), SVP for Operations East (2011-2013) in DPN, SVP for Operational Development in DPN (2009-2011) and SVP for Global Business Services in Chief Financial Officer area (CFO) (2005-2009). From 1995 to 2004 he held various positions in DPN, Natural Gas business area and corporate functions in Statoil.
Education: Master of Science degree from the Norwegian School of Economics and Business Administration (NHH).
Family relations: No family relations to other members of the corporate executive committee, members of the board or the corporate assembly.
Other matters: Hegge is a Norwegian citizen and resident in Norway.

Jannicke Nilsson
Chief operating officer (COO)

Jannicke Nilsson

PUBLIC COPY - CONFIDENTIAL INFORMATION REMOVED

she was appointed programme leader for Statoil technical efficiency programme (STEP), responsible for a project portfolio delivering yearly efficiency gains of 3.2 billion USD from 2016.
Education: MSc in cybernetics and process automation and a BSc in automation from the Rogaland Regional College/University of Stavanger.
Family relations: No family relations to other members of the corporate executive committee, members of the board or the corporate assembly.
Other matters: Nilsson is a Norwegian citizen and resident in Norway.

Lars Christian Bacher,
Executive vice president Development & Production International (DPI)

Lars Christian Bacher
Born: 1964
Position: Executive vice president Development & Production International (DPI) of Statoil ASA since 1 September 2012.
External offices: None
Number of shares in Statoil ASA as of 31 December 2017: 23,309
Loans from Statoil ASA: None
Experience: Bacher joined Statoil in 1991 and has held a number of leading positions in Statoil, including that of platform manager on the Norne and Statfjord fields on the Norwegian continental shelf. He was in charge of the merger process involving the offshore installations of Norsk Hydro and Statoil. Bacher has also been senior vice president for Gullfaks operations and subsequently for the Tampen area. His most recent position, which he held from September 2009, was as senior vice president for Statoil's Canadian operations within DPI.
Education: Master of science in chemical engineering from the Norwegian Institute of Technology (NTH). He also holds a business degree in Finance from the Norwegian School of Economics and Business Administration (NHH).
Family relations: No family relations to other members of the corporate executive committee, the board of directors or the corporate assembly.
Other matters: Bacher is a Norwegian citizen and resident in Norway.

Torgrim Reitan,
Executive vice president Development & Production USA (DPUSA)

Torgrim Reitan
Born: 1969
Position: Executive vice president Development & Production USA (DPUSA) of Statoil ASA since 1 August 2015.
External offices: None
Number of shares in Statoil ASA as of 31 December 2017: 36,235
Loans from Statoil: None
Experience: From 1 January 2011 to 1 August 2015 Reitan held the position as executive vice president and chief financial officer of Statoil (CFO). He has held several managerial positions in Statoil, including senior vice president (SVP) in trading and operations in the Natural Gas business area (2009 - 2010), SVP in performance management and analysis (2007 - 2009) and SVP in performance management, tax and M&A (2005 - 2007). From 1995 to 2004, Reitan held various positions in the Natural Gas business area and corporate functions in Statoil.
Education: Master of science degree from the Norwegian School of Economics and Business Administration (Siviløkonom) (NHH).
Family relations: No family relations to other members of the corporate executive committee, members of the board or the corporate assembly.
Other matters: Reitan is a Norwegian citizen and resident in the United States.

John Knight,
Executive vice president
Global Strategy & Business
Development (GSB)

John Knight
Born: 1958
Position: Executive vice president Global Strategy & Business Development (GSB) of Statoil ASA since 1 January 2011.
External offices: Member on the advisory board of the Columbia University Center on Global Energy Policy in New York and member of the advisory board of Lloyd's Register. Chair of ONS 18 Conference Committee in Stavanger, Norway.
Numbers of shares in Statoil ASA as of 31 December 2017: 109,901
Loans from Statoil ASA: None
Experience: Knight held several central managerial positions in International Operations in Statoil since 2002, mainly in business development. Between 1987 and 2002, Knight held various

positions in energy investment banking. From 1977 to 1987, he qualified and worked as a barrister/lawyer, and was employed by Shell Petroleum in London during the period 1980-1987.
Education: Knight has first and post-graduate degrees in law from Cambridge University and the Inns of Court School of Law in London.
Family relations: No family relations to other members of the corporate executive committee, members of the board or the corporate assembly.
Other matters: Knight is a British citizen and resident in England.

Tim Dodson.
Executive vice president, Exploration (EXP)

Tim Dodson
Born: 1959
Position: Executive vice president Exploration (EXP) of Statoil ASA since 1 January 2011.
External offices: None
Number of shares in Statoil ASA as of 31 December 2017: 34,425
Loans from Statoil ASA: None
Experience: Dodson has worked in Statoil since 1985 and held central management positions in the company, including the positions of senior vice president for Global Exploration, Exploration & Production Norway and the Technology arena.
Education: Bachelor's degree of science in geology and geography from the University of Keele.
Family relations: No family relations to other members of the corporate executive committee, members of the board or the corporate assembly.
Other matters: Dodson is a British citizen and resident in Norway.

Margareth Øvrum.
Executive vice president Technology, Projects & Drilling (TPD)

Margareth Øvrum
Born: 1958
Position: Executive vice president Technology, Projects & Drilling (TPD) of Statoil ASA since September 2004.
External offices: Member of the board of Alfa Laval (Sweden) and FMC Corporation (US).
Number of shares in Statoil ASA as of 31 December 2017: 56,125
Loans from Statoil: None
Experience: Øvrum has worked for Statoil since 1982 and has held central management positions in the company, including the position of executive vice president for Health, Safety and the Environment and executive vice president for Technology & Projects. Øvrum was the company's first female platform manager, on the Gullfaks field. She was senior vice president for operations for Veslefrikk and vice president of Operations Support for the Norwegian continental shelf.
Education: Master's degree in engineering (sivilingeniør) from the Norwegian Institute of Technology (NTH), specialising in technical physics.
Family relations: No family relations to other members of the corporate executive committee, members of the board or the corporate assembly.
Other matters: Øvrum is a Norwegian citizen and resident in Norway.

Arne Sigve Nylund,
Executive vice president Development & Production Norway (DPN)

Arne Sigve Nylund
Born: 1960
Position: Executive vice president Development & Production Norway (DPN) of Statoil ASA since 1 January 2014.
External offices: Member of the board of directors of The Norwegian Oil & Gas Association (Norsk Olje & Gass).
Number of shares in Statoil ASA as of 31 December 2017: 13,354
Loans from Statoil: None
Experience: Nylund was employed by Mobil Exploration Inc. from 1983-1987. Since 1987, he has held several central management positions in Statoil.
Education: Mechanical engineer from Stavanger College of Engineering with further qualifications in operational technology

from Rogaland Regional College/University of Stavanger (UiS). Business graduate of the Norwegian School of Business and Management (NHH).
Family relations: No family relations to other members of the corporate executive committee, members of the board or the corporate assembly.
Other matters: Nylund is a Norwegian citizen and resident in Norway.

Jens Økland,
Executive vice president Marketing, Midstream & Processing (MMP)

Jens Økland
Born: 1969
Position: Executive vice president Marketing, Midstream & Processing (MMP) of Statoil ASA since 1 June 2015.
External offices: None
Number of shares in Statoil ASA as of 31 December 2017: 17,207
Loans from Statoil ASA: None
Experience: Økland joined Statoil in 1994 and has mainly worked in the mid and downstream areas. Before becoming executive vice president of MMP, Økland worked as vice president of operations for the Åsgard area in Development & Production Norway. Previously Økland was senior vice president of Statoil's natural gas portfolio and supply business in North America, marketing and developing infrastructure solutions for equity and non-equity production. Before heading up Statoil's downstream gas division in North America, he had senior marketing and business development positions within natural gas in Europe mainly focusing on Germany, Statoil's largest gas market.
Education: MSc in business from BI Norwegian Business School.
Family relations: No family relations to other members of the corporate executive committee, members of the board or the corporate assembly.
Other matters: Økland is a Norwegian citizen and resident in Norway.

Irene Rummelhoff,
Executive vice president New Energy Solutions (NES)

Irene Rummelhoff
Born: 1967
Position: Executive vice president New Energy Solutions (NES)of Statoil ASA since 1 June 2015.
External offices: Deputy chair of the board of directors of Norsk Hydro ASA.
Number of shares in Statoil ASA as of 31 December 2017: 25,081
Loans from Statoil ASA: None
Experience: Rummelhoff joined Statoil in 1991. She has held a number of management positions within international business development, exploration and the downstream business in Statoil.
Education: Master's degree in petroleum geosciences from the Norwegian Institute of Technology (NTH).
Family relations: No family relations to other members of the corporate executive committee, members of the board or the corporate assembly.
Other matters: Rummehoff is a Norwegian citizen and resident in Norway.

Statoil has granted loans to the Statoil-employed spouse of certain of the executive vice presidents as part of its general loan arrangement for Statoil employees. Employees in salary grade 12 or higher may take out a car loan from Statoil in accordance with standardised provisions set by the company. The standard maximum car loan is limited to the cost of the car, including registration fees, but not exceeding NOK 300,000. Employees outside the collective labour area are entitled to a car loan up to NOK 575,000 (vice presidents and senior vice presidents) or NOK 475,000 (other positions). The car loan is interest-free, but the tax value, "interest advantage", must be reported as salary. Permanent employees in Statoil ASA may also apply for a consumer loan up to NOK 350.000. The interest rate on consumer loans is corresponding to the standard rate in effect at any time for "reasonable loans" from employer as decided by the Norwegian Ministry of Finance, i.e. the lowest rate an employer may offer without triggering taxation of the advantage for the employee.

Deviations from the Code: None

3.9 THE WORK OF THE BOARD OF DIRECTORS

The board is responsible for managing the Statoil group and for monitoring day-to-day management and the group's business activities. This means that the board is responsible for establishing control systems and for ensuring that Statoil operates in compliance with laws and regulations, with our values as stated in The Statoil Book, the Code of Conduct, as well as in accordance with the owners' expectations of good corporate governance. The board emphasises the safeguarding of the interests of all shareholders, but also the interests of Statoil's other stakeholders.

The board handles matters of major importance, or of an extraordinary nature, and may in addition require the management to refer any matter to it. An important task for the board is to appoint the chief executive officer (CEO) and stipulate his/her job instructions and terms and conditions of employment.

The board has adopted a generic annual plan for its work which is revised with regular intervals. Recurrent items on the board's annual plan are: security, safety, sustainability and climate, corporate strategy, business plans, quarterly and annual results, annual reporting, ethics, management's monthly performance reporting, management compensation issues, CEO and top management leadership assessment and succession planning, project status review, people and organisation strategy and priorities, an annual enterprise risk management review, two yearly discussions of main risks and risk issues and an annual review of the board's governing documentation. In the beginning of each board meeting, the CEO meets separately with the board to discuss key matters in the company. At the end of all board meetings, the board has a closed session with only board members attending the discussions and evaluating the meeting.

The work of the board is based on rules of procedure that describe the board's responsibilities, duties and administrative procedures, and determines which cases are to be handled by the board. The rules of procedure also determine the handling of matters in which individual board members or a closely related party have a major personal or financial interest. The rules of procedure further describe the duties of the CEO and his/her duties vis-à-vis the board of directors. The board's rules of procedure are available on our website at www.statoil.com/board. In addition to the board of directors, the CEO, the CFO, the COO, the senior vice president for communication, the general counsel and the company secretary attend all board meetings. Other members of the executive committee and senior management attend board meetings by invitation in connection with specific matters.

New members of the board are offered an induction programme where meetings with key members of the management are arranged, an introduction to Statoil's business is given and relevant information about the company and the board's work is made available through the company's web based board portal.

The board carries out an annual board evaluation, with input from various sources and as a main rule with external facilitation. The evaluation report is discussed in a board meeting and is made available to the nomination committee as input to the committee's work.

The entire board, or part of it, regularly visits several Statoil locations in Norway and globally, and a longer board trip for all board members to an international location is made at least on a biannual basis. When visiting Statoil locations globally, the board emphasises the importance of improving its insight into, and knowledge about, safety and security in Statoil's operations, Statoil's technical and commercial activities as well as the company's local organisations. In 2017, whole or parts of the board visited Statoil's operations in London, Brazil and USA as well as, in Norway, the Oseberg Field and yards in Stord and Haugesund.

Statoil's board has established three sub-committees: the audit committee; the compensation and executive development committee; and the safety, sustainability and ethics committee. The committees prepare items for consideration by the board and their authority is limited to making such recommendations. The committees consist entirely of board members and are answerable to the board alone for the performance of their duties. Minutes of the committee meetings are sent to the whole board, and the chair of each committee regularly informs the board at board meetings about the committee's work. The composition and work of the committees are further described below.

Audit committee

The board of directors elects at least three of its members to serve on the board of directors' audit committee and appoints one of them to act as chair. The employee-elected members of the board of directors may nominate one audit committee member.

At year-end 2017, the audit committee members were Jeroen van der Veer (chair), Roy Franklin, Rebekka Glasser Herlofsen and Ingrid di Valerio (employee-elected board member).

The audit committee is a sub-committee of the board of directors, and its objective is to act as a preparatory body in connection with the board's supervisory roles with respect to financial reporting and the effectiveness of the company's internal control system. It also attends to other tasks assigned to it in accordance with the instructions for the audit committee adopted by the board of directors. The audit committee is instructed to assist the board of directors in its supervising of matters such as:

- Approving the internal audit plan on behalf of the board of directors
- Monitoring the financial reporting process, including oil and gas reserves, fraudulent issues and reviewing the implementation of accounting principles and policies
- Monitoring the effectiveness of the company's internal control, internal audit and risk management systems
- Maintaining continuous contact with the external auditor regarding the annual and consolidated accounts
- Reviewing and monitoring the independence of the company's internal auditor and the independence of the external auditor, reference is made to the Norwegian Auditors Act chapter 4, and, in particular, whether services other than audits provided by the external auditor or the audit firm are a threat to the external auditor's independence

The audit committee supervises implementation of and compliance with the group's Code of Conduct in relation to financial reporting.

Corporate Audit reports administratively to the president and CEO of Statoil and functionally to the chair of the board of directors' audit committee.

Under Norwegian law, the external auditor is appointed by the shareholders at the annual general meeting based on a proposal from the corporate assembly. The audit committee issues a statement to the annual general meeting relating to the proposal.

The audit committee meets at least five times a year and both the board and the board's audit committee hold meetings with the internal auditor and the external auditor on a regular basis without the company's management being present.

The audit committee is also charged with reviewing the scope of the audit and the nature of any non-audit services provided by external auditors.

The audit committee is tasked with ensuring that the company has procedures in place for receiving and dealing with complaints received by the company regarding accounting, internal control or auditing matters, and procedures for the confidential and anonymous submission, via the group's ethics helpline, by company employees of concerns regarding accounting or auditing matters, as well as other matters regarded as being in breach of the group's Code of Conduct, a material violation of an applicable US federal or state securities law, a material breach of fiduciary duties or a similar material violation of any other US or Norwegian statutory provision. The audit committee is designated as the company's qualified legal compliance committee for the purposes of Part 205 in Title 17 of the U.S. Code of Federal Regulations.

In the execution of its tasks, the audit committee may examine all activities and circumstances relating to the operations of the company. In this regard, the audit committee may request the chief executive officer or any other employee to grant it access to information, facilities and personnel and such assistance as it requests. The audit committee is authorised to carry out or instigate such investigations as it deems necessary in order to carry out its tasks and it may use the company's internal audit or investigation unit, the external auditor or other external advice and assistance. The costs of such work will be covered by the company.

The audit committee is only responsible to the board of directors for the execution of its tasks. The work of the audit committee in no way alters the responsibility of the board of directors and its individual members, and the board of directors retains full responsibility for the audit committee's tasks.

The audit committee held six meetings in 2017. There was 100% attendance at the committee's meetings.

The board of directors has decided that a member of the audit committee, Jeroen van der Veer, qualifies as an "audit committee financial expert", as defined in Item 16A of Form 20-F. The board of directors has also concluded that Jeroen van der Veer, Roy Franklin and Rebekka Glasser Herlofsen are independent within the meaning of Rule 10A-3 under the Securities Exchange Act.

The committee's mandate is available at www.statoil.com/auditcommittee.

Compensation and executive development committee

The compensation and executive development committee is a sub-committee of the board of directors that assists the board in matters relating to management compensation and leadership development. The main responsibilities of the compensation and executive development committee are:

(1) as a preparatory body for the board, to make recommendations to the board in all matters relating to principles and the framework for executive rewards, remuneration strategies and concepts, the CEO's contract and terms of employment, and leadership development, assessments and succession planning;

(2) to be informed about and advise the company's management in its work on Statoil's remuneration strategy for senior executive and in drawing up appropriate remuneration policies for senior executives; and

(3) to review Statoil's remuneration policies in order to safeguard the owners' long-term interests.

The committee consists of up to four board members. At year-end 2017, the committee members were Jon Erik Reinhardsen (chair), Bjørn Tore Godal, Maria Johanna Oudeman and Wenche Agerup. All the committee members are non-executive directors. All members are deemed independent.

The committee held six meetings in 2017 and attendance was 100%.

For a more detailed description of the objective and duties of the compensation and executive development committee, please see the instructions for the committee available at www.statoil.com/compensationcommittee.

Safety, sustainability and ethics committee

The safety, sustainability and ethics committee is a sub-committee of the board of directors that assists the board in matters relating to safety, sustainability and ethics.

At year-end 2017, the safety, sustainability and ethics committee was chaired by Roy Franklin and the other members are Bjørn Tore Godal, Wenche Agerup, Stig Lægreid (employee-elected board member) and Per Martin Labråten (employee-elected board member).

In its business activities, Statoil is committed to comply with applicable laws and regulations and to act in an ethical, environmental, safe and socially responsible manner. The committee has been established to support our commitment in this regard, and it assists the board of directors in its supervision of the company's safety, sustainability and ethics policies, systems and principles with the exception of aspects related to "financial matters".

Establishing and maintaining a committee dedicated to safety, sustainability and ethics is intended to ensure that the board of directors has a strong focus on and knowledge of these complex, important and constantly evolving areas. The committee acts as a preparatory body for the board of directors and, among other things, monitors and assesses the effectiveness, development and implementation of policies, systems and principles in the areas of safety, sustainability and ethics, with the exception of aspects related to "financial matters". The committee also reviews the annual Sustainability Report.

The committee held five meetings in 2017, and attendance was 96%.

For a more detailed description of the objective, duties and composition of the committee, please see the instructions for the committee available at www.statoil.com/ssecommittee.

Deviations from the Code: None

3.10 RISK MANAGEMENT AND INTERNAL CONTROL

Risk management

The board focuses on ensuring adequate control of the company's internal control and overall risk management. The board conducts an annual enterprise risk management review and two times pr. year the board is presented with and discusses the main risks and risk issues Statoil is facing. The board's audit committee assists the board and act as a preparatory body in connection with monitoring of the company's internal control, internal audit and risk management systems. The board's safety, sustainability and ethics committee monitors and assesses safety, sustainability and climate risks which are relevant for Statoil's operations and both committees report regularly to the full board.

Statoil manages risk to make sure that our operations are safe and in compliance with our requirements. Our overall risk management approach includes continuously assessing and managing risks related to our value chain in order to support the achievement of our principal objectives, i.e. value creation and avoiding incidents.

The company has a separate corporate risk committee chaired by the chief financial officer. The committee meets at least five times a year to give advice and make recommendations on Statoil's enterprise risk management. Further information about the company's risk management is presented in section 2.11 of the form 20-F Risk review.

All risks are related to Statoil's value chain - from access, maturing, project execution and operations to market. In addition to the financial impact these risks could have on Statoil's cash flows, we have also implemented procedures and systems to reduce safety, security and integrity incidents (such as fraud and corruption), as well as any reputation impact resulting from human rights, labour standards and transparency issues. Most of the risks are managed by our principal business area line managers. Some operational risks are insured by our captive insurance company, which operates in the Norwegian and international insurance markets.

Controls and procedures

This section describes controls and procedures relating to our financial reporting.

Evaluation of disclosure controls and procedures

The management, with the participation of our chief executive officer and chief financial officer, has evaluated the effectiveness of the design and operation of our disclosure controls and procedures pursuant to Exchange Act Rule 13a-15(b) as of the end of the period covered by the Form 20-F. Based on that evaluation, the chief executive officer and chief financial officer have concluded that as a result of a material weakness in internal controls over financial reporting described below, these disclosure controls and procedures were not effective at a reasonable level of assurance as of 31 December 2017.

In order to facilitate the evaluation, the disclosure committee reviews material disclosures made by Statoil for any errors, misstatements and omissions. The disclosure committee is chaired by the chief financial officer. It consists of the heads of investor relations, accounting and financial compliance, performance management and controlling, tax and the general counsel and it may be supplemented by other internal and external personnel. The head of the internal audit is an observer at the committee's meetings.

In designing and evaluating our disclosure controls and procedures, our management, with the participation of the chief executive officer and chief financial officer, recognised that any controls and procedures, no matter how well designed and operated, can only provide reasonable assurance that the desired control objectives will be achieved, and that the management must necessarily exercise judgment when evaluating the cost-benefit aspects of possible controls and procedures. Because of the limitations inherent in all control systems, no evaluation of controls can provide absolute assurance that all control issues and any instances of fraud in the company have been detected.

The management's report on internal control over financial reporting

The management of Statoil ASA is responsible for establishing and maintaining adequate internal control over financial reporting. Our internal control over financial reporting is a process designed, under the supervision of the chief executive officer and chief financial officer, to provide reasonable assurance regarding the reliability of financial reporting and the preparation of Statoil's financial statements for external reporting purposes in accordance with International Financial Reporting Standards (IFRS) as adopted by the European Union (EU). The accounting policies applied by the group also comply with IFRS as issued by the International Accounting Standards Board (IASB).

Material weakness

The management of Statoil has assessed the effectiveness of internal control over financial reporting based on the Internal Control - Integrated Framework (2013) issued by the Committee of Sponsoring Organizations of the Treadway Commission (COSO). Based on this assessment, management has concluded that Statoil's internal control over financial reporting as of 31 December 2017 was not effective due to the existence of a material weakness in our controls and procedures for the identification, assessment and timely and appropriate communication to the Board Audit Committee of questions or concerns (including allegations of misconduct) raised by employees in connection with termination of their employment relating to issues that could potentially have a material impact on our Consolidated financial statements and internal controls over financial reporting (otherwise than through Statoil's external Ethics help line established by the Board Audit Committee). The allegations were subject to thorough investigations with external advisors, and no material misstatements were identified. There has been no effect on the 2017 Consolidated financial statements, or earlier periods, related to this matter.

Specifically, management identified that the established controls, policies and procedures did not operate as intended because our written procedures did not contain a sufficient level of precision for the identification, assessment and timely and appropriate communication of such matters to the appropriate relevant internal bodies including, where appropriate the Board Audit Committee. Other controls that should have compensated for this weakness did not operate as intended with respect to the reporting of such matters by some employees and so were ineffective.

Management has analysed the material weakness and performed additional analysis and procedures in preparing our Consolidated financial statements. We have concluded that our Consolidated financial statements fairly present, in all material respects, our financial condition, results of operations and cash flow at and for the periods presented. Apart from the material weakness described above, Statoil's management has not identified any other deficiencies that would have led management to conclude that Statoil's internal control over financial reporting was not effective. However, the material weakness identified created a possibility that a material misstatement to the Consolidated financial statements would not be prevented or detected on a timely basis and accordingly a remediation plan has been undertaken.

Statoil's internal control over financial reporting includes policies and procedures that pertain to the maintenance of records that, in reasonable detail, accurately and fairly reflect transactions and dispositions of assets, provide reasonable assurance that transactions are recorded in the manner necessary to permit the preparation of financial statements in accordance with IFRS, and that receipts and expenditures are only carried out in accordance with the authorisation of the management and directors of Statoil; and provide reasonable assurance regarding the prevention or timely detection of any unauthorised acquisition, use or disposition of Statoil's assets that could have a material effect on our financial statements.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect all misstatements. Moreover, projections of any evaluation of the effectiveness of internal control to future periods are subject to a risk that controls may become inadequate because of changes in conditions and that the degree of compliance with the policies or procedures may deteriorate.

Attestation report of the registered public accounting firm
The effectiveness of internal control over financial reporting as of 31 December 2017 has been audited by KPMG AS, an independent registered accounting firm that also audits the Consolidated financial statements in this report. Their report on internal control over financial reporting expresses an adverse opinion on the effectiveness of our internal control over financial reporting as of 31 December 2017.

Remediation plan
Our management is actively undertaking remediation efforts to address the material weakness identified above as follows:

- Enhancement of the precision level of written controls, policies and procedures regarding identification, assessment and timely communication to the Board Audit Committee
- Enhanced training of Statoil employees, with respect to these policies and relevant procedures

Management believes the foregoing plan effectively remediate the material weakness. As the remediation is implemented, management may take additional measures or modify the plan described above.

Changes in internal control over financial reporting
Other than the remediation plan described above, no changes occurred in our internal control over financial reporting during the period that have materially affected, or are reasonably likely to materially affect, our internal control over financial reporting.

We will continue to monitor and evaluate the effectiveness of our internal control over financial reporting and are committed to taking further action by implementing additional enhancements or improvements as may be deemed necessary.

Code of Conduct

Ethics - Statoil's approach
Statoil believes that responsible and ethical behaviour is a necessary condition for a sustainable business. Statoil's Code of Conduct is based on its values and reflects Statoil's commitment to high ethical standards in all its activities.

Our Code of Conduct
The Code of Conduct describes Statoil's code of business practice and the requirements to expected behaviour in areas such as anti-corruption, fair competition, human rights and non-discrimination working environments with equal opportunities. The Code of Conduct applies to Statoil's board members, employees and hired personnel.

Statoil seeks to work with others who share its commitment to ethics and compliance, and Statoil manages its risks through in-depth knowledge of suppliers, business partners and markets. Statoil expects its suppliers and business partners to comply with applicable laws, respect internationally recognised human rights and adhere to ethical standards which are consistent with Statoil's ethical requirements when working for or together with Statoil. In joint ventures and entities where Statoil does not have control, Statoil makes good faith efforts to encourage the adoption of ethics and anti-corruption policies and procedures that are consistent with its standards. Anyone working for Statoil who does not comply with the Code of Conduct faces disciplinary action, up to and including summery dismissal or termination of their contract.

Training and Certifying the Code of Conduct
The Code of Conduct training and comprehensive trainings on specific issues, including anti-corruption, anti-trust and reporting, is carried out to explain how the Code of Conduct applies and to describe the tools that Statoil has made available to address risk.

All Statoil employees have to annually confirm electronically that they understand and will comply with the Code of Conduct (Code certification). The Code certification reminds the individuals of their duty to comply with Statoil's values and ethical requirements, and creates an environment with open dialog on ethical issues, both internally and externally.

Anti-corruption compliance programme
Statoil is against all forms of corruption including bribery, facilitation payments and trading in influence and has a company-wide anti-corruption compliance programme which implements its zero-tolerance policy. The programme includes mandatory procedures designed to comply with applicable laws and regulations and training on relevant issues such as gifts, hospitality and conflicts of interest. Compliance officers, who are responsible for ensuring that ethics and anti-corruption considerations are integrated into Statoil's business activities, constitute an important part of the programme.

In 2017, Statoil Anti-Corruption Compliance Manual was updated to reflect the ongoing improvements and best practice in our anti-corruption program. Statoil continues to maintain is global network of compliance officers responsible for supporting the business to ensure that ethical and anti-corruption considerations are integrated into Statoil's activities no matter where they take place. In 2017, we worked towards strengthening support across the organisation through the deployment of senior corporate compliance resources to support regional activities. Statoil continue to work with our partners and suppliers on ethics and anti-corruption, and have initiated dialogs with several of our partners on the risks that we jointly face and actions that can be taken to address them.

Speak Up
Statoil is committed to maintain an open dialog on ethical issues. The Code of Conduct requires those who have a question or suspect misconduct to raise their concern either through internal channels or through Statoil's external Ethics Helpline. Employees are encouraged to discuss their concerns with their supervisor. Statoil recognises that raising a concern is not always easy so there are several internal channels for taking concerns forward, including through human resources or the ethics and compliance function in the legal department. Concerns can also be expressed through the externally operated Ethics Helpline which is available 24/7, and allows for anonymous reporting and two-way communication through the use of a pin-code. Statoil has a non-retaliation policy for anyone who reports in good faith.

More information about Statoil's policies and requirements related to the Code of Conduct is available on www.statoil.com/ethics.

Deviations from the Code: None

3.11 REMUNERATION TO THE BOARD OF DIRECTORS AND CORPORATE ASSEMBLY

Remuneration to the board of directors

The remuneration of the board and its sub-committees is decided by the corporate assembly, based on a recommendation from the nomination committee. The members have an annual, fixed remuneration, except for deputy members (only elected for employee-elected board members) who receive remuneration per meeting attended. Separate rates are set for the board's chair, deputy chair and other members, respectively. Separate rates are also adopted for the board's sub-committees, with similar differentiation between the chair and the other members of each committee. The employee-elected members of the board receive the same remuneration as the shareholder-elected members.

The board receives its remuneration by cash payment. Board members from outside Scandinavia and outside Europe, respectively, receive separate travel allowances for each meeting attended. The remuneration is not linked to the board members' performance, option programmes or similar. None of the shareholder-elected board members have a pension scheme or agreement concerning pay after termination of their office with the company. If shareholder-elected members of the board and/or companies they are associated with should take on specific assignments for Statoil in addition to their board membership, this will be disclosed to the full board.

In 2017, the total remuneration to the board, including fees for the board's three sub-committees, was NOK 6,278,638 (USD 759,846).

Detailed information about the individual remuneration to the members of the board of directors in 2017 is provided in the table below.

Members of the board (figures in USD thousand except number of shares)	Total remuneration	Share ownership as of 31 December 2017
Jon Erik Reinhardsen (chair of the board)1)	37	2,558
Øystein Løseth (chair of the board)2)	52	n.a.
Roy Franklin (deputy chair of the board)3)	118	-
Wenche Agerup	67	2,650
Bjørn Tore Godal	67	-
Rebekka Glasser Herlofsen	63	-
Maria Johanna Oudeman	89	-

Per Martin Labråthen4)	33	1,343
Lill-Heidi Bakkerud5)	25	n.a.
Stig Lægreid	57	1,975
Ingrid Elisabeth di Valerio	63	4,471
Total	760	12,997

1) Chair from September 1, 2017

2) Chair until June 30, 2017 (resigned)

3) Chair between July 1 and August 31, 2017

4) Member from June 8, 2017

5) Member until June 7, 2017 (resigned)

Remuneration to the corporate assembly

The remuneration of the corporate assembly is decided by the general meeting, based on a recommendation from the nomination committee. The members have an annual, fixed remuneration, except for deputy members who receive remuneration per meeting attended. Separate rates are set for the corporate assembly's chair, deputy chair and other members, respectively. The employee-elected members of the corporate assembly receive the same remuneration as the shareholder-elected members. The corporate assembly receives its remuneration by cash payment.

In 2017, the total remuneration to the corporate assembly was NOK 1,070,497 (USD 129,552).
Deviations from the Code: None

3.12 REMUNERATION TO THE CORPORATE EXECUTIVE COMMITTEE

In 2017, the aggregate remuneration to the corporate executive committee was NOK 85,556, 482 (USD 10,354,122). The board of directors' complete declaration on remuneration of executive personnel follows below.

Only the following portions of this Section 3.12 Remuneration to the corporate executive committee form part of Statoil's annual report on Form 20-F as filed with the SEC: the table summarising the main elements of Statoil executive remuneration; the description regarding pension and insurance schemes, severance pay arrangements and other benefits; the deescription regarding performance management and results essential for variable pay and the table summarising the main objectives and KPIs for each perspective; the table summarising remuneration paid to each member of the corporate executive committee; the description of the company performance modifier; and the description regarding share ownership, including the summary table.

DECLARATION FROM CHAIR OF THE BOARD

Declaration on remuneration and other employment terms for Statoil's corporate executive committee

Statoil's remuneration policy and terms are aligned with the company's overall values, people policy and performance-oriented framework. Our rewards and recognition for executives are designed to attract and retain the right people; people who are committed to deliver on our business strategy and able to adapt to changing business environment. A key role for the board is to ensure that executive compensation is competitive, but not market leading, in the markets in which we operate. Executive compensation should also be seen as fair and aligned with overall compensation levels in the company, and with shareholders' interests. The board is responsible for finding this balance.

The board has reviewed the remuneration systems and concluded that practices are efficient, transparent and in accordance with prevailing guidelines and good corporate governance.

Oslo 14 March 2018
Jon Erik Reinhardsen

Pursuant to the Norwegian Public Limited Liability Companies Act, section 6-16 a, the board will present the following declaration regarding remuneration of Statoil's corporate executive committee to the 2018 annual general meeting.

Remuneration policy and concept for the accounting year 2018

Policy and principles
The company's established remuneration principles and concept as described in previous year's declaration on remuneration and other employment terms for Statoil's corporate executive committee will, with exception of the revised threshold for variable pay, be continued in the accounting year 2018.

The remuneration concept is an integrated part of our values based performance framework. It has been designed to:

- Be competitive and aligned with local markets
- Equally reward and recognise "What" we deliver and "How" we deliver
- Differentiate on the basis of responsibilities and performance
- Be acknowledged as fair, transparent, consistent and non-discriminatory
- Promote collaboration and teamwork
- Reflect the company's overall performance and financial result
- Strengthen the common interests of employees in the Statoil group and its shareholders
- Fully aligned with our values and HSE
- Promote continuous improvement and a sustainable cost level

The remuneration concept for the corporate executive committee
Statoil's remuneration policy and guidelines for the corporate executive committee are translated into the following main elements;

- Fixed remuneration: base salary and as applicable cash compensation
- Variable pay: annual variable pay (AVP) and long-term incentive (LTI)
- Benefits: primarily pension, insurance and share savings plan
- Company performance modifier and threshold for variable pay

The table below illustrate how our reward policy and framework is translated into key remuneration elements.

Main elements - Statoil executive remuneration

Remuneration element	Objective	Award level	Performance criteria
Base salary	Attract and retain the right individuals providing competitive but not market-leading terms.	We offer base salary levels which are aligned with and differentiated according to the individual's responsibility and performance. The level is competitive in the markets in which we operate.	The base salary is normally subject to annual review based on an evaluation of the individual's performance; see "Annual Variable Pay" below.
Cash compensation	The cash compensation is applied as a supplementing fixed remuneration element to be competitive in the market.	Reference is made to the remuneration table. Four of the executive vice presidents receive a cash compensation in lieu of pension accrual with reference to the section on pension and insurance scheme.	No performance criteria are linked to the cash compensation. The cash compensation is not included in the pensionable income.
Annual variable pay	Encourage a strong performance culture. Reward individuals for annual achievement of business objectives and goals relating to 'How' results are delivered.	Members of the corporate executive committee are entitled to annual variable pay ranging from 0 - 50% of their fixed remuneration. Target[10] value is 25%. The threshold principles and the company performance modifier are applied. The Company reserves the right to reclaim variable components of the remuneration awarded for performance if performance data is subsequently proven to be misstated.	Achievement of annual performance goals ("How" and "What" to deliver), in order to create long-term and sustainable shareholder value. Assessment of goals defined on the individual's performance contract including objectives related to selected KPI's on the balanced scorecard constitute the basis for annual variable pay.
Long-term incentive (LTI)	Strengthen the alignment of top management and shareholders' long-term interests. Retention of key executives.	The LTI system is a monetary compensation calculated as a portion of the participant's base salary. On behalf of the participant, the company acquires shares equivalent to the net annual grant amount. The shares are subject to a three-year lock-in period and then released for the participant's disposal. If the lock-in obligations are not fulfilled, the executive has to pay back the gross value of the locked-in shares limited to the gross value of the grant amount. The level of the annual LTI reward is in the range of 25-30%. The threshold principles are applied for the annual grant. The company performance modifier is not applied for the LTI in Statoil ASA.	In Statoil ASA, LTI participation and grant level are reflective of the level and impact of the position and not directly linked to the incumbent's performance.
Threshold	Financial threshold for payment of variable remuneration and award of LTI grant.	The threshold has the following guiding parameters; 1) Cash flows provided by operating activities after tax and before working capital items 2) Net debt ratio and development 3) Company's overall operational and financial performance. Cash flows provided by operating activities after tax and before working capital items higher than USD 12 billion and a net debt ratio below 30% will normally guide for no reduction of bonus.	Application of the threshold is subject to a discretionary assessment of the company's overall performance by the board of directors. These measures and targets are indicative and will form part of a broader assessment of bonus award.
Company performance modifier	Strengthen the alignment between variable remuneration and the company's performance.	The company performance modifier determines the proportion of the bonus that will be paid, ranging from 50% to 150% The company performance modifier is subject to approval by the annual general meeting.	Company performance is assessed against two equally weighted measures: relative total shareholder return (TSR) and relative return on average capital employed (ROACE). Application of the modifier is subject to discretionary assessment based on the company's overall performance.
Pension & insurance schemes	Provide competitive postemployment and other benefits.	The company offers a general occupational pension plan and insurance scheme aligned with local markets. Reference is made to the section on pension and insurance scheme.	N/A
Employee share savings plan	Align and strengthen employee and shareholders' interests and remunerate for long term commitment and value creation.	The share savings plan is offered to all employees in the group, provided no restrictions due to local legislation or business requirements. Participants are offered to purchase Statoil shares in the market limited to 5% of annual base salary.	If shares are kept for two calendar years of continued employment, the participants will be allocated bonus shares proportionate to their purchase.

[1] Target value reflects satisfactory deliveries according to agreed goals

Pension and insurance schemes
Members of the corporate executive committee in Statoil ASA are covered by the company's general occupational pension scheme which is a defined contribution scheme with a contribution level of 7% below 7,1 G and 22% above 7,1 G[2]. A defined benefit scheme is retained by a grandfathered group of employees. For new members of the corporate executive committee appointed after 13 February 2015, a cap on pension contribution at 12 G is applied. In lieu of pension accrual above 12 G a cash compensation is provided. Four of the executive vice presidents receive a cash compensation in lieu of pension accrual.

Members of the corporate executive committee appointed before 13 February 2015, will maintain their pension contribution above 12 G based on obligations in previously established agreements.

The chief executive officer and three executive vice presidents have individual early retirement pension agreement with the company.

The chief executive officer and one of the executive vice presidents have individual pension terms according to a previous standard arrangement implemented in October 2006. Subject to specific terms those executives are entitled to a pension amounting to 66% of pensionable salary and a retirement age of 62. Reference is made to the section on CEO terms and conditions below. When calculating the number of years of membership in Statoil's general pension plan, these agreements grant the right to an extra contribution time corresponding to half a year of extra membership for each year the individual has served as executive vice president.

In addition, two members of the corporate executive committee have individually agreed retirement age of 65 and an early retirement pension level amounting to 66% of pensionable salary.

The pension terms for executive vice presidents outlined above are results of previously established individual agreements.

Statoil has implemented a general cap on pensionable income at 12 G for all new hires into the company employed as of 1 September 2017.

In addition to the pension benefits outlined above, the executive vice presidents in the parent company are offered disability and dependents' benefits in accordance with Statoil's general pension plan/defined benefit plan. Members of the corporate executive committee are covered by the general insurance schemes applicable within Statoil.

Severance pay arrangements
The chief executive officer and the executive vice presidents are entitled to a severance payment equivalent to six months' salary, commencing at the time of expiry of a six months' notice period, when the resignation is at the request from the company. The same amount of severance payment is also payable if the parties agree that the employment should be discontinued and the executive vice president gives notice pursuant to a written agreement with the company. Any other payment earned by the executive vice president during the period of severance payment will be fully deducted. This relates to earnings from any employment or business activity where the executive vice president has active ownership.

The entitlement to severance payment is conditional on the chief executive officer or the executive vice president not being guilty of gross misconduct, gross negligence, disloyalty or other material breach of his/her duties.

As a general rule, the chief executive officer's/executive vice president's own notice will not instigate any severance payment.

Other benefits
The members of the corporate executive committee have benefits in kind such as company car and electronic communication. They are also eligible for participation in the share saving scheme as described above.

Performance management, assessment and results essential for variable pay

Individual salary and annual variable pay reviews are based on the performance evaluation in our performance development process.

Performance is evaluated in two dimensions; "What" we deliver and "How" we deliver. "What" we deliver (business delivery) is defined through the company's performance framework "Ambition to Action", which addresses strategic objectives, key performance Indicators (KPIs) and actions across the five perspectives; Safety, Security and Sustainability, People and Leadership, Operations, Market and Finance. Generally, Statoil believes in setting ambitious targets to inspire and drive strong performance.

Goals on "How" we deliver are based on our core values and leadership principles and address the behaviour required and expected in order to achieve our delivery goals.

Performance evaluation is holistic, involving both measurement and assessment. Since KPIs are indicators only, sound judgement are applied. Significant changes in assumptions are taken into account, as well as target ambition levels, sustainability of delivered results and strategic contribution.

This balanced approach, which involves a broad set of goals defined in relation to both "What" and "How" dimensions and an overall performance evaluation, is viewed to significantly reduce the likelihood that remuneration policies may stimulate excessive risk-taking or have other material adverse effects.

In the performance contracts of the chief executive officer and chief financial officer, one of several targets is related to the company's relative total shareholder return (TSR). The amount of the annual variable pay is decided based on an overall assessment of the performance of various targets including but not limited to the company's relative TSR.

[2] G = The basic amount of the Norwegian social security system

In 2017, the main objectives and KPIs for each perspective were as outlined below. Each perspective was in addition supported by comprehensive plans and actions.

Strategic objectives		2017 assessment
Safety, security and sustainability	The strategic objectives and actions address safety, security and sustainability	Total Serious Incident Frequency of 0.6 was on target, improving from the 2016 level. The target on Total Recordable Injury Frequency was narrowly missed. The number of oil and gas leakages improved from 2016 but exceeded the target. CO_2 intensity for the upstream portfolio improved from the 2016 level, and Statoil reached its target of being in the top quartile in the IOGP company report on this parameter.
People and organisation	The strategic objectives and actions address a value based and high performing organisation	The score on Employee engagement exceeded the target, also increasing from the 2016 level, which confirmed the employees' continued engagement and commitment to Statoil despite a challenging business context The results on People development were above target, showing positive trends both in learning activities and in internal deployment.
Operations	The strategic objectives and actions address reliable and cost-efficient operations, and being a driver in oil and gas industry transformation	Production was highest in Statoil's history and exceeded the target. On relative unit production cost, Statoil reached the target of being in the first quartile of the peer group. The company maintained its position at the top of the peer group for the third year running. Production efficiency was above target.
Market	The strategic objectives and actions address a flexible and resilient energy portfolio	Reserve replacement ratio exceeded the target of 1, driven by project sanctions and upward revisions on a number of existing assets, both offshore and onshore. Organic capex was better than the original guiding and target, mainly due to strict prioritisation and continuous focus on capital efficiency. Value creation from exploration did not reach the target, mainly due to lower-than-expected discovered volumes. However, Statoil has secured access to new acreage, such as the Carcara North block in Brazil and the Bajo del Toro block in Argentina.
Finance	The strategic objectives and actions address cash generation, profitability and competitiveness	On Relative Shareholder Return, Statoil ranked 4th in an industry peer group of 12, thus meeting the target of securing a position above average. On Relative ROACE, Statoil ranked 2nd in the peer group, thus meeting the target of securing a position above average. The cash flow improvement programme delivered above target.

Board assessment of the chief executive officer's performance

In its assessment of the chief executive officer's performance, and consequently his annual pay for 2017, the board has put emphasis on a strong delivery on production, continued efficiency improvements, and a positive trend within Safety, Security and Sustainability (SSU). The negative trend from 2016 has been turned and the Serious Incidents Frequency (SIF) is on target. CO2 intensity per boe has been reduced with more than 10% compared to 2016 results.

Statoil has increased production guiding and at the same time reduced the capex, enabled by further efficiency improvements and strict prioritization. Statoil has secured access to new acreage and strengthened the portfolio. The TSR and ROACE results are solid. Employee engagement is strong and improving, supported by a dedicated focus on people development.

Key performance indicators for the chief executive officer for 2018

The delivery dimension for the CEO's variable remuneration (performance year 2018) and base salary merit in 2019 will be based on assessment of results on the following KPIs:

Safety, Security and Sustainability
- Serious Incident Frequency
- CO_2 intensity for the upstream portfolio

Market
- Fixed operating and SG&A expenses (per boe)

Results
- Relative Total Shareholder Return
- Relative ROACE

Execution of the remuneration policy and principles in 2017

Introduction

- The remuneration policy and principles executed in 2017 were in accordance with the declaration given to the AGM 11 May 2017
- Subject to application of the threshold described in the remuneration concept, the LTI grant in 2017 was reduced by 50% of the maximum level.
- Based on a holistic evaluation, with focus on opportunity for further performance improvement, the annual variable pay for members of the corporate executive committee has been reduced by 12%. 12

Performance management system

Statoil's performance management system was changed in 2017, to strengthen continuous feedback and development focus. The aim is to enable performance through a more dynamic approach, strength-based development and forward focus. Some of the principled changes to the performance management system includes discontinuation of the five-grade rating system, while increasing performance and development dialogues throughout the year.

Performance is still assessed, and "How" we deliver will continue to be as important as "What" we deliver.

Revised threshold for variable pay

In 2015 Statoil introduced a threshold for variable pay to strengthen the link between the company's performance and variable pay. Based on experience and market information, the threshold concept has been reviewed and adjusted. The annual threshold decision will be founded on a broad-based assessment comprising several criteria including the company's overall operational and financial performance.

The revised threshold has the following guiding parameters;

- Cash flow provided by operating activities after tax and before working capital items
- Net debt ratio and development
- Company's overall operational and financial performance

Cash flow provided by operating activities after tax and before working capital items higher than USD 12 billion and a net debt ratio below 30% will normally guide for no reduction of bonus. These measures and targets are indicative and will form part of a broader assessment of bonus award. The holistic assessment of the company's overall operational and financial performance, will focus on (but not be limited to); HSE, production, operational efficiency, progress of improvements, project execution, adjusted earnings and adjusted ROACE. The revised threshold will apply for the performance year 2017.

Company modifier for variable pay relating to performance year 2017

The company modifier depends on the outcome of two metrics ROACE and TSR, both parameters measured relatively to a peer group of 11 other companies. The results for Statoil in 2017 were; relative ROACE number 2 and relative TSR number 4 in the peer group. This gives first quartile result for ROACE and second quartile result for TSR, which gives a company modifier of 1,33 for 2017.

12 This reduction is compared to pay-out levels when applying individual performance assessment and the company modifier for 2017

CEO Terms and conditions

Eldar Sætre was appointed chief executive on 4 February 2015, after acting CEO since October 2014. Under his individual pension agreement Eldar Sætre had the right to retire at the age of 62, after three years as chief executive. Due to this, an element of his fixed pay was excluded from his pensionable income. Statoil's board of directors and chief executive Eldar Sætre agreed in 2017 that Sætre will continue as CEO after he turns 62 in February 2018. Hence, it was agreed that the CEO would not use his contractual right to retire at the age of 62. As the CEO did not exercise his right to retire at 62, the board decided to revert to the original provision of pension being calculated on total fixed pay. The fixed pay element amounting to NOK 2,408,505 has thus been included in the pensionable income. Eldar Sætre will at the latest retire when he turns 67, but retains the right to retire at an earlier stage.

The Statoil board has reviewed the CEO's remuneration package compared to the market. Subsequently, the board has increased the CEO's fixed annual pay to NOK 8,767,682, effective from 1 September 2017.

The chief executive officer will continue to participate in an annual variable pay scheme with a target level of 25% (max 50%), and participation in the company's 2018 LTI scheme with a value of 30% (gross) of base salary. Except for the inclusion of the fixed pay element in the CEO's base salary as pensionable income, pension terms remain unchanged, as described in section on pension and insurance scheme.

The decision-making process

The decision-making process for implementing or changing remuneration policies and concepts, and the determination of salaries and other remuneration for corporate executive committee, are in accordance with the provisions of the Norwegian public limited liability companies act sections 5-6 and 6-16 a and the board's rules of procedure. The board's rules of procedure are available at www.statoil.com/board.

The board of directors has appointed a designated compensation and executive development committee. The compensation and executive development committee is a preparatory body for the board. The committee's main objective is to assist the board of directors in its work relating to the terms of employment for Statoil's chief executive officer and the main principles and strategy for the remuneration and leadership development of our senior executives. The board of directors determines the chief executive officer's salary and other terms of employment.

The compensation and executive development committee answers to the board of Statoil ASA for the performance of its duties. The work of the committee in no way alters the responsibilities of the board of directors or the individual board members.

For further details about the roles and responsibilities of the compensation and executive development committee, please refer to the committee's instructions available at www.statoil.com/compensationcommittee.

John Knight[12)]	1,643	0	0	0	181	1,824	0	0	0	1,810	109,901

1) All figures in the table are presented in USD based on average currency rates (2017: USD/NOK = 8.2630, USD/GBP = 1.2882. 2016: USD/NOK = 8.3987, USD/GBP = 1.3538). The figures are presented on accrual basis.
2) All CEC members receive their remuneration in NOK except John Knight who receives the remuneration in GBP.
3) Fixed pay consists of base salary, fixed remuneration element, holiday allowance and other administrative benefits.
4) Cash allowance in lieu of pension accrual above 12 G (G is the base amount in the national insurance scheme).
5) The long-term incentive (LTI) element implies an obligation to invest the net amount in Statoil shares, including a lock-in period. The LTI element is presented the year it is granted for the members of the corporate executive committee employed by Statoil ASA.
6) Annual variable pay includes holiday allowance for corporate executive committee (CEC) members resident in Norway.
7) Estimated pension cost is calculated based on actuarial assumptions and pensionable salary (mainly base salary) at 31 December 2016 and is recognised as pension cost in the statement of income for 2017.
8) Eldar Sætre, Arne Sigve Nylund, Margareth Øvrum and Timothy Dodson are maintained in the closed Defined Benefit Scheme, whereas the remaining members of corporate executive committee employed by Statoil ASA, is covered by the Defined Contribution Pension Scheme.
9) Includes 2016 CEC members who are also CEC members in 2017.
10) Estimated present value of pension obligation for Eldar Sætre is based on retirement at the age of 67. Eldar Sætre has the right to retire at an earlier stage.
11) Terms and conditions for Torgrim Reitan also include compensation according to Statoil's international assignment terms.
12) John Knight's fixed pay includes a fixed remuneration element of USD 143,000 that replaces his defined contribution pension plan and a fixed remuneration element of USD 689,000 replacing his variable pay arrangements.

There are no loans from the company to members of the corporate executive committee.

Company performance modifier

Introduction
Based on initial approval by the annual general meeting in 2016 a company performance modifier was introduced to be applied in calculation of variable pay. The intention is to continue with the performance modifier in 2018. The relative total shareholder return is recommended as one of the criteria in the modifier. Thus, the proposal is submitted to the annual general meeting for approval, pursuant to the provisions in the Public Limited Companies Act § 5-6 third paragraph last sentence ref. § 6-16 a, first paragraph third sentence number 3.

Background
Statoil has implemented annual variable pay schemes (AVP) for members of the corporate executive committee. The schemes are described in section on remuneration concept for the corporate executive committee of this declaration. Other executives, managers and employees in defined professional positions are also eligible for individual variable pay according to the company's guidelines.

The company performance modifier is implemented to strengthen the link between the company's overall financial results and the individual variable pay. The governmental guidelines on executive remuneration also underline that "there shall be a clear connection between the variable salary and the performance of the company."

Proposal
Based on this, the performance modifier will be continued in 2018. The company performance will be assessed against two equally weighted measures: relative total shareholder return (TSR) and relative return on average capital employed (ROACE). TSR and ROACE are currently also applied as performance indicators in the corporate performance management system.

The results of these two performance measures are compared to our peers and our relative position determined. A position of Quartile 1 means that Statoil is amongst the top scoring quartile of peer companies. A position of Quartile 4 means Statoil is in the bottom performing quartile. In years with strong deliveries on relative TSR and ROACE, the matrix will result in the variable pay being modified with a factor higher than one and, correspondingly, lower than one in weak years. The combination of ratings for both measures, will act as a 'multiplier' according to the guideline in the matrix displayed below.

Relative RoACE	Q4	Q3	Q2	Q1
Q1	100 %	117 %	133 %	150 %
Q2	83 %	100 %	117 %	133 %
Q3	67 %	83 %	100 %	117 %
Q4	50 %	67 %	83 %	100 %

Relative TSR

By applying relative numbers, the effect of fluctuating oil price will be reduced. Within the framework of 50 - 150%, the matrix is a guideline and the multiplier (percentages) may be adjusted if oil or gas price effects or other occurrences outside the control of the company are deemed to cause disproportionate results in a given year.

Subject to approval by the 2018 annual general meeting, the company performance modifier will be continued in calculations of annual variable pay for members of the corporate executive committee in the earning year 2018 with subsequent impact on annual variable pay in 2019. The modifier will also be applied in other variable pay schemes below the corporate executive level. Further application of the company performance modifier will also be assessed and decided if deemed appropriate.

The annual variable pay for members of the corporate executive committee will be within a framework of 50% of the fixed remuneration irrespective of the result of the modifier. Any deviations from this framework for members of the corporate executive committee will be explained in the board's annual declaration on remuneration and other employment terms for Statoil's corporate executive committee.

Share ownership

The number of Statoil shares owned by the members of the board of directors and the executive committee and/or owned by their close associates is shown below. Individually, each member of the board of directors and the corporate executive committee owned less than 1% of the outstanding Statoil shares.

Ownership of Statoil shares (including share ownership of «close associates»)	As of 31 December 2017	As of 14 March 2018
Members of the corporate executive committee

Individually, each member of the corporate assembly owned less than 1% of the outstanding Statoil shares as of 31 December 2017 and as of 14 March 2018. In aggregate, members of the corporate assembly owned a total of 30,839 shares as of 31 December 2017 and a total of 33,029 shares as of 14 March 2018. Information about the individual share ownership of the members of the corporate assembly is presented in the section 3.8 Corporate assembly, board of directors and management.

The voting rights of members of the board of directors, the corporate executive committee and the corporate assembly do not differ from those of ordinary shareholders.

Deviations from the Code: None

3.13 INFORMATION AND COMMUNICATIONS

The reporting is based on openness and it takes into account the requirement for equal treatment of all participants in the securities market. Statoil has established guidelines for the company's reporting of financial and other information and the purpose of these guidelines is to ensure that timely and correct information about the company is made available to our shareholders and society in general.

A financial calendar and shareholder information is published at www.statoil.com/calendar.

The investor relations corporate staff function is responsible for coordinating the company's communication with capital markets and for relations between Statoil and existing and potential investors. Investor relations is responsible for distributing and registering information in accordance with the legislation and regulations that apply where Statoil securities are listed. Investor relations reports directly to the chief financial officer.

The company's management holds regular presentations for investors and analysts. The company's quarterly presentations are broadcast live on our website. Investor relations communicate with present and potential shareholders through presentations, one-to-one meetings, conferences, web-site, financial media, telephone, mail and e-mail contact. The pertaining reports from these communication channels are made available together with other relevant information at www.statoil.com/investor.

All information distributed to the company's shareholders is published on the company's website at the same time as it is sent to the shareholders.

Deviations from the Code: None

3.14 TAKE-OVERS

The board of directors endorses the principles concerning equal treatment of all shareholders and Statoil's articles of association do not set limits on share acquisitions. Statoil has no defence mechanisms against take-over bids in its articles of association, nor has it implemented other measures that limit the opportunity to acquire shares in the company. The Norwegian State owns 67% of the shares, and the marketability of these shares is subject to parliamentary decree.

The board is obliged to act professionally and in accordance with the applicable principles for good corporate governance if a situation should arise in which this principle in the Code were put to the test.

Deviations from the Code:
The Code recommends that the board establish guiding principles for how it will act in the event of a take-over bid. The board has not established such guidelines, due to Statoil's ownership structure and for the reasons stated above. In the event of a bid as discussed in section 14 of the Code, the board of directors will, in addition to complying with relevant legislation and regulations, seek to comply with the recommendations in the Code. The board has no other explicit basic principles or written guidelines for procedures to be followed in the event of a take-over bid. The board of directors otherwise concurs with what is stated in the Code regarding this issue.

3.15 EXTERNAL AUDITOR

Our independent registered public accounting firm (external auditor) is independent in relation to Statoil and is elected by the general meeting of shareholders. The external auditor's fee must be approved by the general meeting of shareholders.

Pursuant to the instructions for the board's audit committee approved by the board of directors, the audit committee is responsible for ensuring that the company is subject to an independent and effective external and internal audit. Every year, the external auditor presents a plan to the audit committee for the execution of the external auditor's work. The external auditor attends the meeting of the board of directors that deals with the preparation of the annual accounts.

The external auditor also participates in meetings of the audit committee. The audit committee considers all reports from the external auditor before they are considered by the board of directors. The audit committee meets at least five times a year and both the board and the board's audit committee hold meetings with the internal auditor and the external auditor on a regular basis without the company's management being present.

When evaluating the external auditor, emphasis is placed on the firm's qualifications, capacity, local and international availability and the size of the fee.

The audit committee evaluates and makes a recommendation to the board of directors, the corporate assembly and the general meeting of shareholders regarding the choice of external auditor. The committee is responsible for ensuring that the external auditor meets the requirements in Norway and in the countries where Statoil is listed. The external auditor is subject to the provisions of US securities legislation, which stipulates that a responsible partner may not lead the engagement for more than five consecutive years.

The audit committee's policies and procedures for pre-approval
In its instructions for the audit committee, the board of directors has delegated authority to the audit committee to pre-approve assignments to be performed by the external auditor. Within this pre-approval, the audit committee has issued further guidelines. The audit committee has issued guidelines for the management's pre-approval of assignments to be performed by the external auditor.

All audit-related and other services provided by the external auditor must be pre-approved by the audit committee. Provided that the types of services proposed are permissible under SEC guidelines, pre-approval is usually granted at a regular audit committee meeting. The chair of the audit committee has been authorised to pre-approve services that are in accordance with policies established by the audit committee that specify in detail the types of services that qualify. It is a condition that any services pre-approved in this manner are presented to the full audit committee at its next meeting. Some pre-approvals can therefore be granted by the chair of the audit committee if an urgent reply is deemed necessary.

Remuneration of the external auditor in 2015 - 2017
In the annual Consolidated financial statements and in the parent company's financial statements, the independent auditor's remuneration is split between the audit fee and the fee for audit-related and other services. The chair presents the breakdown between the audit fee and the fee for audit-related and other services to the annual general meeting of shareholders.

The following table sets out the aggregate fees related to professional services rendered by Statoil's external auditor KPMG AS, for the fiscal year 2017, 2016 and 2015.

Auditor's remuneration

(in USD million, excluding VAT)	Full year 2017	2016	2015
Audit fee	6.1	6.5	6.1
Audit related fee	0.9	1.0	1.7
Tax fee	0.0	0.1	0.0
Other service fee	0.0	0.0	0.0
Total	7.0	7.5	7.9

All fees included in the table have been approved by the board's audit committee.

Audit fee is defined as the fee for standard audit work that must be performed every year in order to issue an opinion on Statoil's Consolidated financial statements, on Statoil's internal control over annual reporting and to issue reports on the statutory financial statements. It also includes other audit services, which are services that only the independent auditor can reasonably provide, such as the auditing of non-recurring transactions and the application of new accounting policies, audits of significant and newly implemented system controls and limited reviews of quarterly financial results.

Audit-related fees include other assurance and related services provided by auditors, but not limited to those that can only reasonably be provided by the external auditor who signs the audit report, that are reasonably related to the performance of the audit or review of the company's financial statements, such as acquisition due diligence, audits of pension and benefit plans, consultations concerning financial accounting and reporting standards.

Other services fees include services, if any, provided by the auditors within the framework of the Sarbanes-Oxley Act, i.e. certain agreed procedures.

In addition to the figures in the table above, the audit fees and audit-related fees relating to Statoil operated licences paid to KPMG for the years 2017, 2016 and 2015 amounted to USD 0.8 million, USD 0.8 million and USD 0.9 million, respectively.

4.1 Consolidated financial statements of the Statoil group

The report set out below is provided in accordance with law, regulations, and auditing standards and practices generally accepted in Norway, including International Standards on Auditing (ISAs). KPMG AS has also issued reports in accordance with standards of the Public Company Accounting Oversight Board in the US, which include opinions on the Consolidated financial statements of Statoil ASA and on the effectiveness of internal control over financial reporting as at 31 December 2017. Those reports are set out on pages 131 and 132.

Independent auditor's report

To the annual shareholders' meeting of Statoil ASA

Report on the audit of the financial statements

Opinion

We have audited the financial statements of Statoil ASA for the year ended 31 December 2017.

The financial statements comprise:

- the Consolidated financial statements of Statoil ASA and its subsidiaries (the Group), which comprise the Consolidated balance sheet as at 31 December 2017, the Consolidated statements of income, comprehensive income, changes in equity and cash flows for the year then ended, and notes to the financial statements, including a summary of significant accounting policies.
- the parent company financial statements of Statoil ASA (the Company) on page, which comprise the company balance sheet as at 31 December 2017, and the company's statements of income, comprehensive income and cash flows for the year then ended, and notes to the financial statements, including a summary of significant accounting policies.

In our opinion:

- the financial statements are prepared in accordance with relevant Norwegian law and regulations.
- the Consolidated financial statements give a true and fair view of the financial position of Statoil ASA and its subsidiaries as at 31 December 2017, of its financial performance and its cash flows for the year then ended in accordance with International Financial Reporting Standards as adopted by the EU.
- the parent company financial statements give a true and fair view of the financial position of Statoil ASA as at 31 December 2017, of its financial performance and its cash flows for the year then ended in accordance with simplified application of international accounting standards according to section 3-9 of the Norwegian Accounting Act.

Basis for opinion

We conducted our audit in accordance with laws, regulations, and auditing standards and practices generally accepted in Norway, including International Standards on Auditing (ISAs). Our responsibilities under those standards are further described in the *Auditor's Responsibilities for the Audit of the Financial Statements* section of our report. We are independent of the Company and the Group as required by laws and regulations, and we have fulfilled our other ethical responsibilities in accordance with these requirements. We believe that the audit evidence we have obtained is sufficient and appropriate to provide a basis for our opinion.

Key audit matters

Key audit matters are those matters that, in our professional judgment, were of most significance in our audit of the financial statements for the year ended 31 December 2017. These matters were addressed in the context of our audit of the financial statements as a whole, and in forming our opinion thereon, and we do not provide any discrete opinion on these matters.

Key audit matter	*How the matter was addressed in our audit*
Valuation of upstream assets including assets under development, capitalised exploration expenses and acquisition costs for oil and gas prospects The Group owns significant upstream assets including assets under development, capitalised exploration expenses and acquisition costs for oil and gas prospects. The recoverability of these assets is dependent on management's estimates of the future cash flows that these assets are expected to produce. The carrying value of these assets are therefore particularly sensitive to changes in management's long term commodity price forecasts. Changes in short term commodity price forecasts, which management derives from observed forward oil and gas price curves over a one year period, can also have a significant impact for shorter-lived assets. Additionally, the carrying value of these assets can be impacted by changes in expected reserves and revised cost estimates due to operational developments. In 2017, management recognised various impairment charges and reversals of impairment following asset specific impairment (reversal) triggers, most notably: • a reversal of impairment related to an unconventional onshore asset in North America, triggered by changes in US tax legislation, including a change in the corporate tax from 35 % to 21 % combined with operational improvements and increased recovery rates; • a reversal of impairment related to a conventional offshore asset in the development phase in Norway, triggered by increased expected reserves, cost reductions and increased short term price assumptions; and • an impairment charge for an unconventional onshore asset in North America triggered by changes in the operational plan following lower than expected production and a significant reduction in expected reserves. Capitalised exploration expenses and the capitalised acquisition cost of oil and gas prospects are assessed for impairment when facts and circumstances suggest that the carrying amount of the asset may exceed its recoverable amount. Refer to note 10 *Property, plant and equipment* and note 11 *Intangible assets* to the consolidated financial statements.	We evaluated and tested management's controls over the process it uses to identify triggers that would require impairment (reversal) testing of specific assets. We also assessed the appropriateness of management's identification of cash generating units in light of our knowledge of the business. In addition, we undertook our own analysis to assess whether all material assets requiring impairment testing had been identified by management. We did not identify any assets where impairment testing was required that had not been identified by management. For those assets where management identified an impairment (reversal) trigger, we evaluated and tested management's controls over the impairment calculations performed, including the assumptions applied. We assessed management's macroeconomic assumptions including short and long term commodity price, foreign currency rate and inflation rate forecasts and discount rates. We compared the short term price forecasts to observable market forward curves that we sourced independently. We compared management's long term assumptions to views published by brokers, economists, consultancies and respected industry bodies that we sourced independently, which provided a range of relevant third-party data points, and to our own views. We also assessed by reference to market data the inputs to and calculation of the discount rate used by management. The key inputs included the risk-free rate, market risk premium and industry financing structures (gearing and cost of debt and equity). In testing these assumptions we made use of KPMG valuation experts. For those assets where management identified an impairment (reversal) trigger, we assessed the valuation method, estimates of future cash flows and challenged whether these were appropriate in light of: • management's commodity price, foreign currency rate and inflation rate forecasts; • production and reserve estimates; • capital and operating budgets and historical performance; and • previous estimates. When management relies on valuations prepared by external valuation experts, we have assessed the appropriateness of such valuations making use of KPMG valuation experts. We assessed the mathematical accuracy of the valuation models and the accuracy of the impairment (reversal) recognised in the financial statements. Based on our procedures we consider the impairment charges/reversals to be appropriate. We considered whether the sensitivity analysis included in note 10 *Property, plant and equipment* appropriately described the Group's exposure to further impairments should future commodity prices deviate from management's forecasts. We evaluated and tested management's controls over the process it uses to evaluate whether the carrying value of capitalised exploration expenses and acquisition cost for oil and gas prospects is no longer sustainable.

Key audit matter	*How the matter was addressed in our audit*
Income tax estimates The Group has operations in multiple countries, each with its own taxation regime. Management makes judgements and estimates in relation to uncertain tax positions and valuation of deferred tax assets. The Group has significant deferred tax assets related to historic tax losses. The period over which such assets are expected to be recovered can be extensive and management applies significant judgement in assessing whether those deferred tax assets should be recognised and to determine the recoverability of those balances. In addition, management applies significant judgement in estimating the provision relating to uncertain tax positions and/or related disclosure. These usually arise in countries where the fiscal contribution of the oil and gas industry to the country's budget is very significant and where the tax regime and administration are immature and/or developing. The most notable significant uncertain tax position is a dispute with the Norwegian tax authorities that issued a deviation notice in 2016 regarding transactions between Statoil Coordination Centre (SSC) in Belgium and Norwegian entities within the Group. The issue relates to SCC's capital structure and compliance with the arm's length principle. In addition, in 2016, the Brazilian tax authorities have issued a tax assessment for 2011 disputing the allocation of sale proceeds between entities and assets involved, with regard to a divestment of 40 % interest in the Peregrino field to Sinochem at the time. A dispute with the Angolan Ministry of Finance regarding the Group's participation in Block 4, Block 15, Block 17 and Block 31 offshore Angola with regards to profit oil and taxes on activities between 2002 and 2016 has been settled in 2017. Refer to note 9 *Income taxes* and note 23 *Other commitments, contingent liabilities and contingent assets* to the consolidated financial statements.	We evaluated and tested management's controls over the process it uses to measure deferred tax assets related to historic tax losses and to determine provisions for uncertain tax positions and/or related disclosure. In determining the extent to which deferred tax assets should be recognised, we assessed whether the applied long term commodity price forecasts and foreign currency assumptions were consistent with those described in the key audit matter relating to valuation of upstream assets including assets under development, capitalised exploration expenses and acquisition costs for oil and gas prospects. We challenged the key assumptions made by management and confirmed that these were consistent with the long term business plans used by management to manage and monitor the development of the business. We performed detailed testing over the tax position in each significant jurisdiction in which the Group operates using our global and local tax experts as appropriate. We examined and assessed correspondence with tax authorities and the Group's tax advisers and papers relating to tax investigations/cases as appropriate. The calculations used by management to determine the provisions for uncertain tax positions were assessed based on our understanding of the position of the Group and the position of the tax authorities. We consider that the provisions for uncertain tax positions and related disclosure are appropriate. We highlighted the high level of inherent uncertainty in some of the positions.

Key audit matter	*How the matter was addressed in our audit*
Estimate of asset retirement obligation Given the nature of its operations, the Group incurs obligations to dismantle and remove facilities and to restore the site on which it is located. Management applies significant judgement to estimate the asset retirement obligation due to the inherent complexity in estimating future costs and the limited historical experience against which to benchmark estimates of future costs. Key assumptions are future abandonment costs, foreign currency assumptions and inflation rates. Refer to note 20 *Provisions* to the consolidated financial statements.	We challenged the key assumptions in management's annual process for determining the asset retirement obligation. Our testing was focused on those assumptions having the most significant impact on the asset retirement obligation selected based on our sensitivity analysis. To validate the appropriateness of the expected future abandonment costs we tested whether technical inputs including the number of wells, weight of the structure and length of pipelines applied in the calculation are consistent with technical assessments of the relevant fields. Further, we assessed the reasonableness of rig rates using external market data and historic rig contracts. Our procedures over foreign currency assumptions and inflation rates were an integral part of our assessment of assumptions as applied in impairment testing. We refer to our response as described in the key audit matter over the valuation of upstream including assets under development, capitalised exploration expenses and acquisition costs for oil and gas prospects. Based on our procedures, we consider management's estimate of the asset retirement obligation as at 31 December 2017 to be appropriate.

Key audit matter	*How the matter was addressed in our audit*
Potential illegal acts including alleged accounting misconduct raised by former employees Similar to most large multinational companies, from time to time, the Group receives allegations regarding potentially illegal acts that could potentially have a material impact on the financial statements. The Group has developed certain policies and procedures and designed a control environment to respond to any such allegations and to establish whether or not there are misstatements in its financial statements. It has also developed certain controls designed to reduce the risk that, where any such allegations are in fact correct, intentional misstatement or other material misstatements would not be detected and corrected in a timely manner. In connection with the audit of the financial statements, there were identified such an allegation made by a former employee which had not been communicated to relevant internal bodies, including the Board Audit Committee. The risk is that (1) there could be material misstatement arising from known allegations and (2) the Group's control environment, policies, procedures and controls regarding allegations or indications of accounting impropriety or override of internal controls are not effective to identify and assess whether they have material impact on the financial statements. Refer to section 3.10 *Risk management and internal control*.	We sought to understand why the controls that should have operated in this case had failed to result in the matter being appropriately communicated. We examined whether there were other instances of employee allegations of accounting impropriety during the year. Where it was considered necessary, additional investigative work was carried out which did not identify any misstatements or illegal acts. We assessed the qualifications and independence of the investigations teams and assessed the appropriateness of the investigation activities and their results including utilising our forensic specialists. We requested management to undertake a retrospective review of historical allegations of accounting impropriety or override of internal financial control to establish whether there were any instances that had not been notified to us. We assessed the appropriateness of the review performed by management and no further instances were identified. We independently assessed the related internal control deficiencies described in section 3.10 of the 2017 Annual Report and Form 20-F, which we consider to be balanced disclosure. We concluded that there was a material weakness. We assessed the impact of these deficiencies and the results of our work relating to the additional investigations on our planned audit work and carried out additional audit procedures as we considered necessary. Finally we assessed the control environment, policies and procedures and tested the controls that should operate where such allegations are identified through the Group's Ethics Helpline. We found these to operate effectively and no material weaknesses in this regard.

Other information

Management is responsible for the other information. The other information comprises the chapters introduction, strategic report, governance, section 4.2 *Supplementary oil and gas information* and additional information included in the annual report, but does not include the financial statements and our auditor's report thereon.

Our opinion on the financial statements does not cover the other information and we do not express any form of assurance conclusion thereon.

In connection with our audit of the financial statements, our responsibility is to read the other information and, in doing so, consider whether the other information is materially inconsistent with the financial statements or our knowledge obtained in the audit or otherwise appears to be materially misstated.

If, based on the work we have performed, we conclude that there is a material misstatement of this other information, we are required to report that fact. We have nothing to report in this regard.

Responsibilities of the board of directors and chief executive officer for the financial statements

The board of directors and chief executive officer ('management') are responsible for the preparation and fair presentation of the financial statements of the parent company in accordance with simplified application of international accounting standards according to the Norwegian Accounting Act section 3-9, and for the preparation and fair presentation of the Consolidated financial statements of the Group in accordance with International Financial Reporting Standards as adopted by the EU, and for such internal control as management determines is necessary to enable the preparation of financial statements that are free from material misstatement, whether due to fraud or error.

In preparing the financial statements, management is responsible for assessing the Company's and the Group's ability to continue as a going concern, disclosing, as applicable, matters related to going concern and using the going concern basis of accounting unless management either intends to liquidate the Group or to cease operations, or has no realistic alternative but to do so.

Auditor's responsibilities for the audit of the financial statements

Our objectives are to obtain reasonable assurance about whether the financial statements as a whole are free from material misstatement, whether due to fraud or error, and to issue an auditor's report that includes our opinion. Reasonable assurance is a high level of assurance, but is not a guarantee that an audit conducted in accordance with laws, regulations, and auditing standards and practices generally accepted in Norway, including ISAs will always detect a material misstatement when it exists. Misstatements can arise from fraud or error and are considered material if, individually or in aggregate, they could reasonably be expected to influence the economic decisions of users taken on the basis of these financial statements (see further explanation below).

As part of an audit in accordance with laws, regulations, and auditing standards and practices generally accepted in Norway, including ISAs, we exercise professional judgment and maintain professional scepticism throughout the audit. We also:

- identify and assess the risks of material misstatement of the financial statements, whether due to fraud or error. We design and perform audit procedures responsive to those risks, and obtain audit evidence that is sufficient and appropriate to provide a basis for our opinion. The risk of not detecting a material misstatement resulting from fraud is higher than for one resulting from error, as fraud may involve collusion, forgery, intentional omissions, misrepresentations, or the override of internal control.
- obtain an understanding of internal control relevant to the audit in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the Company's or the Group's internal control.
- evaluate the appropriateness of accounting policies used and the reasonableness of accounting estimates and related disclosures made by management.
- conclude on the appropriateness of management's use of the going concern basis of accounting and, based on the audit evidence obtained, whether a material uncertainty exists related to events or conditions that may cast significant doubt on the Company's and the Group's ability to continue as a going concern. If we conclude that a material uncertainty exists, we are required to draw attention in our auditor's report to the related disclosures in the financial statements or, if such disclosures are inadequate, to modify our opinion. Our conclusions are based on the audit evidence obtained up to the date of our auditor's report. However, future events or conditions may cause the Company and the Group to cease to continue as a going concern.
- evaluate the overall presentation, structure and content of the financial statements, including the disclosures, and whether the financial statements represent the underlying transactions and events in a manner that achieves fair presentation.
- obtain sufficient appropriate audit evidence regarding the financial information of the entities or business activities within the Group to express an opinion on the Consolidated financial statements. We are responsible for the direction, supervision and performance of the audit of the Group. We remain solely responsible for our audit opinion.

We communicate with the board of directors regarding, among other matters, the planned scope and timing of the audit and significant audit findings, including any significant deficiencies in internal control that we identify during our audit.

We also provide the board of directors with a statement that we have complied with relevant ethical requirements regarding independence, and to communicate with them all relationships and other matters that may reasonably be thought to bear on our independence, and where applicable, related safeguards.

From the matters communicated with the board of directors, we determine those matters that were of most significance in the audit of the financial statements of the current period and are therefore the key audit matters. We describe these matters in our auditor's report unless law or regulation precludes public disclosure about the matter or when, in extremely rare circumstances, we determine that a matter should not be communicated in our report because the adverse consequences of doing so would reasonably be expected to outweigh the public interest benefits of such communication.

Report on other legal and regulatory requirements

Opinion on the board of directors' report and the statements on corporate governance and corporate social responsibility

Based on our audit of the financial statements as described above, it is our opinion that the information presented in the board of directors' report and in the statements on Corporate Governance and Corporate Social Responsibility concerning the financial statements and the going concern assumption, and the proposal for the allocation of the profit is consistent with the financial statements and complies with relevant law and regulations.

Opinion on registration and documentation

Based on our audit of the financial statements as described above, and procedures we considered necessary in accordance with the International Standard on Assurance Engagements (ISAE) 3000, «Assurance Engagements Other than Audits or Reviews of Historical Financial Information», it is our opinion that management has fulfilled its duty to produce a proper and clearly set out registration and documentation of the Company's accounting information in accordance with relevant law and bookkeeping standards and practices generally accepted in Norway.

State Authorised Public Accountant

Jimmy Daboo

Note: This translation from Norwegian has been prepared for information purposes only.

[13] Appointed as the responsible auditor by KPMG AS according to the Auditing and Auditors Act section 2-2

The reports set out below are provided in accordance with standards of the Public Company Accounting Oversight Board (United States). KPMG AS has also issued a report in accordance with law, regulations, and auditing standards and practices generally accepted in Norway, including International Standards on Auditing (ISAs), which includes opinions on the Consolidated financial statements and the parent company financial statements of Statoil ASA, and on other required matters. That report is set out on pages 125 to 130.

Report of Independent Registered Public Accounting Firm

The board of directors and shareholders of Statoil ASA

Opinion on the Consolidated Financial Statements

We have audited the accompanying consolidated balance sheets of Statoil ASA and subsidiaries (the Company) as of 31 December 2017 and 2016, the related consolidated statements of income, comprehensive income, changes in equity, and cash flows for each of the years in the three-year period ended 31 December 2017, and the related notes (collectively, the consolidated financial statements). In our opinion, the consolidated financial statements present fairly, in all material respects, the financial position of the Company as of 31 December 2017 and 2016, and the results of its operations and its cash flows for each of the years in the three-year period ended 31 December 2017, in conformity with International Financial Reporting Standards as issued by the International Accounting Standards Board and International Financial Reporting Standards as adopted by the European Union.

We also have audited, in accordance with the standards of the Public Company Accounting Oversight Board (United States) (PCAOB), the Company's internal control over financial reporting as of 31 December 2017, based on criteria established in *Internal Control - Integrated Framework (2013)* issued by the Committee of Sponsoring Organizations of the Treadway Commission, and our report dated 15 March 2018 expressed an adverse opinion on the effectiveness of the Company's internal control over financial reporting.

Changes in Accounting Principle

As discussed in Note 2 to the consolidated financial statements, the Company has elected to present net interest costs related to its defined benefit pension plans within net financial items in 2017. These expenses were previously included in the consolidated statement of income as part of pension cost within net operating income in prior periods.

Basis for Opinion

These consolidated financial statements are the responsibility of the Company's management. Our responsibility is to express an opinion on these consolidated financial statements based on our audits. We are a public accounting firm registered with the PCAOB and are required to be independent with respect to the Company in accordance with the U.S. federal securities laws and the applicable rules and regulations of the Securities and Exchange Commission and the PCAOB.

We conducted our audits in accordance with the standards of the PCAOB. Those standards require that we plan and perform the audit to obtain reasonable assurance about whether the consolidated financial statements are free of material misstatement, whether due to error or fraud. Our audits included performing procedures to assess the risks of material misstatement of the consolidated financial statements, whether due to error or fraud, and performing procedures that respond to those risks. Such procedures included examining, on a test basis, evidence regarding the amounts and disclosures in the consolidated financial statements. Our audits also included evaluating the accounting principles used and significant estimates made by management, as well as evaluating the overall presentation of the consolidated financial statements. We believe that our audits provide a reasonable basis for our opinion.

We have served as the Company's auditor since 2012.

/s/ KPMG AS

Stavanger, Norway
15 March 2018

Report of KPMG on Statoil's internal control over financial reporting

The board of directors and shareholders of Statoil ASA

Opinion on Internal Control Over Financial Reporting

We have audited Statoil ASA*'s* and subsidiaries (the Company) internal control over financial reporting as of 31 December 2017, based on criteria established in *Internal Control – Integrated Framework (2013)* issued by the Committee of Sponsoring Organizations of the Treadway Commission. In our opinion, because of the effect of the material weakness, described below, on the achievement of the objectives of the control criteria, the Company has not maintained effective internal control over financial reporting as of 31 December 2017, based on criteria established in *Internal Control – Integrated Framework (2013)* issued by the Committee of Sponsoring Organizations of the Treadway Commission.

We also have audited, in accordance with the standards of the Public Company Accounting Oversight Board (United States) (PCAOB), the consolidated balance sheets of the Company as of 31 December 2017 and 2016, the related consolidated statements of income, comprehensive income, changes in equity, and cash flows for each of the years in the three-year period ended 31 December 2017, and the related notes (collectively, the consolidated financial statements), and our report dated 15 March 2018 expressed an unqualified opinion on those consolidated financial statements.

A material weakness is a deficiency, or a combination of deficiencies, in internal control over financial reporting, such that there is a reasonable possibility that a material misstatement of the company's annual or interim financial statements will not be prevented or detected on a timely basis.

A material weakness related to controls and procedures for the identification, assessment and timely and appropriate communication to the Board Audit Committee of questions or concerns (including allegation of misconduct) raised by employees in connection with termination of their employment (otherwise than through the Company's external Ethics help line) has been identified as described in management's assessment.

No misstatements in the consolidated financial statements were identified as a result of this matter. The material weakness was considered in determining the nature, timing, and extent of audit tests applied in our audit of the 2017 consolidated financial statements, and this report does not affect our report on those consolidated financial statements.

Basis for Opinion

The Company's management is responsible for maintaining effective internal control over financial reporting and for its assessment of the effectiveness of internal control over financial reporting, included in the accompanying management's report on internal control over financial reporting. Our responsibility is to express an opinion on the Company's internal control over financial reporting based on our audit. We are a public accounting firm registered with the PCAOB and are required to be independent with respect to the Company in accordance with the U.S. federal securities laws and the applicable rules and regulations of the Securities and Exchange Commission and the PCAOB.

We conducted our audit in accordance with the standards of the PCAOB. Those standards require that we plan and perform the audit to obtain reasonable assurance about whether effective internal control over financial reporting was maintained in all material respects. Our audit of internal control over financial reporting included obtaining an understanding of internal control over financial reporting, assessing the risk that a material weakness exists, and testing and evaluating the design and operating effectiveness of internal control based on the assessed risk. Our audit also included performing such other procedures as we considered necessary in the circumstances. We believe that our audit provides a reasonable basis for our opinion.

Definition and Limitations of Internal Control Over Financial Reporting

A company's internal control over financial reporting is a process designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with generally accepted accounting principles. A company's internal control over financial reporting includes those policies and procedures that (1) pertain to the maintenance of records that, in reasonable detail, accurately and fairly reflect the transactions and dispositions of the assets of the company; (2) provide reasonable assurance that transactions are recorded as necessary to permit preparation of financial statements in accordance with generally accepted accounting principles, and that receipts and expenditures of the company are being made only in accordance with authorizations of management and directors of the company; and (3) provide reasonable assurance regarding prevention or timely detection of unauthorized acquisition, use, or disposition of the company's assets that could have a material effect on the financial statements.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements. Also, projections of any evaluation of effectiveness to future periods are subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

(Increase) decrease in financial investments		592	877	(2,813)
(Increase) decrease in other items interest bearing		79	107	(22)
Proceeds from sale of assets and businesses	4	406	761	4,249
Cash flows used in investing activities		(9,678)	(10,446)	(14,501)
New finance debt	18	0	1,322	4,272
Repayment of finance debt		(4,775)	(1,072)	(1,464)
Dividend paid	17	(1,491)	(1,876)	(2,836)
Net current finance debt and other		444	(333)	(701)
Cash flows provided by (used in) financing activities	18	(5,822)	(1,959)	(729)
Net increase (decrease) in cash and cash equivalents		(1,137)	(3,371)	(1,602)
Effect of exchange rate changes on cash and cash equivalents		436	(152)	(871)
Cash and cash equivalents at the beginning of the period (net of overdraft)	16	5,090	8,613	11,085
Cash and cash equivalents at the end of the period (net of overdraft)	16	4,390	5,090	8,613

Cash and cash equivalents include bank overdrafts of zero at 31 December 2017, zero at 31 December 2016 and USD 10 million at 31 December 2015.

Interest paid in cash flows provided by operating activities is excluding capitalised interest of USD 454 million at 31 December 2017, USD 355 million at 31 December 2016 and USD 392 million at 31 December 2015. Capitalised interest is included in Capital expenditures and investments in cash flows used in investing activities.

Notes to the Consolidated financial statements

1 Organisation

Statoil ASA, originally Den Norske Stats Oljeselskap AS, was founded in 1972 and is incorporated and domiciled in Norway. The address of its registered office is Forusbeen 50, N-4035 Stavanger, Norway.

Statoil ASA's shares are listed on the Oslo Børs (OSL, Norway) and the New York Stock Exchange (NYSE, USA).

The Statoil group's business consists principally of the exploration, production, transportation, refining and marketing of petroleum and petroleum-derived products and other forms of energy.

All the Statoil group's oil and gas activities and net assets on the Norwegian continental shelf are owned by Statoil Petroleum AS, a 100% owned operating subsidiary. Statoil Petroleum AS is co-obligor or guarantor of certain debt obligations of Statoil ASA.

The Consolidated financial statements of Statoil for the full year 2017 were authorised for issue in accordance with a resolution of the board of directors on 14 March 2018.

2 Significant accounting policies

Statement of compliance
The Consolidated financial statements of Statoil ASA and its subsidiaries (Statoil) have been prepared in accordance with International Financial Reporting Standards (IFRSs) as adopted by the European Union (EU) and also comply with IFRSs as issued by the International Accounting Standards Board (IASB), effective at 31 December 2017.

Basis of preparation
The financial statements are prepared on the historical cost basis with some exceptions, as detailed in the accounting policies set out below. The policies described in the main part of this note are the ones in effect at the balance sheet date, and these policies have been applied consistently to all periods presented in these Consolidated financial statements. Certain amounts in the comparable years have been restated to conform to current year presentation. The subtotals and totals in some of the tables may not equal the sum of the amounts shown due to rounding.

Operating related expenses in the Consolidated statement of income are presented as a combination of function and nature in conformity with industry practice. Purchases [net of inventory variation] and Depreciation, amortisation and net impairment losses are presented in separate lines based on their nature, while Operating expenses and Selling, general and administrative expenses as well as Exploration expenses are presented on a functional basis. Significant expenses such as salaries, pensions, etc. are presented by their nature in the notes to the Consolidated financial statements.

Standards, amendments to standards, and interpretations of standards, issued but not yet adopted
At the date of these Consolidated financial statements, the following standards, amendments to standards and interpretations of standards applicable to Statoil have been issued, but were not yet effective:

IFRS 9 Financial Instruments
IFRS 9 will be implemented by Statoil on the effective date 1 January 2018. The standard replaces IAS 39 Financial instruments: Recognition and Measurement. Statoil will implement IFRS 9 retrospectively with the cumulative effect of initially applying the standard recognised at the date of initial application. The impact of the IFRS 9 implementation on Statoil's equity is immaterial.

Portions of Statoil's cash equivalents and current financial investments tied to liquidity management, which under IAS 39 are classified as held for trading and reflected at fair value through profit and loss, will under IFRS 9 be measured at amortised cost, based on an evaluation of the contractual terms and the business model applied. For certain financial assets currently classified as Available for sale (AFS), changes in fair value which are currently reflected in OCI, will be reflected in profit and loss under IFRS 9. No major changes are currently deemed necessary for Statoil's expected loss recognition process to satisfy IFRS 9's financial asset impairment requirements.

IFRS 15 Revenue from Contracts with Customers
IFRS 15, which will be implemented by Statoil on the effective date 1 January 2018, covers the recognition of revenue in the financial statements and related disclosure. IFRS 15 replaces existing revenue recognition guidance, including IAS 18 Revenue. IFRS 15 requires identification of the performance obligations for the transfer of goods and services in each contract with customers. Revenue will be recognised upon satisfaction of the performance obligations for the amounts that reflect the consideration to which Statoil expects to be entitled in exchange for those goods and services.

IFRS 15 will principally impact the Marketing, Midstream & Processing segment (MMP), which accounts for the majority of Statoil's sales to customers, and which is responsible for the marketing and sale of the Norwegian State's direct financial interest's (SDFI's) petroleum volumes. To a lesser extent, the segments Exploration & Production International (E&P International) and Exploration & Production Norway (E&P Norway) are however also affected.

The impact on Statoil's equity of the implementation of IFRS 15 is immaterial. Mainly on the basis of the limited implementation impact, Statoil will implement IFRS 15 retrospectively with the cumulative effect recognised at the date of initial application. IFRS 15 will require updated disclosures, in particular related to the distinction between revenue from contracts with customers and other revenue, and disaggregation of revenue streams. Such disclosures will be provided based on consideration of the level of detail necessary. The most significant accounting evaluations and conclusions related to the implementation of IFRS 15 in Statoil are summarised below.

Sale and transportation of goods;
Under IFRS 15, revenue from the sale and transportation of crude oil, natural gas, petroleum products and other merchandise will be recognised when a customer obtains control of the goods, which normally will be when title passes at point of delivery of the goods, based on the contractual terms of the agreements. Each such sale normally represents one performance obligation, which in the case of natural gas sales are completed over time in line with the delivery of the actual physical quantities. A number of bi-lateral long-term contracts, mainly for the sale of natural gas, as well as certain spot and term contracts, represent the sale of non-financial items that may be settled net in cash, but which have been entered into for the purpose of delivery of non-financial commodity items in accordance with Statoil's expected purchase, sale or usage requirements. Statoil consequently will apply IFRS 9's "own use" exemption for such contracts, and these physical sales will be accounted for as revenue from contracts with customers.

In some sales of goods, such as certain sales of crude oil, Statoil may provide transport services after control of the goods has been transferred to the customer. Following implementation of IFRS 15, such transport, which previously was considered part of a single sale of goods transaction, will be considered to be a distinct service that is completed over time and is distinct from the good sold. These transport services will consequently be recognised separately and be combined with other transport revenues. The impact from the resulting immaterial timing differences constitutes the only identified IFRS 15 implementation impact with a net effect on equity and net operating profit in Statoil.

Marketing and sale of the Norwegian State's (the State's) share of crude oil and natural gas production from the Norwegian continental shelf (NCS);
Statoil has considered whether it acts as the principal in these transactions under IFRS 15, i.e. whether it controls the State's volumes prior to onwards sales to third party customers. Statoil's sales of the State's natural gas volumes are performed for the State's account and risk, and although Statoil has been granted the ability to direct the use of the volumes, all the benefits from the sales of these volumes flow to the State. On that basis, Statoil is not considered the principal in the sale of the SDFI's natural gas volumes. In the sales of the State-originated crude oil, Statoil also directs the use of the volumes. However, although certain benefits from these sales subsequently flow to the State, Statoil purchases the crude oil volumes from the State and obtains substantially all the remaining benefits. Statoil therefore is considered the principal in the crude oil sales. The accounting for Statoil's sale of the SDFI's natural gas and crude oil under IFRS 15 will consequently not lead to changes compared to the practice under IAS 18.

Other identified differences;
Certain items, which have previously been classified as Revenues in the Consolidated statement of income, will not qualify as revenue from contracts with customers under IFRS 15. These include taxes paid in kind under certain production sharing agreements (PSAs), and the reflection of commodity-based derivatives connected with sales contracts or revenue-related risk management. Adjustments for imbalances between oil and gas production and sales, following Statoil's transition from the sales method to imbalances accounting on 1 January 2018 (see the item "Voluntary change in significant accounting policies decided upon, but not yet adopted" below), will also not qualify as revenue from contracts with customers under IFRS 15. These items however still either represent a form of revenue or are closely connected to revenue transactions, and they will be reflected as Other revenue following the IFRS 15 implementation. Statoil will combine 'Revenue from contracts with customers' and 'Other revenue' into a single line item, Revenues, in the Consolidated statement of income, and will disclose the relevant disaggregation in the notes to the Consolidated financial statements. In addition, Statoil will reclassify the impact of certain commodity-based earn-out agreements and contingent consideration elements, which previously have been reflected under Revenues, to Other income. Total revenues and other income in the Statement of income will consequently not be impacted by this reclassification.

IFRS 16 Leases
IFRS 16, effective from 1 January 2019, covers the recognition of leases and related disclosure in the financial statements, and will replace IAS 17 Leases. The new standard defines a lease as a contract that conveys the right to control the use of an identified asset for a period of time in exchange for consideration. In the financial statement of lessees, IFRS 16 requires recognition in the balance sheet for each contract that meets its definition of a lease as right-of-use asset and lease liability, while lease payments are to be reflected as interest expense and a reduction of lease liabilities. The right-of-use assets are to be depreciated in accordance with IAS 16 Property, Plant and Equipment over the shorter of each contract's term and the assets' useful life. IFRS 16 will also lead to changes in the classification of lease-related payments in the statement of cash flows, and the portion of lease payments representing payments of lease liabilities will be classified as cash flows used in financing activities. The standard consequently implies a significant change in lessees' accounting for leases currently defined as operating leases under IAS 17 and for other contracts that do not meet this definition but are considered to be leases under IFRS 16, impacting both the balance sheet, the statement of income and the statement of cash flows.

As a practical expedient, IFRS 16 allows for contracts already classified either as leases under IAS 17 or as non-lease service arrangements, to maintain their respective classifications upon the implementation of IFRS 16. Statoil expects to apply this "grandfathering" transition option.

IFRS 16 requires adoption either on a full retrospective basis, or retrospectively with the cumulative effect of initially recognising the standard as an adjustment to retained earnings at the date of initial application ("the modified retrospective method"), and in the latter case allows a number of practical expedients in transitioning existing leases at the time of initial application. Statoil anticipates applying the modified retrospective method in the implementation of IFRS 16.

Implementation of IFRS 16 will affect all Statoil's segments. Statoil will adopt IFRS 16 on 1 January 2019, and is in the process of evaluating the impact of the standard. The actual impact on the Consolidated financial statements of applying IFRS 16 will depend on future economic conditions, including Statoil's borrowing rate and the composition of Statoil's lease portfolio at implementation. IFRS 16 involves several implementation choices and interpretations which may also significantly impact Statoil's Consolidated financial statements. The accounting issues which at this stage are expected to most significantly affect the implementation of IFRS 16 in Statoil, as well as their expected impact where this can currently be determined, are summarised below. In addition to these issues, Statoil has identified several other leasing related interpretations and policy decisions which are under evaluation. Work is continuing in order to determine the impact and the proper accounting for all identified issues, but the assessments have not yet been concluded. Statoil is consequently not yet in a position to determine the expected impact of IFRS 16 on its Consolidated financial statements.

Distinguishing operators and joint operations as lessees, including sublease considerations;
IFRS 16 establishes that when a lease contract is entered into by a joint arrangement, or on behalf of a joint arrangement, the joint arrangement is considered to be the customer, and hence the lessee, in the contract. In the oil and gas industry, where activity frequently is carried out through joint arrangements or similar arrangements, the application of this IFRS 16 requirement depends on evaluations of whether the joint arrangement or its operator is the lessee in each lease agreement. In many cases where an operator is the sole signatory to a contract to lease an asset to be used in the activities of a specific joint operation, the operator does so implicitly or explicitly on behalf of the joint arrangement. In certain jurisdictions, and importantly for Statoil this includes the NCS, the concessions granted by the authorities establish both a right and an obligation for the operator to enter into necessary agreements in the name of the joint operations (licences). As is the customary norm in upstream activities operated through joint arrangements, the operator will manage the lease, pay the lessor, and subsequently re-bill the partners for their share of the lease costs. In each such instance, it is necessary to determine whether the operator is the sole lessee in the arrangement, and if so, whether the billings to partners may represent sub-leases, or whether it is in fact the joint arrangement which is the lessee, with each participant accounting for its proportionate share of the lease. Depending on facts and circumstances in each case, the conclusions reached may vary between contracts and legal jurisdictions. This issue may materially impact the financial statements of Statoil both as an operator and joint operation participant in the oil and gas industry.

Separation of lease and non-lease components;
IFRS 16 allows for additional services and non-lease components included in lease contracts to be accounted for either separately, or as part of the lease. The standard's presumption is that non-lease components should be accounted for separately, while accounting for such components as part of a lease is an exemption that must be taken consistently by class of underlying asset. In the case of significant non-lease components in contracts containing leases, the choice of accounting policy may impact the financial statements significantly, as it entails choosing between expensing service elements as a form of operating cost as incurred, or reflecting them as part of right of use assets (with a corresponding increase in the lease liabilities), with related amortisation and financial expenses. Many of Statoil's lease contracts, such as rig and vessel leases, involve a number of additional services and components, including personnel cost, maintenance, drilling related activities, and other items. For a number of contracts, the additional services may represent a not inconsiderable portion of the total contract value, and such additional services are not always identified and separately priced. The full extent of non-lease components in Statoil's contracts has yet to be established, and Statoil has not yet determined whether it will account for additional services as parts of the lease, and if so, for which underlying classes of assets.

Leases applied in activities that are capitalised;
In exploration activities, direct costs are capitalised until the result of the exploration has been evaluated. In the development phase of projects, direct costs are likewise capitalised and normally become part of Property, plant and equipment (PP&E). During upstream production activities, asset enhancements such as the drilling of production wells are also capitalised. In all these activities, Statoil will frequently employ leased drilling rigs and other leased assets. Statoil is in the process of evaluating how leases under IFRS 16 will be reflected when leased assets are used in an activity for which the costs are capitalised.

Evaluating the impact of option periods for the lease terms;
The term of a lease determines the period of time for which cash flow will be discounted and reflected in the balance sheet. Under IFRS 16 the lease term therefore impacts the recognised amounts of right of use assets and lease liabilities. Many of Statoil's major leases, such as leases of vessels, rigs and buildings, include term options. In applying IFRS 16 it is of increasing importance for Statoil to determine whether each lease contract's term options should be considered to be reasonably certain to be exercised. Such evaluations will be made at commencement of the leases and subsequently when facts and circumstances require it. In Statoil's view, the term 'reasonably certain' implies a probability level significantly higher than 'probable', and this will be reflected in Statoil's ongoing evaluations.

Distinguishing fixed and variable lease payment elements;
Under IFRS 16, fixed and in-substance fixed lease payments are to be included in the commencement date computation of a lease liability, while variable payments dependent on use of the asset are not. Particularly as regards drilling rig leases, Statoil's lease contracts may include fixed rates for when the asset in question is in operation, and alternative, lower rates ("stand-by rates") for periods where the asset is idle, but still under contract. Statoil is currently evaluating the appropriate rates to be reflected in the lease liability.

Use of the standard's short-term lease exemption;
As a practical expedient, IFRS 16 allows an entity not to capitalise short term leases on its balance sheet. The choice must be made by class of underlying asset. The practical expedient provides a simplification, but will also result in less comparability in the Statement of income, as the short-term lease

expenses will be presented as a form of operating expenses, while the cost for long-term leases will be presented as interest expenses and depreciation. Statoil has not yet determined whether the exemption will be applied, and if so, for which classes of underlying assets.

Other standards, amendments to standards and interpretations of standards
The amendments to IFRS 10 Consolidated Financial Statements and IAS 28 Investments in Associates and Joint Ventures, effective from a future date to be determined by the IASB, establish requirements for the accounting for sales or contributions of assets between an investor and its associate or joint venture. Whether or not the assets are housed in a subsidiary, a full gain or loss will be recognised in the statement of income when the transaction involves assets that constitute a business, whereas a partial gain or loss will be recognised when the transaction involves assets that do not constitute a business. The amendments are to be applied prospectively. Statoil has not determined an adoption date for the amendments.

Other standards, amendments to standards, and interpretations of standards, issued but not yet effective, are either not expected to impact Statoil's Consolidated financial statements materially, or are not expected to be relevant to Statoil's Consolidated financial statements upon adoption.

Voluntary change in significant accounting policies decided upon, but not yet adopted
With effect from 1 January 2018, Statoil will change its policy for recognition of revenue from the production of oil and gas properties in which Statoil shares an interest with other companies. Currently Statoil recognises revenue on the basis of volumes lifted and sold to customers during the period (the sales method). Under the new method, Statoil will recognise revenues according to Statoil's ownership in producing fields, where the accounting for the imbalances will be presented as other revenue. This voluntary change in policy is made because it better reflects Statoil's operational performance, and also increases comparability with the financial reporting of Statoil's peers. The change in policy affects the timing of revenue recognition from oil and gas production, however the impact on Statoil's equity upon implementation is immaterial.

Changes in significant accounting policies in the current period
With effect from 1 January 2017, Statoil presents net interest costs related to its defined benefit pension plans within Net financial items. These expenses were previously included in the Consolidated statement of income as part of pension cost within net operating income/(loss). The policy change better aligns the classification of the interest costs with their nature, as the benefit plan is closed to new members and now increasingly represents a financial exposure to Statoil. The change in presentation also impacts the gain or loss from changes in the fair value of Statoil's notional contribution pension plans. The impact on the net operating income at implementation and for comparative periods presented in these financial statements is immaterial.

Basis of consolidation
The Consolidated financial statements include the accounts of Statoil ASA and its subsidiaries and include Statoil's interest in jointly controlled and equity accounted investments.

Subsidiaries
Entities are determined to be controlled by Statoil, and consolidated in Statoil's financial statements, when Statoil has power over the entity, ability to use that power to affect the entity's returns, and exposure to, or rights to, variable returns from its involvement with the entity.

All intercompany balances and transactions, including unrealised profits and losses arising from Statoil's internal transactions, have been eliminated in full.

Non-controlling interests are presented separately within equity in the balance sheet.

Joint operations and similar arrangements, joint ventures and associates
A joint arrangement is present where Statoil holds a long-term interest which is jointly controlled by Statoil and one or more other venturers under a contractual arrangement in which decisions about the relevant activities require the unanimous consent of the parties sharing control. Such joint arrangements are classified as either joint operations or joint ventures.

The parties to a joint operation have rights to the assets and obligations for the liabilities, relating to their respective share of the joint arrangement. In determining whether the terms of contractual arrangements and other facts and circumstances lead to a classification as joint operations, Statoil considers the nature of products and markets of the arrangement and whether the substance of their agreements is that the parties involved have rights to substantially all the arrangement's assets. Statoil accounts for the assets, liabilities, revenues and expenses relating to its interests in joint operations in accordance with the principles applicable to those particular assets, liabilities, revenues and expenses. Normally this leads to accounting for the joint operation in a manner similar to the previous proportionate consolidation method.

Those of Statoil's exploration and production licence activities that are within the scope of IFRS 11 Joint Arrangements have been classified as joint operations. A considerable number of Statoil's unincorporated joint exploration and production activities are conducted through arrangements that are not jointly controlled, either because unanimous consent is not required among all parties involved, or no single group of parties has joint control over the activity. Licence activities where control can be achieved through agreement between more than one combination of involved parties are considered to be outside the scope of IFRS 11, and these activities are accounted for on a pro-rata basis using Statoil's ownership share. Currently there are no significant differences in Statoil's accounting for unincorporated licence arrangements whether in scope of IFRS 11 or not.

Joint ventures, in which Statoil has rights to the net assets, are accounted for using the equity method.

Investments in companies in which Statoil has neither control nor joint control, but has the ability to exercise significant influence over operating and financial policies, are classified as Equity accounted investments.

Under the equity method, the investment is carried on the balance sheet at cost plus post-acquisition changes in Statoil's share of net assets of the entity, less distributions received and less any impairment in value of the investment. Goodwill may arise as the surplus of the cost of investment over Statoil's share of the net fair value of the identifiable assets and liabilities of the joint venture or associate. Such goodwill is recorded within the corresponding investment. The Consolidated statement of income reflects Statoil's share of the results after tax of an equity-accounted entity, adjusted to account for depreciation, amortisation and any impairment of the equity-accounted entity's assets based on their fair values at the date of acquisition. Where material differences in accounting policies arise, adjustments are made to the financial statements of equity-accounted entities in order to bring the accounting policies used into line with Statoil's. Material unrealised gains on transactions between Statoil and its equity-accounted entities are eliminated to the extent of Statoil's interest in each equity-accounted entity. Unrealised losses are also eliminated unless the transaction provides evidence of an impairment of the asset transferred. Statoil assesses investments in equity-accounted entities for impairment whenever events or changes in circumstances indicate that the carrying value may not be recoverable.

Statoil as operator of joint operations and similar arrangements

Indirect operating expenses such as personnel expenses are accumulated in cost pools. These costs are allocated on an hours' incurred basis to business areas and Statoil operated joint operations under IFRS 11 and to similar arrangements (licences) outside the scope of IFRS 11. Costs allocated to the other partners' share of operated joint operations and similar arrangements reduce the costs in the Consolidated statement of income. Only Statoil's share of the statement of income and balance sheet items related to Statoil operated joint operations and similar arrangements are reflected in the Consolidated statement of income and the Consolidated balance sheet.

Reportable segments

Statoil identifies its business areas on the basis of those components of Statoil that are regularly reviewed by the chief operating decision maker, Statoil's corporate executive committee (CEC). Statoil combines business areas when these satisfy relevant aggregation criteria.

Statoil's accounting policies as described in this note also apply to the specific financial information included in reportable segments-related disclosure in these Consolidated financial statements.

Foreign currency translation

In preparing the financial statements of the individual entities, transactions in foreign currencies (those other than functional currency) are translated at the foreign exchange rate at the dates of the transactions. Monetary assets and liabilities denominated in foreign currencies are translated to the functional currency at the foreign exchange rate at the balance sheet date. Foreign exchange differences arising on translation are recognised in the Consolidated statement of income as foreign exchange gains or losses within net financial items. Foreign exchange differences arising from the translation of estimate-based provisions, however, generally are accounted for as part of the change in the underlying estimate and as such may be included within the relevant operating expense or income tax sections of the Consolidated statement of income depending on the nature of the provision. Non-monetary assets that are measured at historical cost in a foreign currency are translated using the exchange rate at the date of the transactions.

Presentation currency

For the purpose of the Consolidated financial statements, the statement of income, the balance sheet and the cash flows of each entity are translated from the functional currency into the presentation currency, USD. The assets and liabilities of entities whose functional currencies are other than USD, are translated into USD at the foreign exchange rate at the balance sheet date. The revenues and expenses of such entities are translated using the foreign exchange rates on the dates of the transactions. Foreign exchange differences arising on translation from functional currency to presentation currency are recognised separately in Other comprehensive income (OCI). The cumulative amount of such translation differences relating to an entity and previously recognised in OCI, is reclassified to the Consolidated statement of income and reflected as a part of the gain or loss on disposal of that entity.

Business combinations

Determining whether an acquisition meets the definition of a business combination requires judgement to be applied on a case by case basis. Acquisitions are assessed under the relevant IFRS criteria to establish whether the transaction represents a business combination or an asset purchase. Depending on the specific facts, acquisitions of exploration and evaluation licences for which a development decision has not yet been made, have largely been concluded to represent asset purchases.

Business combinations, except for transactions between entities under common control, are accounted for using the acquisition method of accounting. The acquired identifiable tangible and intangible assets, liabilities and contingent liabilities are measured at their fair values at the date of the acquisition. Acquisition costs incurred are expensed under Selling, general and administrative expenses.

Revenue recognition

Revenues associated with sale and transportation of crude oil, natural gas, petroleum products and other merchandise are recognised when risk passes to the customer, which is normally when title passes at the point of delivery of the goods, based on the contractual terms of the agreements.

Revenues from the production of oil and gas properties in which Statoil shares an interest with other companies are recognised on the basis of volumes lifted and sold to customers during the period (the sales method). Where Statoil has lifted and sold more than the ownership interest, an accrual is recognised for the cost of the overlift. Where Statoil has lifted and sold less than the ownership interest, costs are deferred for the underlift.

Revenue is presented net of customs, excise taxes and royalties paid in-kind on petroleum products. Revenue is presented gross of in-kind payments of amounts representing income tax.

Sales and purchases of physical commodities, which are not settled net, are presented on a gross basis as revenues and purchases [net of inventory variation] in the statement of income. Activities related to trading and commodity-based derivative instruments are reported on a net basis, with the margin included in revenues.

Transactions with the Norwegian State

Statoil markets and sells the Norwegian State's share of oil and gas production from the Norwegian continental shelf (NCS). The Norwegian State's participation in petroleum activities is organised through the SDFI. All purchases and sales of the SDFI's oil production are classified as purchases [net of inventory variation] and revenues, respectively. Statoil sells, in its own name, but for the Norwegian State's account and risk, the State's production of natural gas. These sales and related expenditures refunded by the Norwegian State are presented net in the Consolidated financial statements.

Employee benefits

Wages, salaries, bonuses, social security contributions, paid annual leave and sick leave are accrued in the period in which the associated services are rendered by employees of Statoil.

Research and development

Statoil undertakes research and development both on a funded basis for licence holders and on an unfunded basis for projects at its own risk. Statoil's own share of the licence holders' funding and the total costs of the unfunded projects are considered for capitalisation under the applicable IFRS requirements. Subsequent to initial recognition, any capitalised development costs are reported at cost less accumulated amortisation and accumulated impairment losses.

Income tax

Income tax in the Consolidated statement of income comprises current and deferred tax expense. Income tax is recognised in the Consolidated statement of income except when it relates to items recognised in OCI.

Current tax consists of the expected tax payable on the taxable income for the year and any adjustment to tax payable for previous years. Uncertain tax positions and potential tax exposures are analysed individually, and the best estimate of the probable amount for liabilities to be paid (unpaid potential tax exposure amounts, including penalties) and for assets to be received (disputed tax positions for which payment has already been made) in each case is recognised within current tax or deferred tax as appropriate. Interest income and interest expenses relating to tax issues are estimated and recognised in the period in which they are earned or incurred, and are presented within net financial items in the Consolidated statement of income. Uplift benefit on the NCS is recognised when the deduction is included in the current year tax return and impacts taxes payable.

Deferred tax assets and liabilities are recognised for the future tax consequences attributable to differences between the carrying amounts of existing assets and liabilities and their respective tax bases, subject to the initial recognition exemption. The amount of deferred tax is based on the expected manner of realisation or settlement of the carrying amount of assets and liabilities, using tax rates enacted or substantively enacted at the balance sheet date. A deferred tax asset is recognised only to the extent that it is probable that future taxable income will be available against which the asset can be utilised. In order for a deferred tax asset to be recognised based on future taxable income, convincing evidence is required, taking into account the existence of contracts, production of oil or gas in the near future based on volumes of proved reserves, observable prices in active markets, expected volatility of trading profits, expected currency rate movements and similar facts and circumstances.

Oil and gas exploration, evaluation and development expenditures

Statoil uses the successful efforts method of accounting for oil and gas exploration costs. Expenditures to acquire mineral interests in oil and gas properties and to drill and equip exploratory wells are capitalised as exploration and evaluation expenditures within intangible assets until the well is complete and the results have been evaluated, or there is any other indicator of a potential impairment. Exploration wells that discover potentially economic quantities of oil and natural gas remain capitalised as intangible assets during the evaluation phase of the find. This evaluation is normally finalised within one year after well completion. If, following the evaluation, the exploratory well has not found potentially commercial quantities of hydrocarbons, the previously capitalised costs are evaluated for derecognition or tested for impairment. Geological and geophysical costs and other exploration and evaluation expenditures are expensed as incurred.

Capitalised exploration and evaluation expenditures, including expenditures to acquire mineral interests in oil and gas properties, related to offshore wells that find proved reserves are transferred from exploration expenditures and acquisition costs - oil and gas prospects (intangible assets) to property, plant and equipment at the time of sanctioning of the development project. For onshore wells where no sanction is required, the transfer of acquisition cost - oil and gas prospects (intangible assets) to property, plant and equipment occurs at the time when a well is ready for production.

For exploration and evaluation asset acquisitions (farm-in arrangements) in which Statoil has made arrangements to fund a portion of the selling partner's (farmor's) exploration and/or future development expenditures (carried interests), these expenditures are reflected in the Consolidated financial statements as and when the exploration and development work progresses. Statoil reflects exploration and evaluation asset dispositions (farm-out arrangements) on a historical cost basis with no gain or loss recognition.

A gain related to a post-tax based disposition of assets on the NCS includes the release of tax liabilities previously computed and recognised related to the assets in question. The resulting gross gain is recognised in full in other income in the Consolidated statement of income.

Consideration from the sale of an undeveloped part of an onshore asset reduces the carrying amount of the asset. The part of the consideration that exceeds the carrying amount of the asset, if any, is reflected in the Consolidated statement of income under other income.

Exchanges (swaps) of exploration and evaluation assets are accounted for at the carrying amounts of the assets given up with no gain or loss recognition.

Property, plant and equipment
Property, plant and equipment is reflected at cost, less accumulated depreciation and accumulated impairment losses. The initial cost of an asset comprises its purchase price or construction cost, any costs directly attributable to bringing the asset into operation, the initial estimate of an asset retirement obligation, if any, exploration costs transferred from intangible assets and, for qualifying assets, borrowing costs. Property, plant and equipment include costs relating to expenditures incurred under the terms of PSAs in certain countries, and which qualify for recognition as assets of Statoil. State-owned entities in the respective countries, however, normally hold the legal title to such PSA-based property, plant and equipment.

Exchanges of assets are measured at the fair value of the asset given up, unless the fair value of neither the asset received nor the asset given up is measurable with sufficient reliability.

Expenditure on major maintenance refits or repairs comprises the cost of replacement assets or parts of assets, inspection costs and overhaul costs. Where an asset or part of an asset is replaced and it is probable that future economic benefits associated with the item will flow to Statoil, the expenditure is capitalised. Inspection and overhaul costs, associated with regularly scheduled major maintenance programmes planned and carried out at recurring intervals exceeding one year, are capitalised and amortised over the period to the next scheduled inspection and overhaul. All other maintenance costs are expensed as incurred.

Capitalised exploration and evaluation expenditures, development expenditure on the construction, installation or completion of infrastructure facilities such as platforms, pipelines and the drilling of production wells, and field-dedicated transport systems for oil and gas are capitalised as producing oil and gas properties within property, plant and equipment. Such capitalised costs, when designed for significantly larger volumes than the reserves from already developed and producing wells, are depreciated using the unit of production method based on proved reserves expected to be recovered from the area during the concession or contract period. Depreciation of production wells uses the unit of production method based on proved developed reserves, and capitalised acquisition costs of proved properties are depreciated using the unit of production method based on total proved reserves. In the rare circumstances where the use of proved reserves fails to provide an appropriate basis reflecting the pattern in which the asset's future economic benefits are expected to be consumed, a more appropriate reserve estimate is used. Depreciation of other assets and transport systems used by several fields is calculated on the basis of their estimated useful lives, normally using the straight-line method. Each part of an item of property, plant and equipment with a cost that is significant in relation to the total cost of the item is depreciated separately. For exploration and production assets, Statoil has established separate depreciation categories which as a minimum distinguish between platforms, pipelines and wells.

The estimated useful lives of property, plant and equipment are reviewed on an annual basis, and changes in useful lives are accounted for prospectively. An item of property, plant and equipment is de-recognised upon disposal or when no future economic benefits are expected to arise from the continued use of the asset. Any gain or loss arising on derecognition of the asset (calculated as the difference between the net disposal proceeds and the carrying amount of the item) is included in other income or operating expenses, respectively, in the period the item is de-recognised.

Assets classified as held for sale
Non-current assets are classified separately as held for sale in the balance sheet when their carrying amount will be recovered through a sale transaction rather than through continuing use. This condition is met only when the sale is highly probable, the asset is available for immediate sale in its present condition, and management is committed to the sale, which should be expected to qualify for recognition as a completed sale within one year from the date of classification. Liabilities directly associated with the assets classified as held for sale, and expected to be included as part of the sale transaction, are correspondingly also classified separately. Once classified as held for sale, property, plant and equipment and intangible assets are not subject to depreciation or amortisation. The net assets and liabilities of a disposal group classified as held for sale are measured at the lower of their carrying amount and fair value less costs to sell.

Leases
Leases for which Statoil assumes substantially all the risks and rewards of ownership are reflected as finance leases. When an asset leased by a joint operation or similar arrangement to which Statoil is a party qualifies as a finance lease, or when such an asset is leased by Statoil as operator directly on behalf of a joint operation or similar arrangement, Statoil reflects its proportionate share of the leased asset and related obligations. Finance leases are classified in the Consolidated balance sheet within property, plant and equipment and finance debt. All other leases are classified as operating leases, and the costs are charged to the relevant operating expense related caption on a straight-line basis over the lease term, unless another basis is more representative of the benefits of the lease to Statoil.

Statoil distinguishes between lease and capacity contracts. Lease contracts provide the right to use a specific asset for a period of time, while capacity contracts confer on Statoil the right to and the obligation to pay for certain volume capacity availability related to transport, terminal use, storage, etc. Such capacity contracts that do not involve specified assets or that do not involve substantially all the capacity of an undivided interest in a specific asset are not considered by Statoil to qualify as leases for accounting purposes. Capacity payments are reflected as operating expenses in the Consolidated statement of income in the period for which the capacity contractually is available to Statoil.

Intangible assets including goodwill
Intangible assets are stated at cost, less accumulated amortisation and accumulated impairment losses. Intangible assets include acquisition cost for oil and gas prospects, expenditures on the exploration for and evaluation of oil and natural gas resources, goodwill and other intangible assets.

Intangible assets relating to expenditures on the exploration for and evaluation of oil and natural gas resources are not amortised. When the decision to develop a particular area is made, its intangible exploration and evaluation assets are reclassified to property, plant and equipment.

Goodwill is initially measured at the excess of the aggregate of the consideration transferred and the amount recognised for any non-controlling interest over the fair value of the identifiable assets acquired and liabilities assumed in a business combination at the acquisition date. Goodwill acquired is allocated to each cash generating unit, or group of units, expected to benefit from the combination's synergies. Following initial recognition, goodwill is measured at cost less any accumulated impairment losses.

Financial assets
Financial assets are initially recognised at fair value when Statoil becomes a party to the contractual provisions of the asset. For additional information on fair value methods, refer to the Measurement of fair values section below. The subsequent measurement of the financial assets depends on which category they have been classified into at inception.

At initial recognition, Statoil classifies its financial assets into the following three main categories: Financial investments at fair value through profit or loss, loans and receivables, and available-for-sale (AFS) financial assets. The first main category, financial investments at fair value through profit or loss, further consists of two sub-categories: Financial assets held for trading and financial assets that on initial recognition are designated as fair value through profit and loss. The latter approach may also be referred to as the fair value option.

Cash and cash equivalents include cash in hand, current balances with banks and similar institutions, and short-term highly liquid investments that are readily convertible to known amounts of cash, are subject to an insignificant risk of changes in fair value and have a maturity of three months or less from the acquisition date.

Trade receivables are carried at the original invoice amount less a provision for doubtful receivables which is made when there is objective evidence that Statoil will be unable to recover the balances in full.

AFS financial assets are carried at fair value in the balance sheet, with changes in fair value initially recognised directly in Other comprehensive income/(loss). If the investment is de-recognised or determined to be impaired, the cumulative change in fair value previously reflected in Other comprehensive income/(loss) is recognised in the statement of income.

A significant part of Statoil's investments in treasury bills, commercial papers, bonds and listed equity securities is managed together as an investment portfolio of Statoil's captive insurance company and is held in order to comply with specific regulations for capital retention. The investment portfolio is managed and evaluated on a fair value basis in accordance with an investment strategy and is accounted for using the fair value option with changes in fair value recognised through profit or loss.

Financial assets are presented as current if they contractually will expire or otherwise are expected to be recovered within 12 months after the balance sheet date, or if they are held for the purpose of being traded. Financial assets and financial liabilities are shown separately in the Consolidated balance sheet, unless Statoil has both a legal right and a demonstrable intention to net settle certain balances payable to and receivable from the same counterparty, in which case they are shown net in the balance sheet.

Inventories
Commodity inventories are stated at the lower of cost and net realisable value. Cost is determined by the first-in first-out method and comprises direct purchase costs, cost of production, transportation and manufacturing expenses. Inventories of drilling and spare parts are reflected according to the weighted average method.

Impairment
Impairment of property, plant and equipment and intangible assets other than goodwill
Statoil assesses individual assets or groups of assets for impairment whenever events or changes in circumstances indicate that the carrying value of an asset may not be recoverable. Assets are grouped into cash generating units (CGUs) which are the smallest identifiable groups of assets that generate cash inflows that are largely independent of the cash inflows from other groups of assets. Normally, separate CGUs are individual oil and gas fields or plants. Each unconventional asset play is considered a single CGU when no cash inflows from parts of the play can be reliably identified as being largely independent of the cash inflows from other parts of the play. In impairment evaluations, the carrying amounts of CGUs are determined on a basis consistent with that of the recoverable amount. In Statoil's line of business, judgement is involved in determining what constitutes a CGU. Development in production, infrastructure solutions, markets, product pricing, management actions and other factors may over time lead to changes in CGUs such as the division of one original CGU into several.

In assessing whether a write-down of the carrying amount of a potentially impaired asset is required, the asset's carrying amount is compared to the recoverable amount. The recoverable amount of an asset is the higher of its fair value less cost of disposal and its value in use. Fair value less cost of disposal is determined based on comparable recent arm's length market transactions, or based on Statoil's estimate of the price that would be received for the asset in an orderly transaction between market participants. Such fair value estimates are mainly based on discounted cash flow models, using assumed market participants' assumptions, but may also reflect market multiples observed from comparable market transactions or independent third-party valuations. Value in use is determined using a discounted cash flow model. The estimated future cash flows applied in establishing value in use are based on reasonable and supportable assumptions and represent management's best estimates of the range of economic conditions that will exist over the remaining useful life of the assets, as set down in Statoil's most recently approved long-term forecasts. Updates of assumptions and economic conditions in establishing the long-term forecasts are reviewed by corporate management on regular basis and updated at least annually. For assets and CGUs with an expected useful life or timeline for production of expected reserves extending beyond 5 years, the forecasts reflect expected production volumes for oil and natural gas, and the related cash flows include project or asset specific estimates reflecting the relevant period. Such estimates are established based on Statoil's principles and assumptions and are consistently applied.

In performing a value-in-use-based impairment test, the estimated future cash flows are adjusted for risks specific to the asset and discounted using a real post-tax discount rate which is based on Statoil's post-tax weighted average cost of capital (WACC). The use of post-tax discount rates in determining value in use does not result in a materially different determination of the need for, or the amount of, impairment that would be required if pre-tax discount rates had been used.

Unproved oil and gas properties are assessed for impairment when facts and circumstances suggest that the carrying amount of the asset or CGU to which the unproved properties belong may exceed its recoverable amount, and at least once a year. Exploratory wells that have found reserves, but where classification of those reserves as proved depends on whether major capital expenditure can be justified or where the economic viability of that major capital expenditure depends on the successful completion of further exploration work, will remain capitalised during the evaluation phase for the exploratory finds. Thereafter it will be considered a trigger for impairment evaluation of the well if no development decision is planned for the near future and there are no firm plans for future drilling in the licence.

An assessment is made at each reporting date as to whether there is any indication that previously recognised impairment losses may no longer be relevant or may have decreased. If such an indication exists, the recoverable amount is estimated. A previously recognised impairment loss is reversed only if there has been a change in the estimates used to determine the asset's recoverable amount since the last impairment loss was recognised. If that is the case, the carrying amount of the asset is increased to its recoverable amount. That increased amount cannot exceed the carrying amount that would have been determined, net of depreciation, had no impairment loss been recognised for the asset in prior years.

Impairment losses and reversals of impairment losses are presented in the Consolidated statement of income as Exploration expenses or Depreciation, amortisation and net impairment losses, on the basis of their nature as either exploration assets (intangible exploration assets) or development and producing assets (property, plant and equipment and other intangible assets), respectively.

Impairment of goodwill

Goodwill is reviewed for impairment annually or more frequently if events or changes in circumstances indicate that the carrying value may be impaired. Impairment is determined by assessing the recoverable amount of the CGU, or group of units, to which the goodwill relates. Where the recoverable amount of the CGU, or group of units, is less than the carrying amount, an impairment loss is recognised. Once recognised, impairments of goodwill are not reversed in future periods.

Financial liabilities

Financial liabilities are initially recognised at fair value when Statoil becomes a party to the contractual provisions of the liability. The subsequent measurement of financial liabilities depends on which category they have been classified into. The categories applicable for Statoil are either financial liabilities at fair value through profit or loss or financial liabilities measured at amortised cost using the effective interest method. The latter applies to Statoil's non-current bank loans and bonds.

Financial liabilities are presented as current if the liability is due to be settled within 12 months after the balance sheet date, or if they are held for the purpose of being traded. Financial liabilities are de-recognised when the contractual obligations expire, are discharged or cancelled. Gains and losses arising on the repurchase, settlement or cancellation of liabilities are recognised either in interest income and other financial items or in interest and other finance expenses within net financial items.

Derivative financial instruments

Statoil uses derivative financial instruments to manage certain exposures to fluctuations in foreign currency exchange rates, interest rates and commodity prices. Such derivative financial instruments are initially recognised at fair value on the date on which a derivative contract is entered into and are subsequently re-measured at fair value through profit and loss. The impact of commodity-based derivative financial instruments is recognised in the Consolidated statement of income under revenues, as such derivative instruments are related to sales contracts or revenue-related risk management for all significant purposes. The impact of other financial instruments is reflected under net financial items.

Derivatives are carried as assets when the fair value is positive and as liabilities when the fair value is negative. Derivative assets or liabilities expected to be recovered, or with the legal right to be settled more than 12 months after the balance sheet date are classified as non-current, with the exception of derivative financial instruments held for the purpose of being traded.

Contracts to buy or sell a non-financial item that can be settled net in cash or another financial instrument, or by exchanging financial instruments, as if the contracts were financial instruments, are accounted for as financial instruments. However, contracts that are entered into and continue to be held for the purpose of the receipt or delivery of a non-financial item in accordance with Statoil's expected purchase, sale or usage requirements, also referred to as own-use, are not accounted for as financial instruments. This is applicable to a significant number of contracts for the purchase or sale of crude oil and natural gas, which are recognised upon delivery.

Derivatives embedded in other financial instruments or in non-financial host contracts are recognised as separate derivatives and are reflected at fair value with subsequent changes through profit and loss, when their risks and economic characteristics are not closely related to those of the host contracts, and the host contracts are not carried at fair value. Where there is an active market for a commodity or other non-financial item referenced in a purchase or sale contract, a pricing formula will, for instance, be considered to be closely related to the host purchase or sales contract if the price formula is based on the active market in question. A price formula with indexation to other markets or products will however result in the recognition of a separate derivative. Where there is no active market for the commodity or other non-financial item in question, Statoil assesses the characteristics of such a price related embedded derivative to be closely related to the host contract if the price formula is based on relevant indexations commonly used by other market participants. This applies to certain long-term natural gas sales agreements.

Pension liabilities
Statoil has pension plans for employees that either provide a defined pension benefit upon retirement or a pension dependent on defined contributions and related returns. A portion of the contributions are provided for as notional contributions, for which the liability increases with a promised notional return, set equal to the actual return of assets invested through the ordinary defined contribution plan. For defined benefit plans, the benefit to be received by employees generally depends on many factors including length of service, retirement date and future salary levels.

Statoil's proportionate share of multi-employer defined benefit plans are recognised as liabilities in the balance sheet to the extent that sufficient information is available and a reliable estimate of the obligation can be made.

Statoil's net obligation in respect of defined benefit pension plans is calculated separately for each plan by estimating the amount of future benefit that employees have earned in return for their services in the current and prior periods. That benefit is discounted to determine its present value, and the fair value of any plan assets is deducted. The discount rate is the yield at the balance sheet date, reflecting the maturity dates approximating the terms of Statoil's obligations. The discount rate for the main part of the pension obligations has been established on the basis of Norwegian mortgage covered bonds, which are considered high quality corporate bonds. The cost of pension benefit plans is expensed over the period that the employees render services and become eligible to receive benefits. The calculation is performed by an external actuary.

The net interest related to defined benefit plans is calculated by applying the discount rate to the opening present value of the benefit obligation and opening present value of the plan assets, adjusted for material changes during the year. The resulting net interest element is presented in the statement of income within Net financial items. The difference between estimated interest income and actual return is recognised in the Consolidated statement of comprehensive income.

Past service cost is recognised when a plan amendment (the introduction or withdrawal of, or changes to, a defined benefit plan) or curtailment (a significant reduction by the entity in the number of employees covered by a plan) occurs, or when recognising related restructuring costs or termination benefits. The obligation and related plan assets are re-measured using current actuarial assumptions, and the gain or loss is recognised in the statement of income.

Actuarial gains and losses are recognised in full in the Consolidated statement of comprehensive income in the period in which they occur, while actuarial gains and losses related to provision for termination benefits are recognised in the Consolidated statement of income in the period in which they occur. Due to the parent company Statoil ASA's functional currency being USD, the significant part of Statoil's pension obligations will be payable in a foreign currency (i.e. NOK). As a consequence, actuarial gains and losses related to the parent company's pension obligation include the impact of exchange rate fluctuations.

Contributions to defined contribution schemes are recognised in the statement of income in the period in which the contribution amounts are earned by the employees.

Notional contribution plans, reported in the parent company Statoil ASA, are recognised as pension liabilities with the actual value of the notional contributions and promised return at reporting date. Notional contributions are recognised in the statement of income as periodic pension cost, while changes in fair value of notional assets are reflected in the statement of income under Net financial items.

Periodic pension cost is accumulated in cost pools and allocated to business areas and Statoil operated joint operations (licences) on an hours' incurred basis and recognised in the statement of income based on the function of the cost.

Onerous contracts
Statoil recognises as provisions the net obligation under contracts defined as onerous. Contracts are deemed to be onerous if the unavoidable cost of meeting the obligations under the contract exceeds the economic benefits expected to be received in relation to the contract. A contract which forms an integral part of the operations of a CGU whose assets are dedicated to that contract, and for which the economic benefits cannot be reliably separated from those of the CGU, is included in impairment considerations for the applicable CGU.

Asset retirement obligations (ARO)
Provisions for ARO costs are recognised when Statoil has an obligation (legal or constructive) to dismantle and remove a facility or an item of property, plant and equipment and to restore the site on which it is located, and when a reliable estimate of that liability can be made. The amount recognised is the present value of the estimated future expenditures determined in accordance with local conditions and requirements. Cost is estimated based on current regulations and technology, considering relevant risks and uncertainties. The discount rate used in the calculation of the ARO is a risk-free rate based on the applicable currency and time horizon of the underlying cash flows, adjusted for a credit premium which reflects Statoil's own credit risk. Normally an obligation arises for a new facility, such as an oil and natural gas production or transportation facility, upon construction or installation. An obligation may also arise during the period of operation of a facility through a change in legislation or through a decision to terminate operations, or be based on

commitments associated with Statoil's ongoing use of pipeline transport systems where removal obligations rest with the volume shippers. The provisions are classified under provisions in the Consolidated balance sheet.

When a provision for ARO cost is recognised, a corresponding amount is recognised to increase the related property, plant and equipment and is subsequently depreciated as part of the costs of the facility or item of property, plant and equipment. Any change in the present value of the estimated expenditure is reflected as an adjustment to the provision and the corresponding property, plant and equipment. When a decrease in the ARO provision related to a producing asset exceeds the carrying amount of the asset, the excess is recognised as a reduction of depreciation, amortisation and net impairment losses in the Consolidated statement of income. When an asset has reached the end of its useful life, all subsequent changes to the ARO provision are recognised as they occur in operating expenses in the Consolidated statement of income. Removal provisions associated with Statoil's role as shipper of volumes through third party transport systems are expensed as incurred.

Measurement of fair values
Quoted prices in active markets represent the best evidence of fair value and are used by Statoil in determining the fair values of assets and liabilities to the extent possible. Financial instruments quoted in active markets will typically include commercial papers, bonds and equity instruments with quoted market prices obtained from the relevant exchanges or clearing houses. The fair values of quoted financial assets, financial liabilities and derivative instruments are determined by reference to mid-market prices, at the close of business on the balance sheet date.

Where there is no active market, fair value is determined using valuation techniques. These include using recent arm's-length market transactions, reference to other instruments that are substantially the same, discounted cash flow analysis, and pricing models and related internal assumptions. In the valuation techniques, Statoil also takes into consideration the counterparty and its own credit risk. This is either reflected in the discount rate used or through direct adjustments to the calculated cash flows. Consequently, where Statoil reflects elements of long-term physical delivery commodity contracts at fair value, such fair value estimates to the extent possible are based on quoted forward prices in the market and underlying indexes in the contracts, as well as assumptions of forward prices and margins where observable market prices are not available. Similarly, the fair values of interest and currency swaps are estimated based on relevant quotes from active markets, quotes of comparable instruments, and other appropriate valuation techniques.

Critical accounting judgements and key sources of estimation uncertainty

Critical judgements in applying accounting policies
The following are the critical judgements, apart from those involving estimations (see below), that Statoil has made in the process of applying the accounting policies and that have the most significant effect on the amounts recognised in the financial statements:

Revenue recognition - gross versus net presentation of traded SDFI volumes of oil and gas production
As described under Transactions with the Norwegian State above, Statoil markets and sells the Norwegian State's share of oil and gas production from the NCS. Statoil includes the costs of purchase and proceeds from the sale of the SDFI oil production in purchases [net of inventory variation] and revenues, respectively. In making the judgement, Statoil considered the detailed criteria for the recognition of revenue from the sale of goods and, in particular, concluded that the risk and reward of the ownership of the oil had been transferred from the SDFI to Statoil.

Statoil sells, in its own name, but for the Norwegian State's account and risk, the State's production of natural gas. These gas sales, and related expenditures refunded by the State, are shown net in Statoil's Consolidated financial statements. In making the judgement, Statoil considered the same criteria as for the oil production and concluded that the risk and reward of the ownership of the gas had not been transferred from the SDFI to Statoil.

Key sources of estimation uncertainty
The preparation of the Consolidated financial statements requires that management make estimates and assumptions that affect reported amounts of assets, liabilities, income and expenses. The estimates and associated assumptions are based on historical experience and various other factors that are believed to be reasonable under the circumstances, the result of which form the basis of making the judgements about carrying values of assets and liabilities that are not readily apparent from other sources. Actual results may differ from these estimates. The estimates and underlying assumptions are reviewed on an on-going basis considering the current and expected future market conditions.

Statoil is exposed to a number of underlying economic factors which affect the overall results, such as liquids prices, natural gas prices, refining margins, foreign exchange rates and interest rates as well as financial instruments with fair values derived from changes in these factors. In addition, Statoil's results are influenced by the level of production, which in the short term may be influenced by, for instance, maintenance programmes. In the long term, the results are impacted by the success of exploration and field development activities.

The matters described below are considered to be the most important in understanding the key sources of estimation uncertainty that are involved in preparing these Consolidated financial statements and the uncertainties that could most significantly impact the amounts reported on the results of operations, financial position and cash flows.

Proved oil and gas reserves
Proved oil and gas reserves may materially impact the Consolidated financial statements, as changes in the proved reserves, for instance as a result of changes in prices, will impact the unit of production rates used for depreciation and amortisation. Proved oil and gas reserves are those quantities of oil and gas, which, by analysis of geoscience and engineering data, can be estimated with reasonable certainty to be economically producible from a given date forward, from known reservoirs, and under existing economic conditions, operating methods and government regulations. Unless evidence indicates that renewal is reasonably certain, estimates of economically producible reserves only reflect the period before the contracts providing the right to operate

expire. The project to extract the hydrocarbons must have commenced, or the operator must be reasonably certain that it will commence within a reasonable time.

Proved oil and gas reserves have been estimated by internal qualified professionals on the basis of industry standards and are governed by the oil and gas rules and disclosure requirements in the U.S. Securities Exchange Commission (SEC) regulations S-K and S-X, and the Financial Accounting Standards Board (FASB) requirements for supplemental oil and gas disclosures. The estimates have been based on a 12-month average product price and on existing economic conditions and operating methods as required, and recovery of the estimated quantities have a high degree of certainty (at least a 90% probability).

Reserves estimates are based on subjective judgements involving geological and engineering assessments of in-place hydrocarbon volumes, the production, historical recovery and processing yield factors and installed plant operating capacity. For future development projects, proved reserves estimates are included only where there is a significant commitment to project funding and execution and when relevant governmental and regulatory approvals have been secured or are reasonably certain to be secured. The reliability of these estimates at any point in time depends on both the quality and availability of the technical and economic data and the efficiency of extracting and processing the hydrocarbons. An independent third party has evaluated Statoil's proved reserves estimates, and the results of this evaluation do not differ materially from Statoil's estimates.

Expected oil and gas reserves
Expected oil and gas reserves may materially impact the Consolidated financial statements, as changes in the expected reserves, for instance as a result of changes in prices, will impact asset retirement obligations and impairment testing of upstream assets, which in turn may lead to changes in impairment charges affecting operating income. Expected oil and gas reserves are the estimated remaining, commercially recoverable quantities, based on Statoil's judgement of future economic conditions, from projects in operation or justified for development. Recoverable oil and gas quantities are always uncertain, and the expected value is the weighted average, or statistical mean, of the possible outcomes. Expected reserves are therefore typically larger than proved reserves as defined by the SEC rules. Expected oil and gas reserves have been estimated by internal qualified professionals on the basis of industry standards and are used for impairment testing purposes and for calculation of asset retirement obligations. Reserves estimates are based on subjective judgements involving geological and engineering assessments of in-place hydrocarbon volumes, the production, historical recovery and processing yield factors, installed plant operating capacity and operating approval limits. The reliability of these estimates at any point in time depends on both the quality and quantity of the technical and economic data and the efficiency of extracting and processing the hydrocarbons. Such estimates are inherently less reliable in early field life or where the available data is limited following a recently implemented change in the method of production.

Exploration and leasehold acquisition costs
Statoil capitalises the costs of drilling exploratory wells pending determination of whether the wells have found proved oil and gas reserves. Statoil also capitalises leasehold acquisition costs and signature bonuses paid to obtain access to undeveloped oil and gas acreage. Judgements as to whether these expenditures should remain capitalised, be de-recognised or written down in the period may materially affect the operating income for the period.

Impairment/reversal of impairment
Statoil has significant investments in property, plant and equipment and intangible assets. Changes in the circumstances or expectations of future performance of an individual asset may be an indicator that the asset is impaired, requiring the carrying amount to be written down to its recoverable amount. Impairments are reversed if conditions for impairment are no longer present. Evaluating whether an asset is impaired or if an impairment should be reversed requires a high degree of judgement and may to a large extent depend upon the selection of key assumptions about the future.

The key assumptions used will bear the risk of change based on the inherent volatile nature of macro-economic factors such as future commodity prices or discount rate and uncertainty in asset specific factors such as reserve estimates and operational decisions impacting the production profile or activity levels for our oil and natural gas properties. When estimating the recoverable amount, the single most likely future cash flows, the point estimate, is the primary method applied to reflect uncertainties in timing and amount inherent in the assumptions used in the estimated future cash flows. For assumptions in which the expected probability distributions or outcome are expected to be significantly skewed the use of decision trees or simulation is applied.

Unproved oil and gas properties are assessed for impairment when facts and circumstances suggest that the carrying amount of the relevant asset or CGU may exceed its recoverable amount, and at least annually. If, following evaluation, an exploratory well has not found proved reserves, the previously capitalised costs are tested for impairment. Subsequent to the initial evaluation phase for a well, it will be considered a trigger for impairment testing of a well if no development decision is planned for the near future and there is no firm plan for future drilling in the licence. Impairment of unsuccessful wells is reversed, as applicable, to the extent that conditions for impairment are no longer present.

Where recoverable amounts are based on estimated future cash flows, reflecting Statoil's or market participants' assumptions about the future and discounted to their present value, the estimates involve complexity. Impairment testing requires long-term assumptions to be made concerning a number of economic factors such as future market prices, refinery margins, currency exchange rates and future output, discount rates and political and country risk among others, in order to establish relevant future cash flows. Long-term assumptions for major economic factors are made at a group level, and there is a high degree of reasoned judgement involved in establishing these assumptions, in determining other relevant factors such as forward price curves, in estimating production outputs and in determining the ultimate terminal value of an asset.

Employee retirement plans
When estimating the present value of defined benefit pension obligations that represent a long-term liability in the Consolidated balance sheet, and indirectly, the period's net pension expense in the Consolidated statement of income, management make a number of critical assumptions affecting these estimates. Most notably, assumptions made about the discount rate to be applied to future benefit payments and plan assets, the expected rate of pension

increase and the annual rate of compensation increase, have a direct and potentially material impact on the amounts presented. Significant changes in these assumptions between periods can have a material effect on the Consolidated financial statements.

Asset retirement obligations
Statoil has significant obligations to decommission and remove offshore installations at the end of the production period. The costs of these decommissioning and removal activities require revisions due to changes in current regulations and technology while considering relevant risks and uncertainties. Most of the removal activities are many years into the future, and the removal technology and costs are constantly changing. The estimates include assumptions of the time required and the day rates for rigs, marine operations and heavy lift vessels that can vary considerably depending on the assumed removal complexity. As a result, the initial recognition of the liability and the capitalised cost associated with decommissioning and removal obligations, and the subsequent adjustment of these balance sheet items, involve the application of significant judgement.

Derivative financial instruments
When not directly observable in active markets, the fair value of derivative contracts must be computed internally based on internal assumptions as well as directly observable market information, including forward and yield curves for commodities, currencies and interest rates. Changes in internal assumptions, forward and yield curves could materially impact the internally computed fair value of derivative contracts, particularly long-term contracts, resulting in a corresponding impact on income or loss in the Consolidated statement of income.

Income tax
Every year Statoil incurs significant amounts of income taxes payable to various jurisdictions around the world and recognises significant changes to deferred tax assets and deferred tax liabilities, all of which are based on management's interpretations of applicable laws, regulations and relevant court decisions. The quality of these estimates is highly dependent upon proper application of at times very complex sets of rules, the recognition of changes in applicable rules and, in the case of deferred tax assets, management's ability to project future earnings from activities that may apply loss carry forward positions against future income taxes.

3 Segments

Statoil's operations are managed through the following business areas: Development & Production Norway (DPN), Development & Production USA (DPUSA), Development & Production International (DPI), Marketing, Midstream & Processing (MMP), New Energy Solutions (NES), Technology, Projects & Drilling (TPD), Exploration (EXP) and Global Strategy & Business Development (GSB).

The development and production business areas are responsible for the commercial development of the oil and gas portfolios within their respective geographical areas: DPN on the Norwegian continental shelf, DPUSA including offshore and onshore activities in the USA and Mexico, and DPI worldwide outside of DPN and DPUSA.

Exploration activities are managed by a separate business area, which has the global responsibility across the group for discovery and appraisal of new resources. Exploration activities are allocated to and presented in the respective development and production business areas.

The MMP business area is responsible for marketing and trading of oil and gas commodities (crude, condensate, gas liquids, products, natural gas and liquefied natural gas), electricity and emission rights, as well as transportation, processing and manufacturing of the above-mentioned commodities, operations of refineries, terminals, processing and power plants.

The NES business area is responsible for wind parks, carbon capture and storage as well as other renewable energy and low-carbon energy solutions.

The business areas DPI and DPUSA are aggregated into the reporting segment Exploration & Production International (E&P International), previously named Development and Production International. The aggregation has its basis in similar economic characteristics, such as the assets' long term and capital-intensive nature and exposure to volatile oil and gas commodity prices, the nature of products, service and production processes, the type and class of customers, the methods of distribution and regulatory environment. The reporting segments Exploration & Production Norway (E&P Norway), previously named Development and Production Norway, and MMP consists of the business areas DPN and MMP respectively. The business areas NES, GSB, TPD, EXP and corporate staffs and support functions are aggregated into the reporting segment "Other" due to the immateriality of these areas. The majority of costs within the business areas GSB, TPD and EXP are allocated to the E&P International, E&P Norway and MMP reporting segments.

The eliminations section includes the elimination of inter-segment sales and related unrealised profits, mainly from the sale of crude oil and products. Inter-segment revenues are based upon estimated market prices.

Segment data for the years ended 31 December 2017, 2016 and 2015 are presented below. The measurement basis of segment profit is Net operating income/(loss). In the tables below, deferred tax assets, pension assets and non-current financial assets are not allocated to the segments. Also, the line additions to PP&E, intangibles and equity accounted investments are excluding movements due to changes in asset retirement obligations.

(in USD million)	E&P Norway	E&P International	MMP	Other	Eliminations	Total

See note 4 Acquisitions and divestments for information on transactions that affect the different segments.

See note 10 Property, plant and equipment for further information on impairment losses that affected the different segments.

See note 11 Intangible assets for information on impairment losses that affected the different segments.

See note 23 Other commitments, contingent liabilities and contingent assets for information on contingencies that have influenced the segments.

Revenues by geographical areas
Statoil has business operations in more than 30 countries. When attributing revenues third party and other income to the country of the legal entity executing the sale, Norway constitutes 74% and the USA constitutes 17%.

Non-current assets by country

(in USD million)	At 31 December 2017	2016	2015
Norway	34,588	31,484	31,487
USA	19,267	18,223	20,531

Total revenues	60,971	45,688	57,900

4 Acquisitions and divestments

2017

Sale of interest in Kai Kos Dehseh

In January 2017 Statoil closed an agreement, entered in December 2016, with Athabasca Oil Corporation to divest its 100% interest in Kai Kos Dehseh (KKD) oil sands. The total consideration consisted of cash consideration of CAD 431 million (USD 328 million), 100 million common shares in Athabasca Oil Corporation (which is accounted for as an available for sale financial investment) and a series of contingent payments. The shares and the contingent consideration were measured at a combined fair value of CAD 185 million (USD 142 million) on the closing date. A loss on the transaction of USD 351 million has been recognised as operating expense and includes a reclassification of accumulated foreign exchange losses, previously recognised in other comprehensive income/(loss). The transaction is reflected in the Exploration & Production International (E&P International) segment.

Acquisition and divestment of operated interest in Brazil

In November 2016 Statoil acquired a 66% operated interest in the Brazilian offshore licence BM-S-8 in the Santos basin from Petróleo Brasileiro S.A. ("Petrobras"). A cash consideration of USD 1,250 million was paid on the closing date and USD 300 million is expected to be paid late March 2018. The payment of the remaining consideration of USD 950 million is subject to certain conditions being met, and is reflected at fair value at the reporting date. The value of the acquired exploration assets resulted in an increase in intangible assets of USD 2,271 million at the transaction date.

In August 2017 Statoil entered into an agreement with Queiroz Galvão Exploração e Produção ("QGEP") to acquire QGEP's 10% interest in the same licence in Brazil's Santos basin increasing the operated interest to 76%. A cash consideration of USD 194 million was paid on the closing date, presented as a capital expenditure in the Statement of cash flows. The remaining consideration consists of two cash payments. The payment of USD 45 million is expected to be paid late March 2018. The payment of USD 144 million is subject to certain conditions being met, and is reflected at fair value at the reporting date. The value of the acquired exploration assets resulted in an increase in intangible assets of USD 362 million at the transaction date. The agreement was closed in December 2017.

In October 2017, the consortium comprising Statoil (operator, 40%), ExxonMobil (40%) and Galp (20%) presented the winning bid (67.12% of profit oil) for the Carcará North block in the Santos basin. Statoil's share of the pre-determined signature bonus paid by the consortium in December 2017 was USD 350 million and is recognised as an intangible asset.

At the same time in October 2017 Statoil has agreed to divest 33% out of its 76% interest in BM-S-8 licence to ExxonMobil for a total potential consideration of around USD 1.3 billion, comprising an upfront cash payment of around USD 800 million and a contingent cash payment of around USD 500 million; a further 3.5% to ExxonMobil and 3% to Galp for a total consideration of around USD 250 million, comprising an upfront cash payment of around USD 155 million and a contingent cash payment of around USD 95 million. As of 31 December 2017, intangible assets related to and liabilities associated with the 39.5% of current interest in BM-S-8 were presented as held for sale in the Consolidated balance sheet. No impact on the Consolidated statement of income is expected upon the closing of the divestment.

After closing these transactions, Statoil will have an ownership share of 36.5% in the licences, which are expected to be unitised. The transactions are accounted for in the E&P International segment.

Extension of the Azeri-Chirag-Deepwater Gunashli (ACG) production sharing agreement
In the third quarter of 2017 the Azeri-Chirag-Deepwater Gunashli (ACG) production sharing agreement was extended by 25 years and will be effective until the end of 2049. The transaction was recognised in the E&P International segment in the fourth quarter of 2017, following ratification by the Parliament (Milli Majlis) of the Republic of Azerbaijan. As part of the new agreement, Statoil's participating interest will be adjusted to 7.27% down from 8.56%. The international partners will make a total payment of USD 3.6 billion to the State Oil Fund of the Republic of Azerbaijan, Statoil's share will be approximately USD 349 million, which will be paid over a period of 8 years.

Acquisition of interests in Roncador field
In December 2017 Statoil entered into agreement with Petrobras to acquire a 25% interest in Roncador, an oil field in the Campos Basin in Brazil. A cash consideration of USD 2.35 billion will be paid on the closing date. The liability for payment of the remaining consideration of up to USD 550 million is subject to certain conditions being met, and will be reflected at fair value at the acquisition date. Petrobras retains operatorship and a 75% interest. Closing is expected in 2018 and is subject to certain conditions, including government approval. The acquired interest will be reflected in accordance with the principles of IFRS 3 Business Combinations, and Statoil's ownership in the field will thereafter be accounted for as a joint operation. The transaction will be accounted for in the E&P International segment.

Acquisition of interests in Martin Linge field and Garantiana discovery
In December 2017 Statoil and Total have agreed on a transaction whereby Statoil will acquire Total's equity stakes and take over as operator in the Martin Linge field (51%) and the Garantiana discovery (40%) on the Norwegian continental shelf (NCS). The transaction is subject to certain conditions, including government approval. Statoil will pay Total consideration which, based on a 1 January 2017 valuation, amounts to USD 1.45 billion. At the completion of the transaction, which is expected late March 2018, the consideration will be subject to adjustment reflecting post-tax cash flows in the period from valuation until the date of closing. The assets and liabilities related to the acquired portion of Martin Linge will be reflected in accordance with the principles of IFRS 3 Business Combinations. The transaction will be accounted for in the Exploration & Production Norway (E&P Norway) segment.

2016

Acquisition of shares in Lundin Petroleum AB (Lundin) and sale of interests in the Edvard Grieg field
In January 2016 Statoil acquired 11.93% of the issued share capital and votes in Lundin Petroleum AB for a total purchase price of SEK 4.6 billion (USD 541 million). In June 2016 Statoil closed an agreement with Lundin to divest its entire 15% interest in the Edvard Grieg field, a 9% interest in the Edvard Grieg Oil pipeline and a 6% interest in the Utsira High Gas pipeline for an increased ownership share in Lundin. In addition to the divested interests, a cash consideration of SEK 544 million (USD 64 million) was paid to Lundin. Following the completion of the transaction Statoil owned 68.4 million shares of Lundin, corresponding to 20.1% of the outstanding shares and votes. Statoil recognised a total net gain of USD 120 million related to the divestment presented in the line item other income in the Consolidated statement of income. In the segment reporting, the gain was recognised in the E&P Norway segment (USD 114 million) and in the Marketing, Midstream & Processing (MMP) segment (USD 5 million). The transaction was tax exempt under the Norwegian petroleum tax legislation.

Following the increase in ownership interest on 30 June 2016, Statoil obtained significant influence over Lundin, and accounted for the investment as an associate under the equity method. Excess values were allocated mainly to Lundin`s exploration and production licences on the Norwegian continental shelf. The investment in Lundin was included in the Consolidated balance sheet within line item equity accounted investments with a book value of USD 1,199 million as per 30 June 2016. The Lundin investment is reported as part of the E&P Norway segment. For summarised financial information relating investment in Lundin Petroleum AB, see note 12 Equity accounted investments. Following the change in accounting classification, Statoil recognised a gain of USD 127 million representing the cumulative gain on its initial 11.93% shareholding being reclassified from the line item net gains (losses) from available for sale financial assets in the Consolidated statement of comprehensive income, to the net financial items line item in the Consolidated statement of income.

Sale of interest in Marcellus operated onshore play
In July 2016 Statoil divested its operated properties in the US state of West Virginia to EQT Corporation for USD 407 million in cash. The transaction was reported as part of E&P International segment with an immaterial effect on the Consolidated statement of income recognised in the third quarter of 2016.

2015

Sale of interests in the Marcellus onshore play
In January 2015 Statoil reduced its average working interest in the non-operated southern Marcellus onshore play from 29% to 23% through a divestment to Southwestern Energy. Proceeds from the sale were USD 365 million, recognised in the E&P International segment with no gain.

Sale of interests in the Shah Deniz project and the South Caucasus Pipeline
In April 2015 Statoil sold its remaining 15.5% interest in the Shah Deniz project and the South Caucasus Pipeline to Petronas with a total gain of USD 1,182 million, recognised in the E&P International and the MMP segments. Total proceeds from the sale were USD 2,688 million.

Sale of buildings
In 2015 Statoil sold the shares in Forusbeen 50 AS, Strandveien 4 AS and Arkitekt Ebbelsvei 10 AS with a gain of USD 211 million, recognised in the Other segment. Proceeds from the sale were USD 486 million. At the same time Statoil entered into 15 year operating lease agreements for the buildings.

Sale of interests in the Trans Adriatic Pipeline AG
In December 2015 Statoil sold its 20% interest in Trans Adriatic Pipeline AG to Snam SpA, with a gain of USD 139 million, recognised in the MMP segment. Total proceeds from the sale were USD 227 million.

Sale of interests in the Gudrun field and acquisition of interests in Eagle Ford
In December 2015 Statoil sold a 15% interest in the Gudrun field on the Norwegian continental shelf (NCS) to Repsol, recognizing a total gain of USD 142 million in the E&P Norway segment. Proceeds from the sale were USD 216 million. Simultaneously Statoil acquired an additional 13% interest in the Eagle Ford formation with the same party. The acquisition was accounted for as a business combination using the acquisition method in the E&P International and MMP segments with the fair value of net identifiable assets of USD 277 million and USD 121 million, respectively as of 30 December 2015. No goodwill was recognised.

5 Financial risk management

General information relevant to financial risks
Statoil's business activities naturally expose Statoil to financial risk. Statoil's approach to risk management includes assessing and managing risk in all activities using a holistic risk approach. Statoil takes into account correlations between the most important market risks and the natural hedges inherent in Statoil's portfolio. This approach allows Statoil to reduce the number of risk management transactions and avoid sub-optimisation.

An important element in risk management is the use of centralised trading mandates. Mandates in the trading organisations within crude oil, refined products, natural gas and electricity are relatively small compared to the total market risk of Statoil. All major strategic transactions are required to be coordinated through Statoil's corporate risk committee.

The corporate risk committee, which is headed by the chief financial officer and includes representatives from the principal business segments, is responsible for defining, developing and reviewing Statoil's risk policies. The chief financial officer, assisted by the committee, is also responsible for overseeing and developing Statoil's Enterprise Risk Management and proposing appropriate measures to adjust risk at the corporate level.

Financial risks
Statoil's activities expose Statoil to the following financial risks:
- Market risk (including commodity price risk, currency risk and interest rate risk)
- Liquidity risk
- Credit risk

Market risk
Statoil operates in the worldwide crude oil, refined products, natural gas, and electricity markets and is exposed to market risks including fluctuations in hydrocarbon prices, foreign currency rates, interest rates, and electricity prices that can affect the revenues and costs of operating, investing and financing. These risks are managed primarily on a short-term basis with a focus on achieving the highest risk-adjusted returns for Statoil within the given mandate. Long-term exposures are managed at the corporate level, while short-term exposures are managed according to trading strategies and mandates.

For more information on sensitivity analysis of market risk see note 25 Financial instruments: fair value measurement and sensitivity analysis of market risk.

Commodity price risk
Statoil's most important long-term commodity risk (oil and natural gas) is related to future market prices as Statoil's risk policy is to be exposed to both upside and downside price movements. To manage short-term commodity risk, Statoil enters into commodity- based derivative contracts, including futures, options, over-the-counter (OTC) forward contracts, market swaps and contracts for differences related to crude oil, petroleum products, natural gas and electricity. Statoil's bilateral gas sales portfolio is exposed to various price indices and uses derivatives to manage the net gas sales exposure towards a diversified combination of long and short dated gas price markers.

The term of crude oil and refined oil products derivatives are usually less than one year, and they are traded mainly on the Inter Continental Exchange (ICE) in London, the New York Mercantile Exchange (NYMEX), the OTC Brent market, and crude and refined products swap markets. The term of natural gas and electricity derivatives is usually three years or less, and they are mainly OTC physical forwards and options, NASDAQ OMX Oslo forwards and futures traded on the NYMEX and ICE.

Currency risk
Statoil's cash flows from operating activities deriving from oil and gas sales, operating expenses and capital expenditures are mainly in USD, but taxes,

dividends to shareholders on the Oslo Børs and a share of our operating expenses and capital expenditures are in NOK. Accordingly, Statoil's currency management is primarily linked to mitigate currency risk related to payments in NOK. This means that Statoil regularly purchases NOK, primarily spot, but also on a forward basis using conventional derivative instruments.

Interest rate risk

Bonds are normally issued at fixed rates in a variety of local currencies (among others USD, EUR and GBP). Bonds are normally converted to floating USD bonds by using interest rate and currency swaps. Statoil manages its interest rates exposure on its bond debt based on risk and reward considerations from an enterprise risk management perspective. This means that the fixed/floating mix on interest rate exposure may vary from time to time. For more detailed information about Statoil's long-term debt portfolio see note 18 Finance debt.

Liquidity risk

Liquidity risk is the risk that Statoil will not be able to meet obligations of financial liabilities when they become due. The purpose of liquidity management is to ensure that Statoil has sufficient funds available at all times to cover its financial obligations.

The main cash outflows are the quarterly dividend payments and Norwegian petroleum tax payments paid six times per year. If the cash flow forecasts indicate that the liquid assets will fall below target levels, new long-term funding will be considered.

Short-term funding needs will normally be covered by the USD 5.0 billion US Commercial papers programme (CP) which is backed by a revolving credit facility of USD 5.0 billion, supported by 21 core banks, maturing in 2022. The facility supports secure access to funding, supported by the best available short-term rating. As at 31 December 2017 it has not been drawn.

Statoil raises debt in all major capital markets (USA, Europe and Asia) for long-term funding purposes. The policy is to have a smooth maturity profile with repayments not exceeding 5% of capital employed in any year for the nearest five years. Statoil's non-current financial liabilities have a weighted average maturity of approximately nine years.

For more information about Statoil's non-current financial liabilities see note 18 Finance debt.

The table below shows a maturity profile, based on undiscounted contractual cash flows, for Statoil's financial liabilities.

(in USD million)	At 31 December 2017	2016
Due within 1 year	14,668	12,756
Due between 1 and 2 years	5,331	8,506
Due between 3 and 4 years	4,810	6,023
Due between 5 and 10 years	11,913	11,045
Due after 10 years	11,498	12,905
Total specified	48,221	51,234

Credit risk

Credit risk is the risk that Statoil's customers or counterparties will cause Statoil financial loss by failing to honor their obligations. Credit risk arises from credit exposures with customer accounts receivables as well as from financial investments, derivative financial instruments and deposits with financial institutions.

Prior to entering into transactions with new counterparties, Statoil's credit policy requires all counterparties to be formally identified and assigned internal credit ratings as well as exposure limits. The internal credit ratings reflect Statoil's assessment of the counterparties' credit risk and are based on a quantitative and qualitative analysis of recent financial statements and other relevant business information including general market and industry information. All counterparties are re-assessed regularly.

Statoil uses risk mitigation tools to reduce or control credit risk both on a counterparty and portfolio level. The main tools include bank and parental guarantees, prepayments and cash collateral.

Statoil has pre-defined limits for the absolute credit risk level allowed at any given time on Statoil's portfolio as well as maximum credit exposures for individual counterparties. Statoil monitors the portfolio on a regular basis and individual exposures against limits on a daily basis. The total credit exposure portfolio of Statoil is geographically diversified among a number of counterparties within the oil and energy sector, as well as larger oil and gas consumers and financial counterparties. The majority of Statoil's credit exposure is with investment grade counterparties.

The following table contains the carrying amount of Statoil's financial receivables and derivative financial instruments split by Statoil's assessment of the counterparty's credit risk. Trade and other receivables include 2% overdue receivables for 30 days and more. The overdue receivables are mainly joint venture receivables pending the settlement of disputed working interest items payable from Statoil's working interest partners within its US unconventional activities. Provisions have been made for expected losses. Only non-exchange traded instruments are included in derivative financial instruments.

(in USD million)	Non-current financial receivables	Trade and other receivables	Non-current derivative financial instruments	Current derivative financial instruments
At 31 December 2017				
Investment grade, rated A or above	262	2,148	1,079	84
Other investment grade	214	6,135	525	71
Non-investment grade or not rated	247	278	0	5
Total financial asset	723	8,560	1,603	159
At 31 December 2016				
Investment grade, rated A or above	234	1,682	754	412
Other investment grade	264	4,090	1,064	75
Non-investment grade or not rated	210	1,302	0	4
Total financial asset	707	7,074	1,819	491

For more information about Trade and other receivables, see note 15 Trade and other receivables.

At 31 December 2017, USD 704 million of cash was held as collateral to mitigate a portion of Statoil's credit exposure. At 31 December 2016, USD 571 million was held as collateral. The collateral cash is received as a security to mitigate credit exposure related to positive fair values on interest rate swaps, cross currency swaps and foreign exchange swaps. Cash is called as collateral in accordance with the master agreements with the different counterparties when the positive fair values for the different swap agreements are above an agreed threshold.

Under the terms of various master netting agreements for derivative financial instruments as of 31 December 2017, USD 706 million presented as liabilities do not meet the criteria for offsetting. At 31 December 2016, USD 817 million was not offset. The collateral received and the amounts not offset from derivative financial instrument liabilities, reduce the credit exposure in the derivative financial instruments presented in the table above as they will offset each other in a potential default situation for the counterparty. Trade and other receivables subject to similar master netting agreements USD 502 million have been offset as of 31 December 2017, and respectively USD 364 million as of 31 December 2016.

6 Remuneration

(in USD million, except average number of employees)	Full year 2017	2016	2015
Salaries[1)]	2,671	2,576	2,791
Pension costs	469	650	846
Payroll tax	387	394	419
Other compensations and social costs	290	276	312
Total payroll costs	3,818	3,895	4,369
Average number of employees[2)]	20,700	21,300	22,300

1) Salaries include bonuses, severance packages and expatriate costs in addition to base pay.
2) Part time employees amount to 3% for each of the years 2017, 2016 and 2015 respectively.

Total payroll expenses are accumulated in cost-pools and partly charged to partners of Statoil operated licences on an hours incurred basis.

Compensation to the board of directors (BoD) and the corporate executive committee (CEC)

(in USD thousand)[1]	Full year 2017	2016	2015
Current employee benefits	11,067	9,270	11,436
Post-employment benefits	636	574	799
Other non-current benefits	25	19	15
Share-based payment benefits	175	102	167
Total	11,902	9,966	12,418

1) All figures in the table are presented on accrual basis.

At 31 December 2017, 2016 and 2015 there are no loans to the members of the BoD or the CEC.

Share-based compensation
Statoil's share saving plan provides employees with the opportunity to purchase Statoil shares through monthly salary deductions and a contribution by Statoil. If the shares are kept for two full calendar years of continued employment following the year of purchase, the employees will be allocated one bonus share for each one they have purchased.

Estimated compensation expense including the contribution by Statoil for purchased shares, amounts vested for bonus shares granted and related social security tax was USD 62 million, USD 61 million and USD 77 million related to the 2017, 2016 and 2015 programmes, respectively. For the 2018 programme (granted in 2017) the estimated compensation expense is USD 72 million. At 31 December 2017 the amount of compensation cost yet to be expensed throughout the vesting period is USD 143 million.

7 Other expenses

Auditor's remuneration

(in USD million, excluding VAT)	Full year 2017	2016	2015
Audit fee	6.1	6.5	6.1
Audit related fee	0.9	1.0	1.7
Tax fee	0.0	0.1	0.0
Other service fee	0.0	0.0	0.0
Total	7.0	7.5	7.9

In addition to the figures in the table above, the audit fees and audit related fees related to Statoil operated licences amount to USD 0.8 million, USD 0.8 million and USD 0.9 million for 2017, 2016 and 2015, respectively.

Research and development expenditures
Research and development (R&D) expenditures were USD 307 million, USD 298 million and USD 344 million in 2017, 2016 and 2015, respectively. R&D expenditures are partly financed by partners of Statoil operated licences. Statoil's share of the expenditures has been recognised as expense in the Consolidated statement of income.

8 Financial items

(in USD million)	Full year 2017	2016	2015
Foreign exchange gains (losses) derivative financial instruments	(920)	353	548
Other foreign exchange gains (losses)	1,046	(473)	(793)
Net foreign exchange gains (losses)	126	(120)	(245)
Dividends received	63	46	42
Gains (losses) financial investments	108	(0)	47
Interest income financial investments	64	63	76
Interest income non-current financial receivables	24	22	23
Interest income current financial assets and other financial items	228	305	208
Interest income and other financial items	487	436	396
Gains (losses) derivative financial instruments	(61)	470	(491)
Interest expense bonds and bank loans and net interest on related derivatives	(1,004)	(830)	(707)
Interest expense finance lease liabilities	(26)	(26)	(27)
Capitalised borrowing costs	454	355	392
Accretion expense asset retirement obligations	(413)	(420)	(481)
Interest expense current financial liabilities and other finance expense	86	(122)	(147)
Interest and other finance expenses	(903)	(1,043)	(971)
Net financial items	(351)	(258)	(1,311)

Statoil's main financial items relate to assets and liabilities categorised in the held for trading category and the amortised cost category. For more information about financial instruments by category see note 25 Financial instruments: fair value measurement and sensitivity analysis of market risk.

The line item interest expense bonds and bank loans and net interest on related derivatives primarily includes interest expenses of USD 1,084 million, USD 1,018 million and USD 1,041 million from the financial liabilities at amortised cost category. This was partially offset by net interest income on related derivatives from the held for trading category, USD 80 million, USD 188 million and USD 334 million for 2017, 2016 and 2015, respectively.

The line item gains (losses) derivative financial instruments primarily includes fair value loss from the held for trading category of USD 77 million, a gain of USD 454 million and a loss of USD 492 million for 2017, 2016 and 2015, respectively.

The line item interest expense current financial liabilities and other finance expense includes an income of USD 319 million in 2017 related to release of a provision. See note 23 Other commitments and contingencies.

Foreign exchange gains (losses) derivative financial instruments include fair value changes of currency derivatives related to liquidity and currency risk.
The line item foreign exchange gains (losses) includes a net foreign exchange gain of USD 427 million, a loss of USD 205 million and a loss of USD 1,208 million from the held for trading category for 2017, 2016 and 2015, respectively.

9 Income taxes

Significant components of income tax expense

(in USD million)	Full year 2017	2016	2015
Current income tax expense in respect of current year	(7,680)	(3,869)	(6,488)
Prior period adjustments	(124)	(158)	(91)
Current income tax expense	(7,805)	(4,027)	(6,579)
Origination and reversal of temporary differences	(904)	1,372	1,519
Change in tax regulations	(14)	(50)	(90)
Prior period adjustments	(100)	(20)	(74)
Deferred tax expense	(1,017)	1,302	1,355
Income tax expense	(8,822)	(2,724)	(5,225)

During the normal course of its business, Statoil files tax returns in many different tax regimes. There may be differing interpretation of applicable tax laws and regulations regarding some of the matters in the tax returns. In certain cases it may take several years to complete the discussions with the relevant tax authorities or to reach a resolution of the tax positions through litigations. Statoil has provided for probable income tax related assets and liabilities based on best estimates reflecting consistent interpretations of the applicable laws and regulations.

Reconciliation of statutory tax rate to effective tax rate

(in USD million)	Full year 2017	2016	2015
Income/(loss) before tax	13,420	(178)	55
Calculated income tax at statutory rate[1)]	(3,827)	676	1,078
Calculated Norwegian Petroleum tax[2)]	(5,945)	(2,250)	(4,145)
Tax effect uplift[2)]	784	812	847
Tax effect of permanent differences regarding divestments	(85)	153	468
Tax effect of permanent differences caused by functional currency different from tax currency	(229)	(356)	719
Tax effect of other permanent differences	291	(48)	(2)
Tax effect of dispute with Angolan Ministry of Finance[3)]	496	0	0
Change in unrecognised deferred tax assets	(169)	(1,625)	(3,557)
Change in tax regulations	(14)	(50)	(90)
Prior period adjustments	(224)	(177)	(165)
Other items including currency effects	100	141	(376)
Income tax expense	(8,822)	(2,724)	(5,225)
Effective tax rate	65.7%	>(100%)	>100%

1) The weighted average of statutory tax rates was positive 28.5% in 2017, positive 379.8% in 2016 and negative 1,950.2% in 2015. The tax rate in 2017, the high rate in 2016 and the change in average statutory tax rates from 2016 to 2017 is mainly caused by earnings composition between tax regimes with lower statutory tax rates and tax regimes with higher statutory tax rates. The high tax rate in 2016, the negative rate in 2015 and the change in average statutory tax rates from 2015 to 2016 was mainly caused by earnings composition between tax regimes with lower statutory tax rates and tax regimes with higher statutory tax rates. In both years there are positive income in tax regimes with relatively lower tax rates and losses, including impairments and provisions, in tax regimes with relatively higher tax rates.

2) When computing the petroleum tax of 54% (55% from 2018) on income from the Norwegian continental shelf, an additional tax-free allowance, or uplift, is granted on the basis of the original capitalised cost of offshore production installations. The uplift may be deducted from taxable income for a period of four years starting in the year in which the capital expenditure is incurred. For investments made in 2017 the uplift is calculated at a rate of 5.4% per year, while the rate is 5.5% per year for investments made in 2014-2016. The rate is 5.3% per year from 2018 for new investments. Transitional rules apply to investments from 5 May 2013 covered by among others Plans for development and operation (PDOs) or Plans for installation and operation (PIOs) submitted to the Ministry of Oil and Energy prior to 5 May 2013. For these investments the rate is 7.5% per year. Unused uplift may be carried forward indefinitely. At year end 2017 and 2016, unrecognised uplift credits amounted to USD 2,003 million and USD 2,121 million, respectively.

3) Tax effect of dispute with Angolan Ministry of Finance as described in note 23 Other commitments, contingent liabilities and contingent assets.

Deferred tax assets and liabilities comprise

(in USD million)	Tax losses carried forward	Property, plant and equipment and Intangible assets	Asset removal obligation	Pensions	Derivatives	Other	Total
Deferred tax at 31 December 2017							
Deferred tax assets	4,459	259	8,049	738	34	763	14,302
Deferred tax liabilities	(0)	(19,027)	0	(11)	(27)	(451)	(19,515)
Net asset (liability) at 31 December 2017	4,459	(18,768)	8,049	728	7	312	(5,213)
Deferred tax at 31 December 2016							
Deferred tax assets	4,283	233	7,078	743	138	849	13,323
Deferred tax liabilities	0	(16,797)	0	0	(270)	(488)	(17,555)
Net asset (liability) at 31 December 2016	4,283	(16,564)	7,078	743	(132)	361	(4,231)

Changes in net deferred tax liability during the year were as follows:

(in USD million)	2017	2016	2015
Net deferred tax liability at 1 January	4,231	5,399	7,881
Charged (credited) to the Consolidated statement of income	1,017	(1,302)	(1,355)
Other comprehensive income	38	(129)	461
Translation differences and other	(73)	264	(1,588)
Net deferred tax liability at 31 December	5,213	4,231	5,399

Deferred tax assets and liabilities are offset to the extent that the deferred taxes relate to the same fiscal authority, and there is a legally enforceable right to offset current tax assets against current tax liabilities. After netting deferred tax assets and liabilities by fiscal entity, deferred taxes are presented on the balance sheet as follows:

(in USD million)	At 31 December 2017	2016
Deferred tax assets	2,441	2,195
Deferred tax liabilities	7,654	6,427

Deferred tax assets are recognised based on the expectation that sufficient taxable income will be available through reversal of taxable temporary differences or future taxable income supported by business forecast. At year end 2017 and 2016 the deferred tax assets of USD 2,441 million and USD 2,195 million, respectively, were primarily recognised in Norway, Angola, Brasil and the UK. Of these amounts USD 924 million and USD 1,258 million, respectively, is recognised in entities which have suffered a loss in either the current or preceding period.

Unrecognised deferred tax assets

	At 31 December			
	2017		2016	
(in USD million)	Basis	Tax	Basis	Tax
Deductible temporary differences	3,415	1,409	3,431	1,360
Tax losses carried forward	17,412	4,661	17,440	6,557
Total	20,827	6,070	20,871	7,917

Approximately 16% of the unrecognised carry forward tax losses can be carried forward indefinitely. The majority of the remaining part of the unrecognised tax losses expire after 2028. The unrecognised deductible temporary differences do not expire under the current tax legislation. Deferred tax assets have not been recognised in respect of these items because currently there is insufficient evidence to support that future taxable profits will be available to secure utilisation of the benefits.

At year end 2017 unrecognised deferred tax assets in the US and Angola represents USD 3,559 million and USD 879 million of the total unrecognised deferred tax assets of USD 6,070 million. Similar amounts for 2016 were USD 5,655 million in the US and USD 800 million in Angola of a total of USD 7,917 million. The reduction in unrecognised deferred tax assets in the US of USD 2,096 million is mainly caused by the change in the corporate tax rate from 35% to 21%.

10 Property, plant and equipment

(in USD million)	Machinery, equipment and transportation equipment, including vessels	Production plants and oil and gas assets	Refining and manufacturing plants	Buildings and land	Assets under development	Total
Cost at 31 December 2016	3,394	142,750	8,262	859	17,315	172,579
Additions and transfers	56	10,181	331	47	111	10,727
Disposals at cost	(7)	0	(288)	(50)	(30)	(374)
Effect of changes in foreign exchange	27	4,602	342	10	743	5,724
Cost at 31 December 2017	3,470	157,533	8,646	866	18,140	188,656
Accumulated depreciation and impairment losses at 31 December 2016	(2,767)	(100,971)	(5,772)	(446)	(3,068)	(113,023)
Depreciation	(122)	(9,051)	(485)	(29)	0	(9,688)
Impairment losses	0	(917)	(0)	0	0	(917)
Reversal of impairment losses	48	935	0	0	989	1,972
Transfers	0	(422)	(1)	(0)	370	(53)

Total net impairment loss/(reversal) recognised	1,301	992	2,293

1) Producing and development assets and goodwill are subject to impairment assessment under IAS 36. The total net impairment reversal recognised under IAS 36 in 2017 amount to USD 1,381 million, compared to 2016 when the net impairment loss amounted to USD 1,890 million, including impairment reversals and impairments of acquisition costs - oil and gas prospects (intangible assets).
2) Acquisition costs related to exploration activities, subject to impairment assessment under the successful efforts method (IFRS 6).
3) See note 11 Intangible assets.

PUBLIC COPY - CONFIDENTIAL INFORMATION REMOVED

For impairment purposes, the asset's carrying amount is compared to its recoverable amount. The recoverable amount is the higher of fair value less cost of disposal (FVLCOD) and estimated value in use (VIU).

The base discount rate for VIU calculations is 6.0% real after tax. The discount rate is derived from Statoil's weighted average cost of capital. A derived pre-tax discount rate would generally be in the range of 7-12%, depending on asset specific characteristics, such as specific tax treatments, cash flow profiles and economic life. For certain assets a pre-tax discount rate could be outside this range, mainly due to special tax elements (for example permanent differences) affecting the pre-tax equivalent. See note 2 Significant accounting policies for further information regarding impairment on property, plant and equipment.

(in USD million)	Impairment method	2017 Carrying amount after impairment [1]	2017 Net impairment loss (reversal)	2016 Carrying amount after impairment [1]	2016 Net impairment loss (reversal)

	FVLCOD	0	0	0	0
Total		11,578	(1,381)	18,625	1,890

1) Carrying amount relates to assets impaired/reversed.
2) Asset sold in 2017

During 2017 net impairment reversal USD 1,381 million was recognised on producing and development assets. For 2016 the net impairment loss recognised was USD 1,890 million primarily due to declining commodity prices.

Exploration & Production Norway
In Exploration & Production Norway net impairment reversal of USD 906 million was recognised in 2017, mainly related to conventional offshore assets in the development phase. The net impairment reversal was mainly triggered by increased reserves, cost reductions and increased short term price assumptions. In 2016 impairment loss of USD 829 million was recognised.

North America - unconventional
In the North America – unconventional area net impairment reversal of USD 410 million was recognised in 2017.

An impairment reversal of USD 1,266 of which USD 517 million is classified as exploration expenses, was triggered by changes in US tax legislation, including a change in the corporate tax from 35% to 21%. Operational improvements and increased recovery rate also influenced the impairment reversal.

An impairment loss of USD 856 million of which USD 191 million is classified as exploration expenses, was triggered by changes in the operational plan following lower than expected production and a significant reduction in expected reserves. To establish the recoverable amount assessed to be fair value less cost of disposal for the impaired asset, Statoil made use of an independent third – party valuation expert as part of the determination. Statoil considered both discounted cash flow calculation and comparable market multiples when determining the fair value less cost of disposal. The primary basis for arriving at the recoverable amount estimate was the use of discounted cash flow calculations which is a level 3 valuation as defined in IFRS 13. The key assumptions used in the discounted cash flow calculations were future commodity prices, the expected operational plan and ultimate recovery rate as well as the discount rates used. The price assumptions used were based on 3 years observable forward prices and maintaining flat real price assumptions thereafter. The discount rate used was 7-9% for proved properties and 12-14% for unproved properties in nominal terms after tax with an additional risking for certain elements. In addition to the change in operational plan, the recoverable amount reflects, among other factors, worsening market sentiment around the shale play associated with the impaired asset and somewhat reduced commodity price outlook.

In 2016 net impairment loss of USD 1,357 million was recognised in the North America – unconventional area.

North America Conventional offshore Gulf of Mexico
In 2017 the North America Conventional offshore Gulf of Mexico area recognised net impairment reversal of USD 17 million. In 2016 the net impairment loss was USD 141 million.

Marketing, Midstream & Processing
Marketing, Midstream & Processing recognised an impairment reversal of USD 48 million in 2017. In 2016 net reversal was USD 74 million.

In the North Africa, Sub - Saharan and Europe and Asia areas no impairments or reversals were recognised in 2017. In 2016 total net reversal in these areas were USD 363 million.

Value in Use (VIU) estimates and discounted cash flows used to determine the recoverable amount of assets tested for impairment are based on internal forecasts on costs, production profiles and commodity prices. Short term commodity prices (2018/2019/2020) are forecasted by using observable forward prices for 2018 and a linear projection towards the 2021 internal forecast.

The price assumptions used for impairment calculations were generally as follows (prices used in 2016 impairment calculations for the respective years are indicated in brackets):

Year Prices in real terms1)	2018		2020		2025		2030	
Brent Blend - USD/bbl	60	(62)	67	(75)	77	(78)	80	(80)
NBP - USD/mmBtu	6.6	(6.0)	6.5	(6.0)	8.0	(8.0)	8.0	(8.0)
Henry Hub - USD/mmBtu	2.9	(3.6)	3.5	(4.0)	4.0	(4.0)	4.0	(4.0)

1) Basis year 2016

Sensitivities
Commodity prices have historically been volatile. Significant downward adjustments of Statoil's commodity price assumptions would result in impairment losses on certain producing and development assets in Statoil's portfolio. If a decline in commodity price forecasts over the lifetime of the assets were 20%, considered to represent a reasonably likely change, the impairment amount to be recognised could illustratively be in the region of USD 11 billion before tax effects. This illustrative impairment sensitivity assumes no changes to input factors other than prices; however, a price reduction of 20% is likely to result in changes in business plans as well as other factors used when estimating an asset's recoverable amount. Changes in such input factors would likely significantly reduce the actual impairment amount compared to the illustrative sensitivity above. Changes that could be expected would include a reduction in the cost level in the oil and gas industry as well as offsetting currency effects, both of which have historically occurred following significant changes in commodity prices. The illustrative sensitivity is therefore not considered to represent a best estimate of an expected impairment impact, nor an estimated impact on revenues or operating income in such a scenario. A significant and prolonged reduction in oil and gas prices would also result in mitigating actions by Statoil and its licence partners, as a reduction of oil and gas prices would impact drilling plans and production profiles for new and existing assets. Quantifying such impacts is considered impracticable, as it requires detailed technical, geological and economical evaluations based on hypothetical scenarios and not based on existing business or development plans.

The useful lives of intangible assets are assessed to be either finite or indefinite. Intangible assets with finite useful lives are amortised systematically over their estimated economic lives, ranging between 10-20 years.

During 2017, intangible assets were impacted by net impairment reversal of signature bonuses and acquisition costs totalling USD 326 million related to North America – unconventional assets and net impairment of acquisition costs related to exploration activities of USD 245 million primarily as a result from dry wells and uncommercial discoveries in US Gulf of Mexico and South America.

Impairment losses and reversals of impairment losses are presented as Exploration expenses and Depreciation, amortisation and net impairment losses on the basis of their nature as exploration assets (intangible assets) and other intangible assets, respectively. The impairment losses and reversal of impairment losses are based on recoverable amount estimates triggered by changes in reserve estimates, cost estimates and market conditions. See note 10 Property, plant and equipment for more information on the basis for impairment assessments.

The table below shows the aging of capitalised exploration expenditures.

(in USD million)	2017	2016
Less than one year	218	311
Between one and five years	1,799	2,216
More than five years	698	329
Total	2,715	2,856

The table below shows the components of the exploration expenses.

	Full year		
(in USD million)	2017	2016	2015
Exploration expenditures	1,234	1,437	2,860
Expensed exploration expenditures previously capitalised	(8)	1,800	2,164
Capitalised exploration	(167)	(285)	(1,151)

Summary financial information of equity accounted investments

The following table provides summarised financial information relating to Lundin Petroleum AB. This information is presented on a Statoil's ownership basis (20.1%) and also reflects adjustments made by Statoil to Lundin Petroleum AB's own results in applying the equity method of accounting. Statoil adjusts Lundin Petroleum AB's results for depreciation of excess values determined in the purchase price allocation at the date of acquisition. Where there are significant differences in accounting policies, adjustments are made to bring the accounting policies applied in line with Statoil's. These adjustments have increased the reported net income for 2017, as shown in the table below, compared with the equivalent amount reported by Lundin Petroleum AB.

	Lundin Petroleum AB	
(in USD million)	2017	2016
At 31 December		
Current assets	101	69
Non-Current assets	2,920	3,069
Current liabilities	(62)	(70)
Non-Current liabilities	(1,834)	(1,947)
Net assets	1,125	1,121
Year ended 31 December		
Gross revenues	376	135
Income/(loss) before tax	226	(83)
Net income/(loss)	126	(78)
Capital expenditures	250	589

In April 2017 Lundin Petroleum completed a spin-off of its assets in Malaysia, France and the Netherlands into International Petroleum Corporation (IPC) by distributing the IPC share, on a pro-rata basis, to Lundin Petroleum shareholders. IPC prepared a repurchasing programme whereas they would repurchase own shares up to a certain amount, Statoil used the opportunity to sell its issued shares in the spin-off to IPC's wholly-owned subsidiary, Lundin Petroleum BV. The sale did not result in material gain or loss.

Statoil's share of Lundin Petroleum AB's quoted market value as per 31.12.2017 was USD 1,565 million.

13 Financial investments and non-current prepayments

Non-current financial investments

(in USD million)	At 31 December 2017	2016
Bonds	1,611	1,362
Listed equity securities	619	731
Non-listed equity securities	611	251
Financial investments	2,841	2,344

Bonds and listed equity securities relate to investment portfolios held by Statoil's captive insurance company which mainly are accounted for using the fair value option.

Non-current prepayments and financial receivables

(in USD million)	At 31 December 2017	2016
Financial receivables interest bearing	716	698
Prepayments and other non-interest bearing receivables	196	195
Prepayments and financial receivables	912	893

Financial receivables interest bearing primarily relate to project financing of equity accounted companies and loans to employees.

Current financial investments

(in USD million)	At 31 December 2017	2016
Time deposits	4,111	3,242
Interest bearing securities	4,337	4,970
Financial investments	8,448	8,211

At 31 December 2017, current financial investments include USD 714 million investment portfolios held by Statoil's captive insurance company which mainly are accounted for using the fair value option. The corresponding balance at 31 December 2016 was USD 818 million.

For information about financial instruments by category, see note 25 Financial instruments: fair value measurement and sensitivity analysis of market risk.

14 Inventories

(in USD million)	At 31 December 2017	2016
Crude oil	2,323	1,966
Petroleum products	596	744
Natural gas	149	160
Other	330	358
Inventories	3,398	3,227

Other inventory consists of spare parts and operational materials, including drilling and well equipment.

The write-down of inventories from cost to net realisable value amounted to an expense of USD 32 million and USD 74 million in 2017 and 2016, respectively.

15 Trade and other receivables

(in USD million)	At 31 December 2017	2016
Trade receivables	7,649	5,504
Current financial receivables	427	862
Joint venture receivables	478	592
Equity accounted associated companies and other related party receivables	6	116
Total financial trade and other receivables	8,560	7,074
Non-financial trade and other receivables	865	765
Trade and other receivables	9,425	7,839

For more information about the credit quality of Statoil's counterparties, see note 5 Financial risk management. For currency sensitivities, see note 25 Financial instruments: fair value measurement and sensitivity analysis of market risk.

16 Cash and cash equivalents

(in USD million)	At 31 December 2017	2016
Cash at bank available	591	596
Time deposits	1,889	1,660
Money market funds	381	65
Interest bearing securities	1,092	2,234
Restricted cash, including margin deposits	437	535
Cash and cash equivalents	4,390	5,090

Restricted cash at 31 December 2017 and 2016 includes collateral deposits related to trading activities of USD 300 million and USD 398 million, respectively. Collateral deposits are related to certain requirements set out by exchanges where Statoil is participating. The terms and conditions related to these requirements are determined by the respective exchanges.

17 Shareholders' equity and dividends

At 31 December 2017, Statoil's share capital of NOK 8,307,919,632.50 (USD 1,179,542,543) comprised 3,323,167,853 shares at a nominal value of NOK 2.50. Share capital at 31 December 2016 was NOK 8,112,623,527.50 (USD 1,155,993,270) comprised 3,245,049,411 shares at a nominal value of NOK 2.50.

Statoil ASA has only one class of shares and all shares have voting rights. The holders of shares are entitled to receive dividends as and when declared and are entitled to one vote per share at general meetings of the company.

A temporary scrip dividend programme was proposed by the board of directors in February 2016, approved by Statoil's general assembly in May 2016 and reconfirmed by the general assembly in May 2017. The scrip dividend programme was implemented for the quarterly dividends from fourth quarter 2015 to third quarter 2017. Issuance of new shares related to the third quarter 2017 dividend was completed 22 March 2018. As part of the scrip dividend programme, eligible shareholders could elect to receive their dividend in the form of new ordinary Statoil shares or in cash. For ADR (American Depository Receipts) holders, dividend could be received in the form of ADSs (American Depository Shares) or in cash. The subscription price for the dividend shares had a discount compared to the volume-weighted average price on OSE of the last two trading days of the subscription period for each quarter. For all quarters, the discount has been set at 5%. As part of the scrip dividend programme, the Norwegian State entered into an agreement where it committed for each quarterly dividend where a scrip option was offered, to receive newly issued shares for a fraction of its shareholdings equal to the average participation among the other shareholders. This to ensure that the State's ownership share was not impacted by the scrip dividend programme.

During 2017 dividend for the third and for the fourth quarter of 2016 and dividend for the first and second quarter of 2017 were settled. Dividend declared but not yet settled, is presented as dividends payable in the Consolidated balance sheet, regardless of whether the dividend is expected to be paid in cash or by issuance of new shares. The Consolidated statement of changes in equity shows declared dividend in the period (retained earnings), offset by scrip dividend settled during the period (share capital and additional paid-in-capital). Dividend declared in 2017 relate to the fourth quarter of 2016 and to the first three quarters of 2017.

(in USD million)	At 31 December 2017	2016
Dividends declared	2,891	2,824
USD per share or ADS	0.8804	0.8804
Dividends paid in cash	1,491	1,876
USD per share or ADS	0.8804	0.8804
NOK per share	7.2615	7.3364
Scrip dividends	1,357	904
Number of shares issued (millions)	78.1	56.4
Sum dividends settled	2,848	2,780

During 2017 a total of 3,323,671 treasury shares were purchased for USD 63 million and 3,219,327 treasury shares were allocated to employees participating in the share saving plan. During 2016 a total of 4,011,860 treasury shares were purchased for USD 62 million and 3,882,153 treasury shares were allocated to employees participating in the share saving plan. At 31 December 2017 Statoil had 11,243,234 treasury shares and at 31 December 2016 11,138,890 treasury shares, all of which are related to Statoil's share saving plan. For further information, see note 6 Remuneration.

18 Finance debt

Capital management

The main objectives of Statoil's capital management policy are to maintain a strong financial position and to ensure sufficient financial flexibility. One of the key ratios in the assessment of Statoil's financial robustness is net interest-bearing debt adjusted (ND) to capital employed adjusted (CE).

(in USD million)	At 31 December 2017	2016
Net interest-bearing debt adjusted (ND)	16,287	19,389
Capital employed adjusted (CE)	56,172	54,490
Net debt to capital employed adjusted (ND/CE)	29.0%	35.6%

ND is defined as Statoil's interest bearing financial liabilities less cash and cash equivalents and current financial investments, adjusted for collateral deposits and balances held by Statoil's captive insurance company (amounting to USD 1,014 million and USD 1,216 million for 2017 and 2016, respectively) and balances related to the SDFI (amounting to USD 164 million and USD 199 million for 2017 and 2016, respectively). CE is defined as Statoil's total equity (including non-controlling interests) and ND.

Non-current finance debt

Finance debt measured at amortised cost

	Weighted average interest rates in %[1]		Carrying amount in USD millions at 31 December		Fair value in USD millions at 31 December[2]

Non-current finance debt			24,183	27,999	27,014	30,488

1) Weighted average interest rates are calculated based on the contractual rates on the loans per currency at 31 December and do not include the effect of swap agreements.
2) Where available, the fair value of the non-current financial liabilities is determined from quoted market prices, classified at level 1 in the fair value hierarchy. If quoted market prices are not available, fair values are determined from external calculation models based on market observations from various sources, classified at level 2 in the fair value hierarchy.

Unsecured bonds amounting to USD 14,953 million are denominated in USD and unsecured bonds amounting to USD 8,347 million are swapped into USD. Four bonds denominated in EUR amounting to USD 3,224 million are not swapped. The table does not include the effects of agreements entered into to swap the various currencies into USD. For further information see note 25 Financial instruments: fair value measurement and sensitivity analysis of market risk.

Substantially all unsecured bond and unsecured bank loan agreements contain provisions restricting future pledging of assets to secure borrowings without granting a similar secured status to the existing bondholders and lenders.

Out of Statoil's total outstanding unsecured bond portfolio, 42 bond agreements contain provisions allowing Statoil to call the debt prior to its final redemption at par or at certain specified premiums if there are changes to the Norwegian tax laws. The carrying amount of these agreements is USD 26,158 million at the 31 December 2017 closing exchange rate.

In addition to the planned repayment of three bonds at maturity date, Statoil did a buy-back of two outstanding bonds of USD 2,25 billion in 2017. These notes were originally due 8 November 2018 and 15 April 2019.

For more information about the revolving credit facility, maturity profile for undiscounted cash flows and interest rate risk management, see note 5 Financial risk management.

Non-current finance debt maturity profile

(in USD million)	At 31 December 2017	2016
Year 2 and 3	3,521	6,478
Year 4 and 5	3,041	3,798
After 5 years	17,620	17,723
Total repayment of non-current finance debt	24,183	27,999
Weighted average maturity (years)	9	9
Weighted average annual interest rate (%)	3.50	3.41

More information regarding finance lease liabilities is provided in note 22 Leases.

Current finance debt

(in USD million)	At 31 December 2017	2016
Collateral liabilities	704	571
Non-current finance debt due within one year	2,908	2,557
Other including bank overdraft	479	545
Total current finance debt	4,091	3,674
Weighted average interest rate (%)	1.65	1.61

Collateral liabilities and other current liabilities relate mainly to cash received as security for a portion of Statoil's credit exposure and outstanding amounts on US Commercial paper (CP) program. Issuance on the CP program amounted to USD 449 million as of 31 December 2017 and USD 500 million as of 31 December 2016.

(in USD million)	Non current finance debt	Current finance debt	Financial receivable Collaterals 1)	Additional paid in capital Share based payment/Treasury shares	Non controlling interest	Dividend payable	Total
At 31 December 2016	27,999	3,674	(735)	(212)	27	712	31,465
Transfer to current portion	(351)	351	-	-	-	-	-
Effect of exchange rate changes	1,302	(13)	-	-	-	(11)	1,278

At 31 December 2017	24,183	4,091	(272)	(191)	24	729	28,564

1) Financial receivables collaterals are in included in trade and other receivables in the balance sheet. See note 15 Trade and other receivables.

19 Pensions

The main pension plans for Statoil ASA and its most significant subsidiaries are defined contribution plans, in which the pension costs are recognised in the Consolidated statement of income in line with payments of annual pension premiums. The pension contribution plans in Statoil ASA also includes certain unfunded elements (notional contribution plans), for which the annual notional contributions are recognised as pension liabilities. These notional pension liabilities are regulated equal to the return on asset within the main contribution plan. See note 2 Significant accounting policies for more information about the accounting treatment of the notional contribution plans reported in Statoil ASA.

In addition, Statoil ASA has a closed defined benefit plan for employees which in 2015 had less than 15 years of future service before their regular retirement age, and for employees in certain subsidiaries. Statoil's defined benefit plans are generally based on a minimum of 30 years of service and 66% of the final salary level, including an assumed benefit from the Norwegian National Insurance Scheme. The Norwegian companies in the group are subject to, and complies with, the requirements of the Norwegian Mandatory Company Pensions Act.

The defined benefit plans in Norway are managed and financed through Statoil Pensjon (Statoil's pension fund - hereafter "Statoil Pension"). Statoil Pension is an independent pension fund that covers the employees in Statoil's Norwegian companies. The pension fund's assets are kept separate from the company's and group companies' assets. Statoil Pension is supervised by the Financial Supervisory Authority of Norway ("Finanstilsynet") and is licensed to operate as a pension fund.

Statoil is a member of a Norwegian national agreement-based early retirement plan ("AFP"), and the premium is calculated on the basis of the employees' income between 1 and 7.1 G. The premium is payable for all employees until age 62. Pension from the AFP scheme will be paid from the AFP plan administrator to employees for their full lifetime. Statoil has determined that its obligations under this multi-employer defined benefit plan can be estimated with sufficient reliability for recognition purposes. Accordingly, the estimated proportionate share of the AFP plan is recognised as a defined benefit obligation.

The present values of the defined benefit obligation, except for the notional contribution plan, and the related current service cost and past service cost are measured using the projected unit credit method. The assumptions for salary increases, increases in pension payments and social security base amount are based on agreed regulation in the plans, historical observations, future expectations of the assumptions and the relationship between these assumptions. At 31 December 2017 the discount rate for the defined benefit plans in Norway was established on the basis of seven years' mortgage covered bonds interest rate extrapolated on a yield curve which matches the duration of Statoil's payment portfolio for earned benefits, which was calculated to be 17.2 years at the end of 2017. Social security tax is calculated based on a pension plan's net funded status and is included in the defined benefit obligation.

Statoil has more than one defined benefit plan, but the disclosure is made in total since the plans are not subject to materially different risks. Pension plans outside Norway are not material and as such not disclosed separately. The pension costs in Statoil ASA are partly re-charged to licence partners.

Net pension cost

(in USD million)	2017	2016	2015
Current service cost	242	238	378
Interest cost	-	192	191
Interest (income) on plan asset	-	(148)	(145)
Past service cost	(0)	2	-
Losses (gains) from curtailment, settlement or plan amendment	15	109	250
Actuarial (gains) losses related to termination benefits	(1)	59	(1)
Notional contribution plans	51	50	36
Defined benefit plans	308	503	709
Defined contribution plans	162	148	135
Total net pension cost	469	650	844

In addition to the pension cost presented in the table above, financial items related to defined benefit plans are included in the statement of income within Net financial items. Interest cost and changes in fair value of notional assets of USD 201 million, and interest income of USD 138 million has been recognised in 2017.

New entrants for the early retirement plans have been included as a settlement cost. The total impact in 2017 was USD 2 million, USD 123 million in 2016 and USD 173 million in 2015.

(in USD million)	2017	2016
Defined benefit obligations (DBO)		
Defined benefit obligations at 1 January	7,791	6,822
Current service cost	243	239
Interest cost	219	192
Actuarial (gains) losses - Financial assumptions	(26)	879
Actuarial (gains) losses - Experience	(21)	(282)
Benefits paid	(311)	(235)
Losses (gains) from curtailment, settlement or plan amendment	13	171
Paid-up policies	(84)	(131)
Foreign currency translation	411	87
Changes in notional contribution liability	52	50
Defined benefit obligations at 31 December	8,286	7,791
Fair value of plan assets		
Fair value of plan assets at 1 January	5,250	5,127
Interest income	148	148
Return on plan assets (excluding interest income)	283	76
Company contributions	39	22
Benefits paid	(196)	(80)
Paid-up policies and personal insurance	(121)	(92)
Foreign currency translation	283	50
Fair value of plan assets at 31 December	5,687	5,250
Net pension liability at 31 December	(2,599)	(2,541)
Represented by:		
Asset recognised as non-current pension assets (funded plan)	1,306	839
Liability recognised as non-current pension liabilities (unfunded plans)	(3,905)	(3,380)
DBO specified by funded and unfunded pension plans	8,286	7,791
Funded	4,392	4,423
Unfunded	3,894	3,368
Actual return on assets	431	131

The actuarial gain in 2017 is related to changes in financial and demographic assumptions. Statoil recognised an actuarial loss from changes in financial assumptions in 2016 mainly relate to increased pension liabilities due to reduced interest rates and a higher expected rate of pension increase.

Actuarial losses and gains recognised directly in Other comprehensive income (OCI)

(in USD million)	2017	2016	2015
Net actuarial (losses) gains recognised in OCI during the year	331	(482)	1,139
Actuarial (losses) gains related to currency effects on net obligation and foreign exchange translation	(158)	(21)	460
Tax effects of actuarial (losses) gains recognised in OCI	(38)	129	(461)
Recognised directly in OCI during the year net of tax	135	(374)	1,138
Cumulative actuarial (losses) gains recognised directly in OCI net of tax	(1,053)	(1,188)	(814)

Actuarial assumptions

	Assumptions used to determine benefit costs in %		Assumptions used to determine benefit obligations in %	
	2017	2016	2017	2016
Discount rate	2.50	2.75	2.50	2.50
Rate of compensation increase	2.25	2.25	2.25	2.25
Expected rate of pension increase	1.75	1.00	1.75	1.75
Expected increase of social security base amount (G-amount)	2.25	2.25	2.25	2.25
Weighted-average duration of the defined benefit obligation			17.2	17.4

The assumptions presented are for the Norwegian companies in Statoil which are members of Statoil's pension fund. The defined benefit plans of other subsidiaries are immaterial to the consolidated pension assets and liabilities.

Expected attrition at 31 December 2017 was 0.2% and 2.2% for employees between 50-59 years and 60-67 years, and 0.4% and 0.1% in 2016.

For population in Norway, the mortality table K2013, issued by The Financial Supervisory Authority of Norway, is used as the best mortality estimate.

Disability tables for plans in Norway developed by the actuary were implemented in 2013 and represent the best estimate to use for plans in Norway.

Sensitivity analysis

The table below presents an estimate of the potential effects of changes in the key assumptions for the defined benefit plans. The following estimates are based on facts and circumstances as of 31 December 2017.

	Discount rate		Expected rate of compensation increase		Expected rate of pension increase		Mortality assumption	
(in USD million)	0.50%	-0.50%	0.50%	-0.50%	0.50%	-0.50%	+ 1 year	- 1 year
Changes in:								
Defined benefit obligation at 31 December 2017	(607)	689	88	(92)	527	(583)	295	(323)
Service cost 2018	(22)	25	8	(8)	21	(19)	8	(11)

The sensitivity of the financial results to each of the key assumptions has been estimated based on the assumption that all other factors would remain unchanged. The estimated effects on the financial result would differ from those that would actually appear in the Consolidated financial statements because the Consolidated financial statements would also reflect the relationship between these assumptions.

Pension assets

The plan assets related to the defined benefit plans were measured at fair value. Statoil Pension invests in both financial assets and real estate.

Real estate properties owned by Statoil Pension amounted to USD 447 million and USD 402 million of total pension assets at 31 December 2017 and 2016, respectively, and are rented to Statoil companies.

The table below presents the portfolio weighting as approved by the board of Statoil Pension for 2017. The portfolio weight during a year will depend on the risk capacity.

(in %)	Pension assets on investments classes 2017	2016	Target portfolio weight
Equity securities	37.5	39.0	31 - 43
Bonds	41.7	41.1	36 - 48
Money market instruments	14.3	13.9	0 - 29
Real estate	6.1	5.4	5 - 10
Other assets	0.4	0.6	
Total	100.0	100.0	

In 2017 92% of the equity securities, 32% of bonds and 67% of money market instruments had quoted market prices in an active market (level 1). 8% of the equity securities, 68% of bonds and 32% of money market instruments had market prices based on inputs other than quoted prices. If quoted market prices are not available, fair values are determined from external calculation models based on market observations from various sources, classified at level 2 in the fair value hierarchy.

In 2016 98% of the equity securities, 30% of bonds and 71% of money market instruments had quoted market prices in an active market. 0% of the equity securities, 70% of bonds and 28% of money market instruments had market prices based on inputs other than quoted prices (level 2).

For definition of the various levels, see note 25 Financial instruments: fair value measurement and sensitivity analysis of market risk.

Company contributions expected to be made to Statoil Pension in 2018 are not considered significant.

20 Provisions

(in USD million)	Asset retirement obligations	Claims and litigations	Other provisions	Total
Non-current portion at 31 December 2016	10,711	1,209	1,487	13,406
Current portion at 31 December 2016 reported as trade and other payables	188	1,147	922	2,258
Provisions at 31 December 2016	10,899	2,356	2,409	15,664
New or increased provisions	768	128	833	1,729
Decrease in the estimates	(388)	(1,120)	(272)	(1,780)
Amounts charged against provisions	(222)	(22)	(579)	(824)
Effects of change in the discount rate	543	-	(6)	538
Reduction due to divestments	(2)	-	-	(2)
Accretion expenses	413	-	-	413
Reclassification and transfer	-	-	16	16
Currency translation	441	(2)	49	487
Provisions at 31 December 2017	12,451	1,339	2,451	16,241
Current portion at 31 December 2017 reported as trade and other payables	69	68	547	684
Non-current portion at 31 December 2017	12,383	1,271	1,904	15,557

Expected timing of cash outflows

(in USD million)	Asset retirement obligations	Other provisions, including claims and litigations	Total
2018 - 2022	993	3,082	4,076
2023 - 2027	2,413	342	2,755
2028 - 2032	986	25	1,011
2033 - 2037	4,368	16	4,384
Thereafter	3,691	324	4,015
At 31 December 2017	12,451	3,790	16,241

The claims and litigations category mainly relates to expected payments on unresolved claims. The timing and amounts of potential settlements in respect of these are uncertain and dependent on various factors that are outside management's control.

The main change in the caption claims and litigations concerns a settlement of a dispute with the Angolan Ministry of Finance. For further information on this dispute and other contingent liabilities, see note 23 Other commitments, contingent liabilities and contingent assets.

The other provisions category relates to expected payments on onerous contracts, cancellation fees and other. In 2016, Statoil recognised a provision amounting to USD 1 billion for a contingent consideration related to the BM-S-8 acquisition in Brazil. In 2017, provisions related to the BM-S-8 acquisition increased to USD 1.2 billion of which USD 0.3 billion is current portion. For further information, see note 4 Acquisitions and divestments.

For further information of methods applied and estimates required, see note 2 Significant accounting policies.

21 Trade, other payables and provisions

(in USD million)	At 31 December 2017	2016
Trade payables	3,181	2,358
Non-trade payables and accrued expenses	2,345	1,623
Joint venture payables	2,464	2,632
Equity accounted associated companies and other related party payables	858	620
Total financial trade and other payables	8,849	7,233
Current portion of provisions and other non-financial payables	888	2,433
Trade, other payables and provisions	9,737	9,666

Included in current portion of provisions and other non-financial payables are certain provisions that are further described in note 20 Provisions and in note 23 Other commitments, contingent liabilities and contingent assets. For information regarding currency sensitivities, see note 25 Financial instruments: fair value measurement and sensitivity analysis of market risk. For further information on payables to equity accounted associated companies and other related parties, see note 24 Related parties.

22 Leases

Statoil leases certain assets, notably drilling rigs, vessels and office buildings. Lease contracts committed by a licence are presented net, based on Statoil's participation interest in the respective licences. Lease contracts for helicopters, supply vessels and other assets used to serve a group of licences are presented net based on Statoil's average participation interests in these licences.

In 2017, net rental expenditures were USD 2,075 million (USD 2,569 million in 2016 and USD 3,439 million in 2015) consisting of minimum lease payments of USD 2,333 million (USD 3,113 million in 2016 and USD 4046 million in 2015) reduced with sublease payments received of USD 272 million (USD 558 million in 2016 and USD 608 million in 2015). There are no significant rig cancellation fees expensed in 2017 (USD 115 million in 2016). No material contingent rent payments have been expensed in 2017, 2016 or 2015.

The information in the table below shows future minimum lease payments due and receivable under non-cancellable operating leases at 31 December 2017:

	Operating leases						
(in USD million)	Rigs	Vessels	Land and buildings	Other	Total	Sublease	Net total
2018	1,039	615	155	152	1,961	(125)	1,837
2019	712	393	140	113	1,359	(105)	1,253
2020	509	382	136	92	1,119	(104)	1,015
2021	374	304	133	60	872	(68)	804
2022	352	233	134	57	777	(22)	755
2023-2027	287	498	621	47	1,453	(61)	1,392
2028-2032	-	93	369	23	485	(0)	485
Thereafter	-	13	50	13	76	-	76
Total future minimum lease payments	3,274	2,532	1,737	558	8,101	(484)	7,617

Statoil had certain operating lease contracts for drilling rigs at 31 December 2017. The remaining significant contracts' terms range from one month to six years. Rig lease agreements are for the most part based on fixed day rates. Certain rigs have been subleased in whole or for part of the lease term mainly to Statoil operated licences on the Norwegian continental shelf. These leases are shown gross as operating leases in the table above.

Statoil has a long-term time charter agreement with Teekay for offshore loading and transportation in the North Sea. The contract covers the lifetime of applicable producing fields and at year end 2017 includes three crude tankers. The contract's estimated nominal amount was approximately USD 585 million at year end 2017, and it is included in the category vessels in the table above.

The category land and buildings includes future minimum lease payments to related parties of USD 511 million regarding the lease of one office building located in Bergen and one in Harstad, both owned by Statoil`s pension fund ("Statoil Pension"). These operating lease commitments extend to the year 2034. USD 387 million of the total is payable after 2021.

Statoil had finance lease liabilities of USD 478 million at 31 December 2017. The nominal minimum lease payments related to these finance leases amount to USD 630 million. Property, plant and equipment includes USD 439 million for finance leases that have been capitalised at year end (USD 484 million in 2016), mainly presented in the category machinery, equipment and transportation equipment, including vessels in note 10 Property, plant and equipment.

Certain contracts contain renewal options. The execution of such options will depend on future market development and business needs at the time when such options are to be exercised.

23 Other commitments, contingent liabilities and contingent assets

Contractual commitments

Statoil had contractual commitments of USD 6,012 million at 31 December 2017. The contractual commitments reflect Statoil's share and mainly comprise construction and acquisition of property, plant and equipment as well as committed investments in equity accounted entities.

As a condition for being awarded oil and gas exploration and production licences, participants may be committed to drill a certain number of wells. At the end of 2017, Statoil was committed to participate in 29 wells, with an average ownership interest of approximately 49%. Statoil's share of estimated expenditures to drill these wells amounts to USD 456 million. Additional wells that Statoil may become committed to participating in depending on future discoveries in certain licences are not included in these numbers.

Other long-term commitments

Statoil has entered into various long-term agreements for pipeline transportation as well as terminal use, processing, storage and entry/exit capacity commitments and commitments related to specific purchase agreements. The agreements ensure the rights to the capacity or volumes in question, but also impose on Statoil the obligation to pay for the agreed-upon service or commodity, irrespective of actual use. The contracts' terms vary, with durations of up to 2045.

Take-or-pay contracts for the purchase of commodity quantities are only included in the table below if their contractually agreed pricing is of a nature that will or may deviate from the obtainable market prices for the commodity at the time of delivery.

Obligations payable by Statoil to entities accounted for using the equity method are included gross in the table below. For assets (for example pipelines) that Statoil accounts for by recognising its share of assets, liabilities, income and expenses (capacity costs) on a line-by-line basis in the Consolidated financial statements, the amounts in the table include the net commitment payable by Statoil (i.e. gross commitment less Statoil's ownership share).

Nominal minimum other long-term commitments at 31 December 2017:

(in USD million)	
2018	1,548
2019	1,415
2020	1,312
2021	1,101
2022	942
Thereafter	5,563
Total	11,881

Guarantees

Statoil has guaranteed for its proportionate portion of an associate's long-term bank debt, amounting to USD 305 million. The book value of the guarantee is immaterial.

Contingent liabilities and contingent assets

Resolution of the dispute with the Angolan Ministry of Finance

In June 2017 Statoil signed an agreement with the Angolan Ministry of Finance which resolved the dispute over previously assessed additional profit oil and taxes due, and established how to allocate profit oil and assess petroleum income tax (PIT) related to Statoil's participation in Block 4, Block 15, Block 17 and Block 31 offshore Angola for the years 2002 to 2016. In accordance with the agreement, Statoil in July 2017 paid in full and final settlement an additional PIT amount to Angola related to the prior reporting periods. The agreement also led to a certain increase in Norwegian taxes payable. In addition to taxes previously provided for in the Consolidated financial statements related to the dispute, the current income tax expense at the time reflected USD 117 million payable in Angola and Norway. Based on the agreement, profit oil and interest expense amounts previously provided for in the current portion of provisions related to claims and litigation were reversed. USD 754 million has been reflected as revenue in the E&P International segment, while USD 319 million has been reflected as interest expense reduction under Net financial items in the Consolidated statement of income. The net effect of the dispute resolution recognised in the Consolidated statement of income consequently was USD 956 million.

Redetermination process for Agbami field

Through its ownership in OML 128 in Nigeria, Statoil is party to an ownership interest redetermination process for the Agbami field. In October 2015, Statoil received the Expert's final ruling which implies a reduction of 5.17 percentage points in Statoil's equity interest in the field. Statoil had previously initiated arbitration proceedings to set aside interim decisions made by the Expert, but this was declined by the arbitration tribunal in its November 2015 judgment. Statoil has proceeded to court of Appeal to have the arbitration award set aside. In October 2016 Statoil also initiated a new arbitration to set aside the Expert's final ruling. Currently Statoil has two distinct, but connected, legal processes ongoing related to the Agbami redetermination. As of 31 December 2017, Statoil has recognised a provision of USD 1,165 million net of tax, which reflects a reduction of 5.17 percentage points in Statoil's equity interest in the Agbami field. The provision is reflected within Provisions in the Consolidated balance sheet.

Price review arbitration

Some long-term gas sales agreements contain price review clauses, which in certain cases lead to claims subject to arbitration. The exposure for Statoil related to arbitration has been estimated to an amount equivalent to approximately USD 343 million for gas delivered prior to year end 2017. Statoil has provided for its best estimate related to contractual gas price disputes in the Consolidated financial statements, with the impact to the Consolidated statement of income reflected as revenue adjustments.

Dispute concerning interpretation of the terms of the OML 128 Production Sharing Contract (PSC)

There is a dispute between the Nigerian National Petroleum Corporation (NNPC) and the partners (Contractor) in Oil Mining Lease (OML) 128 of the unitised Agbami field concerning interpretation of the terms of the OML 128 Production Sharing Contract (PSC). The dispute relates to the allocation between NNPC and Contractor of cost oil, tax oil and profit oil volumes. Following an arbitration process on the matter concluded in 2015, various disputes related to the legality and enforcement of the arbitration verdict in Contractor's favour are currently in process in the Nigerian court system. Statoil's stake in the dispute at year end 2017 mainly relates to claims for return of certain oil volumes lifted by NNPC during the arbitration process and in subsequent years contrary to the PSC terms.

Dispute with Brazilian tax authorities
Brazilian tax authorities have issued an updated tax assessment for 2011 for Statoil's Brazilian subsidiary which was party to Statoil's divestment of 40% of the Peregrino field to Sinochem at that time. The assessment disputes Statoil's allocation of the sale proceeds between entities and assets involved, resulting in a significantly higher assessed taxable gain and related taxes payable in Brazil. Statoil disagrees with the assessment, and has provided responses to this effect. The ongoing process of formal communication with the Brazilian tax authorities, as well as any subsequent litigation that may become necessary, may take several years. No taxes will become payable until the matter has been finally settled. Statoil is of the view that all applicable tax regulations have been applied in the case and that the group has a strong position. No amounts have consequently been provided for in the accounts.

Suit for an annulment of Petrobras' sale of the interest in BM-S-8 to Statoil
In April 2017, a federal judge granted an injunction request to suspend the assignment to Statoil of Petróleo Brasileiro S.A.'s ("Petrobras") 66% operated interest in the Brazilian offshore licence BM-S-8, in a class action suit filed by the Union of Workers of Oil Tankers of Sergipe (Sindipetro) against Petrobras, Statoil, and ANP - the Brazilian Regulatory Agency ("the defendants"). The suit seeks the annulment of Petrobras' sale of the interest in BM-S-8 to Statoil, which was closed in November 2016. The injunction was subsequently lifted by the Federal Regional Court. This decision is appealable. At the end of 2017 the acquired interest remains in Statoil's balance sheet as intangible assets of the Exploration & Production International (E&P International) segment. For further information about Statoil's acquisitions and divestments in BM-S-8, reference is made to the 2017 Consolidated annual financial statements note 4 Acquisitions and divestments.

A deviation notice from Norwegian tax authorities
On 6 July 2016, the Norwegian tax authorities issued a deviation notice for the years 2012 to 2014 related to the internal pricing on certain transactions between Statoil Coordination Centre (SCC) in Belgium and Norwegian entities in the Statoil group. The main issue in this matter relates to SCC`s capital structure and its compliance with the arm's length principle. Statoil is of the view that arm's length pricing has been applied and that the group has a strong position, and no amounts have consequently been provided for this issue in the accounts.

Other claims
During the normal course of its business, Statoil is involved in legal proceedings, and several other unresolved claims are currently outstanding. The ultimate liability or asset, in respect of such litigation and claims cannot be determined at this time. Statoil has provided in its Consolidated financial statements for probable liabilities related to litigation and claims based on its best estimate. Statoil does not expect that its financial position, results of operations or cash flows will be materially affected by the resolution of these legal proceedings. Statoil is actively pursuing the above disputes through the contractual and legal means available in each case, but the timing of the ultimate resolutions and related cash flows, if any, cannot at present be determined with sufficient reliability.

Provisions related to claims are reflected within note 20 Provisions.

24 Related parties

Transactions with the Norwegian State
The Norwegian State is the majority shareholder of Statoil and also holds major investments in other Norwegian companies. As of 31 December 2017, the Norwegian State had an ownership interest in Statoil of 67.0% (excluding Folketrygdfondet, the Norwegian national insurance fund, of 3.3%). This ownership structure means that Statoil participates in transactions with many parties that are under a common ownership structure and therefore meet the definition of a related party. All transactions are considered to be on an arm's length basis.

Total purchases of oil and natural gas liquids from the Norwegian State amounted to USD 7,352 million, USD 5,848 million and USD 7,431 million in 2017, 2016 and 2015, respectively. Total purchases of natural gas regarding the Tjeldbergodden methanol plant from the Norwegian State amounted to USD 39 million, USD 44 million and USD 68 million in 2017, 2016 and 2015, respectively. These purchases of oil and natural gas are recorded in Statoil ASA. In addition, Statoil ASA sells in its own name, but for the Norwegian State's account and risk, the Norwegian State's gas production. These transactions are presented net. For further information please see note 2 Significant accounting policies. The most significant items included in the line item equity accounted investments and other related party payables in note 21 Trade and other payables, are amounts payable to the Norwegian State for these purchases.

Other transactions
In relation to its ordinary business operations Statoil enters into contracts such as pipeline transport, gas storage and processing of petroleum products, with companies in which Statoil has ownership interests. Such transactions are carried out on an arm's length basis and are included within the applicable captions in the Consolidated statement of income. Gassled and certain other infrastructure assets are operated by Gassco AS, which is an entity under common control by the Norwegian Ministry of Petroleum and Energy. Gassco's activities are performed on behalf of and for the risk and reward of pipeline and terminal owners, and capacity payments flow through Gassco to the respective owners. Statoil payments that flowed through Gassco in this respect amounted to USD 1,155 million, USD 1,167 million and USD 1,105 million in 2017, 2016 and 2015, respectively. These payments are recorded in Statoil ASA. In addition, Statoil ASA process in its own name, but for the Norwegian State's account and risk, the Norwegian State's share of the Gassco costs. These transactions are presented net.

As of 31 December 2017, Statoil had an ownership interest in Lundin Petroleum AB (Lundin) of 20.1% of the outstanding shares and votes. Total purchase of oil and related products from Lundin amounted to USD 176 million and USD 155 million in 2017 and 2016, respectively. The purchase of oil and related products is recorded in Statoil ASA.

For information concerning certain lease arrangements with Statoil Pension, see note 22 Leases.

Related party transactions with management are presented in note 6 Remuneration. Management remuneration for 2017 is presented in note 4 Remuneration in the financial statements of the parent company, Statoil ASA.

25 Financial instruments: fair value measurement and sensitivity analysis of market risk

Financial instruments by category
The following tables present Statoil's classes of financial instruments and their carrying amounts by the categories as they are defined in IAS 39 Financial Instruments: Recognition and Measurement. All financial instruments' carrying amounts are measured at fair value or their carrying amounts reasonably approximate fair value except non-current financial liabilities. See note 18 Finance debt for fair value information of non-current bonds, bank loans and finance lease liabilities.

See note 2 Significant accounting policies for further information regarding measurement of fair values.

Fair value hierarchy

The following table summarises each class of financial instruments which are recognised in the Consolidated balance sheet at fair value, split by Statoil's basis for fair value measurement.

(in USD million)	Non-current financial investments	Non-current derivative financial instruments - assets	Current financial investments	Current derivative financial instruments - assets	Cash equivalents	Non-current derivative financial instruments - liabilities	Current derivative financial instruments - liabilities	Net fair value
At 31 December 2017								
Level 1	1,126	-	355	-	-	-	-	1,481
Level 2	1,271	1,320	4,008	122	1,473	(900)	(399)	6,896
Level 3	397	283	-	37	-	-	(4)	713
Total fair value	2,794	1,603	4,363	159	1,473	(900)	(403)	9,090
At 31 December 2016								
Level 1	1,095	-	516	-	-	-	-	1,611
Level 2	1,042	970	4,479	426	2,299	(1,414)	(503)	7,299
Level 3	207	848	(0)	66	-	(6)	(4)	1,110
Total fair value	2,344	1,819	4,994	492	2,299	(1,420)	(508)	10,019

Level 1, fair value based on prices quoted in an active market for identical assets or liabilities, includes financial instruments actively traded and for which the values recognised in the Consolidated balance sheet are determined based on observable prices on identical instruments. For Statoil this category will, in most cases, only be relevant for investments in listed equity securities and government bonds.

Level 2, fair value based on inputs other than quoted prices included within level 1, which are derived from observable market transactions, includes Statoil's non-standardised contracts for which fair values are determined on the basis of price inputs from observable market transactions. This will typically be when Statoil uses forward prices on crude oil, natural gas, interest rates and foreign exchange rates as inputs to the valuation models to determining the fair value of its derivative financial instruments.

Level 3, fair value based on unobservable inputs, includes financial instruments for which fair values are determined on the basis of input and assumptions that are not from observable market transactions. The fair values presented in this category are mainly based on internal assumptions. The internal assumptions are only used in the absence of quoted prices from an active market or other observable price inputs for the financial instruments subject to the valuation.

The fair value of certain earn-out agreements and embedded derivative contracts are determined by the use of valuation techniques with price inputs from observable market transactions as well as internally generated price assumptions and volume profiles. The discount rate used in the valuation is a risk-free rate based on the applicable currency and time horizon of the underlying cash flows adjusted for a credit premium to reflect either Statoil's credit premium, if the value is a liability, or an estimated counterparty credit premium if the value is an asset. In addition a risk premium for risk elements not adjusted for in the cash flow may be included when applicable. The fair values of these derivative financial instruments have been classified in their entirety in the third category within current derivative financial instruments and non-current derivative financial instruments. Another reasonable assumption, that could have been applied when determining the fair value of these contracts, would be to extrapolate the last observed forward prices with inflation. Applying this assumption would have an insignificant impact on the fair value for these contracts.

The reconciliation of the changes in fair value during 2017 and 2016 for financial instruments classified in the third level in the hierarchy are presented in the following table.

(in USD million)	Non-current financial investments	Non-current derivative financial instruments - assets	Current derivative financial instruments - assets	Non-current derivative financial instruments liabilities	Current derivative financial instruments - liabilities	Total amount
Full year 2017						
Opening balance	207	848	66	(6)	(4)	1,110
Total gains and losses recognised in statement of income	-	(69)	36	6	-	(27)
Purchases	90	-	-	-	-	90

Foreign currency translation differences	5	37	3	-	-	45
Closing balance	397	283	37	-	(4)	713
Full year 2016						
Opening balance	209	941	50	(59)	-	1,141
Total gains and losses recognised in statement of income	-	(98)	66	49	-	17
Purchases	2	-	-	-	-	2
Settlement	(5)	(17)	(53)	-	-	(75)
Transfer to current portion	-	(1)	1	4	(4)	-
Foreign currency translation differences	1	23	1	-	-	25
Closing balance	207	848	66	(6)	(4)	1,110

During 2017 the financial instruments within level 3 have had a net decrease in the fair value of USD 397 million. The USD 27 million recognised in the Consolidated statement of income during 2017 are impacted by a reduction of USD 78 million related to changes in fair value of certain earn-out agreements. Related to the same earn-out agreements, USD 528 million included in the opening balance for 2017 has been agreed settled, while USD 72 million has been fully realised as the underlying volumes have been delivered during 2017.

Sensitivity analysis of market risk

Commodity price risk

The table below contains the commodity price risk sensitivities of Statoil's commodity based derivatives contracts. For further information related to the type of commodity risks and how Statoil manages these risks, see note 5 Financial risk management.

Statoil's assets and liabilities resulting from commodity based derivatives contracts consist of both exchange traded and non-exchange traded instruments, including embedded derivatives that have been bifurcated and recognised at fair value in the Consolidated balance sheet.

Price risk sensitivities at the end of 2017 at 20%, and at the end of 2016 at 30%, are assumed to represent a reasonably likely change based on the duration of the derivatives.

Since none of the derivative financial instruments included in the table below are part of hedging relationships, any changes in the fair value would be recognised in the Consolidated statement of income.

Commodity price sensitivity	2017		2016	
(in USD million)	- 20%	+ 20%	- 30%	+ 30%
At 31 December				
Crude oil and refined products net gains (losses)	687	(606)	395	(390)
Natural gas and electricity net gains (losses)	613	(613)	810	(809)

Currency risk

The following currency risk sensitivity has been calculated, by assuming an 8% reasonable change in the main exchange rates that impact Statoil's financial accounts, based on balances at 31 December 2017. At 31 December 2016 a change of 12% in the main exchange rates were viewed as a reasonable change. With reference to table below, an increase in the exchange rates means that the disclosed currency has strengthened in value against all other currencies. The estimated gains and the estimated losses following from a change in the exchange rates would impact the Consolidated statement of income. For further information related to the currency risk and how Statoil manages these risks, see note 5 Financial risk management.

Currency risk sensitivity	2017		2016	
(in USD million)	- 8%	+ 8%	- 12%	+ 12%
At 31 December				
USD net gains (losses)	119	(119)	79	(79)
NOK net gains (losses)	(94)	94	31	(31)

Interest rate risk

The following interest rate risk sensitivity has been calculated by assuming a change of 0.6 percentage points as reasonably possible changes in the interest rates at the end of 2017. At the end of 2016 a change of 0.8 percentage points in the interest rates was viewed as reasonably possible changes. The estimated gains following from a decrease in the interest rates and the estimated losses following from an interest rate increase would impact the Consolidated statement of income. For further information related to the interest risks and how Statoil manages these risks, see note 5 Financial risk management.

Interest risk sensitivity	2017		2016	
(in USD million)	- 0.6 percentage points	+ 0.6 percentage points	- 0.8 percentage points	+ 0.8 percentage points
At 31 December				
Interest rate net gains (losses)	664	(664)	897	(897)

26 Subsequent events

On 28 February 2018, Statoil received a notice of deviation from Norwegian tax authorities related to an ongoing dispute regarding the level of Research & Development cost to be allocated to the offshore tax regime, increasing the maximum exposure in this matter to USD 470 million. Statoil has provided for its best estimate in the matter, and is currently evaluating the notice of deviation.

27 Condensed consolidated financial information related to guaranteed debt securities

Statoil Petroleum AS, a 100% owned subsidiary of Statoil ASA, is the co-obligor of certain existing debt securities of Statoil ASA that are registered under the US Securities Act of 1933 ("US registered debt securities"). As co-obligor, Statoil Petroleum AS fully, unconditionally and irrevocably assumes and agrees to perform, jointly and severally with Statoil ASA, the payment and covenant obligations for these US registered debt securities. In addition, Statoil ASA is also the co-obligor of a US registered debt security of Statoil Petroleum AS. As co-obligor, Statoil ASA fully, unconditionally and irrevocably assumes and agrees to perform, jointly and severally with Statoil Petroleum AS, the payment and covenant obligations of that security. In the future, Statoil ASA may from time to time issue future US registered debt securities for which Statoil Petroleum AS will be the co-obligor or guarantor.

The following financial information on a condensed consolidated basis provides financial information about Statoil ASA, as issuer and co-obligor, Statoil Petroleum AS, as co-obligor and guarantor, and all other subsidiaries as required by SEC Rule 3-10 of Regulation S-X. The condensed consolidated information is prepared in accordance with Statoil's IFRS accounting policies as described in note 2 Significant accounting policies, except that investments in subsidiaries and jointly controlled entities are accounted for using the equity method as required by Rule 3-10.

The following is condensed consolidated financial information for the full year 2017, 2016 and 2015, and as of 31 December 2017 and 2016.

4.2 Supplementary oil and gas information (unaudited)

In accordance with the US Financial Accounting Standards Board Accounting Standards Codification "Extractive Activities - Oil and Gas" (Topic 932), Statoil is reporting certain supplemental disclosures about oil and gas exploration and production operations. While this information is developed with reasonable care and disclosed in good faith, it is emphasised that some of the data is necessarily imprecise and represents only approximate amounts because of the subjective judgement involved in developing such information. Accordingly, this information may not necessarily represent the present financial condition of Statoil or its expected future results.

For further information regarding the reserves estimation requirement, see note 2 Significant accounting policies - Critical accounting judgements and key sources of estimation uncertainty - Proved oil and gas reserves within the Consolidated financial statements.

No new events have occurred since 31 December 2017 that would result in a significant change in the estimated proved reserves or other figures reported as of that date.

The Agbami equity redetermination in Nigeria implies a reduction of 5.17 percentage points in Statoil's equity interest in the field. Statoil has proceeded to the court of appeal to have the arbitration award set aside. Final approval in the licence was pending at year end 2017, hence the negative effect on the proved reserves, which is estimated to be less than 10 million boe, is not yet included.

In Algeria, an agreement has been signed which will amend the In Amenas Production Sharing Contract by five years, from 2022 to 2027. The effect on the proved reserves will be included once the agreement is approved by the authorities and the effect is known. The effect of the farm out of the Leismer oil sands projects was implemented in 2017 resulting in a reduction of the proved reserves in Canada.

Oil and gas reserve quantities

Statoil's oil and gas reserves have been estimated by its qualified professionals in accordance with industry standards under the requirements of the U.S. Securities and Exchange Commission (SEC), Rule 4-10 of Regulation S-X. Statements of reserves are forward-looking statements.

The determination of these reserves is part of an ongoing process subject to continual revision as additional information becomes available. Estimates of proved reserve quantities are imprecise and change over time as new information becomes available. Moreover, identified reserves and contingent resources that may become proved in the future are excluded from the calculations.

Statoil's proved reserves are recognised under various forms of contractual agreements, including production sharing agreements (PSAs) where Statoil's share of reserves can vary due to commodity prices or other factors. Reserves from agreements such as PSAs and buy back agreements are based on the volumes to which Statoil has access (cost oil and profit oil), limited to available market access. At 31 December 2017, 6% of total proved reserves were related to such agreements (11% of total oil, condensate and natural gas liquids (NGL) reserves and 2% of total gas reserves). This compares with 7% and 9% of total proved reserves for 2016 and 2015, respectively. Net entitlement oil and gas production from fields with such agreements was 94 million boe during 2017 (96 million boe for 2016 and 104 million boe for 2015). Statoil participates in such agreements in Algeria, Angola, Azerbaijan, Libya, Nigeria and Russia.

Statoil is recording, as proved reserves, volumes equivalent to our tax liabilities under negotiated fiscal arrangements (PSAs) where the tax is paid on behalf of Statoil. Reserves are net of royalty oil paid in kind and quantities consumed during production.

Rule 4-10 of Regulation S-X requires that the estimation of reserves is based on existing economic conditions, including a 12-month average price determined as an unweighted arithmetic average of the first-of-the month price for each month within the reporting period, unless prices are defined by contractual arrangements. The proved reserves at year end 2017 have been determined based on a Brent blend price equivalent of USD 54.32/bbl, compared to USD 42.82/bbl and USD 54.17/bbl for 2016 and 2015 respectively. The volume weighted average gas price for proved reserves at year end 2017 was USD 4.65 mmBtu. The comparable gas price used to determine gas reserves at year end 2016 and 2015 was USD 4.50 mmBtu and USD 5.76 mmBtu. The volume weighted average NGL price for proved reserves at year end 2017 was USD 32.02/boe. The corresponding NGL price used to determine NGL reserves at year end 2016 and 2015 was USD 24.85/boe and USD 30.56/boe. The increase in commodity prices affects the profitable reserves to be recovered from accumulations, resulting in increased reserves. The positive revisions due to price are in general a result of extended economic cut-off. For fields with a production-sharing type of agreement this is to some degree offset by lower entitlement to the reserves. These changes are all included in the revision category in the tables below, giving a net increase of Statoil's proved reserves at year end.

From the Norwegian continental shelf (NCS), Statoil is responsible for managing, transporting and selling the Norwegian State's oil and gas on behalf of the Norwegian State's direct financial interest (SDFI). These reserves are sold in conjunction with the Statoil reserves. As part of this arrangement, Statoil delivers and sells gas to customers in accordance with various types of sales contracts on behalf of the SDFI. In order to fulfil the commitments, Statoil utilises a field supply schedule which provides the highest possible total value for the joint portfolio of oil and gas between Statoil and the SDFI.

Statoil and the SDFI receive income from the joint natural gas sales portfolio based upon their respective share in the supplied volumes. For sales of the SDFI natural gas, to Statoil and to third parties, the payment to the Norwegian State is based on achieved prices, a net back formula calculated price or market value. All of the Norwegian State's oil and NGL is acquired by Statoil. The price Statoil pays to the SDFI for the crude oil is based on market reflective prices. The prices for NGL are either based on achieved prices, market value or market reflective prices.

The regulations of the owner's instruction, as described above, may be changed or withdrawn by the Statoil ASA's general meeting. Due to this uncertainty and the Norwegian State's estimate of proved reserves not being available to Statoil, it is not possible to determine the total quantities to be purchased by Statoil under the owner's instruction.

Topic 932 requires the presentation of reserves and certain other supplemental oil and gas disclosures by geographic area, defined as country or continent containing 15% or more of total proved reserves. At 31 December 2017 Norway contains 73% and US 16% of the total proved reserves. Accordingly, management has determined that the most meaningful presentation of geographic areas would be Norway, US, and the continents of Eurasia (excluding Norway), Africa, and Americas (excluding US).

The following tables reflect the estimated proved reserves of oil and gas at 31 December 2014 through 2017, and the changes therein.

The reason for the most significant changes to our proved reserves at year end 2017 were:

- Revisions of previously booked reserves, including the effect of improved recovery, increased the proved reserves by 605 million boe in 2017. Many producing fields have significant positive revisions due to better performance, maturing of new wells and improved recovery projects, as well as reduced uncertainty due to further drilling and production experience. The effect of the increased commodity prices, increasing the proved reserves by approximately 200 million boe through extended economic life time on several fields, is also included in this. The largest revisions are seen in Norway, where many of the larger offshore fields continue to decline less than assumed for the proved reserves, and in the US where continued drilling and production from the onshore plays in the Appalachian basin (Marcellus and Utica), Bakken and Eagle Ford have increased the proved reserves
- A total of 441 million boe of new proved reserves are added through extensions and new discoveries booking proved reserves for the first time. New field developments in Norway, such as Johan Castberg, Ærfugl and Bauge, and Peregrino Phase 2 in Brazil, all contribute to this with a total of 260 million boe. Extensions of the proved areas in the US onshore plays contribute with167 million boe. The remaining 14 million boe come from other minor extensions on producing fields where new wells have been drilled in previously unproven areas
- New discoveries with proved reserves booked in 2017 are all expected to start production within a period of five years
- A total of 50 million boe of new proved reserves were purchased in 2017 (the Azeri-Chirag-Gunashli PSA extension and transfer of certain ownership shares in the Appalachian basin from Northwood Energy)
- Sale of 38 million boe of proved reserves from the Leismer oil sands development in Canada which was finalised in 2017
- The 2017 entitlement production was 705 million boe, an increase of 4.7% compared to 2016

Changes to the proved reserves in 2017 are also described in some detail by each geographic area in section 2.8 Operational performance, Proved oil and gas reserves. Development of the proved reserves are described in section 2.8 Operational performance, Development of reserves.

The conversion rates used are 1 standard cubic meter = 35.3 standard cubic feet, 1 standard cubic meter oil equivalent = 6.29 barrels of oil equivalent (boe) and 1,000 standard cubic meter gas = 1 standard cubic meter oil equivalent.

Capitalised cost related to oil and gas producing activities

Consolidated companies

(in USD million)	2017	2016	At 31 December 2015
Unproved properties	12,627	13,563	13,341
Proved properties, wells, plants and other equipment	173,954	159,284	150,653
Total capitalised cost	186,581	172,847	163,994
Accumulated depreciation, impairment and amortisation	(120,170)	(109,160)	(99,118)
Net capitalised cost	66,411	63,687	64,876

Net capitalised cost related to equity accounted investments as of 31 December 2017 was USD 1,351 million, USD 2,000 million in 2016 and USD 1,000 million in 2015. The decrease is mainly caused by the reclassification of the 9,67% ownership share in the heavy oil project Petrocedeño in Venezuela from an equity accounted investment to a non-current financial investment as of 30 June 2017. The reported figures are based on capitalised costs within the upstream segments in Statoil, in line with the description below for result of operations for oil and gas producing activities.

Expenditures incurred in oil and gas property acquisition, exploration and development activities

These expenditures include both amounts capitalised and expensed.

Consolidated companies

(in USD million)	Norway	Eurasia excluding Norway	Africa	US	Americas excluding US	Total

Total	6,665	1,710	1,784	4,335	1,188	15,682

Expenditures incurred in development activities related to equity accounted investments was USD 19 million in 2017, USD 1,370 million in 2016 and USD 46 million in 2015.

Results of operation for oil and gas producing activities
As required by Topic 932, the revenues and expenses included in the following table reflect only those relating to the oil and gas producing operations of Statoil.

The result of operations for oil and gas producing activities contains the two upstream reporting segments Exploration & Production Norway (E&P Norway) and Exploration & Production International (E&P International) as presented in note 3 Segments within the Consolidated financial statements. Production cost is based on operating expenses related to production of oil and gas. From the operating expenses certain expenses such as; transportation costs, accruals for over/underlift position, royalty payments and diluent costs are excluded. These expenses and mainly upstream business administration are included as other expenses in the tables below. Other revenues mainly consist of gains and losses from sales of oil and gas interests and gains and losses from commodity based derivatives within the upstream segments.

Income tax expense is calculated on the basis of statutory tax rates adjusted for uplift and tax credits. No deductions are made for interest or other elements not included in the table below.

Average production cost in USD per boe based on entitlement volumes (consolidated)	Norway	Eurasia excluding Norway	Africa	US	Americas excluding US	Total
2017	5	9	6	5	12	5
2016	5	8	7	4	13	5
2015	6	10	8	6	13	6

Production cost per boe is calculated as the production costs in the result of operations table, divided by the produced entitlement volumes (mboe) for the corresponding period.

Standardised measure of discounted future net cash flows relating to proved oil and gas reserves

The table below shows the standardised measure of future net cash flows relating to proved reserves. The analysis is computed in accordance with Topic 932, by applying average market prices as defined by the SEC, year end costs, year end statutory tax rates and a discount factor of 10% to year end quantities of net proved reserves. The standardised measure of discounted future net cash flows is a forward-looking statement.

Future price changes are limited to those provided by existing contractual arrangements at the end of each reporting year. Future development and production costs are those estimated future expenditures necessary to develop and produce year-end estimated proved reserves based on year-end cost indices, assuming continuation of year-end economic conditions. Pre-tax future net cash flow is net of decommissioning and removal costs. Estimated future income taxes are calculated by applying the appropriate year-end statutory tax rates. These rates reflect allowable deductions and tax credits and are applied to estimated future pretax net cash flows, less the tax basis of related assets. Discounted future net cash flows are calculated using a discount rate of 10% per year. Discounting requires a year-by-year estimate of when future expenditures will be incurred and when reserves will be produced. The standardised measure of discounted future net cash flows prescribed under Topic 932 requires assumptions as to the timing and amount of future development and production costs and income from the production of proved reserves. The information does not represent management's estimate or Statoil's expected future cash flows or the value of its proved reserves and therefore should not be relied upon as an indication of Statoil's future cash flow or value of its proved reserves.

Changes in the standardised measure of discounted future net cash flows from proved reserves

(in USD million)	2017	2016	2015
Consolidated companies			
Standardised measure at beginning of year	21,092	25,366	46,270
Net change in sales and transfer prices and in production (lifting) costs related to future production	22,640	(21,148)	(71,817)
Changes in estimated future development costs	(5,572)	(16)	6,739
Sales and transfers of oil and gas produced during the period, net of production cost	(22,446)	(16,824)	(20,803)
Net change due to extensions, discoveries, and improved recovery	3,836	1,099	3,745
Net change due to purchases and sales of minerals in place	(167)	(566)	(1,026)
Net change due to revisions in quantity estimates	10,798	8,163	7,491
Previously estimated development costs incurred during the period	7,597	7,998	10,474
Accretion of discount	4,415	5,949	11,335
Net change in income taxes	(15,530)	11,070	32,958
Total change in the standardised measure during the year	5,571	(4,274)	(20,904)
Standardised measure at end of year	26,663	21,092	25,366
Equity accounted investments			
Standardised measure at end of year	333	406	140
Standardised measure at end of year including equity accounted investments	26,995	21,498	25,506

In the table above, each line item presents the sources of changes in the standardised measure value on a discounted basis, with the accretion of discount line item reflecting the increase in the net discounted value of the proved oil and gas reserves due to the fact that the future cash flows are now one year closer in time.

The standardised measure at the beginning of the year represents the discounted net present value after deductions of both future development costs, production costs and taxes. The 'Net change in sales and transfer prices and in production (lifting) costs related to future production' is, on the other hand, related to the future net cash flows at 31 December 2016. The proved reserves at 31 December 2016 were multiplied by the actual change in price, and change in unit of production costs, to arrive at the net effect of changes in price and production costs. Development costs and taxes are reflected in the line items 'Change in estimated future development costs' and 'Net change in income taxes' and are not included in the 'Net change in sales and transfer prices and in production (lifting) costs related to future production'.

Notes to the Financial statements Statoil ASA

1 Significant accounting policies and basis of presentation

Statoil ASA is the parent company of the Statoil Group (Statoil), consisting of Statoil ASA and its subsidiaries. Statoil ASA's main activities includes shareholding in group companies, group management, corporate functions and group financing. Statoil ASA also carries out activities related to external sales of oil and gas products, purchased externally or from group companies, including related refinery and transportation activities. Reference is made to disclosure note 1 Organisation and basis of presentation in Statoil's Consolidated financial statements.

The financial statements of Statoil ASA ("the company") are prepared in accordance with simplified IFRS pursuant to the Norwegian Accounting Act §3-9 and regulations regarding simplified application of IFRS issued by the Norwegian Ministry of Finance on 3 November 2014. The presentation currency of Statoil ASA is US dollar (USD), consistent with the presentation currency for the group financial statements and with the company's functional currency.

These parent company financial statements should be read in connection with the Consolidated financial statements of Statoil, published together with these financial statements. With the exceptions described below, Statoil ASA applies the accounting policies of the group, as described in Statoil's disclosure note 2 Significant Accounting Policies, and reference is made to the Statoil note for further details. Insofar that the company applies policies that are not described in the Statoil note due to group level materiality considerations, such policies are included below if necessary for a sufficient understanding of Statoil ASA's accounts.

Subsidiaries, associated companies and joint ventures
Shareholdings and interests in subsidiaries, associated companies (companies in which the company does not have control, or joint control, but has the ability to exercise significant influence over operating and financial policies, generally when the ownership share is between 20% and 50%) and joint ventures are accounted for using the equity method. The company applies the equity method on the basis of the respective entities' financial reporting prepared in compliance with the Statoil group's IFRS accounting principles. Reserves for valuation variances included within the company's equity are established based on the sum of contributions from each individual equity accounted investment, with the limitation that the net amount cannot be negative. Goodwill included in the balance sheets of subsidiaries and associated companies is tested for impairment as part of the related investment in the subsidiary or associated company. Any related impairment expense is included in the company's statement of income under Net income/(loss) from subsidiaries and other equity accounted companies.

Expenses related to the Statoil group as operator of joint operations and similar arrangements (licences)
Indirect operating expenses incurred by the company, such as personnel expenses, are accumulated in cost pools. Such expenses are allocated in part on an hours incurred cost basis to Statoil Petroleum AS, to other group companies and to licences where Statoil Petroleum AS or other group companies are operators. Costs allocated in this manner reduce the expenses in the company's statement of income.

Asset transfers between the company and its subsidiaries
Transfers of assets and liabilities between the company and the entities that it directly or indirectly controls are accounted for at the carrying amounts (continuity) of the assets and liabilities transferred, when the transfer is part of a reorganisation within the Statoil group.

Dividends payable and group contributions
Dividends are reflected as Dividends payable within current liabilities. Group contributions for the year to other entities within Statoil's Norwegian tax group are reflected in the balance sheet as current liabilities within Liabilities to group companies. Under simplified IFRS the presentation of dividends payable and payable group contributions differs from the presentation under IFRS, as it also includes dividends and group contributions payable which at the date of the balance sheet is subject to a future general assembly approval before distribution.

Reserves for unrealised gains
Reserves for unrealised gains included within the Company's equity consists of accumulated unrealised gains on non-exchange traded financial instruments and the fair value of embedded derivatives, with the limitation that the net amount cannot be negative.

2 Financial risk management and measurement of financial instruments

General information relevant to financial risks
Statoil ASA's activities expose the company to market risk, liquidity risk and credit risk, and the management of such risks do not substantially differ from the Group's. See note 5 Financial risk management in the Consolidated financial statements.

Measurement of financial instruments by categories
The following tables present Statoil ASA's classes of financial instruments and their carrying amounts by the categories as they are defined in IAS 39 Financial Instruments: Recognition and Measurement. All financial instruments' carrying amounts are measured at fair value or their carrying amounts reasonably approximate fair value except non-current financial liabilities. See note 18 Finance debt for fair value information of non-current bonds, bank loans and finance lease liabilities and note 25 Financial instruments fair value measurement and sensitivity analysis of market risk in the Consolidated financial statements where fair value measurement is explained in detail.

See note 2 Significant accounting policies in the Consolidated financial statements for further information regarding measurement of fair values.

Natural gas and electricity	84	(277)	(193)
Total	1,502	(1,279)	223
At 31 December 2016			
Foreign currency instruments	365	(28)	337
Interest rate instruments	987	(1,417)	(430)
Crude oil and refined products	13	(39)	(26)
Natural gas and electricity	41	(426)	(385)
Total	1,407	(1,911)	(504)

Sensitivity analysis of market risk

Commodity price risk
Statoil ASA's assets and liabilities resulting from commodity based derivatives contracts consist of both exchange traded and non-exchange traded instruments mainly in crude oil and refined products.

Price risk sensitivities at the end of 2017 at 20%, and at the end of 2016 at 30%, are assumed to represent a reasonably likely change based on the duration of the derivatives.

	2017		2016	
(in USD million)	- 20% sensitivity	20% sensitivity	- 30% sensitivity	30% sensitivity
At 31 December				
Crude oil and refined products net gains (losses)	494	(480)	650	(644)
Natural gas and electricity net gains (losses)	77	(77)	57	(57)

Currency risk

The estimated gains and the estimated losses following from a change in the foreign exchange rates would impact the company's statement of income.

Currency risk sensitivity for Statoil ASA mainly differ from currency risk sensitivity in Group due to interesting bearing receivables from subsidiaries. For more detailed information about these receivables see note 11 Financial assets and liabilities.

	2017		2016	
(in USD million)	-8% sensitivity	8% sensitivity	- 12% sensitivity	12% sensitivity
At 31 December				
NOK net gains (losses)	(1,264)	1,264	(1,691)	1,691

Interest rate risk

The estimated gains following from a decrease in the interest rates and the estimated losses following from an interest rate increase would impact the company's statement of income.

	2017		2016	
(in USD million)	- 0.6 percentage points sensitivity	0.6 percentage points sensitivity	- 0.8 percentage points sensitivity	0.8 percentage points sensitivity
At 31 December				
Interest rate net gains (losses)	620	(620)	817	(817)

3 Revenues

	Full year	
(in USD million)	2017	2016
Revenues third party	35,083	28,333
Intercompany revenues	4,665	3,221
Revenues	39,748	31,554

4 Remuneration

Statoil ASA remuneration in 2017

(in USD million, except average number of employees)	Full year 2017	2016
Salaries[1)]	2,198	2,163
Pension cost	439	631
Social security tax	318	336
Other compensations	253	240
Total	3,208	3,370
Average number of employees[2)]	18,100	18,800

1) Salaries include bonuses, severance packages and expatriate costs in addition to base pay.
2) Part time employees amount to 3% for 2017 and 2016 respectively.

Total payroll expenses are accumulated in cost-pools and charged to partners of Statoil operated licences and group companies on an hours incurred basis. For further information see note 22 Related parties.

Compensation to and share ownership of the corporate assembly, the board of directors (BoD) and the corporate executive committee (CEC)
Compensation to the corporate assembly was USD 129,552 and the total share ownership of the members of the corporate assembly was 30,839 shares. Remuneration to members of the BoD and the CEC during the year and share ownership at the end of the year were as follows:

Members of the board (figures in USD thousand except number of shares)	Total remuneration	Share ownership as of 31 December 2017
Jon Erik Reinhardsen (chair of the board)[1)]	37	2,558
Øystein Løseth (chair of the board)[2)]	52	n.a.

John Knight[12)]	1,643	0	0	0	181	1,824	0	0	0	1,810	109,901

1) All figures in the table are presented in USD based on average currency rates (2017: USD/NOK = 8.2630, USD/GBP = 1.2882. 2016: USD/NOK = 8.3987, USD/GBP = 1.3538). The figures are presented on accrual basis.
2) All CEC members receive their remuneration in NOK except John Knight who receives the remuneration in GBP.
3) Fixed pay consists of base salary, fixed remuneration element, holiday allowance and other administrative benefits.
4) Cash allowance in lieu of pension accrual above 12 G (G is the base amount in the national insurance scheme).
5) The long-term incentive (LTI) element implies an obligation to invest the net amount in Statoil shares, including a lock-in period. The LTI element is presented the year it is granted for the members of the corporate executive committee employed by Statoil ASA.
6) Annual variable pay includes holiday allowance for corporate executive committee (CEC) members resident in Norway.
7) Estimated pension cost is calculated based on actuarial assumptions and pensionable salary (mainly base salary) at 31 December 2016 and is recognised as pension cost in the statement of income for 2017.
8) Eldar Sætre, Arne Sigve Nylund, Margareth Øvrum and Timothy Dodson are maintained in the closed Defined Benefit Scheme, whereas the remaining members of corporate executive committee employed by Statoil ASA, is covered by the Defined Contribution Pension Scheme.
9) Includes 2016 CEC members who are also CEC members in 2017.
10) Estimated present value of pension obligation for Eldar Sætre is based on retirement at the age of 67. Eldar Sætre has the right to retire at an earlier stage.
11) Terms and conditions for Torgrim Reitan also include compensation according to Statoil's international assignment terms.
12) John Knight's fixed pay includes a fixed remuneration element of USD 143,000 that replaces his defined contribution pension plan and a fixed remuneration element of USD 689,000 replacing his variable pay arrangements.

There are no loans from the company to members of the corporate executive committee.

Remuneration policy and concept

The main elements of Statoil's executive remuneration are described in chapter 3 Governance, section 3.12 Remuneration to the corporate executive committee in this report. Reference is made to the section on Declaration on remuneration and other employment terms for Statoil's Corporate Executive committee for a detailed description of the remuneration and remuneration policy for executive management applicable for the years 2017 and 2018.

5 Share-based compensation

Statoil's share saving plan provides employees with the opportunity to purchase Statoil shares through monthly salary deductions. If the shares are kept for two full calendar years of continued employment, following the year of purchase, the employees will be allocated one bonus share for each one they have purchased.

Estimated compensation expense including the contribution by Statoil ASA for purchased shares, amounts vested for bonus shares granted and related social security tax was USD 55 million in 2017 and USD 54 million in 2016. For the 2018 programme (granted in 2017) the estimated compensation expense is USD 65 million. At 31 December 2017 the amount of compensation cost yet to be expensed throughout the vesting period is USD 128 million.

6 Auditor's remuneration

	Full year	
(in USD million, excluding VAT)	2017	2016
Audit fee	1.4	1.3
Audit related fee	0.4	0.3
Total	1.8	1.7

There are no fees incurred related to other services or to tax services.

7 Financial items

	Full year	
(in USD million)	2017	2016
Foreign exchange gains (losses) derivative financial instruments	(920)	353
Other foreign exchange gains (losses)	1,538	(59)
Net foreign exchange gains (losses)	618	294
Interest income from group companies	798	682
Interest income current financial assets and other financial items	227	298
Interest income and other financial items	1,025	981
Gains (losses) derivative financial instruments	(61)	470
Interest expense to group companies	(142)	(163)
Interest expense non-current finance debt	(1,023)	(850)
Interest expense current financial liabilities and other finance expense	(104)	(3)
Interest and other finance expenses	(1,269)	(1,016)
Net financial items	312	728

Statoil's main financial items relate to assets and liabilities categorised in the held for trading category and the amortised cost category. For more information about financial instruments by category see note 25 Financial instruments: fair value measurement and sensitivity analysis of market risk in the Consolidated financial statements.

The line item interest expense non-current finance debt primarily includes interest expenses of USD 1,103 million and USD 1,039 million for 2017 and 2016, respectively, from the financial liabilities at amortised cost category. This was partially offset by net interest income on related derivatives from the held for trading category, USD 80 million and USD 188 million for 2017 and 2016, respectively.

The line item gains (losses) derivative financial instruments primarily includes fair value loss from the held for trading category of USD 77 million and a gain of USD 454 million for 2017 and 2016, respectively.

Foreign exchange gains (losses) derivative financial instruments include fair value changes of currency derivatives related to liquidity and currency risk. The line item foreign exchange gains (losses) includes a net foreign exchange gain of USD 447 million and a loss of USD 289 million from the held for trading category for 2017 and 2016, respectively.

8 Income taxes

Income tax

(in USD million)	Full year 2017	2016
Current taxes	(134)	92
Change in deferred tax	(95)	(499)
Income tax	(229)	(407)

Reconciliation of Norwegian statutory tax rate to effective tax rate

(in USD million)	2017	Full year 2016
Income/(loss) before tax	5,543	(2,202)
Nominal tax rate in 2017 (24%) and in 2016 (25%)	(1,330)	550
Tax effect of:		
Permanent differences caused by NOK being the tax currency	(35)	(198)
Tax effect of permanent differences related to equity accounted companies	1,204	(671)
Other permanent differences	(87)	(81)
Income tax prior years	(25)	(21)
Change in tax regulations - reduction of nominal tax rate from 24% in 2017 to 23% in 2018	(31)	10
Other	75	4
Total	(229)	(407)
Effective tax rate	4.1%	(18.5%)

Change in tax regulations refers to change in deferred taxes caused by a reduction in Norwegian statutory tax rate from 24% to 23% effective from 2018.

Significant components of deferred tax assets and liabilities were as follows:

(in USD million)	At 31 December 2017	2016
Deferred tax - assets		
Other current items	0	5
Tax losses carry forward	0	22
Pensions	626	627
Long term provisions	73	75
Derivatives	30	122
Other non-current items	47	59
Total deferred tax assets	776	911
Deferred tax - liabilities		
Other current items	14	0
Property, plant and equipment	51	65
Total deferred tax liabilities	65	65
Net deferred tax assets	711	846

At 31 December 2017, Statoil ASA had recognised net deferred tax assets of USD 711 million, as it is considered probable that taxable profit will be available to utilise the deferred tax assets.

Overview showing significant components of deferred tax assets and liabilities at 31 December 2016 is reallocated compared with disclosure for 2016. 38 million USD is reallocated from derivatives and long term debt to other non-current items, 6 million of inventory is reallocated other non-current items and at last a review of long term provisions has resulted in reallocation of 5 million USD to other current items and 25 million USD to other non-current items.

Movement in deferred tax

(in USD million)	2017	2016
Deferred tax assets at 1 January	846	1,183

10 Investments in subsidiaries and other equity accounted companies

(in USD million)	2017	2016
Investments at 1 January	39,886	51,330
Net income/(loss) from subsidiaries and other equity accounted companies	5,051	(2,726)
Increase (decrease) in paid-in capital	(1,861)	(8,462)
Acquisitions	0	1,199
Distributions	(1,236)	(1,194)
Net gains/(losses) from available for sale financial assets	(64)	0
Share of OCI from equity accounted investments	(40)	0
Translation adjustments	973	(260)
Other	(27)	(1)
Investments at 31 December	42,683	39,886

Reference is made to note 12 Equity accounted investments in the Consolidated financial statements for more information regarding equity accounted companies.

The closing balance of investments at 31 December of USD 42,683 million consists of investments in subsidiaries amounting to USD 41,448 million and investments in other equity accounted companies amounting to USD 1,235 million. In 2016, the amounts were USD 38,660 million and USD 1,226 million respectively.

The foreign currency translation adjustments relate to currency translation effects from subsidiaries with functional currencies other than USD.

In 2017 net income/(loss) from subsidiaries and other equity accounted companies was impacted by net impairment reversal related to property, plant and equipment and exploration assets of USD 447 million after tax. The net impairment reversal is a result of increased production estimates, cost reductions, increased prices and operational improvements in addition to change in US tax legislation. For more information see the Consolidated financial statements note 9 Property, plant and equipment. In 2016 net income/(loss) from subsidiaries and other equity accounted companies was impacted by net impairment losses related to property, plant and equipment and exploration assets of USD 1,678 million after tax, primarily resulting from reduced short term commodity price assumptions.

Increase (decrease) in paid-in capital in 2017 mainly consist of repayment of capital from Statoil Coordination Centre of USD 3,303 million, and group contributions related to 2017 to group companies of USD 278 million after tax.

Distributions during 2017 mainly consist of dividends related to 2016 from group companies of USD 1,236 million. In 2016 distributions mainly consisted of dividends and group contributions related to 2015 from group companies of USD 1,194 million.

In January 2016 Statoil ASA acquired 11.93% of the issued share capital and votes in Lundin Petroleum AB for a total purchase price of SEK 4.6 billion (USD 541 million). In June 2016 Statoil ASA increased ownership share in Lundin Petroleum AB till 68.4 million shares of Lundin, corresponding to 20.1% of the outstanding shares and votes. The consideration for these additional shares consisted of SEK 544 million (USD 64 million) in cash and the conversion of a previous receivable for the amount of USD 496 million.

Up until the transaction on 30 June 2016, the shares were accounted for as a non-current financial investment at fair value with changes in fair value presented in the line item net gains (losses) from available for sale financial assets in the Statoil ASA statement of comprehensive income. Statoil recognised gain of USD 153 million in the line net financial items in the Statoil ASA statement of income.

For further information, see in the Consolidated Financial Statements of Statoil Group note disclosure 4 Acquisitions and divestments.

The acquisition cost for investments in subsidiaries and other equity accounted companies are USD 37,239 million in 2017 and USD 39,254 million in 2016.

The following table shows significant subsidiaries and equity accounted companies directly held by Statoil ASA as of December 2017

11 Financial assets and liabilities

Non-current receivables from subsidiaries and other equity accounted companies

(in USD million)	At 31 December 2017	2016
Interest bearing receivables from subsidiaries and other equity accounted companies	25,668	23,520
Non-interest bearing receivables from subsidiaries	228	124
Receivables from subsidiaries and other equity accounted companies	25,896	23,644

Interest bearing receivables from subsidiaries and other equity accounted companies are mainly related to Statoil Petroleum AS. The remaining amount on financial receivables interest bearing primarily relate to long term funding of other subsidiaries

The total amount of credit facility given to Statoil Petroleum AS is NOK 120 billion (USD 14,625 million) at 31 December 2017 and NOK 135 billion (USD 15,661 million) at 31 December 2016. In 2017 the full facility is utilised while in 2016, USD 14,501 million was drawn. Of the total interest bearing non-current receivables at 31 December 2017, USD 6,703 million (NOK 55 billion) is due within the next five years, but there is no current portion. Remaining amounts fall due beyond five years.

Of the non-interest-bearing receivables from subsidiaries at 31 December 2017, USD 57 million relates to pensions, see also note 17 Pensions. Correspondingly, USD 79 million related to pension at 31 December 2016.

Current receivables from subsidiaries and other equity accounted companies include a positive internal bank balances of USD 603 million at 31 December 2017. Current receivables from subsidiaries and other equity accounted companies at 31 December 2016 include positive internal bank balances of USD 787 million and current portion of credit facility given to Statoil Petroleum AS of USD 1,740 million.

Current financial investments

(in USD million)	At 31 December 2017	2016
Time deposits	4,045	3,217
Interest bearing securities	3,649	4,176
Financial investments	7,694	7,393

Current Financial investments
The cost price for current financial investments was USD 7.7 billion at 31 December 2017 and USD 7.6 billion at 31 December 2016.

In 2017, interest bearing securities were split in seven currencies, the main being: NOK (35%), SEK (25%), EUR (24%) and USD (11%). Time deposits were mainly in EUR (38%), USD (28%), NOK (16%) and SEK (10%). In 2016, interest bearing securities were split in five currencies: EUR (34%), NOK (19%), USD (18%), SEK (16%) and DKK (12%), while time deposits were mainly in EUR (91%) and the rest in NOK (9%).

For more information about financial instruments by category, see note 25 Financial instruments: fair value measurement and sensitivity analysis of market risk in the Consolidated financial statements.

Current liabilities to subsidiaries and other equity accounted companies
Liabilities to subsidiaries and other equity accounted companies include current liabilities to Statoil Petroleum AS of USD 2.9 billion and liabilities related to Statoil groups' internal bank arrangements of USD 7.4 billion at 31 December 2017. The corresponding amounts were USD 2.2 billion and USD 8.5 billion at 31 December 2016.

12 Inventories

(in USD million)	At 31 December 2017	2016
Crude oil	1,697	1,504
Petroleum products	586	478
Natural gas	108	133
Other	26	36
Inventories	2,417	2,150

The write-down of inventories from cost to net realisable value amounts to an expense of USD 11 million and USD 11 million in 2017 and 2016, respectively.

13 Trade and other receivables

(in USD million)	At 31 December 2017	2016
Trade receivables	5,481	3,755
Other receivables	458	1,004
Trade and other receivables	5,939	4,760

14 Cash and cash equivalents

(in USD million)	At 31 December 2017	2016
Cash at bank available	275	128
Time deposits	1,878	1,658
Money market funds	381	65
Interest bearing securities	1,077	2,220

Cash and cash equivalents	3,759	4,274

Restricted cash at 31 December 2017 and 2016 consists of margin deposits including both cash and exchange traded derivative products with daily settlement of USD 149 million and USD 203 million, respectively.

15 Equity and shareholders

Change in equity

(in USD million)	At 31 December 2017	2016
Shareholders' equity at 1 January	34,059	39,277
Net income/(loss)	5,314	(2,608)
Actuarial gain (loss) defined benefit pension plans	134	(374)
Foreign currency translation adjustments	978	(304)
Ordinary dividend	(2,943)	(2,838)
Scrip dividend	1,357	904
Net gains/(losses) from available for sale financial assets	(64)	0
Share of OCI from equity accounted investments	(40)	0
Value of stock compensation plan	(30)	(26)
Treasury shares purchased	22	27
Total equity at 31 December	38,788	34,059

The accumulated foreign currency translation effect as of 31 December 2017 decreased total equity by USD 358 million. At 31 December 2016 the corresponding effect was a decrease in total equity of USD 1,338 million. The foreign currency translation adjustments relate to currency translation effects from the subsidiaries.

Common stock

	Number of shares	NOK per value	At 31 December Common stock
Authorised and issued	3,323,167,853	2.50	8,307,919,632.50
Treasury shares	11,243,234	2.50	28,108,085.00
Total outstanding shares	3,311,924,619	2.50	8,279,811,547.50

There is only one class of shares and all the shares have the same voting rights.

During 2017 a total of 3,323,671 treasury shares were purchased for USD 63 million and 3,219,327 treasury shares were allocated to employees participating in the share saving plan. During 2016 a total of 4,011,860 treasury shares were purchased for USD 62 million and 3,882,153 treasury shares were allocated to employees participating in the share saving plan. At 31 December 2017 Statoil had 11,243,234 treasury shares and at 31 December 2016 11,138,890 treasury shares, all of which are related to Statoil's share saving plan. For further information, see note 5 Share-based compensation.

Statoil's general assembly has authorised the company to acquire Statoil shares in the market. The authorisation may be used to acquire Statoil shares with an overall nominal value of up to NOK 35.0 million. Such shares acquired in accordance with the authorisation may only be used for sale and transfer to employees of the Statoil group as part of the group's share saving plan approved by the board. The minimum and maximum amount that may be paid per share will be NOK 50 and NOK 500, respectively. The authorisation is valid until the next ordinary general meeting. For further details, please see note 17 Shareholder's equity of the Consolidated financial statements.

For information regarding the 20 largest shareholders in Statoil ASA, please see Major Shareholders in section 5.1 Shareholder information.

16 Finance debt

Non-current finance debt

(in USD million)	At 31 December 2017	2016
Unsecured bonds	26,524	29,964
Unsecured loans	89	85
Finance lease liabilities	347	382
Total finance debt	26,959	30,432
Less current portion	2,900	2,549
Non-current finance debt	24,059	27,883
Weighted average interest rate (%)	3.33	3.30

Statoil ASA uses currency swaps to manage foreign exchange risk on its non-current financial liabilities. For information about the Statoil Group and Statoil ASA's interest rate risk management, see note 5 Financial risk management in the Consolidated financial statement and note 2 Financial risk management and measurement of financial instruments in the Statoil ASA financial statement.

Substantially all unsecured bond and unsecured bank loan agreements contain provisions restricting future pledging of assets to secure borrowings without granting a similar secured status to the existing bond holders and lenders.

Out of Statoil ASA total outstanding unsecured bond portfolio, 42 bond agreements contain provisions allowing Statoil to call the debt prior to its final redemption at par or at certain specified premiums if there are changes to the Norwegian tax laws. The carrying amount of these agreements is USD 26.158 billion at the 31 December 2017 closing exchange rate.

Statoil ASA has a revolving credit facility of USD 5.0 billion, supported by 21 core banks, maturing in 2022. The facility supports secure access to funding, supported by the best available short-term rating. As at 31 December 2017 and 2016 it has not been drawn.

Non-current finance debt repayment profile

(in USD million)	
2019	1,397
2020	2,114
2021	1,978
2022	1,052
Thereafter	17,519
Total	24,059

More information regarding finance lease liabilities is provided in note 20 Leases.

Current finance debt

(in USD million)	At 31 December 2017	2016
Collateral liabilities and other current financial liabilities	1,068	1,112
Non-current finance debt due within one year	2,900	2,549
Current finance debt	3,968	3,661
Weighted average interest rate (%)	1.69	1.62

Collateral liabilities and other current financial liabilities relate mainly to cash received as security for a portion of Statoil ASA's credit exposure and outstanding amounts on US Commercial paper (CP) programme. At 31 December 2017 USD 448 million were issued on the CP programme. Corresponding at 31 December 2016 were USD 500 million.

17 Pensions

Statoil ASA is subject to the Mandatory Company Pensions Act, and the company's pension scheme follows the requirements of the Act. Reference is made to the Annual notes in the Consolidated financial statements, for a description of the pension scheme in Statoil ASA.

Net pension cost

(in USD million)	2017	2016
Current service cost	241	234
Interest cost	-	182

Equity accounted associated companies and other related party payables	877	615
Trade, other payables and provisions	4,118	2,893

20 Leases

Statoil ASA leases certain assets, notably vessels and office buildings.

In 2017, net rental expenditures were USD 425 million (USD 464 million in 2016) consisting of minimum lease payments of USD 501 million (USD 533 million in 2016) reduced with sublease payments received of USD 77 million in 2017 (USD 70 million in 2016). Contingent rents expensed were immaterial both years.

The information in the table below shows future minimum lease payments under non-cancellable leases at 31 December 2017. Amounts related to finance leases include future minimum lease payments for assets recognised in the financial statements at year end 2017.

			Finance leases		
(in USD million)	Operating leases	Operating sublease	Minimum lease payments	Discount element	Net present value minimum lease payments
2018	435	(25)	53	(2)	50
2019	325	(24)	53	(4)	48
2020	323	(23)	53	(7)	46
2021	301	(22)	53	(8)	44
2022	264	(21)	53	(10)	42
2023-2027	815	(57)	158	(42)	116
2028-2032	314	0	0	0	0
Thereafter	49	0	0	0	0
Total future minimum lease payments	2,828	(170)	421	(74)	347

More information related to the operating leases of vessels and office buildings is found in the Consolidated financial statements.

Statoil ASA leases three LNG vessels on behalf of Statoil and the State's direct financial interest (SDFI). Statoil ASA accounts for the combined Statoil and SDFI share of these agreements as finance leases in the balance sheet, and further accounts for the SDFI related portion as operating sublease. The finance leases included in the balance sheet reflect the original lease term of 20 years from 2006.

Property, plant and equipment includes USD 278 million for leases that have been capitalised at year end 2017 (USD 312 million in 2016), also presented in the category vessels in note 9 Property, plant and equipment.

21 Other commitments, contingent liabilities and contingent assets

Contractual commitments
Statoil ASA had contractual commitments of USD 412 million at 31 December 2017. The contractual commitments reflect the Statoil ASA share and comprise financing commitments related to exploration activities.

Other long-term commitments
Statoil ASA has entered into various long-term agreements for pipeline transportation as well as terminal use, processing, storage and entry/exit capacity commitments and commitments related to specific purchase agreements. The agreements ensure the rights to the capacity or volumes in question, but also impose on the company the obligation to pay for the agreed-upon service or commodity, irrespective of actual use. The contracts' terms vary, with duration of up to 2035.

Take-or-pay contracts for the purchase of commodity quantities are only included in the table below if their contractually agreed pricing is of a nature that will or may deviate from the obtainable market prices for the commodity at the time of delivery.

Obligations payable by Statoil ASA to entities accounted for as associates and joint ventures are included gross in the table below. Obligations payable by Statoil ASA to entities accounted for as joint operations (for example pipelines) are included net (i.e. gross commitment less Statoil ASA's ownership share).

Nominal minimum commitments at 31 December 2017:

(in USD million)	
2018	1,205
2019	1,155
2020	1,086
2021	881
2022	722
Thereafter	3,869
Total	8,917

Guarantees
Statoil ASA has provided parent company guarantees covering liabilities of subsidiaries with operations in Algeria, Angola, Australia, Azerbaijan, Brazil, Colombia, Denmark, Germany, Greenland, India, Ireland, Libya, New Zealand, Nicaragua, Nigeria, Norway, Russia, Sweden, United Kingdom, USA, Uruguay, Venezuela. The company has also counter-guaranteed certain bank guarantees covering liabilities of subsidiaries in Algeria, Argentina, Australia, Brazil, Canada, Colombia, the Faroes, Indonesia, Mexico, Myanmar, the Netherlands, Norway, South Africa, Sweden, United Kingdom, USA, Uruguay.

Statoil ASA has guaranteed for its proportionate portion of an associate's long-term bank debt, amounting to USD 305 million. The book value of the guarantee is immaterial.

Contingencies
Statoil ASA is the participant in certain entities ("DAs") in which the company has unlimited responsibility for its proportionate share of such entities' liabilities, if any, and also participates in certain companies ("ANSs") in which the participants in addition have joint and several liability. For further details, see note 10 Investments in subsidiaries and other equity accounted investments.

Some long-term gas sales agreements contain price review clauses, which in certain cases lead to claims subject to arbitration. The exposure for Statoil related to arbitration has been estimated to an amount equivalent to approximately USD 343 million for gas delivered prior to year-end 2017. Statoil has provided for its best estimate related to contractual gas price disputes in the Consolidated financial statements, with the impact to the Consolidated statement of income reflected as revenue adjustments.

On 6 July 2016, the Norwegian tax authorities issued a deviation notice for the years 2012 to 2014 related to the internal pricing on certain transactions between Statoil Coordination Centre (SCC) in Belgium and Statoil ASA. The main issue relates to SCC`s capital structure and its compliance with the arm's length principle. Statoil ASA is of the view that arm's length pricing has been applied and that Statoil ASA has a strong position, and no amounts have consequently been provided for this issue in the accounts.

During the normal course of its business Statoil ASA is involved in legal proceedings, and several other unresolved claims are currently outstanding. The ultimate liability or asset in respect of such litigation and claims cannot be determined at this time. Statoil ASA has provided in its financial statements for probable liabilities related to litigation and claims based on the company's best judgment. Statoil ASA does not expect that its financial position, results of operations or cash flows will be materially affected by the resolution of these legal proceedings.

Provisions related to claims and disputes are reflected within note 18 Provisions.

22 Related parties

Reference is made to note 24 Related parties in Statoil's Consolidated financial statement for information regarding Statoil ASAs related parties. This include information regarding related parties as a result of Statoil ASA's ownership structure and also information regarding transactions with the Norwegian State.

Transactions with internally owned companies
Revenue transactions with related parties are presented in note 3 Revenues. Total intercompany revenues amounted to USD 4,665 million and USD 3,221 million in 2017 and 2016, respectively. The major part of intercompany revenues is attributed to sales of crude oil and sales of refined products to Statoil Refining Denmark AS, USD 2,220 million and USD 1,443 million in 2017 and 2016, respectively and Statoil Marketing, USD 2,268 million and USD 1,663 million in 2017 and 2016, respectively.

Statoil ASA sells natural gas and pipeline transport on a back-to-back basis to Statoil Petroleum AS. Similarly, Statoil ASA enters into certain financial contracts, also on a back-to-back basis with Statoil Petroleum AS. All of the risks related to these transactions are carried by Statoil Petroleum AS and the transactions are therefore not reflected in Statoil ASA's financial statements.

Statoil ASA buys volumes from its subsidiaries and sells them into the market. Total purchases of goods from subsidiaries amounted to USD 16,555 million and USD 12,511 million in 2017 and 2016, respectively. The major part of intercompany purchases of goods is attributed to Statoil Petroleum AS, USD 10,564 million and USD 8,163 million in 2017 and 2016, respectively.

In relation to its ordinary business operations, Statoil ASA has regular transactions with group companies in which Statoil has ownership interests. Statoil ASA makes purchases from group companies amounting to USD 200 million and USD 490 million in 2017 and 2016, respectively.

Expenses incurred by the company, such as personnel expenses, are accumulated in cost pools. Such expenses are allocated in part on an hours incurred cost basis to Statoil Petroleum AS, to other group companies, and to licences where Statoil Petroleum AS or other group companies are operators. Cost allocated in this manner is not reflected in Statoil ASA's financial statements. Expenses allocated to group companies amounted to USD 4,309 million and USD 4,214 million in 2017 and 2016, respectively. The major part of the allocation is related to Statoil Petroleum AS, USD 3,481 million and USD 3,302 million in 2017 and 2016, respectively.

Other transactions
Reference is made to note 24 Related parties in Statoil's Consolidated financial statement for information regarding Statoil ASAs transactions with related parties based on ordinary business operations.

Current receivables and current liabilities from subsidiaries and other equity accounted companies are included in note 11 Financial assets and liabilities.

Related party transactions with management and management remunerations for 2017 are presented in note 4 Remuneration.

5.1 SHAREHOLDER INFORMATION

Statoil is the largest company listed on the Oslo Børs where it trades under the ticker code STL. Statoil is also listed on the New York Stock Exchange under the ticker code STO, trading in the form of American Depositary Shares (ADS).

Statoil's shares have been listed on the Oslo Børs and the New York Stock Exchange since our initial public offering on 18 June 2001. The ADSs traded on the New York Stock Exchange are evidenced by American Depositary Receipts (ADR), and each ADS represents one ordinary share.

Statoil Share	2017	2016	2015	2014	2013
Shareprice STL (low) (NOK)	136.00	97.90	116.30	120.00	123.00
Shareprice STL (average) (NOK)	152.98	133.50	137.59	166.41	136.72
Shareprice STL (high) (NOK)	176.90	159.80	160.80	194.80	147.70
Shareprice STL (year-end) (NOK)	175.20	158.40	123.70	131.20	147.00
Shareprice STO (low) (USD)	16.29	11.38	13.42	15.82	20.14
Shareprice STO (average) (USD)	18.50	15.92	17.11	26.52	23.32
Shareprice STO (high) (USD)	21.42	18.51	21.31	31.91	27.00
Shareprice STO (year-end) (USD)	21.42	18.24	13.96	17.61	24.13
STL Market value year-end (NOK billion)	582	514	394	418	469
STL Daily turnover (million shares)	3.14	4.7	5.1	3.7	3.0
Ordinary shares outstanding, year-end	3,323,167,853	3,245,049,411	3,188,647,103	3,188,647,103	3,188,647,103

As of 31 December 2017, Statoil represented 22.96% of the total value of all companies registered on the Oslo Børs, with a market value of NOK 582 billion. Total shareholder return (dividend reinvested) for 2017 is 16.0%.

The graph shows the development of the Statoil share price compared to the oil price and the Oslo Børs Benchmark Index (OSEBX). The turnover of shares is a measure of traded volumes. On average, 3.14 million Statoil shares were traded on the Oslo Børs every day in 2017 compared to 4.7 million shares in 2016. In 2017, Statoil shares accounted for 11,24% of the total market value traded throughout the year.

Statoil ASA has one class of shares, and each share confers one vote at the general meeting. Statoil ASA had 3,323,167,853 ordinary shares outstanding at year end. As of 31 December 2017, Statoil had 89,405 shareholders registered in the Norwegian Central Securities Depository (VPS), down from 91,128 shareholders at 31 December 2016.

The ticker code will be changed in connection with the company's proposed name change to Equinor.

Share prices

These are the reported high and low quotations at market closing for the ordinary shares on the Oslo Børs and New York Stock Exchange for the periods indicated. They are derived from the Oslo Børs Daily Official List, and the highest and lowest sales prices of the ADSs as reported on the New York Stock Exchange composite tape.

Dividend policy and dividends

It is Statoil's ambition to grow the annual cash dividend measured in USD per share in line with long-term underlying earnings.

Statoil's board approves first, second and third quarter interim dividends, based on an authorisation from the annual general meeting (AGM), while the AGM approves the fourth quarter dividend and implicitly the total annual dividend based on a proposal from the board. It is Statoil's intention to pay quarterly dividends, although when deciding the interim dividends and recommending the total annual dividend level, the board will take into consideration expected cash flow, capital expenditure plans, financing requirements and appropriate financial flexibility.

In addition to cash dividend, Statoil might buy back shares as part of total distribution of capital to the shareholders. The shareholders at the AGM may vote to reduce, but may not increase, the fourth quarter dividend proposed by the board of directors. Statoil announces dividend payments in connection with quarterly results. Payment of quarterly dividends is expected to take place within six months after the announcement of each quarterly dividend.

The board of directors has proposed to the AGM a dividend of USD 0.23 per share for the fourth quarter 2017 which is an increase from the previous quarter.

The following table shows the cash dividend amounts to all shareholders since 2013 on a per share basis and in aggregate.

ADDITIONAL INFORMATION

									Ordinary dividend per share	
				Ordinary dividend per share						Ordinary dividend per share
Fiscal year	Curr.	Q1	Curr.	Q2	Curr.	Q3	Curr.	Q4	Curr.	share
2013									NOK	7.0000
2014	NOK	1.8000	NOK	1.8000	NOK	1.8000	NOK	1.8000	NOK	7.2000
2015	NOK	1.8000	NOK	-	NOK	-	NOK	-	NOK	1.8000
2015	USD	-	USD	0.2201	USD	0.2201	USD	0.2201	USD	0.6603
2016	USD	0.2201	USD	0.2201	USD	0.2201	USD	0.2201	USD	0.8804
2017	USD	0.2201	USD	0.2201	USD	0.2201	USD	0.2300	USD	0.8903

The proposed fourth quarter 2017 dividend will be considered at the annual general meeting 15 May 2018. The Statoil share will be traded ex dividend 16 May 2018 and the dividend will be disbursed around 30 May 2018. For US ADR holders, the ex-dividend date will be 16 May 2018 and expected payment will be 31 May 2018.

Dividends in NOK per share will be calculated and communicated four business days after record date for shareholders at Oslo Børs. The NOK dividend will be based on average USD/NOK fixing rates from Norges Bank in the period plus/minus three business days from record date, in total seven business dates.

Share repurchase
For the period 2013-2017, the board of directors was authorised by the annual general meeting of Statoil to repurchase Statoil shares in the market for subsequent annulment. Statoil has not undertaken any share repurchase based on this authorisation.

It is Statoil's intention to renew this authorisation at the annual general meeting in May 2018.

ADDITIONAL INFORMATION

SHARES PURCHASED BY ISSUER

Shares are acquired in the market for transfer to employees under the share savings scheme in accordance with the limits set by the board of directors. No shares were repurchased in the market for the purpose of subsequent annulment in 2017.

Statoil's share savings plan

Since 2004, Statoil has had a share savings plan for employees of the company. The purpose of this plan is to strengthen the business culture and encourage loyalty through employees becoming part-owners of the company.

Through regular salary deductions, employees can invest up to 5% of their base salary in Statoil shares. In addition, the company contributes 20% of the total share investment made by employees in Norway, up to a maximum of NOK 1,500 per year (approximately USD 170). This company contribution is a tax-free employee benefit under current Norwegian tax legislation. After a lock-in period of two calendar years, one extra share will be awarded for each share purchased. Under current Norwegian tax legislation, the share award is a taxable employee benefit, with a value equal to the value of the shares and taxed at the time of the award.

The board of directors is authorised to acquire Statoil shares in the market on behalf of the company. The authorization is valid until the next annual general meeting, but not beyond 30 June 2019. This authorisation replaces the previous authorisation to acquire Statoil's own shares for implementation of the share savings plan granted by the annual general meeting 11 May 2017. It is Statoil's intention to renew this authorisation at the annual general meeting.

Period in which shares were repurchased	Number of shares repurchased	Average price per share in NOK	Total number of shares purchased as part of programme	Maximum number of shares that may yet be purchased under the programme authorisation

Statoil ADR programme fees

Fees and charges payable by a holder of ADSs.
As depositary from 31 January 2013, Deutsche Bank Trust Company Americas collects its fees for the delivery and surrender of ADSs directly from investors depositing shares or surrendering ADSs for the purpose of withdrawal, or from intermediaries acting for them.

The depositary collects fees from investors by deducting the fees from the amounts distributed or by selling a portion of distributable property to pay the fees. The depositary may refuse to provide fee-attracting services until its fees for those services are paid.

The charges of the depositary payable by investors are as follows:

Persons depositing or withdrawing shares must pay:	For:
USD 5.00 (or less) per 100 ADSs (or portion of 100 ADSs)	Issuance of ADSs, including issuances resulting from a distribution of shares or rights or other property Cancellation of ADSs for the purpose of withdrawal, including if the deposit agreement terminates
USD 0.02(or less) per ADS, subject to the company's consent	Any cash distribution made made pursuant to the Deposit Agreement
USD 0.05 (or less) per ADS, subject to the company's consent	For the operation and maintenance costs in administering the ADR programme
A fee equivalent to the fee that would be payable if securities distributed to you had been shares and the shares had been deposited for issuance of ADSs	Distribution of securities distributed to holders of deposited securities which are distributed by the Depositary to ADS registered holders
Registration or transfer fees	Transfer and registration of shares on our share register to or from the name of the Depositary or its agent when you deposit or withdraw shares
Expenses of the Depositary	Cable, telex and facsimile transmissions (as provided in the deposit agreement) Converting foreign currency to USD
Taxes and other governmental charges the Depositary or the custodian have to pay on any ADS or share underlying an ADS, for example, stock transfer taxes, stamp duty or withholding taxes	As necessary
Any charges incurred by the Depositary or its agents for servicing the deposited securities	As necessary

Reimbursements and payments made and fee waivers granted by the depositary
The depositary has agreed to reimburse certain company expenses related to the company's ADR programme and incurred by the company in connection with the programme. In the year ended 31 December 2017, the depositary reimbursed approximately USD 2.978 million to the company in relation to certain expenses including investor relations expenses, expenses related to the maintenance of the ADR programme, legal counsel fees, printing and ADR certificates. In addition, 2017 was the first year Statoil claimed dividend fee proceeds which is included here.

The depositary has also agreed to waive fees for costs associated with the administration of the ADR programme, and it has paid certain expenses directly to third parties on behalf of the company. The expenses paid to third parties include expenses relating to reporting services, access charges to its online platform, re-registration costs borne by the custodian and costs in relation to printing and mailing AGM materials. For the year ended 31 December 2017, the depositary paid expenses of approximately USD 211,635 directly to third parties.

TAXATION

This section describes the material Norwegian tax consequences that apply to shareholders resident in Norway and to non-resident shareholders in connection with the acquisition, ownership and disposal of shares and American Depositary Shares (ADS). The term "shareholder" refers to both holders of shares and holders of ADSs, unless otherwise explicitly stated.

Norwegian tax matters

The outline does not provide a complete description of all tax regulations that might be relevant (i.e. for investors to whom special regulations may be applicable), and is based on current law and practice. Shareholders should consult their professional tax adviser for advice about individual tax consequences.

Taxation of dividends received by Norwegian shareholders

Corporate shareholders (i.e. limited liability companies and similar entities) residing in Norway for tax purposes are generally subject to tax in Norway on dividends received from Norwegian companies. The basis for taxation is 3% of the dividends received, which is subject to the standard income tax rate. The standard income tax rate has been reduced from 24% in 2017 to 23% in 2018.

Individual shareholders resident in Norway for tax purposes are subject to the standard income tax rate (reduced from 24% in 2017 to 23% in 2018) in Norway for dividend income exceeding a basic tax free allowance. However, in 2018 dividend income exceeding the basic tax free allowance is grossed up with a factor of 1.33 before included in the ordinary taxable income, resulting in an effective tax rate of 30.59% (23% x 1.33). The tax free allowance is computed for each individual share or ADS and corresponds as a rule to the cost price of that share or ADS multiplied by an annual risk-free interest rate. Any part of the calculated allowance for one year that exceeds the dividend distributed for the share or ADS ("unused allowance") may be carried forward and set off against future dividends received for (or gains upon the realisation of, see below) the same share or ADS. Any unused allowance will also be added to the basis for computation of the allowance for the same share or ADS the following year.

Taxation of dividends received by foreign shareholders

Non-resident shareholders are as a starting point subject to Norwegian withholding tax at a rate of 25% on dividends distributed by Norwegian companies. It is the responsibility of the distributing company to deduct the withholding tax when dividends are paid to non-resident shareholders.

Corporate shareholders that carry on business activities in Norway, and whose shares or ADSs are effectively connected with such activities are not subject to withholding tax. For such shareholders, 3% of the received dividends are subject to the standard income tax rate (reduced from 24% in 2017 to 23% in 2018).

Certain important exceptions and modifications are outlined below.

This withholding tax does not apply to corporate shareholders in the EEA area that are equal to Norwegian private or public limited liability companies or certain other types of Norwegian entities, and that are further able to demonstrate that they are genuinely established and carry on genuine economic business activity within the EEA area, provided that Norway is entitled to receive information from the state of residence pursuant to a tax treaty or other international treaty. If no such treaty exists with the state of residence, the shareholder may instead present confirmation issued by the tax authorities of the state of residence verifying the documentation.

The withholding rate of 25% is often reduced in tax treaties between Norway and other countries. The reduced withholding tax rate will generally only apply to dividends paid on shares held by shareholders who are able to properly demonstrate that they are the beneficial owner and entitled to the benefits of the tax treaty.

Individual shareholders resident for tax purposes in the EEA area may apply to the Norwegian tax authorities for a refund if the tax withheld by the distributing company exceeds the tax that would have been levied on individual shareholders resident in Norway.

Procedure for claiming a reduced withholding tax rate on dividends

A foreign shareholder that is entitled to a reduced withholding tax rate on dividends, may request that the reduced rate is applied at source by the distributor. Such request must be accompanied by satisfactory documentation which supports that the foreign shareholder is entitled to a reduced withholding tax rate. It is expected that specific documentation requirements soon will be implemented in the regulations to the Norwegian Tax Payment Act, and the Norwegian Ministry of Finance has stated that these requirements should apply from 1 January 2019.

For holders of shares and ADSs deposited with Deutsche Bank Trust Company Americas (Deutsche Bank), documentation establishing that the holder is eligible for the benefits under a tax treaty with Norway, may be provided to Deutsche Bank. Deutsche Bank has been granted permission by the Norwegian tax authorities to receive dividends from us for redistribution to a beneficial owner of shares and ADSs at the applicable treaty withholding rate.

Dividends paid to shareholders (either directly or through a depositary) who have not provided the relevant documentation to the relevant party that they are eligible for the reduced rate, will be subject to withholding tax of 25%. The beneficial owners will in this case have to apply to the Central Office - Foreign Tax Affairs for a refund of the excess amount of tax withheld. Please refer to the tax authorities' web page for more information and the requirements of such application: http://www.skatteetaten.no/en/person/Aksjer-og-verdipapirer/withholding-tax-refund-on-dividends/.

Taxation on the realisation of shares and ADSs

Corporate shareholders resident in Norway for tax purposes are not subject to tax in Norway on gains derived from the sale, redemption or other disposal of shares or ADSs in Norwegian companies. Capital losses are not deductible.

Individual shareholders residing in Norway for tax purposes are subject to tax in Norway on the sale, redemption or other disposal of shares or ADSs. Gains or losses in connection with such realisation are included in the individual's ordinary taxable income in the year of disposal, which is subject to the standard income tax rate, being reduced from 24% in 2017 to 23% in 2018. However, in 2018 the taxable gain or deductible loss is grossed up with a factor of 1.33 before included in the ordinary taxable income, resulting in an effective tax rate of 30.59% (23% x 1.33).

The taxable gain or deductible loss (before gross up) is calculated as the sales price adjusted for transaction expenses minus the taxable basis. A shareholder's tax basis is normally equal to the acquisition cost of the shares or ADSs. Any unused allowance pertaining to a share may be deducted from a taxable gain on the same share or ADS, but may not lead to or increase a deductible loss. Furthermore, any unused allowance may not be set off against gains from the realisation of the other shares or ADSs.

If the shareholder disposes of shares or ADSs acquired at different times, the shares or ADSs that were first acquired will be deemed to be first sold (the "FIFO" principle) when calculating gain or loss for tax purposes.

From 2017, individual shareholders may hold listed shares in companies resident within EEA through a stock savings account. If the conditions for the stock savings account are met, taxable gain or loss on shares owned through the stock savings account will be payable when the gain is withdrawn from the account whereas loss on shares will be deductible when the account is terminated. Dividends are not comprised by the stock savings account scheme and will thus be taxed pursuant to the ordinary rules described above.

A corporate shareholder or an individual shareholder who ceases to be tax resident in Norway due to Norwegian law or tax treaty provisions may, in certain circumstances, become subject to Norwegian exit taxation on capital gains related to shares or ADSs.

Shareholders not residing in Norway are generally not subject to tax in Norway on capital gains, and losses are not deductible on the sale, redemption or other disposal of shares or ADSs in Norwegian companies, unless the shareholder carries on business activities in Norway and such shares or ADSs are or have been effectively connected with such activities.

Wealth tax

The shares or ADSs are included in the basis for the computation of wealth tax imposed on individuals resident in Norway for tax purposes. Norwegian limited companies and certain similar entities are not subject to wealth tax. The current marginal wealth tax rate is 0.85% of the value assessed. The assessment value of listed shares (including ADSs) is 80% (reduced from 90% with effect from and including the income year 2018) of the listed value of such shares or ADSs on 1 January in the assessment year.

Non-resident shareholders are not subject to wealth tax in Norway for shares and ADSs in Norwegian limited companies unless the shareholder is an individual and the shareholding is effectively connected with the individual's business activities in Norway.

Inheritance tax and gift tax

No inheritance or gift tax is imposed in Norway.

Transfer tax

No transfer tax is imposed in Norway in connection with the sale or purchase of shares or ADSs.

United States tax matters

This section describes the material United States federal income tax consequences for US holders (as defined below) of owning shares or ADSs. It only applies to you if you hold your shares or ADSs as capital assets for tax purposes and are not a member of a special class of holders subject to special rules, including dealers in securities, traders in securities that elect to use a mark-to-market method of accounting for securities holdings, insurance companies, partnerships, persons liable for the alternative minimum tax, persons that actually or constructively own 10% of the combined power of voting stock of Statoil or of the total value of stock of Statoil, persons that hold shares or ADSs as part of a straddle or a hedging or conversion transaction, persons that purchase or sell shares or ADSs as part of wash sale for tax purposes, or persons whose functional currency is not USD.

This section is based on the Internal Revenue Code of 1986, as amended, its legislative history, existing and proposed regulations, published rulings and court decisions, and the Convention between the United States of America and the Kingdom of Norway for the Avoidance of Double Taxation and the Prevention of Fiscal Evasion with Respect to Taxes on Income and Property (the "Treaty"). These laws are subject to change, possibly on a retroactive basis. In addition, this section is based in part upon the representations of the depositary and the assumption that each obligation in the deposit agreement and any related agreement will be performed in accordance with its terms. For United States federal income tax purposes, if you hold ADRs evidencing ADSs, you will generally be treated as the owner of the ordinary shares represented by those ADRs. Exchanges of shares for ADRs and ADRs for shares will not generally be subject to United States federal income tax.

A "US holder" is a beneficial owner of shares or ADSs that is: (i) a citizen or resident of the United States; (ii) a United States domestic corporation; (iii) an estate whose income is subject to United States federal income tax regardless of its source; or (iv) a trust if a United States court can exercise primary supervision over the trust's administration and one or more United States persons are authorised to control all substantial decisions of the trust.

You should consult your own tax adviser regarding the United States federal, state and local and Norwegian and other tax consequences of owning and disposing of shares and ADSs in your particular circumstances.

Taxation of dividends

The gross amount of any dividend (including any Norwegian tax withheld from the dividend payment) paid by Statoil out of its current or accumulated earnings and profits (as determined for United States federal income tax purposes) is taxable for you when you, in the case of shares, or the depositary, in the case of ADSs, receive the dividend, actually or constructively. If you are a non-corporate US holder, dividends paid to you will be eligible to be taxed at the preferential rates applicable to long-term capital gains as long as, in the year that you receive the dividend, the shares or ADSs are readily tradable on an established securities market in the United States or Statoil is eligible for benefits under the Treaty. To qualify for the preferential rates, you must hold the shares or ADSs for more than 60 days during the 121-day period beginning 60 days before the ex-dividend date and meet certain other requirements. The dividend will not be eligible for the dividends-received deduction generally allowed to United States corporations in respect of dividends received from other United States corporations.

The amount of the dividend distribution that you must include in your income as a US holder will be the value in USD of the payments made in NOK determined at the spot NOK/USD rate on the date the dividend distribution is includible in your income, regardless of whether or not the payment is in fact converted into USD. Distributions in excess of current and accumulated earnings and profits, as determined for United States federal income tax purposes, will be treated as a non-taxable return of capital to the extent of your tax basis in the shares or ADSs and, to the extent in excess of your tax basis, will be treated as capital gain.

Subject to certain limitations, the 15% Norwegian tax withheld in accordance with the Treaty and paid to Norway will be creditable or deductible against your United States federal income tax liability, unless a refund of the tax withheld is available to you under Norwegian law. Special rules apply when determining the foreign tax credit limitation with respect to dividends that are subject to the preferential rates. Dividends will be income from sources outside the United States and will generally, depending on your circumstances, be either "passive" or "general" income for purposes of computing the foreign tax credit allowable to you. Any gain or loss resulting from currency exchange rate fluctuations during the period from the date you include the dividend payment in income until the date you convert the payment into USD will generally be treated as US-source ordinary income or loss and will not be eligible for the special tax rate.

Taxation of capital gains

If you sell or otherwise dispose of your shares or ADSs, you will generally recognise a capital gain or loss for United States federal income tax purposes equal to the difference between the value in USD of the amount that you realise and your tax basis, determined in USD, in your shares or ADSs. A capital gain of a non-corporate US holder is generally taxed at preferential rates if the property is held for more than one year. The gain or loss will generally be income or loss from sources within the United States for foreign tax credit limitation purposes. If you receive any foreign currency on the sale of shares or ADSs, you may recognise ordinary income or loss from sources within the United States as a result of currency fluctuations between the date of the sale of the shares or ADSs and the date the sales proceeds are converted into USD. You should consult your own tax adviser regarding how to account for payments made or received in a currency other than USD.

PFIC rules

We believe that the shares and ADSs should not be treated as stock of a PFIC for United States federal income tax purposes, but this conclusion is a factual determination that is made annually and thus may be subject to change. If we were to be treated as a PFIC, a gain realised on the sale or other disposition of the shares or ADSs would in general not be treated as a capital gain. Instead, unless you elect to be taxed annually on a mark-to-market basis with respect to the shares or ADSs, you would be treated as if you had realised such gain and certain "excess distributions" ratably over your holding period for the shares or ADSs. Amounts allocated to the year in which the gain is realised or the "excess distribution" is received or to a taxable year before we were classified as a PFIC would be subject to tax at ordinary income tax rates, and amounts allocated to all other years would be taxed at the highest tax rate in effect for each such year to which the gain or distribution was allocated, together with an interest charge in respect of the tax attributable to each such year. With certain exceptions, your shares or ADSs will be treated as stock in a PFIC if we were a PFIC at any time during the period you held the shares or ADSs. Dividends that you receive from us will not be eligible for the preferential tax rates if we are treated as a PFIC with respect to you, either in the taxable year of the distribution or the preceding taxable year, but will instead be taxable at rates applicable to ordinary income.

Foreign Account Tax Compliance Withholding

A 30% withholding tax will be imposed on certain payments to certain non-US financial institutions that fail to comply with information reporting requirements or certification requirements in respect of their direct and indirect United States shareholders and/or United States accountholders. To avoid becoming subject to the 30% withholding tax on payments to them, we and other non-US financial institutions may be required to report information to the IRS regarding the holders of shares or ADSs and to withhold on a portion of payments under the shares or ADSs to certain holders that fail to comply with the relevant information reporting requirements (or hold shares or ADSs directly or indirectly through certain non-compliant intermediaries). However, such withholding will not apply to payments made before January 1, 2019. The rules for the implementation of this legislation have not yet been fully finalised, so it is impossible to determine at this time what impact, if any, this legislation will have on holders of the shares and ADSs.

EXCHANGE RATES

The table below shows the high, low, average and end-of-period exchange rates for the Norwegian krone for USD 1.00 as announced by Norges Bank (Norway's central bank).

The average is computed using the monthly average exchange rates announced by Norges Bank during the period indicated.

For the year ended 31 December	Low	High	Average	End of Period
2013	5.4438	6.2154	5.8753	6.0837
2014	5.8611	7.6111	6.3011	7.4332
2015	7.3593	8.8090	8.0637	8.8090
2016	7.9766	8.9578	8.4014	8.6200
2017	7.7121	8.6781	8.2712	8.2050

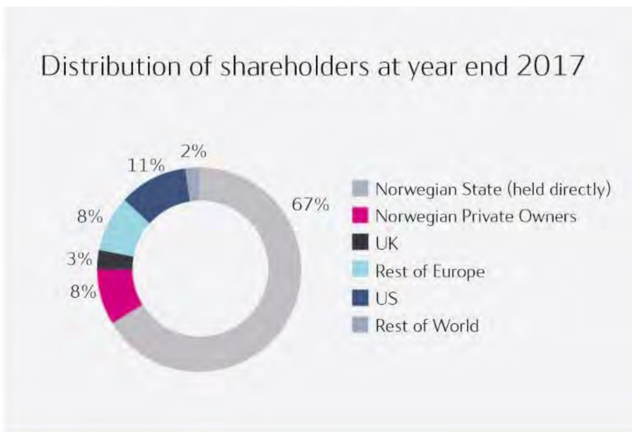
	Low	High
2017		
September	7.7192	7.9726
October	7.8906	8.2161
November	8.1140	8.3043
December	8.2050	8.4103
2018		
January	7.6760	8.1055
February	7.6579	7.9836
March (up to and including 14 March 2018)	7.7393	7.9369

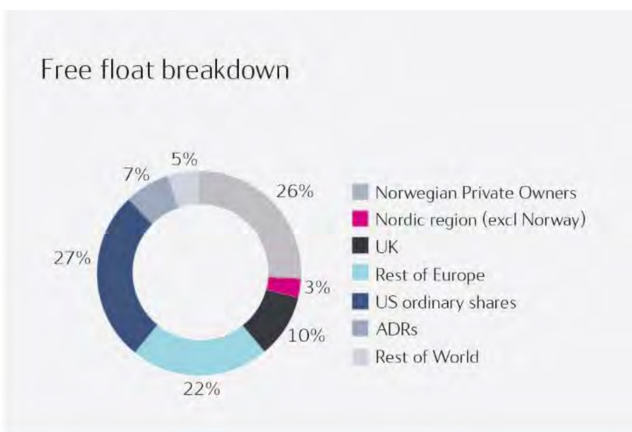
On 14 March 2018, the exchange rate announced by the Norges Bank for the Norwegian krone was USD 1.00 = NOK 7.7393

Fluctuations in the exchange rate between the NOK and USD will affect the amounts in USD received by holders of American Depositary Shares (ADSs) on the conversion of dividends, if any, paid in Norwegian kroner on the ordinary shares, and they may affect the USD price of the ADSs on the New York Stock Exchange.

MAJOR SHAREHOLDERS

The Norwegian State is the largest shareholder in Statoil, with a direct ownership interest of 67%. Its ownership interest is managed by the Norwegian Ministry of Petroleum and Energy.





Pursuant to the exchange ratio agreed in connection with the merger with Hydro's oil and gas activities, the State's ownership interest in the merged company was 62.5%, or 1,992,959,739 shares, on 1 October 2007. In accordance with the Norwegian parliament's decision of 2001 concerning a minimum state shareholding in Statoil of two-thirds, the Government built up the State's ownership interest in Statoil by buying shares in the market during the period from June 2008 to March 2009. In March 2009, the Government announced that the State's direct ownership interest had reached 67% and the Government's direct purchase of Statoil shares was completed.

As of 31 December2017, the Norwegian State had a 67% direct ownership interest in Statoil and a 3.30% indirect interest through the National Insurance Fund (Folketrygdfondet), totaling 70.30%. See note 17 Shareholder's equity and dividends regarding the Norwegian State and the scrip option.

Statoil has one class of shares, and each share confers one vote at the general meeting. The Norwegian State does not have any voting rights that differ from the rights of other ordinary shareholders. Pursuant to the Norwegian Public Limited Liability Companies Act, a majority of at least two-thirds of the votes cast as well as of the votes represented at a general meeting is required to amend our articles of association. As long as the Norwegian State owns more than one-third of our shares, it will be able to prevent any amendments to our articles of association. Since the Norwegian State, acting through the Norwegian Minister of Petroleum and Energy, has in excess of two-thirds of the shares in the company, it has sole power to amend our articles of association. In addition, as majority shareholder, the Norwegian State has the power to control any decision at general meetings of our shareholders that requires a majority vote, including the election of the majority of the corporate assembly, which has the power to elect our board of directors and approve the dividend proposed by the board of directors.

The Norwegian State endorses the principles set out in "The Norwegian Code of Practice for Corporate Governance", and it has stated that it expects companies in which the State has ownership interests to adhere to the code. The principle of ensuring equal treatment of different groups of shareholders is a key element in the State's own guidelines. In companies in which the State is a shareholder together with others, the State wishes to exercise the same rights and obligations as any other shareholder and not act in a manner that has a detrimental effect on the rights or financial interests of other shareholders. In addition to the principle of equal treatment of shareholders, emphasis is also placed on transparency in relation to the State's ownership and on the general meeting being the correct arena for owner decisions and formal resolutions.

	Shareholders at December 2017	Number of Shares	Ownership in %
1	Government of Norway	2,226,522,461	67.00%
2	Folketrygdfondet	109,611,652	3.30%

EXCHANGE CONTROLS AND LIMITATIONS

Under Norwegian foreign exchange controls currently in effect, transfers of capital to and from Norway are not subject to prior government approval. An exception applies to the physical transfer of payments in currency exceeding certain thresholds, which must be declared to the Norwegian custom authorities. This means that non-Norwegian resident shareholders may receive dividend payments without Norwegian exchange control consent as long as the payment is made through a licensed bank or other licensed payment institution.

There are no restrictions affecting the rights of non-Norwegian residents or foreign owners to hold or vote for our shares.

5.2 USE AND RECONCILIATION OF NON-GAAP FINANCIAL MEASURES

Since 2007, Statoil has been preparing the Consolidated financial statements in accordance with International Financial Reporting Standards (IFRS) as adopted by the European union (EU) and as issued by the International Accounting Standards Board. The IFRS standards have been applied consistently to all periods presented in the 2017 Consolidated financial statements.

Statoil is subject to SEC regulations regarding the use of non-GAAP financial measures in public disclosures. Non-GAAP financial measures are defined as numerical measures that either exclude or include amounts that are not excluded or included in the comparable measures calculated and presented in accordance with generally accepted accounting principles. The following financial measures may be considered non-GAAP financial measures:

a) Net debt to capital employed ratio before adjustments and Net debt to capital employed ratio adjusted
b) Return on average capital employed (ROACE)
c) Organic capital expenditures
d) Free cash flow
e) Adjusted earnings after tax

a) Net debt to capital employed ratio

In Statoil's view, the calculated net debt to capital employed ratio before adjustments and net debt to capital employed ratio adjusted gives an alternative picture of the current debt situation than gross interest-bearing financial debt.

The calculation is based on gross interest bearing financial debt in the balance sheet and adjusted for cash, cash equivalents and current financial investments. Certain adjustments are made, e.g. collateral deposits classified as cash and cash equivalents in the Consolidated balance sheet are considered non-cash in the non-GAAP calculations. The financial investments held in Statoil Forsikring AS are excluded in the non-GAAP calculations as they are deemed restricted. These two adjustments increase net debt and give a more prudent definition of the net debt to capital employed ratio than if the IFRS based definition was to be used. Similarly, certain net interest-bearing debts incurred from activities pursuant to the Owners Instruction from the Norwegian State are set off against receivables on the Norwegian State's direct financial interest (SDFI). Net interest-bearing debt adjusted for these items is included in the average capital employed. The table below reconciles the net interest-bearing debt adjusted, the capital employed and the net debt to capital employed adjusted ratio with the most directly comparable financial measure or measures calculated in accordance with IFRS.

Calculation of capital employed and net debt to capital employed ratio (in USD million, except percentages)	For the year ended 31 December 2017	2016	2015
Shareholders' equity	**39,861**	35,072	40,271
Non-controlling interests	**24**	27	36
Total equity (A)	**39,885**	35,099	40,307
Current finance debt	**4,091**	3,674	2,326
Non-current finance debt	**24,183**	27,999	29,965
Gross interest-bearing debt (B)	**28,274**	31,673	32,291
Cash and cash equivalents	**4,390**	5,090	8,623
Current financial investments	**8,448**	8,211	9,817
Cash and cash equivalents and current financial investment (C)	**12,837**	13,301	18,440
Net interest-bearing debt before adjustments (B1) (B-C)	**15,437**	18,372	13,852
Other interest-bearing elements 1)	**1,014**	1,216	1,111
Marketing instruction adjustment 2)	**(164)**	(199)	(214)
Net interest-bearing debt adjusted (B2)	**16,287**	19,389	14,748
Calculation of capital employed:			
Capital employed before adjustments to net interest-bearing debt (A+B1)	**55,322**	53,471	54,159
Capital employed adjusted (A+B2)	**56,172**	54,488	55,055
Calculated net debt to capital employed:			
Net debt to capital employed before adjustments (B1/(A+B1)	**27.9%**	34.4%	25.6%
Net debt to capital employed adjusted (B2/(A+B2)	**29.0%**	35.6%	26.8%

1) Other interest-bearing elements are cash and cash equivalents adjustments regarding collateral deposits classified as cash and cash equivalents in the Consolidated balance sheet but considered as non-cash in the non-GAAP calculations as well as financial investments in Statoil Forsikring AS classified as current financial investments.

2) Marketing instruction adjustment is an adjustment to gross interest-bearing financial debt due to the SDFI part of the financial lease in the Snøhvit vessels that are included in Statoil's Consolidated balance sheet.

b) Return on average capital employed (ROACE)

This measure provides useful information for both the group and investors about performance during the period under evaluation. Statoil uses ROACE to measure the return on capital employed, regardless of whether the financing is through equity or debt. The use of ROACE should not be viewed as an alternative to income before financial items, income taxes and minority interest, or to net income, which are measures calculated in accordance with GAAP or ratios based on these figures. ROACE was 8.2% in 2017, compared to negative 0.4% in 2016 and 4.1% in 2015. The change from 2016 is due to an increase in adjusted earnings after tax.

Calculated ROACE based on Adjusted earnings after tax and capital employed adjusted (in USD million, except percentages)	For the year ended 31 December 2017	2016	2015
Adjusted earnings after tax (A)	4,528	(208)	2,465
Average capital employed adjusted (B)	55,330	54,772	59,712
Calculated ROACE based on Adjusted earnings after tax and capital employed adjusted (A/B)	8.2%	-0.4%	4.1%

c) Organic capital expenditures

Organic capital expenditures are capital expenditures excluding acquisitions, capital leases and other investments with significant different cash flow pattern. In 2017, a total of USD 1.4 billion were excluded from the organic capital expenditures. Among items excluded from the organic capital expenditure in 2017 were signature bonus for the Carcara North production sharing contract in Brazil, acquisition cost for a 10% stake in the BM-S-8 licence in Brazil and bonus for the extension of the Azeri-Chirag-Deepwater Gunashli (ACG) Production Sharing Agreement in Azerbaijan.

In 2016, a total of USD 4.0 billion were excluded from the organic capital expenditures. Among items excluded from the organic capital expenditure in 2016 were investment in ownership in Lundin Petroleum AB, acquisition of a 66% operated interest in the offshore licence BM-S-8 in Brazil and acquisition of a 50% stake in the Arkona offshore wind farm in Germany.

For more information, see note 3 Segment, line item Additions to PP&E, intangibles and equity accounted investments and, note 4 Acquisitions and divestments to the Consolidated financial statements.

d) Free cash flow

Free cash flow includes the following line items in the Consolidated statement of cash flows: Cash flows provided by operating activities before taxes paid and working capital items, taxes paid, capital expenditures and investments, (increase) decrease in other items interest bearing, proceeds from sale of assets and businesses and dividend paid.

e) Adjusted earnings after tax

Adjusted earnings are based on net operating income and adjusts for certain items affecting the income for the period in order to separate out effects that management considers may not be well correlated to Statoil's underlying operational performance in the individual reporting period. Management considers adjusted earnings to be a supplemental measure to Statoil's IFRS measures that provides an indication of Statoil's underlying operational performance in the period and facilitates an alternative understanding of operational trends between the periods, and uses this metric in determining variable remuneration and awards of LTI grants to members of the corporate executive committee. Adjusted earnings adjust for the following items:

- Certain gas contracts are, due to pricing or delivery conditions, deemed to contain embedded derivatives, required to be carried at fair value. Certain transactions related to historical divestments include contingent consideration, carried at fair value. The accounting impacts of changes in fair value of the aforementioned are excluded from adjusted earnings. In addition, adjustments are also made for changes in the unrealised **fair value of derivatives** related to some natural gas trading contracts. Due to the nature of these gas sales contracts, these are classified as financial derivatives to be measured at fair value at the balance sheet date. Unrealised gains and losses on these contracts reflect the value of the difference between current market gas prices and the actual prices to be realised under the gas sales contracts. Only realised gains and losses on these contracts are reflected in adjusted earnings. This presentation best reflects the underlying performance of the business as it replaces the effect of temporary timing differences associated with the re-measurements of the derivatives to fair value at the balance sheet date with actual realised gains and losses for the period
- **Periodisation of inventory hedging effect**: Commercial storage is hedged in the paper market. Commercial storage is accounted for by using the lower of cost and market price. If market prices increase above cost price, there will be a loss in the IFRS income statement since the derivatives always reflect changes in the market price. An adjustment is made to reflect the unrealised market value of the commercial storage. As a result, loss on derivatives is matched by a similar adjustment for the exposure being managed. If market prices decrease below cost price, the write-down and the derivative effect in the IFRS income statement will offset each other and no adjustment is made
- **Over/underlift** is accounted for using the sales method and therefore revenues are reflected in the period the product is sold rather than in the period it is produced. The over/underlift position depends on a number of factors related to our lifting programme and the way it corresponds to our entitlement share of production. The effect on income for the period is therefore adjusted, to show estimated revenues and associated costs based upon the production for the period which management

believes reflects operational performance and increase comparability with peers

- Statoil holds **operational storage** which is not hedged in the paper market due to inventory strategies. Cost of goods sold is measured based on the FIFO (first-in, first-out) method, and includes realised gains or losses that arise due to changes in market prices. These gains or losses will fluctuate from one period to another and are not considered part of the underlying operations for the period
- **Impairment** and **reversal of impairment** are excluded from adjusted earnings since they affect the economics of an asset for the lifetime of that asset; not only the period in which it is impaired or the impairment is reversed. Impairment and reversal of impairment can impact both the exploration expenses and the depreciation, amortisation and impairment line items
- **Gain or loss from sales of assets** is eliminated from the measure since the gain or loss does not give an indication of future performance or periodic performance; such a gain or loss is related to the cumulative value creation from the time the asset is acquired until it is sold
- **Internal unrealised profit on inventories**: Volumes derived from equity oil inventory will vary depending on several factors and inventory strategies, i.e. level of crude oil in inventory, equity oil used in the refining process and level of in-transit cargoes. Internal profit related to volumes sold between entities in the group, and still in inventory at period end, is eliminated according to IFRS (write down to production cost). The proportion of realised versus unrealised gain will fluctuate from one period to another due to inventory strategies and accordingly impact net operating income. This impact is not assessed to be a part of the underlying operational performance, and elimination of internal profit related to equity volumes is excluded in adjusted earnings
- **Other items of income and expense** are adjusted when the impacts on income in the period are not reflective of Statoil's underlying operational performance in the reporting period. Such items may be unusual or infrequent transactions but they may also include transactions that are significant which would not necessarily qualify as either unusual or infrequent. Other items can include transactions such as provisions related to reorganisation, early retirement, etc

The measure **adjusted earnings after tax** excludes net financial items and the associated tax effects on net financial items. It is based on adjusted earnings less the tax effects on all elements included in adjusted earnings (or calculated tax on operating income and on each of the adjusting items using an estimated marginal tax rate). In addition, tax effect related to tax exposure items not related to the individual reporting period is excluded from adjusted earnings after tax. Management considers adjusted earnings after tax, which reflects a normalised tax charge associated with its operational performance excluding the impact of financing, to be a supplemental measure to Statoil's net income. Certain net USD denominated financial positions are held by group companies that have a USD functional currency that is different from the currency in which the taxable income is measured. As currency exchange rates change between periods, the basis for measuring net financial items for IFRS will change disproportionally with taxable income which includes exchange gains and losses from translating the net USD denominated financial positions into the currency of the applicable tax return. Therefore, the effective tax rate may be significantly higher or lower than the statutory tax rate for any given period.

Management considers that adjusted earnings after tax provides an alternative indication of the taxes associated with underlying operational performance in the period (excluding financing), and therefore facilitates an alternative comparison between periods. However, the adjusted taxes included in adjusted earnings after tax should not be considered indicative of the amount of current or total tax expense (or taxes payable) for the period.

Adjusted earnings and adjusted earnings after tax should be considered additional measures rather than substitutes for net operating income and net income, which are the most directly comparable IFRS measures. There are material limitations associated with the use of adjusted earnings and adjusted earnings after tax compared with the IFRS measures since they do not include all the items of revenues/gains or expenses/losses of Statoil which are needed to evaluate its profitability on an overall basis. Adjusted earnings and adjusted earnings after tax are only intended to be indicative of the underlying developments in trends of Statoil's on-going operations for the production, manufacturing and marketing of its products and exclude pre- and post-tax impacts of net financial items. Statoil reflect such underlying development in its operations by eliminating the effects of certain items that may not be directly associated with the period's operations or financing. However, for that reason, adjusted earnings and adjusted earnings after tax are not complete measures of profitability. The measures should therefore not be used in isolation.

Adjusted earnings equal the sum of net operating income less all applicable adjustments. Adjusted earnings after tax equals the sum of net operating income less income tax in business areas and adjustments to operating income taking the applicable marginal tax into consideration. See the table below for details.

Tax on adjusted earnings	**(8,110)**	**(4,277)**
Adjusted earnings after tax	**4,528**	**(208)**

5.3 LEGAL PROCEEDINGS

Statoil is involved in a number of proceedings globally concerning matters arising in connection with the conduct of its business. No further update is provided on previously reported legal or arbitration proceedings which Statoil does not believe will, individually or in the aggregate, have a significant effect on Statoil's financial position, profitability, results of operations or liquidity. See also note 9 Income taxes and note 23 Other commitments, contingent liabilities and contingent assets to the Consolidated financial statements.

5.4 PAYMENTS TO GOVERNMENTS

Reporting in accordance with the Norwegian transparency rule
Pursuant to Norwegian Accounting Act §3-3d and the Norwegian Security Trading Act §5-5a, Statoil has prepared the report payments to governments. The companies involved in extractive and logging activities are required to disclose payments they made to governments at project and country level and additional contextual information, consisting of certain legal, monetary, numerical and production volume information, related to the extractive part of the operations or to the entire group.

Basis for preparation
The regulation requires Statoil to prepare a consolidated report for the previous financial year on direct payments to governments, including payments made by subsidiaries, joint operations and joint ventures, or on behalf of such entities involved in extractive activities.

Scope and validity
Statoil's extractive activities covering the exploration, prospecting, discovery, development and extraction of oil and natural gas are included in this report. Additional contextual information is disclosed for legal entities engaged in extractive activities or for the entire group, on a country or legal entity basis, as applicable.

Reporting principles
The report includes payments made directly by Statoil to governments, such as taxes and royalties. Payments made by the operator of an oil and/or gas licence on behalf of the licensed partners, such as area fees, are also included in this report. For assets where Statoil is the operator, the full payment made on behalf of the whole partnership (100%) is included. No payment will be disclosed in cases where Statoil is not the operator, unless the operator is a state-owned entity and it is possible to distinguish the payment from other cost recovery items.

Host government production entitlements paid by the licence operator are also included in the report. The size of such entitlements can in some cases constitute the most significant payments to governments.

For some of our projects, we have established a subsidiary to hold the ownership in a joint venture. For these projects, payments may be made to governments in the country of operation as well as to governments in the country where the subsidiary resides.

Payments to governments are reported in the year that the actual cash payment was made (cash principle). Amounts included as contextual information are reported in the year the transaction relates to (accrual principle), regardless of when the cash flows occurred. Amounts are subject to rounding. Rounding differences may occur in summary tables.

Changes from last year
Following the revised Norwegian regulation ("Forskrift om land-for-land rapportering") additional financial contextual information was included from 2017 in the section Contextual information at Statoil group level.

Government
In the context of this report, a government is defined as any national, regional or local authority of a country. It includes any department, agency or undertaking (i.e. corporation) controlled by that government.

Project definition
A project is defined as the operational activity governed by a single contract, licence, lease, concession or similar legal agreement and that forms the basis for payment obligations to a government.

Payments not directly linked to a specific project but levied at the company entity level, are reported at that level.

Materiality
Payments constitute a single payment, or a series of related payments that equal or exceed NOK 800,000 (approximately USD 100,000 at average annual 2017 exchange rates) during the year. Payments below the threshold in a given country will not be included in the overview of projects and payments.

Reporting currency
Payments to governments in foreign currencies (other than USD) are converted to USD using the average annual 2017 exchange rate.

Payment types disclosed at project or legal entity level that are relevant for Statoil
The following payment types are disclosed for legal entities involved in extractive activities. They are presented on a cash basis, net of any interest expenses, whether paid in cash or in-kind. In-kind payments are reported in millions of barrels of oil equivalent and the equivalent cash value.

- Tax levied on the income, production or profits of companies includes severance tax and taxes paid in-kind. The value of taxes paid in-kind is calculated based on the market price at the time of the in-kind payment. Taxes levied on consumption, such as value added tax, personal income tax, sales tax, withholding tax, property tax and environmental tax are excluded. Negative amounts represent tax refunds received from governments
- Royalties are usage-based payments for the right to the ongoing use of an asset
- Fees are typically levied on the right to use a geographical area for exploration, development and production and include rental fees, area fees, entry fees, concession fees and other considerations for licences and/or concessions. Administrative government fees that are not specifically related to the extractive activities or to access extractive resources, are excluded

- Bonuses are payments made when signing an oil and gas lease, when discovering natural resources and/or when production has commenced. Bonuses often include signature, discovery and production bonuses and are a commonly used payment type, depending on the petroleum fiscal regime. Bonuses can also include elements of social contribution
- Host government production entitlements are the host government's share of production after oil production has been allocated to cover costs and expenses under a production sharing agreement (PSA). Host government production entitlements are most often paid in-kind. The value of these payments is calculated based on the market price at the time of the in-kind payment. For some PSAs, the host government production entitlements are sold by the operator, and the related costs are split between the partners. For these contracts, Statoil does not make payments directly to governments, but to the operator.

Contextual information at country level

The report discloses contextual information for legal entities engaged in extractive activities in Statoil, as listed below. All information is disclosed in accordance with the accrual accounting principle.

- Investments are defined as additions to property, plant and equipment (including capitalised finance leases), capitalised exploration expenditures, intangible assets, long-term share investments and investments in associated companies
- Revenues associated with the production of crude oil and natural gas related to our extractive activities. Revenues include third party revenues and other income, inter-segment revenues and net income from equity accounted investments
- Cost shows the sum of operating expenses, SG&A (sales, general and administrative expenses) and exploration expenses, adjusted for net impairments
- Equity production volumes are the volumes that correspond to Statoil's ownership interest in a field and do not include production of the Norwegian State's share of oil and natural gas

Contextual information at entity level

The following contextual information is disclosed for all of Statoil's subsidiaries as of 31 December 2017:

- Country of incorporation is the jurisdiction in which the company is registered
- Country of operation is the country where the company performs its main activities
- Number of employees (per subsidiary) is based on the registered company location. The actual number of employees present in a country can deviate from the reported figures due to expatriation. In some subsidiaries there are no employees. These may purchase man-hours from other companies in the Statoil group, as applicable
- Net intercompany interest is the company's net intercompany interest expense (interest expense minus interest income) to subsidiaries in another jurisdiction. Interest between companies within the same jurisdiction is eliminated. Intercompany interest is the interest levied on long-term and short-term borrowings within the Statoil group
- Total revenue and other income as presented in the Consolidated statement of income, including third party revenues and other income, inter-company revenues and net income from equity accounted investments
- Income before tax as presented in the Consolidated statement of income
- Income tax expense as defined in note 9 to the Consolidated financial statements
- Income taxes paid are reconciled to the amount presented in the Consolidated statement of the cash flows and in addition include taxes paid in-kind in Algeria, Libya and Nigeria
- Retained earnings include the gains and losses accumulated by the companies together with currency translation adjustments and other comprehensive income. Being part of shareholders equity, retained earnings are presented as reported in Statoil accounting system for consolidation purposes
- The description of the core business activity is presented according to the business areas where the business operations take place. Each subsidiary is associated to a business area. Section 2.2 Business overview, Corporate structure under the Strategic report chapter of the annual report provides the descriptions of the business areas

ADDITIONAL INFORMATION

Consolidated overview

The consolidated overview below discloses the sum (total) of Statoil's payments to governments in each country, according to the payment type. The overview is based on the location of the receiving government. The total payments to each country may be different from the total payments disclosed in the overview of payments for each project in the report. This is because payments disclosed for each project relate to the country of operation, irrespective of the location of the receiving government.

In 2017, there is an upward shift in overall payments with increasing taxes and royalties paid following the higher prices and volumes in 2017 compared to 2016 as explained in the chapter 2.9 Financial review of the Strategic report in 20-F.

Payments to governments per country (in USD million)	Taxes	Royalties	Fees	Bonuses	Host government entitlements (value in USD million)	Host government entitlements (mmboe)	Total (value) 2017

Total 2016	4,607	125	122	16	1,593	40	6,463

This report covers payments made directly by Statoil to governments, such as taxes and royalties. Payments made by the operator of an oil and/or gas licence on behalf of the licensed partners, such as area fees, are included. For assets where Statoil is the operator, the full payment made on behalf of the whole partnership (100%) is reported. In cases, where Statoil is not the operator, payments are not disclosed, unless the operator is a state-owned entity and it is possible to distinguish the payment from other cost recovery items. Host government production entitlements paid by the licence operator are reported.

1) Algeria - Tax payments in-kind to Sonatrach of 3.6 mmboe were valued at USD 121.4 million.
2) Angola - Taxes paid in Angola include the settlement of dispute with the Angolian Ministry of Finance. For further information please refer to Note 23 Other commitments, contingent liabilities and contingent assets in the Consolidated financial statements
3) Brazil - Statoil paid USD 906.9 million in signature bonus related to the Carcará North block in the Santos basin as an operator on behalf of all partners. Statoil's share is USD 350 million.
4) Iran - National Iranian Oil Company (NIOC) settled, on behalf of Statoil, a prior year tax obligation of USD 5,13 million equivalent in Iranial Rial to the local tax authorities. The amount was settled towards historical recoverable taxes from NIOC to Statoil.
5) Libya - Tax payments in kind to Tax Department Libya of 0.5 mmboe were valued at USD 26.9 million.
6) Nigeria - Tax payments in-kind to Nigerian National Petroleum Corporation (NNPC) of 4.4 mmboe were valued at USD 282.4 million.
7) USA - Bakken is owned by Statoil Oil & Gas LP. Eagle Ford is owned by Statoil Texas Onshore Properties LLC. Appalachian basin is owned by Statoil USA Onshore Properties Inc.

Contextual information at country level

The contextual information on investments, revenues, cost and production volumes is disclosed for each country and relates only to the Statoil's entities engaged in extractive activities, covering the exploration, prospecting, discovery, development and extraction of oil and natural gas. The contextual information reported is based on data collected mainly for the purpose of financial reporting and is reconciled to the numbers reported for the Exploration and Production segments of Statoil.

1) Income tax expense as defined in note and 9 of the Consolidated financial statements
2) All intercompany balances and transactions arising from Statoil's internal transactions, have been eliminated in full. The relevant amounts are included in the consolidation eliminations line. Revenues column: the eliminations of intercompany revenues and netting of some intercompany costs. Income before tax column: the eliminations of intercompany dividend distribution and share impairment as well as foreign exchange gain on intergroup loan. Income tax expense column: tax effects of certain elimination entries. Retained earnings column: the entries here mainly relate to foreign currency translation effects in the consolidation process. Translation of results and financial position to presentation currency of USD is significantly affected by the investment in subsidiary, which has NOK as a functional currency. In turn, that subsidiary includes the results and financial position of its investments in foreign subsidiaries, which have USD functional currency
3) The retained earnings as presented in this report may be different compared to the figures in the statutory financial statement reported to the Norwegian company register (Brønnøysundregistrene). The main reason for the deviations relates to foreign currency translation, classification of capital contributions and differences in accounting principles.

Independent Limited Assurance Report to Statoil ASA on the Payments to governments report

We were engaged by management of Statoil ASA to report on Statoil ASA's Payments to governments report for the year ended 31 December 2017 ("the Report"), in the form of an independent limited assurance conclusion that based on our work performed and evidence obtained, nothing has come to our attention that causes us to believe that the Report, in all material respects, is not fairly stated

Statoil ASA's Responsibilities

The board of directors and management are responsible for properly preparing and presenting the Report that is free from material misstatement in accordance with the Norwegian Accounting Act §3-3d and the detailed regulation included in "Forskrift om land-for-land rapportering" and the reporting principles as set out in the Report and for the information contained therein. This responsibility includes: designing, implementing and maintaining internal control relevant to the preparation and presentation of the Report that is free from material misstatement, whether due to fraud or error.

The board of directors and management are also responsible for ensuring that management and staff involved with the preparation of the Report are properly trained, systems are properly updated and that any changes in reporting encompass all significant business units.

Our Responsibilities

Our responsibility is to examine the Report prepared by Statoil ASA and to report thereon in the form of an independent limited assurance conclusion based on the evidence obtained. We conducted our engagement in accordance with the International Standard for Assurance Engagements (ISAE) 3000: Assurance Engagements other than Audits or Reviews of Historical Financial Information, issued by the International Auditing and Assurance Standards Board. That standard requires that we plan and perform our procedures to obtain a meaningful level of assurance about whether the Report is properly prepared and presented, in all material respects, as the basis for our limited assurance conclusion.

The firm applies International Standard on Quality Control 1 and accordingly maintains a comprehensive system of quality control including documented policies and procedures regarding compliance with ethical requirements, professional standards and applicable legal and regulatory requirements.

We have complied with the Code of Ethics for Professional Accountants (IESBA Code) issued by the International Ethics Standards Board for Accountants, which is founded on fundamental principles of integrity, objectivity, professional competence and due care, confidentiality and professional behavior.

The procedures selected depend on our understanding of the Report prepared by Statoil ASA and other engagement circumstances, and our consideration of areas where material misstatements are likely to arise. In obtaining an understanding of the Report and other engagement circumstances, we have considered the process used to prepare the Report in order to design assurance procedures that are appropriate in the circumstances, but not for the purposes of expressing a conclusion as to the effectiveness of Statoil ASA's process or internal control over the preparation and presentation of the Report.

Our engagement also included: assessing the appropriateness of the Report, the suitability of the criteria used by Statoil ASA in preparing the Report in the circumstances of the engagement, evaluating the appropriateness of the methods and procedures used in the preparation of the Report. The procedures performed included inquiries, inspection of documents, analytical procedures, evaluating the appropriateness of quantification methods and reporting policies and agreeing or reconciling the Report with underlying records.

The procedures performed in a limited assurance engagement vary in nature and timing from, and are less in extent than for, a reasonable assurance engagement. Consequently, the level of assurance obtained in a limited assurance engagement is substantially lower than the assurance that would have been obtained had a reasonable assurance engagement been performed.

We do not express a reasonable assurance conclusion about whether the Report has been prepared and presented, in all material respects, in accordance with the Norwegian Accounting Act §3-3d and the detailed regulation included in "Forskrift om land-for-land rapportering" and the reporting principles as set out in the Report and for the information contained therein.

PUBLIC COPY - CONFIDENTIAL INFORMATION REMOVED

ADDITIONAL INFORMATION

Limited Assurance Conclusion
Our conclusion has been formed on the basis of, and is subject to, the matters outlined in this report. We believe that the evidence we have obtained is sufficient and appropriate to provide a basis for our conclusion.

Based on the procedures performed and the evidence obtained nothing has come to our attention that causes us to believe that the Report for the year ended 31 December 2016 is not prepared and presented, in all material respects, in accordance with the Norwegian Accounting Act §3-3d and the detailed regulation included in "Forskrift om land-for-land rapportering" and the reporting principles as set out in the Report.

5.5 STATEMENTS ON THIS REPORT

Board statement on Reporting of payments to governments

Today, the board of directors and the chief executive officer have reviewed and approved the board of director's report prepared in accordance with the Norwegian Securities Trading Act section 5-5a regarding Reporting on payments to governments as of 31 December 2017.

To the best of our knowledge, we confirm that:

- The information presented in the report has been prepared in accordance with the requirements of the Norwegian Securities Trading Act section 5-5a and associated regulations

Statement on compliance

Today, the board of directors, the chief executive officer and the chief financial officer reviewed and approved the 2017 Annual report and Form 20-F, which includes the board of directors' report and the Statoil ASA Consolidated and parent company annual financial statements as of 31 December 2017.

To the best of our knowledge, we confirm that:

- the Statoil Consolidated annual financial statements for 2017 have been prepared in accordance with IFRS and IFRIC as adopted by the European Union (EU), IFRS as issued by the International Accounting Standards Board (IASB) and additional Norwegian disclosure requirements in the Norwegian Accounting Act, and that
- the parent company financial statements for Statoil ASA for 2017 have been prepared in accordance with simplified IFRS pursuant to the Norwegian Accounting Act §3-9 and regulations regarding simplified application of IFRS issued by the Norwegian Ministry of Finance, and that
- the board of directors' report for the group and the parent company is in accordance with the requirements in the Norwegian Accounting Act and Norwegian Accounting Standard no 16 and that
- the information presented in the financial statements gives a true and fair view of the company's and the group's assets, liabilities, financial position and results for the period viewed in their entirety, and that

- the board of directors' report gives a true and fair view of the development, performance, financial position, principle risks and uncertainties of the company and the group

Recommendation of the corporate assembly

Resolution:
At its meeting of 22 March 2018, the corporate assembly discussed the 2017 annual accounts of Statoil ASA and the Statoil group, and the board of directors' proposal for the allocation of net income.

The corporate assembly recommends that the annual accounts and the allocation of net income proposed by the board of directors are approved.

Oslo, 22 March 2018

Tone Cathrine Lunde Bakker
Chair of the corporate assembly

Equivalent measurements are based upon

- 1 barrel equals 0.134 tonnes of oil (33 degrees API)
- 1 barrel equals 42 US gallons
- 1 barrel equals 0.159 standard cubic metres
- 1 barrel of oil equivalent equals 1 barrel of crude oil
- 1 barrel of oil equivalent equals 159 standard cubic metres of natural gas
- 1 barrel of oil equivalent equals 5,612 cubic feet of natural gas
- 1 barrel of oil equivalent equals 0.0837 tonnes of NGLs
- 1 billion standard cubic metres of natural gas equals 1 million standard cubic metres of oil equivalent
- 1 cubic metre equals 35.3 cubic feet
- 1 kilometre equals 0.62 miles
- 1 square kilometre equals 0.39 square miles
- 1 square kilometre equals 247.105 acres
- 1 cubic metre of natural gas equals 1 standard cubic metre of natural gas
- 1,000 standard cubic meter gas equals 1 standard cubic meter oil equivalent

ADDITIONAL INFORMATION

- 1,000 standard cubic metres of natural gas equals 6.29 boe
- 1 standard cubic foot equals 0.0283 standard cubic metres
- 1 standard cubic foot equals 1000 British thermal units (btu)
- 1 tonne of NGLs equals 1.9 standard cubic metres of oil equivalent
- 1 degree Celsius equals minus 32 plus five-ninths of the number of degrees Fahrenheit

Miscellaneous terms

- Appraisal well: A well drilled to establish the extent and the size of a discovery
- Backwardation and contango are terms used in the crude oil market. Contango is a condition where forward prices exceed spot prices, so the forward curve is upward sloping. Backwardation is the opposite condition, where spot prices exceed forward prices, and the forward curve slopes downward
- Biofuel: A solid, liquid or gaseous fuel derived from relatively recently dead biological material and is distinguished from fossil fuels, which are derived from long dead biological material
- BOE (barrels of oil equivalent): A measure to quantify crude oil, natural gas liquids and natural gas amounts using the same basis. Natural gas volumes are converted to barrels on the basis of energy content
- Clastic reservoir systems: The integrated static and dynamic characteristics of a hydrocarbon reservoir formed by clastic rocks of a specific depositional sedimentary succession and its seal
- Condensates: The heavier natural gas components, such as pentane, hexane, iceptane and so forth, which are liquid under atmospheric pressure - also called natural gasoline or naphtha
- Crude oil, or oil: Includes condensate and natural gas liquids
- Development: The drilling, construction, and related activities following discovery that are necessary to begin production of crude oil and natural gas fields
- Downstream: The selling and distribution of products derived from upstream activities
- Equity and entitlement volumes of oil and gas: Equity volumes represent volumes produced under a production sharing agreement (PSA) that correspond to Statoil's percentage ownership in a particular field. Entitlement volumes, on the other hand, represent Statoil's share of the volumes distributed to the partners in the field, which are subject to deductions for, among other things, royalties and the host government's share of profit oil. Under the terms of a PSA, the amount of profit oil deducted from equity volumes will normally increase with the cumulative return on investment to the partners and/or production from the licence. The distinction between equity and entitlement is relevant to most PSA regimes, whereas it is not applicable in most concessionary regimes such as those in Norway, the UK, Canada and Brazil. The overview of equity production provides additional information for readers, as certain costs described in the profit and loss analysis were directly associated with equity volumes produced during the reported years
- Heavy oil: Crude oil with high viscosity (typically above 10 cp), and high specific gravity. The API classifies heavy oil as crudes with a gravity below 22.3° API. In addition to high viscosity and high specific gravity, heavy oils typically have low hydrogen-to-carbon ratios, high asphaltene, sulphur, nitrogen, and heavy-metal content, as well as higher acid numbers
- High grade: Relates to selectively harvesting goods, to cut the best and leave the rest. In reference to exploration and production this entails strict prioritisation and sequencing of drilling targets
- Hydro: A reference to the oil and energy activities of Norsk Hydro ASA, which merged with Statoil ASA
- IOR (improved oil recovery): Actual measures resulting in an increased oil recovery factor from a reservoir as compared with the expected value at a certain reference point in time. IOR comprises both of conventional and emerging technologies
- Liquids: Refers to oil, condensates and NGL
- LNG (liquefied natural gas): Lean gas - primarily methane - converted to liquid form through refrigeration to minus 163 degrees Celsius under atmospheric pressures
- LPG (liquefied petroleum gas): Consists primarily of propane and butane, which turn liquid under a pressure of six to seven atmospheres. LPG is shipped in special vessels
- Midstream: Processing, storage, and transport of crude oil, natural gas, natural gas liquids and sulphur
- Naphtha: inflammable oil obtained by the dry distillation of petroleum
- Natural gas: Petroleum that consists principally of light hydrocarbons. It can be divided into 1) lean gas, primarily methane but often containing some ethane and smaller quantities of heavier hydrocarbons (also called sales gas) and 2) wet gas, primarily ethane, propane and butane as well as smaller amounts of heavier hydrocarbons; partially liquid under atmospheric pressure
- NGL (natural gas liquids): Light hydrocarbons mainly consisting of ethane, propane and butane which are liquid under pressure at normal temperature
- Oil sands: A naturally occurring mixture of bitumen, water, sand, and clay. A heavy viscous form of crude oil
- Oil and gas value chains: Describes the value that is being added at each step from 1) exploring; 2) developing; 3) producing; 4) transportation and refining; and 5) marketing and distribution
- Organic capital expenditures: Capital expenditures excluding acquisitions, capital leases and other investments with significant different cash flow pattern
- Oslo Børs: Oslo stock exchange
- Peer group: Statoil's peer group consists of Statoil, Shell, ExxonMobil, OMV, ConocoPhillips, BP, Marathon, Chevron, Total, Repsol, Anadarko and Eni
- Petroleum: A collective term for hydrocarbons, whether solid, liquid or gaseous. Hydrocarbons are compounds formed from the elements hydrogen (H) and carbon (C). The proportion of different compounds, from methane and ethane up to the heaviest components, in a petroleum find varies from discovery to discovery. If a reservoir primarily contains light hydrocarbons, it is described as a gas field. If heavier hydrocarbons predominate, it is described as an oil field. An oil field may feature free gas above the oil and contain a quantity of light hydrocarbons, also called associated gas
- Proved reserves: Reserves claimed to have a reasonable certainty (normally at least 90% confidence) of being recoverable under existing economic and political conditions, and using existing technology. They are the only type the US Securities and Exchange Commission allows oil companies to report
- Refining reference margin: Is a typical average gross margin of our two refineries, Mongstad and Kalundborg. The reference margin will differ from the actual margin, due to variations in type of crude and other feedstock, throughput, product yields, freight cost, inventory etc
- Rig year: A measure of the number of equivalent rigs operating during a given period. It is calculated as the number of days rigs are operating divided by the number of days in the period
- Upstream: Includes the searching for potential underground or underwater oil and gas fields, drilling of exploratory wells, subsequent operating wells which bring the liquids and or natural gas to the surface
- VOC (volatile organic compounds): Organic chemical compounds that have high enough vapour pressures under normal conditions to significantly vaporise and enter the earth's atmosphere (e.g. gasses formed under loading and offloading of crude oil)

5.7 FORWARD-LOOKING STATEMENTS

This Annual Report on Form 20-F contains certain forward-looking statements that involve risks and uncertainties, in particular in the sections "Business overview" and "Strategy and market overview". In some cases, we use words such as "aim", "ambition", "anticipate", "believe", "continue", "could", "estimate", "expect", "intend", "likely", "objective", "outlook", "may", "plan", "schedule", "seek", "should", "strategy", "target", "will", "goal" and similar expressions to identify forward-looking statements. All statements other than statements of historical fact, including, among others, statements regarding future financial position, results of operations and cash flows; future financial ratios and information; future financial or operational portfolio or performance; future market position and conditions; future credit rating; future worldwide economic trends and market conditions; future investment in new energy solutions; business strategy; our name change; growth strategy; sales, trading and market strategies; research and development initiatives and strategy; market outlook and future economic projections and assumptions; competitive position; projected regularity and performance levels; expectations related to production levels, investment, exploration and development in connection with our recent transactions and projects, in Brazil, the NCS, Russia, Turkey, the United Kingdom and the United States; discoveries on the NCS and internationally; our joint venture with Rosneft; expectations related to our refining plants and terminals; our ownership share in Gassled; completion and results of acquisitions, disposals and other contractual arrangements and delivery commitments; reserve information; recovery factors and levels; future margins; projected returns; future levels or development of capacity, reserves or resources; future decline of mature fields; planned turnarounds and other maintenance activity; plans for cessation and decommissioning; oil and gas production forecasts and reporting; gas volume; growth, expectations and development of production, projects, pipelines or resources; estimates related to production and development levels and dates; operational expectations, estimates, schedules and costs; exploration and development activities, plans and expectations; projections and expectations for upstream and downstream activities; expectations relating to licences; expectations relating to leases; oil, gas, alternative fuel and energy prices and volatility; oil, gas, alternative fuel and energy supply and demand; renewable energy production, projects, our carbon footprint and carbon dioxide emissions, industry outlook and carbon capture and storage; processes related to human rights laws; organisational structure and policies; planned responses to climate change; technological innovation, implementation, position and expectations; future energy efficiency; projected operational costs or savings; our ability to create or improve value; future sources of financing; expectations regarding board composition, remuneration and application of the company performance modifier future levels of diversity; exploration and project development expenditure; our goal of safe and efficient operations; effectiveness of our internal policies and plans; our ability to manage our risk exposure; our liquidity levels and management; estimated or future liabilities, obligations or expenses; expected impact of currency and interest rate fluctuations; expectations related to contractual or financial counterparties; capital expenditure estimates and expectations; projected outcome, impact or timing of HSE regulations; HSE goals and objectives of management for future operations; expectations related to regulatory trends; impact of PSA effects; projected impact or timing of administrative or governmental rules, standards, decisions, standards or laws (including taxation laws); projected impact of legal claims against us; plans for capital distribution and share buy-backs and amounts of dividends are forward-looking statements. You should not place undue reliance on these forward-looking statements. Our actual results could differ materially from those anticipated in the forward-looking statements for many reasons, including the risks described above in "Risk review", and in "Operational review", and elsewhere in this Annual Report on Form 20-F.

These forward-looking statements reflect current views about future events and are, by their nature, subject to significant risks and uncertainties because they relate to events and depend on circumstances that will occur in the future. There are a number of factors that could cause actual results and developments to differ materially from those expressed or implied by these forward-looking statements, including levels of industry product supply, demand and pricing; exchange rate and interest rate fluctuations; the political and economic policies of Norway and other oil-producing countries; EU directives; general economic conditions; political and social stability and economic growth in relevant areas of the world; Euro-zone uncertainty; global political events and actions, including war, terrorism and sanctions; security breaches, including breaches of our digital infrastructure (cybersecurity); changes or uncertainty in or non-compliance with laws and governmental regulations; the timing of bringing new fields on stream; an inability to exploit growth opportunities; material differences from reserves estimates; unsuccessful drilling; an inability to find and develop reserves; ineffectiveness of crisis management systems; adverse changes in tax regimes; the development and use of new technology, particularly in the renewable energy sector; geological or technical difficulties; operational problems; operator error; inadequate insurance coverage; the lack of necessary transportation infrastructure when a field is in a remote location and other transportation problems; the actions of competitors; the actions of field partners; the actions of the Norwegian state as majority shareholder; counterparty defaults; natural disasters, adverse weather conditions, climate change, and other changes to business conditions; failure to meet our ethical and social standards; an inability to attract and retain personnel and other factors discussed elsewhere in this report.

Although we believe that the expectations reflected in the forward-looking statements are reasonable, we cannot assure you that our future results, level of activity, performance or achievements will meet these expectations. Moreover, neither we nor any other person assumes responsibility for the accuracy and completeness of the forward-looking statements. Unless we are required by law to update these statements, we will not necessarily update any of these statements after the date of this Annual Report, either to make them conform to actual results or changes in our expectations.

5.8 SIGNATURE PAGE

The registrant hereby certifies that it meets all of the requirements for filing on Form 20-F and that it has duly caused and authorised the undersigned to sign this Annual Report on its behalf.

STATOIL ASA
(Registrant)

Name: Hans Jakob Hegge
Title: Executive Vice President and Chief Financial Officer

Dated: 23 March 2018

5.9 EXHIBITS

The following exhibits are filed as part of this Annual Report:

Exhibit no	Description
Exhibit 1	Articles of Association of Statoil ASA, as amended, effective from 6 February 2018 (English translation).
Exhibit 2.1	Form of Indenture among Statoil ASA (formerly known as StatoilHydro ASA), Statoil Petroleum AS (formerly known as Statoil Hydro Petroleum AS) and Deutsche Bank Trust Company Americas (incorporated by reference to Exhibit 4.1 of Statoil ASA's and Statoil Petroleum AS's Post - Effective Amendment No.1 to their Registration Statement on Form F-3 (File No. 333-143339) filed with the Commission on 2 April 2009).
Exhibit 2.2	Amended and Restated Agency Agreement, dated as of 5 May 2017, by and among Statoil ASA, as Issuer, Statoil Petroleum AS as Guarantor, the Bank of New York Mellon, as Agent and the Bank of New York Mellon SA/NV, Luxembourg Branch as Paying Agent in respect of a €20,000,000 Euro Medium Term Note Programme.
Exhibit 2.3	Deed of Covenant, dated as of 5 February 2016, of Statoil ASA in respect of a €20,000,000 Euro Medium Term Notes Programme. (incorporated by reference to Exhibit 2.2 of Statoil's Annual Report on Form 20-F for the fiscal year ended December 31, 2016 (File no. 001-15200) (the "2016 20-F") filed with the Commission on March 17, 2017)
Exhibit 2.4	Deed of Guarantee, dated as of 5 February 2016, of Statoil Petroleum AS in respect of a €20,000,000 Euro Medium Term Notes Programme. (incorporated by reference to Exhibit 2.4 of Statoil's 2016 20-F filed with the Commission on March 17, 2017)
Exhibit 4(a)(i)	Technical Services Agreement between Gassco AS and Statoil Petroleum AS, dated November 24, 2010. (incorporated by reference to Exhibit 4(a)(i) of Statoil's 2016 Form 20-F (File no. 001-15200) filed with the Commission on March 17, 2017)
Exhibit 4(a)(ii)	Amendment no. 1, 2, 3, 4, 5 and 6, dated 17 October 2010, 19 February 2013, 15 December 2012, 17 September 2014, 15 December 2017 and 22 December 2017, respectively, to Technical Services Agreement between Gassco AS and Statoil Petroleum AS, dated November 24, 2010.
Exhibit 4(c)	Employment agreement with Eldar Sætre as of 4 February 2015. (incorporated by reference to Exhibit 4(c) of Statoil's 2016 20-F (File no. 001-15200) filed with the Commission on March 17, 2017)
Exhibit 7	Calculation of ratio of earnings to fixed charges.
Exhibit 8	Subsidiaries (see Significant subsidiaries included in section 2.7 Corporate in this Annual Report).
Exhibit 12.1	Rule 13a-14(a) Certification of Chief Executive Officer.
Exhibit 12.2	Rule 13a-14(a) Certification of Chief Financial Officer.
Exhibit 13.1	Rule 13a-14(b) Certification of Chief Executive Officer.[1)]
Exhibit 13.2	Rule 13a-14(b) Certification of Chief Financial Officer.[1)]
Exhibit 15(a)(i)	Consent of KPMG AS.
Exhibit 15(a)(ii)	Consent of DeGolyer and MacNaughton.
Exhibit 15(a)(iii)	Report of DeGolyer and MacNaughton.
Exhibit 101	Interactive Data Files (formatted in XBRL (Extensible Business Reporting Language)). Submitted electronically with the Annual Report on Form 20-F.

1) Furnished only.

The total amount of long term debt securities of Statoil ASA and its subsidiaries authorised under instruments other than those listed above does not exceed 10% of the total assets of Statoil ASA and its subsidiaries on a consolidated basis. The company agrees to furnish copies of any such instruments to the Commission upon request.

	Oil and Gas Disclosures	2.8 (Operational performance—Proved oil and gas reserves); 2.8 (Operational performance—Production volumes and prices); Exhibit 15(a)(iii)
Item 4A.	Unresolved Staff Comments	None
Item 5.	Operating and Financial Review and Prospects	
	A. Operating Results	2.7 (Corporate—Applicable laws and regulations); 2.9 (Financial review); 2.10 (Liquidity and capital resources—Impact of reduced prices); 2.11 (Risk review—Risk management—Managing operational risks); 2.11 (Risk review—Risk management—Managing financial risks); note 25 (Financial instruments: fair value measurement and sensitivity analysis of market risk) to Statoil Consolidated financial statements
	B. Liquidity and Capital Resources	2.10 (Liquidity and capital resources); 2.11 (Risk review—Risk management); notes 5 (Financial risk management), 15 (Trades and other receivables); 16 (Cash and cash equivalents); 18 (Finance debt), 23 (Other commitments, contingent liabilities and contingent assets) and 25 (Financial instruments: fair value measurement and sensitivity analysis of market risk) to Statoil Consolidated financial statements
	C. Research and development, Patents and Licences, etc.	2.2 (Business overview—Research and development); note 7 (Other expenses) to Statoil Consolidated financial statements
	D. Trend Information	passim
	E. Off-Balance Sheet Arrangements	2.10 (Liquidity and capital resources—Principal Contractual obligations); 2.10 (Liquidity and capital resources—Off balance sheet arrangements); notes 22 (Leases) and 23 (Other commitments, contingent liabilities and contingent assets) to Statoil Consolidated financial statements
	F. Tabular Disclosure of Contractual Obligations	2.10 (Liquidity and capital resources—Principal contractual obligations)
	G. Safe Harbor	5.7 (Forward-Looking Statements)
Item 6.	Directors, Senior Management and Employees	

	A. Directors and Senior Management	3.8 (Corporate assembly, board of directors and management)
	B. Compensation	3.11 (Remuneration to the board of directors an corporate assembly); 3.12 (Remuneration to the corporate executive committee);
	C. Board Practices	3.8 (Corporate assembly, board of directors and management); 3.9 (The work of the board of directors—Audit committee; Compensation and executive development committee)
	D. Employees	2.13 (Our people—Employees in Statoil); 2.13 (Our people—Unions and representatives)
	E. Share Ownership	3.11 (Remuneration to the board of directors an corporate assembly); 3.12 (Remuneration to the corporate executive committee); 5.1 (Shareholder information—Shares purchased by the issuer—Statoil's share savings plan)
Item 7.	Major Shareholders and Related Party Transactions	
	A. Major Shareholders	5.1 (Shareholder information—Major shareholders)
	B. Related Party Transactions	2.7 (Corporate—Related party transactions); note 24 (Related parties) to Statoil Consolidated financial statement
	C. Interests of Experts and Counsel	N/A
Item 8.	Financial Information	
	A. Consolidated Statements and Other Financial Information	3.3 (Equity and dividends); 4.1 (Statoil Consolidated financial statements); 5.1 (Shareholder information—Dividend policy and dividends); 5.3 (Legal proceedings)
	B. Significant Changes	Note 28 (Subsequent events) to Statoil Consolidated financial statements)
Item 9.	The Offer and Listing	
	A. Offer and Listing Details	5.1 (Shareholder information); 5.1 (Shareholder information—Share Prices)
	B. Plan of Distribution	N/A
	C. Markets	5.1 (Shareholder Information)
	D. Selling Shareholders	N/A
	E. Dilution	N/A
	F. Expenses of the Issue	N/A
Item 10.	Additional Information	
	A. Share Capital	N/A
	B. Memorandum and Articles of Association	2.11 (Risk review—Risks related to state ownership); 3.1 (Implementation and reporting—Articles of association); 3.6 (General meeting of shareholders); 5.1 (Shareholder information); 5.1 (Shareholder Information—Major Shareholders) and note 17 (Shareholders' Equity and dividends) to Statoil Consolidated financial statements
	C. Material Contracts	N/A
	D. Exchange Controls	5.1 (Shareholder information—Exchange controls and limitations)
	E. Taxation	5.1 (Shareholder information—Taxation)
	F. Dividends and Paying Agents	N/A
	G. Statements by Experts	N/A
	H. Documents On Display	About the Report
	I. Subsidiary Information	N/A
Item 11.	Quantitative and Qualitative Disclosures About Market Risk	2.11 (Risk review—Risk management); notes 5 (Financial risk management) and 25 (Financial instruments: fair value measurement and sensitivity analysis of market risk) to Statoil Consolidated financial statements
Item 12.	Description of Securities Other than Equity Securities	
	A. Debt Securities	N/A
	B. Warrants and Rights	N/A
	C. Other Securities	N/A
	D. American Depositary Shares	5.1 (Shareholder information—Statoil ADR programme fees)
Item 13.	Defaults, Dividend Arrearages and Delinquencies	None
Item 14.	Material Modifications to the Rights of Security Holders and Use of	None

ADDITIONAL INFORMATION

	Proceeds	
Item 15.	Controls and Procedures	3.10 (Risk management and internal control); note 28 Condensed consolidated financial information related to guaranteed debt securities to Statoil Consolidated financial statements
Item 16A.	Audit Committee Financial Expert	3.9 (The work of the board of directors—Audit committee)
Item 16B.	Code of Ethics	3.10 (Risk management and internal control)
Item 16C.	Principal Accountant Fees and Services	3.15 (External Auditor)
Item 16D.	Exemptions from the Listing Standards for Audit Committees	3.1 (Implementation and reporting—Compliance with NYSE listing rules)
Item 16E.	Purchases of Equity Securities by the Issuer and Affiliated Purchases	5.1 (Shareholder Information—Shares purchased by the Issuer)
Item 16F.	Changes in Registrant's Certifying Accountant	N/A
Item 16G.	Corporate Governance	3.1 (Implementation and reporting—Compliance with NYSE listing rules)
Item 16H	Mine Safety Disclosure	None
Item 17.	Financial Statements	N/A
Item 18.	Financial Statements	4.1 (Statoil Consolidated financial statements)

(Name, Telephone, E-mail and/or Facsimile number and Address of Company Contact Person)

Securities registered or to be registered pursuant to Section 12(b) of the Act:

Title of Each Class	Name of Each Exchange On Which Registered
American Depositary Shares	**New York Stock Exchange**
Ordinary shares, nominal value of NOK 2.50 each	**New York Stock Exchange***

*Listed, not for trading, but only in connection with the registration of American Depositary Shares, pursuant to the requirements of the Securities and Exchange Commission

Securities registered or to be registered pursuant to Section 12(g) of the Act: **None**

Securities for which there is a reporting obligation pursuant to Section 15(d) of the Act: **None**

ADDITIONAL INFORMATION

Indicate the number of outstanding shares of each of the issuer's classes of capital or common stock as of the close of the period covered by the annual report.

Ordinary shares of NOK 2.50 each **3,323,167,853**

Indicate by check mark if the registrant is a well-known seasoned issuer, as defined in Rule 405 of the Securities Act.

☒ Yes ☐ No

If this report is an annual or transition report, indicate by check mark if the registrant is not required to file reports pursuant to Section 13 or 15(d) of the Securities Exchange Act of 1934.

☐ Yes ☒ No

Note – Checking the box above will not relieve any registrant required to file reports pursuant to Section 13 or 15(d) of the Securities Exchange Act of 1934 from their obligations under those Sections.

Indicate by check mark whether the registrant: (1) has filed all reports required to be filed by Section 13 or 15(d) of the Securities Exchange Act of 1934 during the preceding 12 months (or for such shorter period that the registrant was required to file such reports), and (2) has been subject to such filing requirements for the past 90 days.

☒ Yes ☐ No

Indicate by check mark whether the registrant has submitted electronically and posted on its corporate Web site, if any, every Interactive Data File required to be submitted and posted pursuant to Rule 405 of Regulation S-T (§232.405 of this chapter) during the preceding 12 months (or for such shorter period that the registrant was required to submit and post such files).

☒ Yes ☐ No

Indicate by check mark whether the registrant is a large accelerated filer, an accelerated filer, or a non-accelerated filer. See definition of "accelerated filer and large accelerated filer" in Rule 12b-2 of the Exchange Act. (Check one):

Large accelerated filer ☒ Accelerated filer ☐ Non-accelerated filer ☐ Emerging growth company ☐

If an emerging growth company that prepares its financial statements in accordance with U.S. GAAP, indicate by check mark if the registrant has elected not to use the extended transition period for complying with any new or revised financial accounting standards† provided pursuant to Section 13(a) of the Exchange Act. ☐

† The term "new or revised financial accounting standard" refers to any update issued by the Financial Accounting Standards Board to its Accounting Standards Codification after April 5, 2012.

Indicate by check mark which basis of accounting the registrant has used to prepare the financial statements included in this filing:

U.S. GAAP ☐ International Financial Reporting Standards as issued by the International Accounting Standards Board ☒ Other ☐

If "Other" has been checked in response to the previous question, indicate by check mark which financial statement item the registrant has elected to follow.

Item 17 ☐
Item 18 ☐

If this is an annual report, indicate by check mark whether the registrant is a shell company (as defined in Rule 12b-2 of the Exchange Act).

☐ Yes ☒ No

2016 Annual Report and Form 20-F

2016 Annual Report and Form 20-F

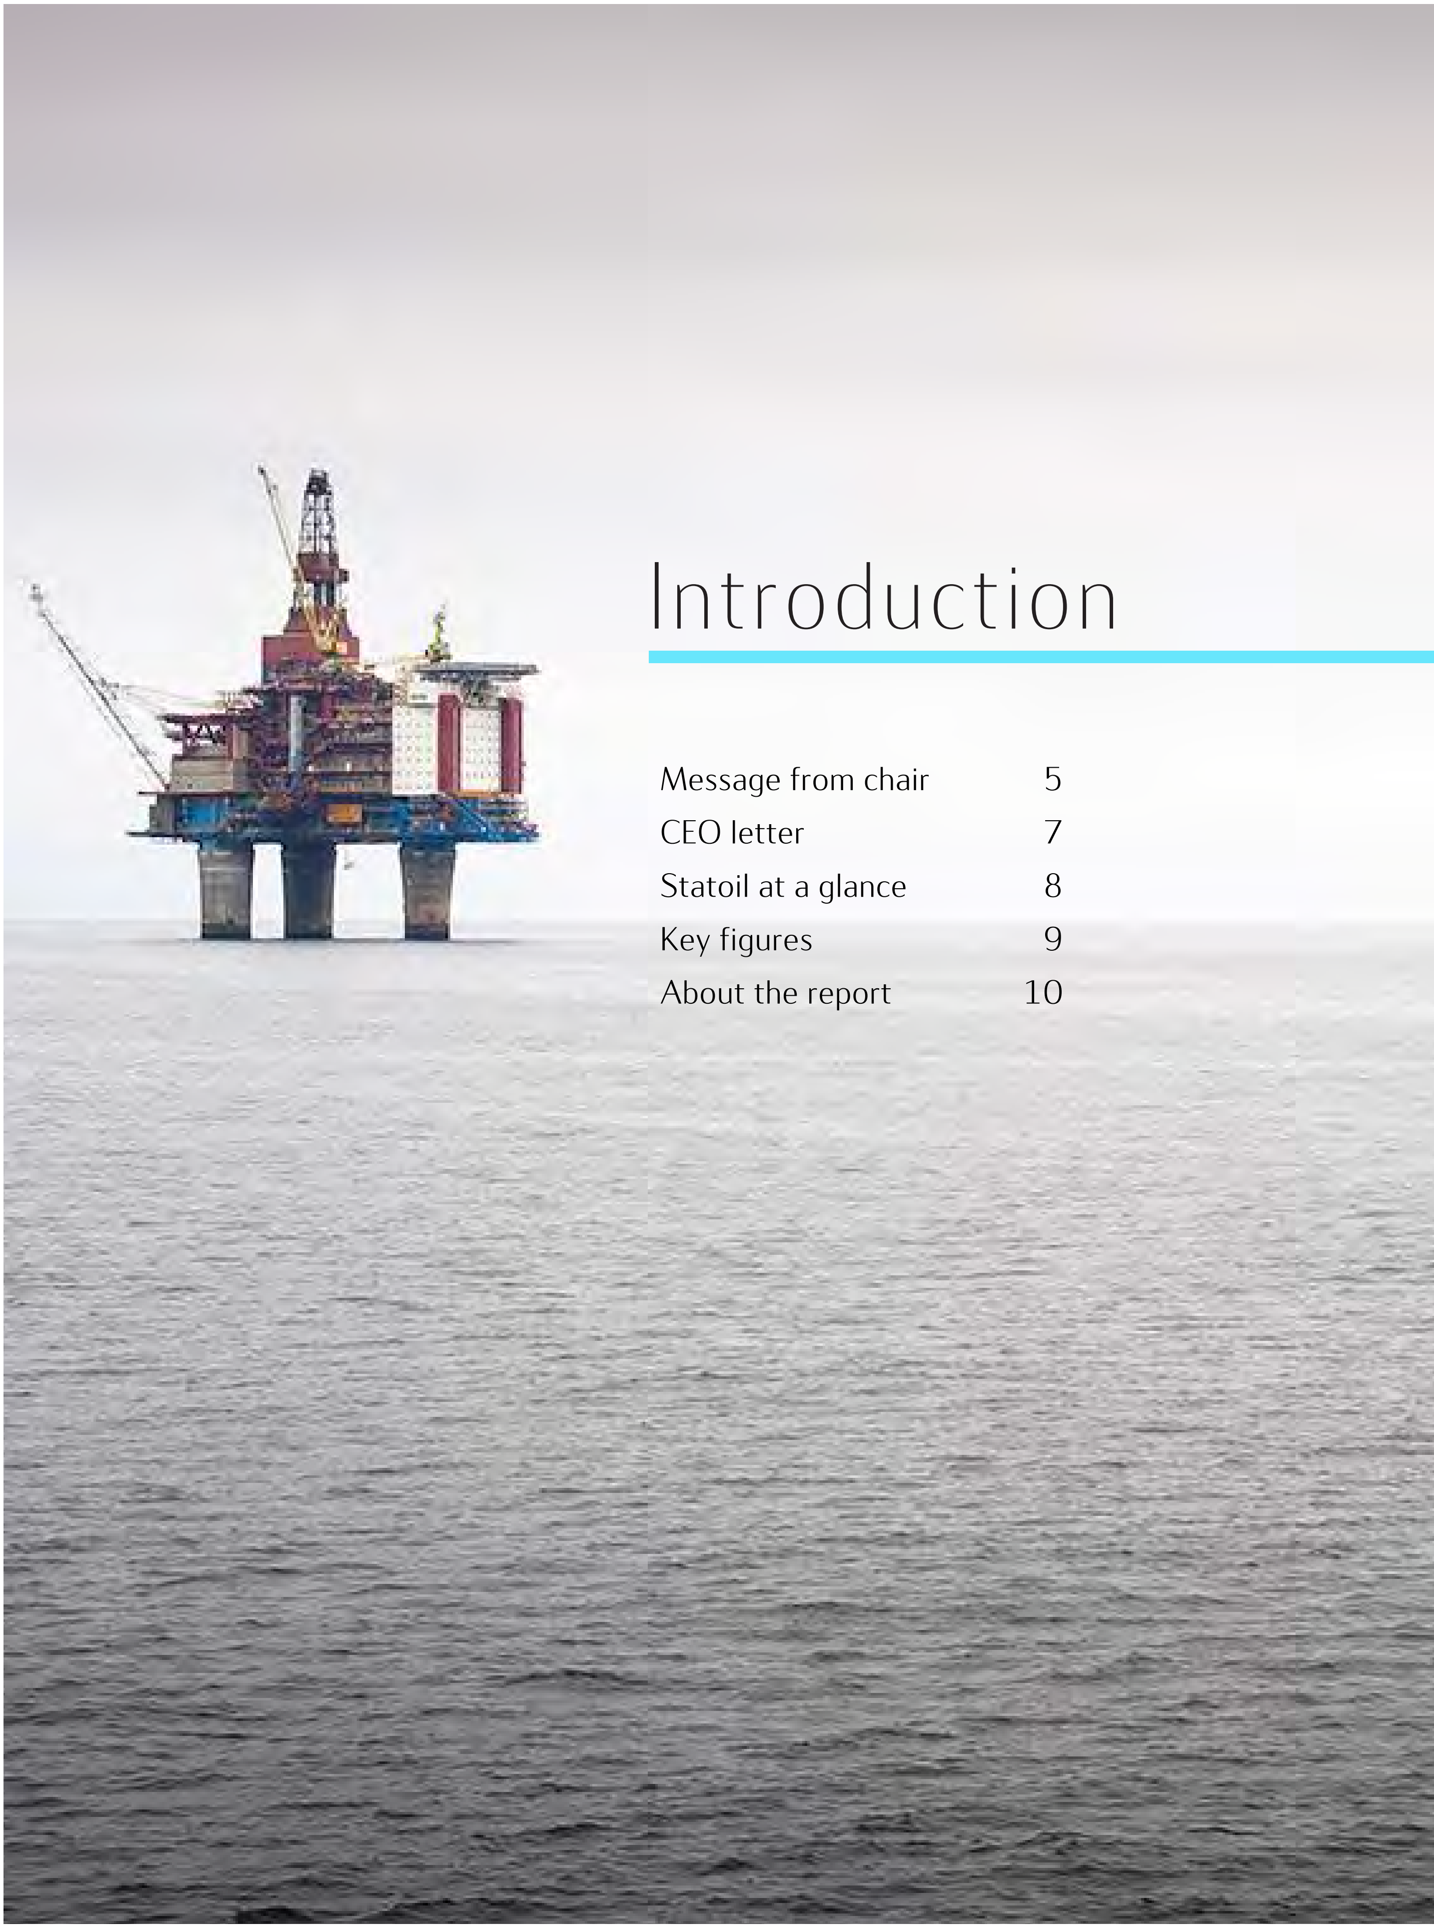
INTRODUCTION

STRATEGIC REPORT

GOVERNANCE

FINANCIAL STATEMENTS AND SUPPLEMENTS

ADDITIONAL INFORMATION



Introduction

MESSAGE FROM CHAIR OF THE BOARD

Dear shareholder,

2016 was a challenging year for the oil and gas industry. Across the industry, the financial results were impacted by the continued low price environment and Statoil ended up with a negative net income of USD 2.9 billion. In this situation, it is encouraging to see how well the company has delivered on its improvement programme and that the operational performance has continued to be strong. Statoil is now well positioned to for the future.

The board of directors has in its work focused both on short term measurements to secure the company's position in a challenging environment, and more long term through the work of sharpening our strategy. Protecting and enhancing shareholder value guides the board of directors in its work and priorities - short and long term.

Strong safety performance is essential for the company's operations. Last year we experienced the worst imaginable, with a fatality on a yard in South Korea and a helicopter crash outside Bergen that took 13 lives.

Further, the serious incident frequency, measured as incidents per million hours worked for both Statoil employees and contractors, increased from 0.6 in 2015 to 0.8 in 2016. Together with the administration, the board of directors has focused on new steps to reinforce safety measures and get back to a positive trend to improve our safety performance.

The response to the market challenge through our improvement programme delivered annualised efficiency gains of USD 3.2 billion measured against a 2013 baseline, USD 700 million above the USD 2.5 billion target. As the company moves from an improvement programme to an improvement culture, new targets are set.

The board of directors have during the year worked closely with the administration to review and confirm Statoil's sharpened strategy. Statoil has set clear principles for the development of a distinct and competitive portfolio. Statoil will develop long-term value on the Norwegian continental shelf, deepen in core areas and develop new growth options internationally, and grow value creation in its marketing and midstream business. The company is making progress in creating a material industrial position in new energy solutions, primarily focused on offshore wind.

Responding to the climate challenge and preparing Statoil for a low carbon future is an integrated part of our strategy. Concrete actions to reduce greenhouse gas emissions in the operations have been implemented, and steps have been taken to build a more resilient portfolio. The updated climate roadmap captures the new set of measurements to be implemented.

Statoil remains committed to shareholder value creation and maintained the dividend during the year. A resolution is proposed to the annual general meeting to maintain the dividend at USD 0.2201 per share in the fourth quarter, and to continue the scrip dividend programme through to the third quarter of 2017.

The board of directors believes the company is well prepared to deal with the current market situation and has the competence, capacity and leadership necessary to create new opportunities and long-term value for our shareholders.

I would like to thank our shareholders for their continued investment, as well as the many employees of Statoil for all the dedication and commitment they show every day.

Øystein Løseth
Chair of the board

CHIEF EXECUTIVE LETTER

DEAR FELLOW SHAREHOLDER,

Safety and security is our top priority in Statoil. And while 2016 was a year of many achievements, we also experienced the worst thinkable. We had a contractor fatality during construction work in South Korea, and on 29 April we lost 13 colleagues when a helicopter crashed on its way from Gullfaks B to Bergen.

For the year as a whole, our serious incident frequency came in at 0.8, an increase from the two previous years. We are not satisfied with this development and have taken several steps to reinforce safety measures throughout the company.

In 2016, we saw oil prices below USD 30 per barrel and while prices increased towards the end of the year, our average realised liquids price was still below USD 40 per barrel for the year as a whole.

We delivered our cost improvement programme above target. The next step will be to go from project mode to a culture of continuous improvement, and we have set a target of achieving USD 1 billion in additional cost improvements in 2017.

By reworking solutions from reservoir to market, we have transformed our opportunity set. The break-even price for our "Next generation" portfolio of projects (those sanctioned since 2015 or planned for sanction with start up by 2022), is now at USD 27 per barrel of oil equivalent (boe).

Organic capex for 2016 was USD 10.1 billion, a USD 3 billion reduction from the original guiding. Production for the full year was 1,978 mboe per day, a slight increase from 2015 due to continued high production efficiency and despite high turnaround activity. Our reserve-replacement ratio (RRR) was 93%.

"High value, low carbon" is at the core of our sharpened strategy. We believe the winners in the energy transition will be the producers which can deliver at low cost and with low carbon emissions.

Statoil is pursuing a distinct and value-driven strategy:

- On the Norwegian continental shelf (NCS) we have a unique position which we will leverage further to build our future business and maximise value
- In our international upstream business, we will focus, deepen and explore further. Brazil is a core area for us, together with our position in the highly flexible US onshore business
- For the Marketing, Midstream and Processing (MMP) business area, the job is to secure flow assurance by accessing premium markets and strengthening asset-backed trading, based on a 'capex light' approach
- In the New Energy Solutions (NES) business area, we are building a profitable business with the long-term potential to account for 15-20% of our capex in 2030, provided that we can access and mature attractive opportunities

Our commitment to long-term sustainable value creation, is in line with the principles of the UN Global Compact.

We believe a low carbon footprint will make us more competitive in the future. We also believe there are attractive business opportunities in the transition to a low-carbon economy. Statoil intends to be part of this transformation in order to fulfil our purpose of turning natural resources into energy for people and progress for society. Our Climate roadmap explains how we plan to achieve this and how we will develop our business, supporting the ambitions of the Paris climate agreement.

I look forward to further strengthening Statoil in 2017, pursuing the priorities set out at our Capital markets update: resetting our cost base, transforming our opportunity set and continuing to chase improvements. We have sharpened our strategy as an energy company towards 2030, and are ready to capitalise on high-value opportunities.

Eldar Sætre
President and Chief Executive Officer
Statoil ASA

STATOIL AT A GLANCE

OUR HISTORY

The company was founded as The Norwegian State Oil company (Statoil) in 1972, and became listed on the Oslo Børs (Norway) and New York Stock Exchange (US) in June 2001. Statoil merged with Hydro`s oil and gas division in October 2007.

Statoil is an international energy company with operations in over 30 countries. We are headquartered in Stavanger, Norway with approximately 20,500 employees worldwide. We create value through safe and efficient operations, innovative solutions and technology. Statoil's competitiveness is founded on our values-based performance culture, with a strong commitment to transparency, cooperation and continuous operational improvement.

OUR SHAREHOLDERS

The Norwegian State is the largest shareholder in Statoil, with a direct ownership interest of 67%. Its ownership interest is managed by the Norwegian Ministry of Petroleum and Energy. US investors hold 9.6%, Norwegian Private owners hold 8.9%, other European investors hold 7.1%, UK investors hold 5.1% and others hold 1.5%.

OUR BUSINESS AREAS

We have eight business areas:

- Development and Production Norway
- Development and Production International
- Development and Production USA
- Marketing, Midstream and Processing
- Technology, Projects and Drilling
- Exploration
- Global Strategy and Business Development
- New Energy Solutions

OUR STRATEGY

Statoil is an energy company committed to long-term value creation in a low carbon future. Statoil will develop and maximise the value of its unique Norwegian continental shelf position, its international oil and gas business and its growing new energy business; focusing on safety, cost and carbon efficiency. Statoil is a values based company where empowered people collaborate to shape the future of energy.

OUR VALUES

Open, Collaborative, Courageous and Caring.

OUR DIVIDEND POLICY

It is Statoil's ambition to grow the annual cash dividend, measured in USD per share, in line with long term underlying earnings. Statoil announces dividends on a quarterly basis. In May 2016, the annual general meeting approved the introduction of a two-year scrip dividend programme commencing from the fourth quarter of 2015.

KEY FIGURES AND HIGHLIGHTS

		For the year ended 31 December			
(in USD million, unless stated otherwise)	2016	2015	2014	2013	2012
Financial information[4]					
Total revenues and other income[3]	**45,873**	59,642	99,264	108,318	123,660

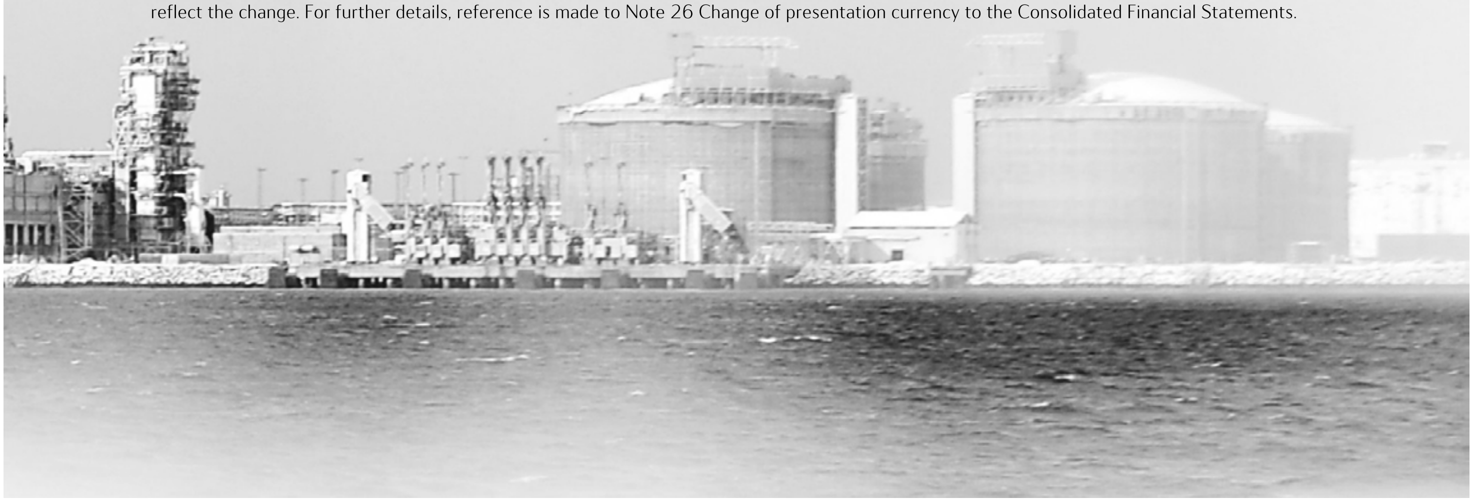
1) See section 5.1 Shareholder information for a description of how dividends are determined and information on share repurchases.

2) Proposed cash dividend for the second quarter of 2016. From and including the third quarter of 2015, dividends were declared in USD. Dividends in previous periods were declared in NOK. Figures for 2015 and earlier periods are presented using the Central Bank of Norway year end rates for Norwegian kroner.

3) Total revenues and other income for 2013 and 2012 are restated.

4) On 1 January 2016 Statoil changed its presentation currency from Norwegian kroner (NOK) to US dollar (USD), mainly in order to better reflect the underlying USD exposure of Statoil's business activities and to align with industry practice. Comparative figures have been represented in USD to reflect the change. For further details, reference is made to Note 26 Change of presentation currency to the Consolidated Financial Statements.



ABOUT THE REPORT

This document constitutes the Statutory annual report in accordance with Norwegian requirements and the Annual report on Form 20-F in accordance with the US Securities and Exchange Act of 1934 applicable to foreign private issuers, for Statoil ASA for the year ended 31 December 2016. A cross reference to the Form 20-F requirements are set out in section 5.10 in this report. The Annual report on Form 20-F and other related documents are filed with the US Securities and Exchange Commission (the SEC). The Annual report and Form 20-F are filed with the Norwegian Register of company accounts.

This report presents the Director's report (pages 3-116 and 231-265), the Consolidated Financial Statements of Statoil (pages 119-190) and the Parent company financial statements of Statoil ASA (pages 191-230) according to the Norwegian Accounting Act of 1998. This report also contains the Board Statement on Corporate Governance according to The Norwegian Code of Practice for Corporate Governance (NUES) in chapter 3 Governance (pages 81-116), the Declaration on remuneration for Statoil's corporate executive committee (pages 106 -114) and the Payments to governments report according to Norwegian requirements in section 5.4 (pages 248-264).

Financial reporting terms used in this report are in accordance with International Financial Reporting Standards (IFRS) as adopted by the European union (EU) and also comply with IFRS as issued by the International Accounting Standards Board (IASB), effective at 31 December 2016. This document should be read in conjunction with the cautionary statement in section 5.7 Forward-looking statement.

Specific accounting requirements for Norway

Section 4.2 Parent company financial statements and related notes to such financial statements (pages 191-230), the Payments to governments report (pages 248-264), the Board Statement on Corporate Governance according to The Norwegian Code of Practice for Corporate Governance (NUES)(pages 81-116), the statements on this report in section 5.5 comprising the Statement of directors' responsibilities (pages 264-265), the recommendation of the Corporate Assembly (page 266), the independent auditor's report issued in accordance with law, regulations and auditing standards and practices generally accepted in Norway (pages 226-230) and the going concern assumption (page 55), do not form part of Statoil's Annual report on Form 20-F as filed with the SEC.

In addition, the following sections of this report do not form part of Statoil's Annual report on Form 20-F as filed with the SEC: the second through sixth paragraphs under Employees in Statoil in Section 2.12 Our people (pages 78-79); Nomination and elections in Statoil (page 83), section 3.1 Implementing and reporting (page 84), section 3.2 Business (page 86), section 3.3 Equity and dividends (pages 86-87), section 3.4 Equal treatment of shareholders and transactions with close associates (pages 87-88), section 3.5 Freely negotiable shares (page 88), section 3.10 Risk management and internal controls (page 102), as indicated in the Declaration on remuneration and other employment terms for Statoil's corporate executive committee (pages 106-114), section 3.13 Information and communications (page 114) and section 3.14 Take-overs (page 114).

The Statoil Annual report and Form 20-F may be downloaded from Statoil's website at [Statoil.com/annualreport2016]. No other material on Statoil's website forms any part of such document. References to this document or other documents on Statoil's website are included as an aid to their location and are not incorporated by reference into this document. All of the SEC filings made available electronically by Statoil may be obtained from the SEC at 100 F Street, N.E., Washington D.CC. 20549, United States or on the SEC's website at www.sec.gov.

Strategic report

2.1 STRATEGY AND MARKET OVERVIEW

STATOIL'S BUSINESS ENVIRONMENT

Market overview

2016 was another year of sub-par growth, with global economic GDP growth easing from 2.6% to 2.3%. This was largely driven by the slowdown in OECD economies, with non-OECD economies gaining momentum over the year. In the United States, consumer spending remained healthy, but investment contracted and resulted in GDP growth decelerating from 2.6% in 2015 to 1.6%. Economic expansion continued at a moderate pace in the Euro-zone at 1.7%, supported by private consumption and higher employment. The economy in the United Kingdom held up well despite the EU Leave vote, while in contrast Japan logged relatively modest growth. Emerging markets maintained their growth rate from 2015, partly due to Russia heading towards economic recovery during the year. 2016 saw China's growth stabilise due to intensified stimulus efforts amidst the continued slowdown since 2012, caused by economic rebalancing. India's GDP growth rate eased to 6.6% on the sudden demonetarisation of large currency notes that hampered consumption. Several major forces are at play in the global economy and will continue to affect demand, including relatively low commodity prices, low interest rates, increased policy uncertainty and weak world trade.

Global oil demand grew by a healthy 1.5 mmbbl per day in 2016. Production from non-Opec countries reacted to lower prices and declined by 0.9 mmbbl, with most of the decline taking place in North America and China. However, Opec added 1.1 mmbbl per day to production. This resulted in an oversupplied market throughout 2016, with storage levels moderately increasing.

The first half of 2016 saw a downward trend in gas prices, which reflected both market balance and surrounding competitive fuels. However, in the second half of 2016, markets have strengthened due to a rebounding commodity market and demand responding to weak gas prices in the first half of 2016.

Oil prices and refining margins

Higher than usual volatility characterised the oil market in 2016 as it did in the previous year, with the price of dated Brent moving in a range between USD 26 per barrel to USD 55 per barrel.

Oil prices

The oil market is generally volatile and has been highly volatile since June 2014. The average price for dated Brent crude in 2016 was USD 43.7 per barrel, down USD 10 per barrel from 2015. The dated Brent oil price started the year on a downward trajectory and hit a low of USD 26 per barrel in the second half of January. Positive market sentiment driven by healthy demand growth and significant supply disruptions pushed the price of dated Brent up to around USD 50 per barrel by the end of second quarter. The return of disrupted volumes during the summer and signs of weakening demand growth sent prices down again towards USD 40 per barrel early in August. The price of dated Brent recovered somewhat again in the third quarter after Opec and Russia agreed to come up with a plan to freeze or cut their production. The Opec meeting in late November concluded with an agreement among the members to cut joint output by 1.2 mmbbl per day effective 1 January 2017, alongside a non-Opec cut of around 0.6 mmbbl per day. The immediate effect of this announcement was an increase in the dated Brent price towards USD 53 per barrel. The futures market for Brent at the Intercontinental Exchange (ICE) was in contango throughout 2016.

Over the course of 2016, North American tight oil has provided the largest share of non-Opec declines that offset continued growth in Opec production. While US shale production has been in decline over much of the past two years, productivity gains and cost reductions have accelerated, planting the seeds of future growth. Specifically, enhanced completions and extended-reach laterals have allowed producers to do more with less. Nowhere is this more evident than in the Permian basin of West Texas. As oil prices have increased during the course of the year, the Permian has recorded the largest rebound in drilling rigs. At current levels, the Permian basin is home to almost 50% of all oil rigs in the US, up from 30% in early 2013. From a pricing perspective, declining production, an abundance of infrastructure, and the lifting of the crude export ban have caused most North American grades to price close to their technical refining values, reflective of the ongoing de-bottlenecking of US onshore crude pipeline infrastructure. These narrow differentials relative to global waterborne crudes have caused rail loadings to fall precipitously with all indications being that this trend is set to continue in the years ahead.

Refinery margins

2016 was a solid year for European refinery margins. Through 2015, a surplus of crude oil had been converted to a surplus of products, incentivised by strong margins. By early 2016, diesel stocks were building fast and diesel margins were low. Refineries then shifted to maximise gasoline output, in expectation of a strong summer gasoline market. However, summer gasoline demand disappointed, leading to stocks building and sharply falling gasoline margins. Weak product prices through the summer led to constrained refinery throughput and supported demand. By the fourth quarter, the gasoline market rebalanced and diesel stocks fell again. This caused refinery margins to improve again in the fourth quarter. The average margin for an upgraded refinery in North West Europe was solid and in line with 2014, but well below 2015 margins.

Natural gas prices

Natural gas prices declined throughout 2015 but stabilised in the second quarter of 2016. The fourth quarter of 2016 experienced a robust price recovery due to consumption growth in Asia and Europe. Henry Hub experienced its lowest annual price in over a decade through 2016.

Gas prices - Europe

NBP prices fell from an average of USD 7.5/MMBtu in first quarter 2015 to USD 5.4/MMBtu in fourth quarter 2015. The decline continued in first quarter 2016, averaging USD 4.3/MMBtu, before falling to a decade low of USD 3/MMBtu in August 2016. Since August's low point, average monthly prices have strengthened, closing 2016 at USD 6.2/MMBtu and resulting in an annual 2016 average of USD 5/MMBtu.

EU gas consumption continued to grow in 2016 as power generation responded to higher priced coal and outages of nuclear reactors in France. Furthermore, heating demand has responded to a more normal European weather pattern. EU indigenous gas production held at a record low of 125 bcm as the Dutch government revised the production limit at the Groningen field down to 24 bcm. European imports from Russia were at a record high of 179 bcm and imports from Norway were at the same record level as in 2015, 108 bcm. Record levels of pipeline imports have been encouraged by a small downturn in LNG deliveries to Europe. LNG supplies into North Western Europe have diminished, whilst imports into Southern Europe remain constant.

Gas prices - North America

Gas prices were volatile in 2016, falling below USD 2/MMBtu early in the year, before rising above USD 3/MMBtu at the end of the year. The Henry Hub average of USD 2.4/MMBtu was the lowest annual price in over a decade, down from USD 2.6/MMBtu in 2015 largely as a result of oversupply. US gas producers responded to the falling prices by withdrawing rigs to the lowest level in decades. Gas production fell throughout the year as a result. Demand for gas was strong in 2016, with natural gas replacing coal in the power sector and LNG exports starting from the Gulf Coast.

Global LNG prices

LNG prices fell throughout 2015 from an average of USD 7.3/MMBtu in first quarter 2015 to USD 4.5/MMBtu in first quarter 2016, but stabilised in second quarter of 2016 at an average of USD 4.9/MMBtu. The second half of 2016 experienced robust price recovery to average USD 8/MMBtu in fourth quarter 2016, largely due to consumption growth in Asia and the Middle East, further intensified by lower-than-expected ramp-up of new LNG facilities as well as unplanned outages.

Statoil's corporate strategy

Statoil is an energy company committed to long-term value creation in a low carbon future. Statoil creates value by turning natural resources into energy for people and progress for society. Statoil will develop and maximise the value of its unique NCS position, its international oil and gas business and its growing new energy business, focusing on safety, cost and carbon efficiency. Statoil is a values-based company where empowered people collaborate to shape the future of energy.

To succeed in turning Statoil's vision into reality, Statoil pursues a strategy to:

- Deepen and prolong the NCS position
- Grow material and profitable international positions
- Provide energy for a low-carbon future through growth in New Energy Solutions (NES)
- Focused and value-adding mid- and downstream

In addition, Statoil will research, develop, and deploy technology to create opportunities and enhance the value of Statoil's current and future assets.

Deepen and prolong the NCS position

For more than 40 years, Statoil has explored, developed and produced oil and gas from the NCS. Statoil aims to deepen and prolong its position by accessing and maturing opportunities into valuable production. At the same time, Statoil plans to improve the reliability, efficiency and lifespan of fields already in production. The NCS represents approximately two thirds of Statoil's equity production at 1,235 mboe per day in 2016.

- **Exploration:** Statoil continues to be a committed NCS explorer across mature, growth and frontier areas. In 2016, Statoil participated in 14 exploration wells on the NCS, resulting in 11 discoveries. Statoil was awarded 29 licenses in mature areas in Norway's Awards for Predefined Areas (APA) 2016 round (result announced January 2017), 16 as operator and 13 as non-operating partner, and five licenses in frontier areas in Norway's 23rd concession round, four as operator and one as partner
- **Development:** The Johan Sverdrup Phase 1 project is progressing in line with schedule. Production drilling started in the first quarter of 2016. Pre-sanction for Johan Sverdrup Phase 2 is scheduled for the first quarter of 2017. Statoil increased its equity interest in the UK part of the Utgard license and submitted the Utgard Plan for Development and Operation (PDO) in the second quarter of 2016. The PDOs for Byrding and Trestakk were delivered and the PDO for Oseberg Vestflanken 2 was approved during 2016
- **Production:** Gullfaks Rimfaksdalen came on-stream. Production started at Fram C, tied into existing infrastructure in the Fram and Troll area

Statoil has completed two share transactions resulting in a 20.1 per cent equity ownership in Lundin Petroleum AB. Lundin is our partner in several fields, including a 22.6% interest in the unitised Johan Sverdrup field development. Statoil also acquired 25% of Byrding.

By the end of 2016, Statoil had achieved CO_2 emission reductions in excess of 1 million tonnes per year compared to a 2008 baseline on the NCS, primarily through better energy management and improved energy efficiency. Our 2020 target is to deliver 1.2 million tonnes of CO_2 emission reductions compared to 2008. In August 2016, the Norwegian petroleum industry announced its ambition to implement CO_2 reduction measures corresponding to 2.5 million tonnes on the NCS by 2030 compared to 2020. Statoil's commitment is to deliver 2.0 million tonnes of this CO_2 reduction target.

Grow material and profitable international positions

International oil and gas production represented approximately one third of Statoil's equity production at 744 mboe per day in 2016. Statoil will continue to explore, develop, and produce oil and gas opportunities outside Norway to enhance Statoil's upstream portfolio.

- **Exploration:** Statoil continues to explore internationally for oil and gas. Statoil participated in nine exploration wells internationally, of which three were discoveries, including the Baccalieu discovery in Canada. Statoil added exploration acreage in Brazil, Canada, New Zealand, Russia, the UK and the US Gulf of Mexico, accessed exploration acreage in Ireland and Turkey and entered two new countries, Mexico and Uruguay. A joint venture comprising Statoil, BP and Total was awarded Blocks 1 and 3 in the Saline Basin in Mexico, with Statoil as the operator.
- **Development:** Statoil strengthened its strategic partnership with Petrobras in Brazil. Construction progress continued as planned on Peregrino Phase II
- **Production:** Heidelberg and Julia production came on-stream in the US Gulf of Mexico and, along with operator BP and other

partners, significant advances have been made towards the award of a licence extension for Azeri-Chirag Guneshli (ACG) in Azerbaijan. The In Salah southern fields in Algeria and the Corrib field in Ireland both had major ramp-ups in 2016

In Brazil, Statoil acquired a 66% interest in and became the operator license of BM-S-8, which contains a substantial part of the Carcará field. Operatorship was assumed and appraisal activities began on BM-C-33. In the US, Statoil increased its stake in the Eagle Ford field and assumed full operatorship. Statoil continued to focus its portfolio with a partial divestment of non-core Marcellus acreage and agreeing the sale of its oil sands business in Canada.

Provide energy for a low-carbon future
Statoil recognises that opportunities are increasingly available in producing low carbon energy.

In 2016 Statoil launched Statoil Energy Ventures, a USD 200 million venture capital fund dedicated to investing in attractive and ambitious growth companies in renewable energy. This fund made its first investments in United Wind Inc. and later in ChargePoint Inc., Convergent Energy and Power Inc. and Oxford Photovoltaics Ltd., and is continuing to evaluate market opportunities. Statoil has also continued to explore new business opportunities in carbon capture and storage as well as other potential new energy markets.

- **Development:** The 402 MW Dudgeon Offshore Wind Park development started installation in the first quarter of 2016 and is expected to be fully commissioned by the fourth quarter of 2017
- **Production:** In 2016, Statoil signed a letter of intent to become operator of the Sheringham Shoal Offshore Wind Farm in January 2017; it currently produces from an installed capacity of 317 MW. Statoil has a 40% ownership stake of the Scira consortium which produces electricity from the Sheringham Shoal wind park

Statoil partnered with E.ON to develop the 385 MW Arkona wind farm offshore Germany, with start-up planned for 2019. In the US, Statoil was declared the provisional winner of the US government's wind lease sale offshore New York, with a potential generation capacity of more than 1.8 GW.

Statoil will also start production from the world's first floating windfarm, Hywind Scotland, in the fourth quarter of 2017. Statoil's partner in the 30 MW project is Masdar, which acquired 25% of the project in January 2017. The project will also include an innovative battery storage solution, Batwind, which represents the company's first wind development with integrated energy storage.

Statoil has delivered a feasibility study to the Norwegian government for part of a Norwegian carbon capture and storage (CCS) value chain. The scope has been to find commercial methods to inject CO_2 volumes arriving via ship into an underground reservoir on the NCS. Statoil's long experience with CO_2 storage from Sleipner and Snøhvit has been valuable, finding commercial and technical means to store large volumes of third party CO_2 in order to accommodate the world's need for CCS solutions.

Focused and value-adding mid- and downstream
The prime objective for Statoil's mid- and downstream activities is to process and transport its oil and gas production (including the Norwegian State's petroleum) competitively to premium markets, securing maximum value realisation. The main focus is on:

- Safe and efficient operations
- Continuous improvement in operational regularity, HSE and costs
- Flow assurance and marketing of Statoil's equity production (crude oil, natural gas, related products) and the State's Direct Financial Interest (SDFI) volumes for maximum value creation
- Utilisation of the Asset Backed Trading model across commodities to capture margin opportunities
- Maintaining Statoil's position as a leading European gas supplier
- A capital lean asset structure

Strategic focus is directed at optimising the value of Statoil's flexible Norwegian gas production assets that supply Europe and at Statoil's midstream activities in North America, where Statoil's onshore portfolio is developing. Statoil achieved strong marketing trading results across all commodities.

Research, development, and deployment of technology to unlock opportunities and enhance value
Statoil believes that technology is a critical success factor for value creation. Statoil's technology development activities aim to increase access to new oil and gas resources at competitive cost, reduce field development, drilling and operating costs, and CO_2 and other greenhouse gas emissions. Statoil's technology efforts focus on the following priority areas:

- **Business-critical technologies:** Upstream technologies are prioritised, primarily in the areas of Exploration, Reservoir, Drilling and Well, and Subsea Production Systems. Statoil's main focus has been on cost reduction, for example Statoil's simplified subsea production concept Cap-X™ has been developed to enable possible future development projects in the Barents Sea
- **Strengthening Statoil's licence to operate:** Statoil has strengthened its commitment to sustainability. For the oil & gas and new energy value chains, technology development is concentrated on increased energy efficiency for power generation and reduced CO_2 emissions. For renewables, technological improvements to reduce cost in the areas of construction and maintenance for both fixed and floating offshore wind applications is a priority
- **Expanding Statoil's capabilities:** Statoil continues its broader research efforts for both the oil and gas value chain and new value chains. Work is conducted both in-house and in collaboration with academia, research institutes and suppliers and through venture activities
- **Capturing the value of digitalisation:** Statoil is exploring the opportunities of digitalisation in the energy industry. In 2016, the focus has been determining the optimal approach to accelerate digitalisation to capture a greater value potential

At the capital markets update (CMU) on 7 February 2017, Statoil shared its sharpened strategy to respond to the changing business context. Geopolitical shifts, challenges in accessing new oil and gas resources, changing market dynamics, digitalisation and a global transition towards a low carbon economy are increasing uncertainty and volatility. This change in outlook drives the need to build a more resilient, diverse and option-rich portfolio, delivered by an agile organisation that embraces change and empowers its people. To deliver on the sharpened strategy and fulfill the strategic intent of "high value, low carbon", Statoil will continue to build opportunities to optimise its portfolio around the following pillars:

- **Norwegian continental shelf** - Build on unique position to maximise and develop long-term value
- **International Oil & Gas** - Focus geographically to deepen core areas and develop growth options
- **New Energy Solutions** - Create a new material industrial position
- **Midstream and Marketing** - Secure market access and grow value creation through cycles

The following strategic principles guide Statoil in shaping a robust, balanced and distinct portfolio:

1. **Cash generation capacity**
   Generating positive cash flows from operations, even at low oil and gas prices, in order to sustain dividend and investment capacity through the cycle.
2. **Capex flexibility**
   Having sufficient flexibility in organic capital expenditure to be able to respond to market downturns and avoid value destructive decisions.
3. **Capture value from cycles**
   Ensuring the ability and capacity to act counter-cyclically to capture value through the cycles.
4. **Low-carbon advantage**
   Maintaining competitive advantage as a leading company in carbon efficient oil and gas production, while building a low carbon business to capture new opportunities in the energy transition.

GROUP OUTLOOK

Statoil's plans address the current environment while continuing to invest in high-quality projects. Statoil continues to reiterate its efforts and commitment to deliver on its priorities of high value creation, increased efficiency and competitive shareholder return.

- Organic capital expenditures for 2017 (i.e. excluding acquisitions, capital leases and other investments with significant different cash flow pattern) are estimated at around USD 11 billion
- Statoil intends to continue to mature its large portfolio of exploration assets and estimates a total exploration activity level of around USD 1.5 billion for 2017, excluding signature bonuses
- Statoil expects to achieve an additional USD 1 billion in efficiency improvements in 2017 for a total of USD 4.2 billion
- Statoil's ambition is to keep the unit of production cost in the top quartile of its peer group
- For the period 2016 - 2020, organic production growth is expected to come from new projects resulting in around 3% CAGR (Compound Annual Growth Rate)
- The equity production for 2017 is estimated to be around 4-5% above the 2016 level
- Scheduled maintenance activity is estimated to reduce quarterly production by approximately 10 mboe per day in the first quarter of 2017. In total, maintenance is estimated to reduce equity production by around 30 mboe per day for the full fiscal year 2017, which is lower than the 2016 impact
- Indicative effects from Production sharing agreements (PSA-effect) and US royalties are estimated to be around 150 mboe per day in 2017 based on an oil price of USD 40 per barrel and 165 mboe per day based on an oil price of USD 70 per barrel
- Deferral of production to create future value, gas off-take, timing of new capacity coming on stream and operational regularity represent the most significant risks related to the foregoing production guidance

These forward-looking statements reflect current views about future events and are, by their nature, subject to significant risks and uncertainties because they relate to events and depend on circumstances that will occur in the future. For further information, see section 5.7 Forward-Looking Statements.

2.2 BUSINESS OVERVIEW

HISTORY

On 18 September 1972, Statoil was formed by a decision of the Norwegian parliament and incorporated as a limited liability company under the name Den norske stats oljeselskap AS. Being a company owned 100% by the Norwegian State, Statoil's initial role was to be the government's commercial instrument in the development of the oil and gas industry in Norway. Growing in parallel with the Norwegian oil and gas industry, Statoil's operations have primarily been focused on exploration, development and production of oil and gas on the Norwegian continental shelf (NCS).

During the 1980s, Statoil grew substantially through the development of the NCS. Statoil also became a major player in the European gas market by entering into large sales contracts for the development and operation of gas transport systems and terminals. During the same decade, Statoil was involved in manufacturing and marketing in Scandinavia and established a comprehensive network of service stations. This line of business was fully divested in 2012.

In 2001, Statoil was listed on the Oslo and New York stock exchanges and became a public limited company under the name Statoil ASA, 67% majority owned by the Norwegian State. Since then, substantial investments both on the NCS and internationally, have grown our business. The merger with Hydro's oil and gas division on 1 October 2007 further strengthened Statoil's ability to fully realise the potential of the NCS. Enhanced utilisation of expertise to design and manage operations in various environments have expanded our upstream activities outside our traditional area of offshore production. This includes the development of heavy oil and shale gas projects and projects that focus on other forms of energy, such as offshore wind and carbon capture and storage.

ACTIVITIES

Statoil is an international energy company primarily engaged in oil and gas exploration and production activities, organised under the laws of Norway and subject to the provisions of the Norwegian Public Limited Liability Companies Act. In addition to being the leading operator on the Norwegian continental shelf (NCS), Statoil has also substantial international activities and is present in several of the most important oil and gas provinces in the world. Our activities span operations in more than 30 countries and employs approximately 20,500 employees worldwide.

Our access to crude oil in the form of equity, governmental and third party volumes makes Statoil a large seller of crude oil, and Statoil is the second-largest supplier of natural gas to the European market. Processing and refining are also part of our operations.

Statoil's registered office is at Forusbeen 35, 4035 Stavanger, Norway and the telephone number of its registered office is +47 51 99 00 00.

OUR COMPETITIVE POSITION

Key factors affecting competition in the oil and gas industry are oil and gas supply and demand, exploration and production costs, global production levels, alternative fuels, and environmental and governmental regulations. When acquiring assets and licences for exploration, development and production and in refining, marketing and trading of crude oil, natural gas and related products, Statoil competes with other integrated oil and gas companies.

Statoil's ability to remain competitive will depend, among other things, on continuous focus on reducing costs and improving efficiency. It will also depend on technological innovation to maintain long-term growth in reserves and production and the ability to seize opportunities in new areas.

The information about Statoil's competitive position in the strategic report is based on a number of sources; e.g. investment analyst reports, independent market studies, and our internal assessments of our market share based on publicly available information about the financial results and performance of market players.

Improvement programmes

Improvement programmes are Statoil's response to the industrial challenge that has emerged over the recent years characterised by reducing prices for our products and declining returns. More specifically, the ambition is to realise positive production effects and capex and operating cost savings to improve financial results and cash-flows. For 2017 Statoil targets additional annual efficiency improvements of USD 1 billion on top of the already achieved USD 3.2 billon.

CORPORATE STRUCTURE

Business areas

Statoil's operations are managed through the following business areas:

Development and Production Norway (DPN)

DPN manages Statoil's upstream activities on the Norwegian continental shelf (NCS) and explores for and extracts crude oil, natural gas and natural gas liquids. The business area's ambition is to continue Statoil's leading position on the NCS and ensure maximum value creation through continuously improved HSE and operational performance.

Development and Production International (DPI)

DPI manages Statoil's worldwide upstream activities that are not included in the DPN and Development and Production USA (DPUSA) business areas. It explores for and extracts crude oil, natural gas and natural gas liquids. DPI's ambition is to build a large and profitable international production portfolio comprising activities ranging from accessing new opportunities to delivering on profitable projects in a range of complex environments.

Development and Production United States (DPUSA)

DPUSA manages Statoil's upstream activities in the USA and Mexico. DPUSA's ambition is to develop a material and profitable position in the US and Mexico, including the deep water regions of the Gulf of Mexico and unconventional oil and gas in the US.

Marketing, Midstream and Processing (MMP)

MMP manages Statoil's marketing and trading activities related to oil products and natural gas, transportation, processing and manufacturing, and the development of oil and gas. MMP seeks to maximise value creation in Statoil's midstream and marketing business.

Technology, Projects and Drilling (TPD)
TPD is accountable for the global project portfolio, well deliveries, new technologies and sourcing across Statoil. TPD seeks to provide safe and secure, efficient and cost-competitive global well and project delivery, technological excellence, and research and development. Cost-competitive procurement is an important contributory factor for maximising value for Statoil.

Exploration (EXP)
EXP manages Statoil's worldwide exploration activities with the aim of positioning Statoil as one of the leading global exploration companies and this is achieved through accessing high potential new acreage in priority basins, globally prioritising and drilling more significant wells in growth and frontier basins, delivering near-field exploration on the NCS and other select areas, and achieving step-change improvements in performance.

New Energy Solutions (NES)
NES reflects Statoil's long-term goal to complement our oil and gas portfolio with profitable renewable energy and other low-carbon energy solutions. NES is responsible for wind farms, carbon capture and storage as well as other renewable energy and low-carbon energy solutions.

Global Strategy and Business Development (GSB)
GSB sets the corporate strategy, business development and merger and acquisition activities for Statoil. The ambition of the GSB business area is to closely link corporate strategy, business development and merger and acquisition activities to actively drive Statoil's corporate development.

Reporting segments

Statoil reports its business in the following reporting segments:

- DPN reporting segment - Development and Production Norway – the DPN business area
- DPI reporting segment - Development and Production International, which combines the DPI and the DPUSA business areas
- MMP reporting segment - Marketing, Midstream and Processing – the MMP business area
- Other – which includes activities in NES, TPD, GSB and Corporate staffs and support functions

Activities relating to the EXP business area are fully allocated to - and presented in - the relevant development and production reporting segment. Activities relating to the TPD and GSB business areas are partly allocated to - and presented in - the relevant development and production reporting segments.

Presentation

In the following sections in the report, the operations are reported according to the reporting segment. Underlying activities or business clusters are presented according to how the reporting segment organises its operations.

See note 3 Segments to the Consolidated financial statements for further details.

As required by the SEC, Statoil prepares its disclosures about oil and gas reserves and certain other supplementary oil and gas disclosures based on geographic areas. Statoil's geographical areas are defined by country and continent and consist of Norway, Eurasia excluding Norway, Africa, and the Americas.

SEGMENT REPORTING

Internal transactions in oil and gas volumes occur between our reporting segments before being sold in the market. The pricing policy for internal transfers is based on estimated market prices. See Production volumes and prices in section 2.8 Operating and financial performance for further information.

We eliminate intercompany sales when combining the results of reporting segments. Intercompany sales include transactions recorded in connection with our oil and natural gas production in the DPN or the DPI business areas and also in connection with the sale, transportation or refining of our oil and natural gas production in the MMP business area. Certain types of transportation costs are reported in both the MMP and the DPUSA business areas.

The DPN business area produces oil and natural gas which is sold internally to the MMP business area. A large share of the oil produced by the DPI and DPUSA business areas is also sold through the MMP business area. The remaining oil and gas from the DPI and the DPUSA business areas is sold directly in the market. For intercompany sales and purchases, Statoil has established a market-based transfer pricing methodology for the oil and natural gas that meets the requirements as to applicable laws and regulations.

In 2016, the average transfer price for natural gas was USD 3.42 per mmbtu. The average transfer price was USD 5.17 per mmbtu in 2015 and USD 6.55 in 2014. For oil sold from DPN to MMP, the transfer price is the applicable market-reflective price minus a cost recovery rate.

The following table shows certain financial information for the four reporting segments, including intercompany eliminations for each of the years in the three-year period ending 31 December 2016. For additional information please refer to note 3 Segments to the Consolidated financial statements.

Segment performance (in USD million)	For the year ended 31 December 2016	2015	2014
Development & Production Norway			
Total revenues and other income	**13,077**	17,339	28,926
Net operating income	**4,451**	7,161	17,753
Non-current segment assets[1)]	**27,816**	27,706	35,243
Development & Production International

RESEARCH AND DEVELOPMENT

Statoil is a technology-intensive company and research and development is an integral part of our strategy. Our technology strategy is about prioritising technology for value creation that enables us to achieve growth and access, and sets the direction for technology development and implementation for the future. Our focus is on low cost, low carbon solutions and re-using standardised technologies.

We continuously research, develop and deploy innovative technologies to create opportunities and enhance the value of Statoil's current and future assets. Statoil's technology development activities aim to reduce field development, drilling and operating costs, and CO_2 and other greenhouse gas emissions. We utilise a range of tools for the development of new technologies:

- In-house research and development (R&D)
- Cooperation with academia and research institutes
- Collaborative development projects with our major suppliers
- Project related development as part of our field development activities
- Direct investment in technology start-up companies through our Statoil Technology Invest venture activities
- Invitation to open innovation challenges as part of Statoil Innovate

Research and development expenditures were USD 298 million, USD 344 million and USD 476 million in 2016, 2015 and 2014, respectively.

2.3 DPN - DEVELOPMENT AND PRODUCTION NORWAY

OVERVIEW

The Development and Production Norway (DPN) reporting segment is responsible for field development and operations on the Norwegian continental shelf (NCS) which includes the North Sea, the Norwegian Sea and the Barents Sea. DPN aims to ensure safe and efficient operations and to maximise the value potential from the NCS. For proved reserves development see Development of reserves in Proved oil and gas reserves in section 2.8 Operating and financial performance.

Key events and portfolio developments in 2016:

- In January, Statoil announced the acquisition of 11.93% of the shares and votes in **Lundin** Petroleum AB (Lundin) for a total cash purchase price of SEK 4.6 billion (USD 0.5 billion), and in May, Statoil announced divestment of its entire 15% interest in Edvard Grieg for an increased shareholding in Lundin. The transaction also included divestment of a 9% interest in the Edvard Grieg oil pipeline and a 6% interest in the Utsira High gas pipeline, and in addition payment of cash consideration of USD 64 million to Lundin. Statoil now owns 20.1% of the shares in Lundin.
- On 1 March, the drilling of the first well of the **Johan Sverdrup** field development commenced.
- On 12 March, the **Goliat** field came on stream with Eni Norge as operator.
- In June, the plan for development and operation for **Oseberg Vestflanken 2** was approved by the Ministry of Petroleum and Energy.
- In June, the **Njord Future** project was established to secure long-term production for both the Njord and Hyme fields. The Njord field was temporarily shut in, and both the Njord A and Njord B platforms were towed to shore.
- On 9 August, Statoil and its partners submitted the plan for development and operation for the **Utgard** gas and condensate discovery to the Norwegian and UK authorities. The plan for development and operation was approved on 17 January 2017.
- On 19 August, Statoil and its partners submitted the plan for development and operation of the **Byrding** oil and gas discovery. On 30 December, Statoil completed the acquisition of Wintershall's 25% interest in Byrding, increasing Statoil's interest to 70%. The plan for development and operation of the Byrding discovery was approved on 17 January 2017.
- **Gullfaks Rimfaksdalen** started production ahead of schedule on 24 August.
- **Volve** ceased production on 17 September.
- The plan for development and operation of the **Trestakk** discovery was submitted on 1 November.
- On 24 December, the **Ivar Aasen** field came on stream with Aker BP as operator.

Fields in production on the NCS

The following table shows DPN's average daily entitlement for the years ending 31 December 2016, 2015 and 2014.
Production level maintained by new fields and new wells from existing fields. See chapter "Fields under development on the NCS" for future production replacement.

	For the year ended 31 December								
	2016			2015			2014

12) PL209/250 expires in 2041 and PL208 expires in 2040.
13) PL212/262 expires in 2033 and PL159 expires in 2029.
14) From 1 January to 30 June 2016 Statoil owned a 15% interest in the Edvard Grieg field. On 30 June 2016 this interest was sold to Lundin. The Edvard Grieg swap agreement was a part of Statoil increasing the ownership in Lundin.
15) PL001B, PL452BS and PL242 expire in 2036. PL 338BS expire in 2029.

MAIN PRODUCING FIELDS ON THE NCS

Statoil operated fields

Troll is both the largest gas field on the NCS and a major oil field. The Troll field regions are connected to the Troll A, B and C platforms. Troll gas is mainly exported and produced at Troll A, while oil is mainly produced at Troll B and C. Fram and Fram H Nord are tie-ins to Troll C.

The **Åsgard** field includes the Åsgard A production and storage ship for oil, the Åsgard B semi-submersible floating production platform for gas, and the Åsgard C storage vessel for condensate. In 2015 Statoil started the world first subsea gas compressor train on Åsgard, and the second train was started in February 2016. Mikkel and Morvin are tie-ins to Åsgard. The Trestakk development will be a tie-in to Åsgard A with production start planned in 2019.

Gullfaks has been developed with three large concrete production platforms. Since production started on Gullfaks in 1986, several satellite fields have been developed with subsea wells that are remotely controlled from the Gullfaks A and C platforms.

The **Oseberg** area includes the Oseberg Field Centre, Oseberg C, Oseberg East and Oseberg South production platforms. Oil and gas from the satellites are transported to Oseberg Field Centre for processing and transportation.

Kvitebjørn is a gas and condensate field developed with an integrated accommodation, drilling and processing facility with a steel jacket.

Visund is an oil and gas field that includes a floating drilling, production and living quarter unit and two subsea templates.

Partner-operated fields

Ormen Lange operated by Shell, is a deepwater gas field in the Norwegian Sea. The well stream is transported to an onshore processing and export plant at Nyhamna.

Skarv is an oil and gas field located in the Norwegian Sea, with BP as operator. The field development includes a floating production, storage and offloading vessel (FPSO) and five subsea multi-well installations.

Goliat is the first oil field to be developed in the Barents Sea. The field is being developed by means of 22 subsea wells tied back to a circular floating production, storage and offloading vessel (FPSO). The oil is offloaded to shuttle tankers. The Goliat field is operated by Eni and started production 12 March 2016.

Ekofisk is operated by ConocoPhillips. It consists of the Ekofisk, Tor, Eldfisk and Embla fields. The Eldfisk II project delivered a new PDQ platform early 2015 that will serve as Eldfisk field center.

Marulk is operated by Eni. It is a gas- and condensate field developed as a tie-back to the Norne FPSO.

Ivar Aasen is an oil and gas field located in the North Sea. The development includes a fixed steel jacket with partial processing and living quarters tied in as a satellite to Edvard Grieg for further processing and export. The Ivar Aasen development is operated by Aker BP ASA and started production 24 December 2016.

Exploration on the NCS

Statoil holds exploration acreage and actively explores for new resources in all three regions on the NCS, the Norwegian Sea, the North Sea and the Barents Sea.

In 2016 Statoil was awarded five licences (four as operator) in the **23rd concession round** for frontier areas, 29 licences (16 as operator) in the **Awards for Predefined Areas (APA) round 2016** for mature areas and completed several farm-in transactions with other companies, notably in the Barents Sea.

Throughout 2016, as part of the industry initiative **Barents Sea Exploration Collaboration** (BaSEC), Statoil have been preparing for a drilling campaign of five to seven wells in the Barents Sea that will commence in 2017,

In 2016 Statoil completed a six well appraisal campaign of the Krafla discovery in the North Sea and made five new discoveries. The campaign set a record in drilling efficiency, with the Beerenberg well taking only nine days from spud to reaching total depth of 2,694 meters below the seabed.

In 2016 Statoil and its partners completed 14 exploratory wells and made 11 discoveries in Norway. In 2017 Statoil expects to complete 16 to18 exploration wells on the NCS, with the Barents Sea campaign being at the core of the activity plan.

1) Wells completed during the year, including appraisals of earlier discoveries.

Fields under development on the NCS

Statoil's major development projects on the NCS as of 31 December 2016:

Johan Sverdrup (Statoil 40.03%, operator, with additional 4.54% indirect interest held through Lundin) is an oil discovery in the North Sea. A plan for development and operation was submitted in February 2015 and approved by the Norwegian authorities in August 2015. Phase 1 of the development will consist of 35 production and water injection wells and a field centre with four platforms: A living quarter platform, a wellhead platform with permanent drilling facility, a processing platform and a riser and utility platform. Crude oil will be exported to Mongstad through a 274 km long dedicated pipeline, and gas will be exported to the gas processing facility at Kårstø through a 156 km long pipeline via a subsea connection to the Statpipe pipeline. On 1 March 2016, the drilling of the first well of the Johan Sverdrup field development commenced. Production is expected to start in 2019.

Aasta Hansteen (Statoil 51%, operator) is a deep water gas discovery in the Norwegian Sea. The field development concept includes three subsea templates tied in to a floating processing unit with gas export through a new pipeline, Polarled, to Nyhamna and further exportation through the Langeled pipeline. The Aasta Hansteen processing unit can also serve as a hub for other potential discoveries in the area. On 9 January 2016, the living quarter was lifted onto the topside, which is under construction in South Korea. On 27 July 2016, the final megablock was lifted onto the substructure in South Korea. Production is expected to start in 2018.

Gina Krog (Statoil 58.7%, operator) is an oil and gas discovery in the North Sea. The field development concept includes a steel-jacket platform and a total of 15 wells. Oil will be exported via offshore loading from a floating storage unit. Due to the high condensate content, the rich gas will be exported via Sleipner, where it will be further processed. The development concept also includes gas injection in order to maximise the recovery factor for the field. On 20 July 2015, the drilling of the first well of the Gina Krog field development commenced, and the drilling operations continued in 2016. On 23 August 2016, all the topside modules had been lifted in place, and the Gina Krog platform was complete in the field. Production is expected to start in 2017.

The **Utgard** development (Statoil 38.44% interest in the Norwegian and 38% in the UK sector, operator) will include two wells in a standard subsea concept, with one drilling target on each side of the UK-Norwegian maritime border. Gas and condensate will be piped through a new pipeline to the Sleipner field for processing and further transportation to market. On 17 January 2017, the plan for development and operation and the field development plan were approved by Norwegian and UK authorities. Production is expected to start in 2019.

The **Trestakk** discovery (Statoil 59.1%, operator) will be developed with five wells, three producers and two injectors, to be tied in to the Åsgard A installation for processing, measurement and gas injection. On 1 November, 2016, Statoil, on behalf of the licensees, submitted the plan for development and operation. Production is expected to start in 2019.

Oseberg Vestflanken 2 (Statoil 49.3%, operator) is the development of the oil and gas structures Alfa, Gamma and Kappa. The well stream will be routed to the Oseberg field centre through a new pipeline. The plan for development and operation was approved by the Ministry of Petroleum and Energy in June, 2016. The discoveries will be developed using an unmanned wellhead platform. Production is expected to start in 2018.

Gullfaks C subsea compression (Statoil 51%, operator), an increased gas recovery project for the Gullfaks Sør Brent reservoir, includes the installation of a subsea compressor solution in the vicinity of the L/M template in order to prolong the gas production plateau at Gullfaks C and increase the recoverable reserves from the Gullfaks Sør Brent reservoir. The compressor is expected to come on stream in 2017.

Byrding (Statoil 70%, operator) will be developed as a subsea installation with one well drilled from an existing template on Fram H-Nord. On 17 January 2017, the Norwegian Ministry of Petroleum and Energy approved the plan for development and operation. Production is expected to start in 2017.

Troll B gas module (Statoil 30.58%, operator), a new gas module being installed to increase the processing capacity at Troll B, was sanctioned in September 2016, and is expected to be brought on stream in 2018.

Martin Linge (Statoil 19%) is an oil and gas field operated by Total, near the British sector of the North Sea. The reservoir is complex with gas under high pressure and high temperatures. The development includes a fixed steel jacket platform with processing and export facilities, with electric power to be supplied from Kollsnes. The operator expects production to start in 2018.

Decommissioning on the NCS

Under the Petroleum Act, the Norwegian government has imposed strict procedures for removal and disposal of offshore oil and gas installations. The Convention for the Protection of the Marine Environment of the Northeast Atlantic (OSPAR) stipulates similar procedures.

Huldra ceased production in September 2014, after 13 years in production. The permanent plugging and abandonment of wells has been ongoing in 2016 with removal of topside facilities planned in 2019.

Volve ceased production in September 2016, after more than eight years in production. The permanent plugging of wells was finalised during 2016, and the removal of subsea templates is expected to be completed in 2017.

During 2016, there were permanent plugging and abandonment operations at **Statfjord**, **Visund**, **Tune**, **Kristin** and **Heimdal**. The partner-operated field **Ekofisk** also had ongoing removal and plugging activities.

For further information about decommissioning, see note 2 Significant accounting policies to the Consolidated financial statements.

PUBLIC COPY - CONFIDENTIAL INFORMATION REMOVED

2.4 DPI - DEVELOPMENT AND PRODUCTION INTERNATIONAL

DPI overview

Statoil is present in several of the most important oil and gas provinces in the world. The Development and Production International (DPI) reporting segment covers all development and production of oil and gas outside the Norwegian continental shelf (NCS).

DPI is present in more than 20 countries and had production in 11 countries in 2016. DPI produced 38% of Statoil's total equity production of oil and gas in 2016. For information about proved reserves development see section 2.8 Proved oil and gas reserves.

The map shows the countries where DPI has activity.

Key events and portfolio developments in 2016 and early 2017:

- In January, the **Heidelberg** field achieved first oil. The field is located in the Green canyon area of the Gulf of Mexico with Anadarko as the operator. Discovery was made in 2009, and sanctioning took place in 2013
- Operations at the **In Salah Southern Fields** project in Algeria started in March
- In April, the **Julia** field achieved first oil, on time and under budget. Julia is located in the Walker Ridge area of the Gulf of Mexico near Jack and St Malo. ExxonMobil is the operator
- In May, Statoil divested its operated acreage in the **Marcellus West Virginia** to EQT Corporation for USD 407 million in cash. The transaction was completed in July
- In July, Statoil announced acquisition of Petrobras' 66% operated interest in the offshore licence **BM-S-8** in Brazil's Santos Basin. This licence contains a substantial part of the Carcará pre-salt oil discovery. The transaction was completed in November
- The third processing train on the **In Amenas** field in Algeria, which was damaged in the January 2013 terrorist attack, restarted in July, and the **In Amenas Gas Compression project** came into operation in February 2017. The compression project has enabled increased production and thereby capacity to utilize all three trains
- In December, the drilling of the first well of the **Mariner** field development commenced
- In December, Statoil increased its ownership in the deep-water **Vito** discovery from 30.0% to 36.89%, after exercising pre-emption rights on the Freeport-McMoran sale to Anadarko. The field is located in the Mississippi Canyon area. A final investment decision is expected in 2018 with first production in 2021
- In December, on request of US authorities, Statoil has become operator of record for blocks **MC941** and **MC942** in the Gulf of Mexico following the bankruptcy of Bennu Oil & Gas LLC. With the bankruptcy proceedings still ongoing, the full implications for Statoil are still to be determined
- In 2016, Statoil completed transactions to increase its equity interest to 100% in the UK continental shelf licence (P312) of the **Utgard** field, which spans the UK-Norway maritime border. In March 2016, Statoil's purchase of a 31% equity interest from Talisman Sinopec North Sea Limited was completed, and

in June the purchase of a 45% operated equity share from JX Nippon was completed. In January 2017, the plan for development and operation for the Utgard field was approved by the Norwegian and UK authorities. For more information, see Fields under development on the NCS in section 2.3 DPN - Development and production Norway

- In December, Statoil signed an agreement to divest its 100% owned **Kai Kos Dehseh (KKD) oil sands** projects in the Canadian province of Alberta to Athabasca Oil Corporation. The transaction covers the producing Leismer demonstration plant and the undeveloped Corner project, along with a number of midstream contracts associated with Leismer's production. Following this transaction, Statoil will no longer own or operate any oil sands assets. As part of the transaction, Statoil will own just below 20% of Athabasca's shares, and this will be managed as a financial investment. The transaction was completed 31 January 2017. For more information about the transaction see note 4 Acquisitions and disposals to the Consolidated financial statements.

International production

Statoil's entitlement production outside Norway was about 32% of Statoil's total entitlement production in 2016.

The following table shows DPI's average daily entitlement production of liquids and natural gas for the years ending 31 December 2016, 2015 and 2014. Entitlement production volumes are Statoil's share of the volumes distributed to the partners according to production sharing agreement (PSA) (see section 5.6 Terms and abbreviations). For US assets entitlement production is expressed net of royalty interests. For all other countries royalties paid in-cash are included in entitlement production and royalties payable in-kind are excluded.

Petrocedeño[5]	Venezuela	9.68	Petrocedeño	2008	2033	10.3
Total Development and Production International (DPI) including share of equity accounted production						743.4

1) Statoil's actual equity interest can vary depending on wells and area.
2) Held by Production (HBP): A company's right to own and operate an oil and gas lease is perpetuated beyond its original primary term, as long thereafter as oil and gas is produced in paying quantities. In the case of Canada, in addition to continuing to be in production, other regulatory requirements must be met.
3) Statoil's equity interests are 5.0% in Hibernia and 9.0% in Hibernia Southern Extension.
4) Varies by field.
5) Petrocedeño is a non-consolidated company and accounted for pursuant to the equity accounting method. It produces extra-heavy crude oil from the Junin area in the Orinoco Belt.

Americas

Statoil has had strong growth in production and continues to optimize its portfolio within US shale since entering the first play in 2008. Statoil entered the **Marcellus** shale gas play, located in the Appalachian region in north east US, in 2008 through a partnership with Chesapeake Energy Corporation; Statoil has continued to optimize its North America onshore portfolio through acreage acquisition and divestments since 2008. In 2012, Statoil became an operator in the Marcellus through the purchase of additional acreage in the State of West Virginia and Ohio. The most recent divestments occurred in 2016 with divestment of West Virginia to EQT and Antero Resources. At the end of 2016, Statoil continues operatorship in the State of Ohio.

Statoil entered the **Bakken** tight oil play through the acquisition of Brigham Exploration Company in December 2011. Statoil's net acreage position in Bakken and Three Forks shale formation at the end of 2016 was 241,000 acres.

Statoil entered the **Eagle Ford** shale formation located in southwest Texas in 2010. In 2013, Statoil became operator for 50% of the Eagle Ford acreage. As part of a global transaction in December 2015 with Repsol, which acquired Talisman in May 2015, Statoil increased its working interest and took full operatorship of all of the assets in the Eagle Ford Shale. As a result, Statoil has a total working interest of 63%. Our joint venture partner, Repsol, continues to hold 37% working interest.

US gathering system

Statoil's participates in gathering and facilities for initial processing of oil and gas in the **Bakken**, **Eagle Ford** and **Marcellus** assets in the US. This includes crude and natural gas gathering systems, fresh water supply systems, salt water disposal wells, oil and gas treatment and processing facilities to provide flow assurance for Statoil's upstream production. Midstream assets in Bakken are owned and operated 100% by Statoil. In Eagle Ford, Statoil is the operator for 100% of the midstream assets outside of the Oak, Karnes, DeWitt and Bee (KDB) area with a working interest of 63%. In the KDB area of Eagle Ford, Statoil has an ownership interest of 25.2% in Edwards Lime Gathering LLC, which is operated by Energy Transfer Partners L.P. For Marcellus, Statoil has operated assets in Marcellus South in Monroe Country, Ohio while in the Marcellus non-operated areas both in the North and South, Statoil's working interest ranges from 16.25% to 32.5% depending on gathering system and number of JV partners which include Williams Energy and Anadarko.

As of 1 January 2016 responsibility for the US gathering system has been transferred from MMP to DPI North America.

Statoil is positioned in the Gulf of Mexico for the following offshore developments:
The **Tahiti** oil field is located in the Green Canyon area and is produced through a floating spar facility. As of 31 December 2016, there were 12 production wells in operation, and additional wells will be phased in over time to fully develop the field.

The **Caesar Tonga** oil field is located in the Green Canyon area. As of 31 December 2016, there were seven producing wells tied back to the Anadarko-operated Constitution spar host, and additional production wells will be phased in over time.

The **Jack** and **St. Malo** oil fields are located in the Walker Ridge area. The fields are subsea tie-backs to the Chevron operated Walker Ridge Regional Host facility. First production was achieved in December 2014. As of 31 December 2016, there were three wells producing on Jack and six wells producing for St. Malo. Additional production wells will be phased in over time.

The **Julia** oil field is located in the Walker Ridge area of the Gulf of Mexico near Jack and St Malo. First oil was in April 2016 and two wells are currently online. Additional production wells are currently being drilled and completed and will come online in 2017.

The **Heidelberg** oil field is located in the Green Canyon area. First oil was on January 2016 and four wells are currently online.

Canada

Statoil has interests in the Jeanne d'Arc Basin offshore the province of Newfoundland and Labrador in the partner operated producing oil fields **Terra Nova**, **Hibernia** and **Hibernia Southern Extension**. In January 2017, Statoil completed the transaction to fully divest the 123,200 net acres of oil sands leases in Alberta which form the **Kai Kos Dehseh** project to Athabasca Oil Corporation.

Brazil

The **Peregrino** field is a heavy oil field located in the Campos Basin, about 85 kilometres off the coast of Rio de Janeiro. The field came on stream in 2011. The oil is produced from two wellhead platforms with drilling capability and it is processed on the Peregrino FPSO and offloaded to shuttle tankers. Statoil holds a 60% ownership interest in the field and is operator.

Africa

Angola

The deep water blocks 17, 15 and 31 contributed with 38% of Statoil's equity liquid production outside Norway in 2016. Each block is governed by a PSA which sets out the rights and obligations of the participants, including mechanisms for sharing of the production with the Angolan state oil company Sonangol.

Block 17 has production from four FPSOs; CLOV, Dalia, Girassol and Pazflor.

Block 15 has production from four FPSOs: Kizomba A, Kizomba B, Kizomba C-Mondo, and Kizomba C-Saxi Batuque.

Block 31 has production from the PSVM FPSO.

The FPSOs serve as production hubs and each receives oil from more than one field and a large number of wells. In 2016, new wells were added and set into production on all three blocks.

Nigeria

Statoil has a 20.2% interest in the **Agbami** deep water field which is located 110 km off the coast of the Central Niger Delta region. The field is developed with subsea wells connected to an FPSO. The Agbami field straddles the two licences OML 127 and OML 128 and is operated by Chevron under a Unit Agreement. Statoil has 53.85% interest in OML 128.

For information related to the Agbami redetermination process and the dispute between the Nigerian National Petroleum Corporation and the partners in Oil Mining Lease (OML) 128 concerning certain terms of the OML 128 Production Sharing Contract (PSC), see note

23 Other commitments and contingencies to the Consolidated financial statements.

Algeria
The **In Salah** onshore gas development is a joint operatorship between Sonatrach, BP and Statoil. The Northern fields have been operating since 2004, and the **Southern fields project** started production from two fields (Garet el Befinat and Hassi Moumene) in March 2016. The remaining two fields (Gour Mahmoud and In Salah) will start production in 2017. The Southern fields are tied back into the Northern fields' existing facilities.

The **In Amenas** onshore development is a gas development which contains significant liquid volumes. The In Amenas infrastructure includes a gas treatment plant composed of three processing trains. The production facility is connected to the Sonatrach distribution system. The facilities are operated through a joint operatorship between Sonatrach, BP and Statoil. The third processing train, which was damaged in the January 2013 terrorist attack, restarted in July 2016. The **In Amenas Gas Compression project**, which was led by BP, came into operation in February 2017. The compressors will make it possible to reduce wellhead pressure and thereby increase production.

Separate PSAs including mechanisms for revenue sharing, govern the rights and obligations of the Parties and establish joint operatorships between Sonatrach, BP and Statoil for In Salah and In Amenas.

Eurasia

Production largely consists of the output from the **Azeri-Chirag-Gunashli** oil field in the Caspian Sea and the **Corrib** gas field off Ireland's northwest coast, which has successfully ramped up production since its start up in December 2015. The cessation of production from **Jupiter** in the UK North Sea has been declared and the decommissioning of the wells started in fourth quarter of 2016.

International exploration

Statoil has reduced exploration drilling activity outside Norway in 2016 and prioritised new access efforts and prospect maturation to support an increased drilling activity in 2017 and onwards.

Brazil is one of Statoil's core exploration areas, where in 2016 Statoil successfully completed an appraisal program in BM-C-33, which includes the Pao de Acucar, Seat and Gavea discoveries.

In **Canada** Statoil and its partners completed a 19-month drilling campaign in the Bay du Nord area, making two new oil discoveries, Baccalieu and Bay de Verde.

In 2016 Statoil secured a position in **Turkey** through a partnership with Valeura Energy Inc. in the Thrace region in the European north-western part of Turkey.

In December 2016, **Mexico**'s deepwater bidding round, Round 1.4, took place in Mexico City. A joint venture comprised of Statoil, BP and Total was awarded 2 licenses in Block 1 and Block 3 in the Saline Basin, with Statoil as the operator.

In 2016 Statoil and its partners completed nine exploratory wells and made three discoveries internationally. In 2017 Statoil's international exploration drilling activity will comprise growth opportunities in basins where Statoil already is established with discoveries and producing fields, such as Canada, Brazil and the UK as well as new frontier opportunities like Suriname and Indonesia. Statoil expects to complete 12 to 14 exploration wells internationally in 2017.

Fields under development internationally

This section covers all the sanctioned projects and selected pre-sanctioned projects.

Americas

US
The **Stampede** oil field is located in the Green Canyon area. The development includes a tension-leg platform (TLP) with downhole gas lift and water injection from start of production. Hess is the operator, and Statoil has a 25% working interest. Start of production is expected in 2018.

TVEX is an extension to Tahiti field, targeting shallower reservoirs above the existing main Tahiti reservoir, which is located in Green Canyon in Gulf of Mexico. Chevron is the operator, and Statoil has a 25% working interest. Start of production is expected in fourth quarter of 2018.

The **Big Foot** oil field is located in Walker Ridge area. The development includes a dry tree TLP with a drilling rig. Chevron is the operator, and Statoil has a 27.5% working interest. Start of production is expected in 2018. Initial plans called for production to start in late 2015, however, installation was halted and the TLP moved to sheltered waters following damage to subsea installation tendons in late May 2015

US Onshore operations use hydraulic fracturing to recover resources. Despite reduction in investment and activity level in recent years in shale plays Bakken, Eagle Ford and Marcellus, production growth continues. The increase in onshore production despite investment reduction is attributed to higher recovery per well due to enhanced completion and improved operational efficiency.

Canada

The **Hebron** field, operated by Exxon Mobil, is located in the Jeanne d'Arc basin offshore Newfoundland near the partner-operated producing fields Terra Nova, Hibernia and Hibernia Southern Extension. The Hebron field will be developed using a fixed gravity base structure (GBS) and first oil is expected in late 2017. The topside was constructed in Korea and was transported to Newfoundland during 2016, whereas the GBS was constructed in Newfoundland. The topside and GBS were successfully tested and mated in December 2016. Statoil working interest was reduced from 9.7% to 9.01% effective 1 January 2016 due to a redetermination process.

Statoil has made oil discoveries in the Flemish Pass offshore Newfoundland comprising the **Bay du Nord** project, and work is on-going to assess options for developing Bay du Nord. Statoil is the operator of Bay du Nord and holds a 65% working interest.

Brazil

Peregrino phase II (Statoil 60%, operator) includes the Peregrino South and Southwest discoveries. The development consists of one wellhead platform tied back to the existing floating production, storage and offloading vessel. In December 2014, Statoil approved the investment decision for the development of the second phase of the Peregrino oil field. Following a programme improving project economics, project execution started in April, 2016. In September 2016, the plan for development was formally approved by the Brazilian national agency of petroleum, natural gas and biofuels (ANP). Production is expected to start in late 2020.

In November 2016, Statoil completed the acquisition of 66% operated share from Petrobras in licence **BM-S-8** in the Santos basin. This licence contains a substantial part of the pre-salt discovery Carcará. Carcará straddles both BM-S-8 and open acreage to the north. The definition of the development concept and the subsequent development of licence are dependent on ownership of the open acreage. The open acreage is expected to be included in the licencing round in 2017.

In August 2016, Statoil took over the operatorship of licence **BM-C-33** from Repsol Sinopec Brasil. Statoil has 35% equity interest in this licence which is located in the Campos basin. Work is on-going to assess options for developing the discoveries in the licence. For information regarding exploration activity in BM-C-33 see International exploration earlier in this section.

Africa

Tanzania

Statoil has made several large gas discoveries in **Block 2** offshore Tanzania. Statoil is the operator of Block 2 and holds a 65% working interest. The licence is located in the Indian Ocean 100 km off the southern part of Tanzania. Work is on-going to assess options for developing the discoveries, including the construction of an onshore LNG plant jointly with the co-venturers in Blocks 1 and 4 which are operated by BG Tanzania (100% owned by Shell).

Eurasia

United Kingdom

Mariner (Statoil 65.11%, operator) is a heavy oil development in the UK, where Statoil is the operator. The field development concept includes a production, drilling and living quarter platform based on a steel jacket. Oil will be exported by offshore loading from a floating storage unit. The development concept includes a possible future subsea tie-in of Mariner East, a small heavy oil discovery. The Mariner B storage vessel arrived Scotland on 26 August 2016, after a two-month voyage from South Korea. On 1 December 2016, the drilling of the first well of the Mariner field development commenced. Production from Mariner is expected to start in 2018.

Bressay (Statoil 81.6%, operator) is also a heavy oil discovery. In February 2016, Statoil decided to pause the concept selection work on Bressay. The partnership has agreed an extension of the licence period until end 2019 with the UK Oil and Gas Authority (OGA).

2.5 MMP - MARKETING, MIDSTREAM AND PROCESSING

MMP overview

The Marketing, Midstream and Processing (MMP) reporting segment is responsible for marketing, trading, processing and transporting of crude oil and condensate, natural gas, NGL and refined products, including operation of Statoil operated refineries, terminals and processing plants. In addition, MMP is responsible for developing transportation solutions for natural gas, liquids and crude oil from Statoil assets including pipelines, shipping, trucking and rail. The business activities are organised in the following business clusters: Marketing and Trading, Asset Management and Processing and Manufacturing.

Key events in 2016:

- Statoil had a strong increase in delivered sales of crude oil into Asia during 2016, based on West African equity production and shipping capability
- The South Riding Point Terminal in Grand Bahamas sustained damage in the hurricane Matthew in October and was closed to traffic for a period
- Major planned turnarounds at both Kalundborg and Mongstad refineries, Tjeldbergodden methanol plant and Gassled facilities

Marketing and Trading

The Marketing and Trading business cluster (MT) is responsible for the marketing, trading and transportation of all products from Statoil's upstream, processing and refining business and for power and emissions trading.

MMP handles Statoil's own volumes, the Norwegian state's direct financial interest (SDFI) equity production of crude oil and NGL and third-party volumes, representing approximately 50% of all Norwegian liquids exports. MMP is also responsible for marketing SDFI's gas together with Statoil's own volumes and third party gas, representing approximately 70% of all Norwegian gas exports. See the Norwegian state's participation and SDFI oil and gas marketing and sale in Applicable laws and regulations in section 2.7 Corporate.

Marketing and trading of gas and LNG

Statoil's gas marketing and trading business is conducted from Norway and from offices in Belgium, the UK, Germany, the USA and Singapore.

Europe

The major export markets for gas from the NCS are Germany, France, the UK, Belgium, the Netherlands, Italy and Spain. LNG from the Snøhvit field, combined with third party LNG cargoes, allow Statoil to reach global gas markets. The major part of the gas is sold to counterparties through bi-lateral sales and the remaining volumes over the trading desk through all the main European trading hubs. The bi-lateral sales are mainly carried out with large industrial customers, power producers and local distribution companies. A few of Statoil's long-term gas contracts contain contractual price review mechanisms that can be triggered by the buyer or seller at regular intervals, or under certain given circumstances.

Statoil is active on both physical and exchange markets such as the Intercontinental Exchange (ICE). Statoil expects to continue to optimise the market value of the gas through a mix of bi-lateral contracts and trading via its production, transportation systems and downstream assets.

USA

Statoil Natural Gas LLC (SNG), a wholly-owned subsidiary, has a gas marketing and trading organization in Stamford, Connecticut that markets natural gas to local distribution companies, industrial customers and power generators. SNG also markets equity production volumes from the Gulf of Mexico, Eagle Ford and Marcellus and transports some of the northern Marcellus production to New York City and to Niagara, providing access to the greater Toronto area.

In addition, SNG has long-term capacity contracts with Dominion Resources Inc., which owns the Cove Point LNG re-gasification terminal in Maryland. LNG is sourced from the Snøhvit LNG facility in Norway. Due to continuing low gas prices in the US, almost all of Statoil's LNG cargoes have been diverted away from the US and delivered into higher-priced markets in Europe, South-America and Asia.

Marketing and trading of liquids

MMP is responsible for the sale of Statoil's and the SDFI's crude oil and NGL, in addition to commercial optimisation of the refineries and terminals. The liquids marketing and trading business is conducted from Norway, UK, Singapore, US and Canada. The main crude oil market for Statoil is northwest Europe.

MMP also markets equity volumes from DPI assets located in Canada, US, Brazil, Angola, Nigeria, Algeria, Azerbaijan and UK, as well as third party volumes. Value is maximised through marketing, physical and financial trading and through optimisation of own and leased capacity such as refineries, processing, terminals, storages, pipelines, railcars and vessels.

Production plants

Statoil owns and is operator of the Mongstad refinery in Norway including the Mongstad Heat and Power Plant (MHPP). The refinery is a medium-sized refinery built in 1975, with a crude oil and condensate distillation capacity of 226,000 barrels per day. The refinery is directly linked to offshore fields through two crude oil pipelines, to the crude oil terminal at Sture and the gas processing plant at Kollsnes through an NGL/condensate pipeline, and to Kollsnes by a gas pipeline. MHPP produces heat and power from gas received from Kollsnes and from the refinery. It has capacity of approximately 280 megawatts of electric power and 350 megawatts of process heat.

Statoil has an ownership interest of 34% in Vestprosess, which transports and processes NGL and condensate. The Vestprosess pipeline connects the Kollsnes and Sture plants to Mongstad.

Statoil owns and is operator of the Kalundborg refinery in Denmark, which has a crude oil and condensate distillation capacity of

108,000 barrels per day. The refinery is connected via one gasoline and one gas oil pipeline to the terminal at Hedehusene near Copenhagen, and most of its products are sold locally.

Statoil has an ownership interest of 82% in the methanol plant at Tjeldbergodden. It receives natural gas from the Norwegian Sea through the Haltenpipe pipeline. In addition, Statoil holds a 50.9% ownership interest in the air separation unit Tjeldbergodden Luftgassfabrikk DA.

The following table shows operating statistics for the plants at Mongstad, Kalundborg and Tjeldbergodden.

	Throughput[1]			Distillation capacity[2]			On stream factor %[3]			Utilisation rate %[4]		
Refinery	2016	2015	2014	2016	2015	2014	2016	2015	2014	2016	2015	2014
Mongstad	**9.8**	11.9	9.2	**9.3**	9.3	9.3	**94.4**	97.6	93.4	**93.9**	93.4	90.0
Kalundborg	**5.0**	5.2	4.5	**5.4**	5.4	5.4	**98.0**	98.5	91.8	**91.0**	91.0	82.0
Tjeldbergodden	**0.76**	0.92	0.83	**0.95**	0.95	0.95	**94.8**	98.5	88.4	**94.8**	98.5	97.1

1) Actual throughput of crude oils, condensates, NGL, feed and blendstock, measured in million tonnes.
Higher than distillation capacity for Mongstad due to high volumes of fuel oil and NGL not going through the crude distillation unit.
Higher than distillation capacity for Kalundborg, due to volumes of kero, naphta, gasoil and biodiesel-additive not going through the crude-/condensate units.
2) Nominal crude oil and condensate distillation capacity, and methanol production capacity, measured in million tonnes.
3) Composite reliability factor for all processing units, excluding turnarounds.
4) Composite utilisation rate for all processing units, stream day utilisation.

Terminals and storage

Statoil has a 65% ownership interest in Mongstad crude oil terminal. Crude oil is landed at Mongstad through pipelines from the NCS and by crude tankers from the market. The Mongstad terminal has a storage capacity of 9.4 million barrels of crude oil.

The Sture crude oil terminal receives crude oil through pipelines from the North Sea. The terminal is part of the Oseberg Transportation System (Statoil interest 36.2%). The processing facilities at Sture stabilise Oseberg crude oil and recover LPG mix (propane and butane) and naphtha.

Statoil operates the South Riding Point Terminal, which is located on Grand Bahamas Island and consists of two shipping berths and ten storage tanks, with a storage capacity of 6.75 million barrels of crude oil. The terminal has facilities to blend crude oils, including heavy oils. The main damages suffered in the Matthew hurricane in October were related to the loading infrastructure at the Sea Island, and Berth 2 is still out of operation. Statoil is in the process of scoping the reconstruction.

Statoil UK holds one third share of the interests in the Aldbrough Gas Storage in UK, operated by SSE Hornsea Ltd.

Statoil Deutschland Storage GmbH holds a 23.7% stake in the Etzel Gas Lager in the northern part of Germany which has a total of nineteen caverns and secures regularity for gas deliveries from the NCS.

Statoil UK holds a 27.3% stake in the Teesside terminal, which stabilises unstable oil from the Ekofisk area and several other Norwegian and UK fields and recovers NGL.

Pipelines

Statoil is a significant shipper in the NCS gas pipeline system. Most gas pipelines on the NCS that are accessed by third-party customers are owned by a single joint venture, Gassled, with regulated third-party access. The Gassled system is operated by the independent system operator Gassco AS, which is wholly owned by the Norwegian state. Statoil's current ownership share in Gassled is 5%. See Gas sales and transportation from the NCS in section 2.7 Corporate for further information.

MMP is technical service provider (TSP) for the Kårstø and Kollsnes gas processing plants in accordance with the technical service agreement between Statoil and Gassco AS, included as Exhibit 4(a)(i) to Form 20-F. MMP also performs the TSP role for the larger share of the Gassco operated gas pipeline infrastructure.

In addition, MMP manages Statoil's ownership in the following pipelines in the Norwegian gas transportation system: Oseberg oil transportation system, Grane oil pipeline, Kvitebjørn oil pipeline, Troll oil pipeline I and II, Edvard Grieg oil pipeline, Utsira High gas pipeline, Valemon rich gas pipeline, Haltenpipe, Norpipe and Mongstad gas pipeline.

Statoil Deutschland GmbH held a 30.8% stake in the Norddeutsche Erdgas Transversale (NETRA) overland gas transmission pipeline via Jordgas Transport GmbH, which was sold during 2016 to Open Grid Europe GmbH and Gasuni Deutschland Transport Services GmbH.

Polarled (Statoil 37.1%, operator) will secure a gas export pipeline for fields in the Norwegian Sea. The project is aligned with the Aasta Hansteen field development.

The **Johan Sverdrup oil and gas export pipelines** (Statoil 40.0%, operator) will provide export from the Johan Sverdrup field.

2.6 OTHER GROUP

The Other reporting segment includes activities in New Energy Solutions (NES), Global Strategy and Business Development (GSB), Technology, Projects and Drilling (TPD) and corporate staffs and support functions.

New Energy Solutions (NES)

The NES business area reflects Statoil's aspirations to gradually complement its oil and gas portfolio with profitable renewable energy and other low-carbon energy solutions. Offshore wind and carbon capture and storage have been key focus areas in 2016.

Key events in 2016:

- Acquisition of a 50% stake in the Arkona asset in the German part of the Baltic Sea
- Launch of Statoil Energy Venture Fund and 4 subsequent investments
- Agreement to increase UK presence through increasing owner share in the Dogger Bank projects
- Signed a letter of intent to take over as operator of the Sheringham Shoal wind farm in 2017
- Statoil has concluded a 25% farm down in the Hywind Scotland project
- Winner of US Government's wind lease sale of 79,350 acres offshore New York

The **Sheringham Shoal** offshore wind farm (Statoil 40%, operator from 2017) located off the coast of Norfolk, UK, was formally opened in September 2012. The wind farm is in full production with 88 turbines and an installed capacity of 317 megawatt (MW). Following divestment in 2014, it is now owned 40% by Statkraft, a Norwegian wholly state-owned company, 40% by Statoil and 20% by the UK Green Investment Bank (GIB). The wind farm's annual production is approximately 1.1 terawatt hours (TWh) and it has the capacity to provide power to approximately 220,000 households. Statkraft and Statoil have signed a letter of intent that Statoil takes over as operator of Sheringham Shoal in 2017.

The **Dudgeon** offshore wind farm (Statoil 35%, operator) is located in the Greater Wash area off the English east coast, short distance from Sheringham Shoal. A final investment decision for the 402 MW project was made in July 2014. The wind farm is expected to produce 1.7 TWh yearly from 67 turbines, with the capacity to provide power for around 410,000 households. On 7 January 2017, the first turbine was energised. On 7 February 2017, the first turbine was set in production, delivering electric power to the UK national grid. The wind farm is expected to be in full operation in fourth quarter 2017.

The **Dogger Bank** area has a total consented capacity of 4.8 GW and is potentially the largest offshore wind farm development in the world. Statoil and Statkraft, together with RWE and SSE, are partners in the Forewind consortium, each with a 25% equity stake. In February and August 2015, the consortium received consent from the UK authorities for four projects, each with a capacity of 1200 MW. Statoil has recently signed an agreement to acquire Statkraft's share in Dogger Bank, the final shareholding is pending, among other things, partner approval.

The **Arkona** offshore wind farm (Statoil 50%) is being developed in the German part of the Baltic Sea, and the operations and maintenance base will be located in Sassnitz on the island of Rügen. In April 2016, Statoil acquired a 50% share in AWE-Arkona-Windpark Entwicklungs-GmbH from E.ON Climate & Renewables. A final investment decision for the up to 385 MW project was made in April 2016. All main construction contracts have been awarded, and fabrication has started. The wind farm is expected to supply approximately 400,000 German households from 60 turbines, and to be in full operation in 2019.

The **Hywind Scotland pilot** wind park (Statoil 75%, operator) is a floating wind pilot park using the Hywind concept, developed and owned by Statoil. The project is located at Buchan Deep, approximately 25 km off Peterhead on the east coast of Scotland. Statoil will install 5 Siemens 6MW turbines, a total capacity of 30MW. Production is expected to be 0.14 TWh/year, powering around 20,000 households. The project was sanctioned in October 2015. The planned first deliveries to the grid are in fourth quarter 2017. This is the next step in Statoil's strategy towards deployment of the first utility scale floating wind farms.

Statoil is the winner of the New York Wind Energy Area lease, following the December 2016 BOEM lease sale, with a winning bid of USD 42.5 million. The lease is 321 km^2, large enough to support one or more offshore wind developments with a total capacity of more than 1GW. The lease is located approximately 20 km directly south of Long Island. The project will be further matured during 2017.

Since 1996, Statoil has proven experience in **carbon capture and storage** (CCS) and has continued to develop competence through research engagement in the Technical Centre Mongstad (TCM) and offshore operations in Sleipner and Snøhvit. Statoil will seek to deploy our competence and experience in other CCS projects, continue to evaluate opportunities to reduce carbon dioxide emissions and explore carbon dioxide for enhanced oil recovery (EOR) possibilities. Statoil has on behalf of the Norwegian Ministry of Petroleum and Energy (MPE) performed a feasibility study for establishing a CO2 storage on the NCS. The MPE intends to issue a tender process at the end of this year for planning, construction and operation of such CO2 storage as a part of a full CCS value chain from three industrial sources in Norway.

In February 2016, Statoil launched the Statoil Energy Ventures Fund, a new energy investment fund dedicated to investing in attractive and ambitious growth companies in low carbon energy, supporting Statoil's strategy of growth in new energy solutions. The Statoil Energy Ventures Fund, will invest up to USD 200 million over a period of four to seven years. During 2016, the fund made four investments in four different segments. United Wind is a distributed wind generation company based in New York that offers to install wind turbines on small property owner's land in exchange for a 20-year lease arrangement. ChargePoint is the largest electric vehicle charging infrastructure company in the USA with plans to expand globally in light of the growth in electric vehicles sales. Convergent Energy & Power is a US based energy storage project developer that builds, finances, owns and operates storage projects on behalf of large utilities and commercial and industrial customers. Oxford PV is a third generation solar technology company based in Oxford, UK that is developing a perovskites material that has the potential to make a significant increase in the efficiency of silicon photovoltaic panels.

Global Strategy and Business Development (GSB)

The Global Strategy and Business Development (GSB) business area is Statoil's functional centre for strategy and business development. GSB is responsible for Statoil's global strategy processes and identifies and delivers inorganic business development opportunities, including corporate mergers and acquisitions. This is achieved through close collaboration across geographic locations and business areas. Statoil's strategy forms the basis for guiding the company's business development focus.

GSB also hosts a number of corporate functions including Statoil's Corporate Sustainability function, which is shaping the company's strategic response to sustainability issues and reporting on Statoil's sustainability performance.

Corporate staffs and support functions

Corporate Staffs and support functions comprise the non-operating activities supporting Statoil, and include headquarters and central functions that provide business support such as finance and control, corporate communication, safety, audit, legal services and people and organisation.

Technology, Projects and Drilling (TPD)

The business area **Technology, Projects and Drilling (TPD)** is responsible for the development and execution of projects, well deliveries, procurement, research and technology in Statoil.

The TPD organisation was restructured 1 January 2016 to reduce cost, increase efficiency and secure high quality execution. All project expertise was integrated in one Project development organisation (PRD), and all expertise within technology, research and innovation was integrated in one Research and technology organisation (R&T).

Research and Technology (R&T) delivers technical expertise to projects, business developments and assets. Further, R&T drives research, innovation and implementation of new technology across Statoil, to secure both short and long term business needs.

Project Development (PRD) develops and executes all major facility developments, modifications and field decommissioning.

Drilling and Well (D&W) provides cost efficient well deliveries and rig management, including expertise and support to drilling and well operations globally in Statoil.

Procurement and Supplier Relations (PSR) manages the supply chain, conducts all procurements and provides management of contracts in accordance with business needs.

2.7 CORPORATE

APPLICABLE LAWS AND REGULATIONS

Statoil operates in more than 30 countries and is exposed to, and committed to compliance with, a number of laws and regulations globally.

This article focuses primarily on Norwegian laws specific for Statoil`s core activities, taking into account that the majority of Statoil's production is produced on the NCS, the ownership structure of the company and that Statoil is registered and has its headquarters in Norway.

Norwegian petroleum laws and licensing system

The principal laws governing Statoil's petroleum activities in Norway are the Norwegian Petroleum Act and the Norwegian Petroleum Taxation Act.

Norway is not a member of the European Union (EU), but Norway is a member of the European Free Trade Association (EFTA). The EU and the EFTA Member States have entered into the Agreement on the European Economic Area, referred to as the EEA Agreement, which provides for the inclusion of EU legislation in the national law of the EFTA Member States (except Switzerland). Statoil's business activities are subject to both the EFTA Convention and EU laws and regulations adopted pursuant to the EEA Agreement.

For further information about the jurisdictions in which Statoil operates, see sections 2.2 Business overview and 2.10 Risk review.

Under the Petroleum Act, the Norwegian Ministry of Petroleum and Energy ("MPE") is responsible for resource management and for administering petroleum activities on the NCS. The main task of the MPE is to ensure that petroleum activities are conducted in accordance with the applicable legislation, the policies adopted by the Norwegian Parliament (the Storting) and relevant decisions of the Norwegian State.

The Storting's role in relation to major policy issues in the petroleum sector can affect Statoil in two ways: firstly, when the Norwegian State acts in its capacity as majority owner of Statoil shares and, secondly, when the Norwegian State acts in its capacity as regulator:

- The Norwegian State's shareholding in Statoil is managed by the Ministry of Petroleum and Energy. The Ministry of Petroleum and Energy will normally decide how the Norwegian State will vote on proposals submitted to general meetings of the shareholders. However, in certain exceptional cases, it may be necessary for the Norwegian State to seek approval from the Storting before voting on a certain proposal. This will normally be the case if Statoil issues additional shares and such issuance would significantly dilute the Norwegian State's holding, or if such issuance would require a capital contribution from the Norwegian State in excess of government mandates. A decision by the Norwegian State to vote against a proposal on Statoil's part to issue additional shares would prevent Statoil from raising additional capital in this manner and could adversely affect Statoil's ability to pursue business opportunities. For more information about the Norwegian State's ownership, see Risks related to state ownership in section 2.10 Risk review and Major shareholders in section 5.1 Shareholder information
- The Norwegian State exercises important regulatory powers over Statoil, as well as over other companies and corporations on the NCS. As part of its business, Statoil or the partnerships to which Statoil is a party, frequently need to apply for licences and other approval of various kinds from the Norwegian State. Although Statoil is majority-owned by the Norwegian State, it does not receive preferential treatment with respect to licences granted by or under any other regulatory rules enforced by the Norwegian State

The principal laws governing Statoil's petroleum activities in Norway and on the NCS are the Norwegian Petroleum Act of 29 November 1996 (the "Petroleum Act") and the regulations issued thereunder, and the Norwegian Petroleum Taxation Act of 13 June 1975 (the "Petroleum Taxation Act"). The Petroleum Act sets out the principle that the Norwegian State is the owner of all subsea petroleum on the NCS, that exclusive right to resource management is vested in the Norwegian State and that the Norwegian State alone is authorised to award licences for petroleum activities as well as determine its terms. Licensees are required to submit a plan for development and operation (PDO) to the Ministry of Petroleum and Energy for approval. For fields of a certain size, the Storting has to accept the PDO before it is formally approved by the Ministry of Petroleum and Energy. Statoil is dependent on the Norwegian State for approval of its NCS exploration and development projects and its applications for production rates for individual fields.

Production licences are the most important type of licence awarded under the Petroleum Act and are normally awarded for an initial exploration period, which is typically six years, but which can be shorter. The maximum period is ten years. During this exploration period, the licensees must meet a specified work obligation set out in the licence. If the licensees fulfil the obligations set out in the initial license period, they are entitled to require that the licence be prolonged for a period specified at the time when the licence is awarded, typically 30 years.

The terms of the production licences are decided by the Ministry of Petroleum and Energy. A production licence grants the holder an exclusive right to explore for and produce petroleum within a specified geographical area. The licensees become the owners of the petroleum produced from the field covered by the licence. Production licences are awarded to group of companies forming a joint venture at the Ministry's discretion. The members of the joint venture are jointly and severally responsible to the Norwegian State for obligations arising from petroleum operations carried out under the licence. The Ministry of Petroleum and Energy decides the form of the joint operating agreements and accounting agreements.

The governing body of the joint venture is the management committee. In licences awarded since 1996 where the state's direct financial interest (SDFI) holds an interest, the Norwegian State, acting through Petoro AS, may veto decisions made by the joint venture management committee, which, in the opinion of the Norwegian State, would not be in compliance with the obligations of the licence with respect to the Norwegian State's exploitation policies or financial interests. This power of veto has never been used.

Interests in production licences may be transferred directly or indirectly subject to the consent of the Ministry of Petroleum and Energy and the approval of the Ministry of Finance of a corresponding tax treatment position. In most licences, there are no pre-emption rights in favour of the other licensees. However, the SDFI, or the Norwegian State, as appropriate, still holds pre-emption rights in all licences.

The day-to-day management of a field is the responsibility of an operator appointed by the Ministry of Petroleum and Energy. The operator is in practice always a member of the joint venture holding the production licence, although this is not legally required. The terms of engagement of the operator are set out in the joint operating agreement.

Licensees are required to submit a plan for development and operation (PDO) to the Ministry of Petroleum and Energy for approval. For fields of a certain size, the Storting has to accept the PDO before it is formally approved by the Ministry of Petroleum and Energy.

If important public interests are at stake, the Norwegian State may instruct Statoil and other licensees on the NCS to reduce the production of petroleum. The last time the Norwegian State instructed a reduction in oil production was in 2002.

A licence from the Ministry of Petroleum and Energy is also required in order to establish facilities for the transportation and utilisation of petroleum. Ownership of most facilities for the transportation and utilisation of petroleum in Norway and on the NCS is organised in the form of joint ventures. The participants' agreements are similar to the joint operating agreements.

Licensees are required to prepare a decommissioning plan before a production licence or a licence to establish and use facilities for the transportation and utilisation of petroleum expires or is relinquished, or the use of a facility ceases. On the basis of the decommissioning plan, the Ministry of Petroleum and Energy makes a decision as to the disposal of the facilities.

For an overview of Statoil's activities and shares in Statoil's production licences on the NCS, see section 2.5 Development and Production Norway (DPN).

Gas sales and transportation from the NCS

Statoil markets gas from the NCS on its own behalf and on the Norwegian State's behalf. Gas is transported through the Gassled pipeline network to customers in the UK and mainland Europe.

Most of Statoil's and the Norwegian State's gas produced on the NCS is sold under gas contracts to customers in the European Union (EU), and changes in EU legislation may affect Statoil's marketing of gas.

The Norwegian gas transport system, consisting of the pipelines and terminals through which licensees on the NCS transport their gas, is owned by a joint venture called Gassled. The Norwegian Petroleum Act of 29 November 1996 and the pertaining Petroleum Regulation establish the basis for non- discriminatory third-party access to the Gassled transport system.

The tariffs for the use of capacity in the transport system are determined by applying a formula set out in separate tariff regulations stipulated by the Ministry of Petroleum and Energy. The tariffs are paid on the basis of booked capacity, not on the basis of the volumes actually transported.

For further information, see Pipelines in section 2.5 MMP - Marketing, Midstream and Processing.

The Norwegian State's participation

The Norwegian State's policy as a shareholder in Statoil has been and continues to be to ensure that petroleum activities create the highest possible value for the Norwegian State.

In 1985, the Norwegian State established the State's direct financial interest (SDFI) through which the Norwegian State has direct participating interests in licences and petroleum facilities on the NCS. As a result, the Norwegian State holds interests in a number of licences and petroleum facilities in which Statoil also hold interests. Petoro AS, a company wholly owned by the Norwegian State, was formed in 2001 to manage the SDFI assets.

SDFI oil and gas marketing and sale

Statoil markets and sells the Norwegian State's oil and gas together with Statoil's own production. The arrangement has been implemented by the Norwegian State.

At an extraordinary general meeting held on 25 May 2001, the Norwegian State, as sole shareholder, approved an instruction to Statoil setting out specific terms for the marketing and sale of the Norwegian State's oil and gas. This resolution is referred to as the Owner's instruction.

Statoil is obliged under the Owner's instruction to jointly market and sell the Norwegian State's oil and gas as well as Statoil's own oil and gas. The overall objective of the marketing arrangement is to obtain the highest possible total value for Statoil's oil and gas and the Norwegian State's oil and gas, and to ensure an equitable distribution of the total value creation between the Norwegian State and Statoil.

Withdrawal or amendment

- The Norwegian State may at any time utilise its position as majority shareholder of Statoil to withdraw or amend the marketing instruction

HSE regulation

Statoil's petroleum operations are subject to extensive laws and regulations relating to health, safety and the environment (HSE).

With business operations in more than 30 countries, Statoil is subject to a wide variety of HSE laws and regulations concerning its products, operations and activities. Laws and regulations may be jurisdiction specific, but also international regulations, conventions or treaties, as well as EU directives and regulations, are relevant.

As a result of the Macondo incident, in 2011, the US Department of the Interior created two new agencies to administer operations and activities in the Gulf of Mexico - the Bureau of Safety and Environmental Enforcement (BSEE) and the Bureau of Offshore

Energy Management (BOEM). The department also issued new regulations to address the respective roles of the new agencies. Application of these regulations has the potential to affect Statoil's operations in the US. Similarly, the effects from implementing the EU offshore Safety Directive in EU-member states' legislation will affect operations in relevant EU member countries.

See also Risk factors in section 2.10 Risk review.

Taxation of Statoil

Statoil is subject to ordinary Norwegian corporate income tax and to a special petroleum tax relating to its offshore activities in Norway. Statoil's profits, both from offshore oil and natural gas activities and from onshore activities, are subject to Norwegian corporate income tax. The standard corporate income tax rate has been reduced from 25% in 2016 to 24% in 2017. In addition, a special petroleum tax is levied on profits from petroleum production and pipeline transportation on the NCS. The special petroleum tax rate has been increased from 53% in 2016 to 54% in 2017. The special petroleum tax rate is applied to relevant income in addition to the standard income tax rate, resulting in a 78% marginal tax rate on income subject to the special petroleum tax. For further information, see note 9 Income taxes to the Consolidated financial statements.

Statoil's international petroleum activities are subject to tax pursuant to local legislation. Fiscal regulation of Statoil's upstream operations is generally based on corporate income tax regimes and/or PSAs.

SUBSIDIARIES AND PROPERTIES

Significant subsidiaries

The following table shows significant subsidiaries and equity accounted companies directly held by Statoil ASA as of 31 December 2016.

Our voting interest in each company is equivalent to our equity interest.

Ownership in certain subsidiaries and other equity accounted companies

PROPERTY, PLANT AND EQUIPMENT

Statoil has interests in real estate in many countries throughout the world. However, no individual property is significant. The largest office buildings are the Statoil's head office located at Forusbeen 50, NO-4035, Stavanger, Norway which comprises approximately 135,000 square meters of office space, and the 65,500-square-metre office building located at Fornebu on the outskirts of Norway's capital Oslo. Both office buildings are leased.

For a description of our significant reserves and sources of oil and natural gas, see Proved oil and gas reserves in section 2.8 Operating and financial performance below, and note 27 Supplementary oil and gas information (unaudited) to the Consolidated financial statements. For a description of our operational refineries, terminals and processing plants, see section 2.5 MMP - Marketing, midstream and processing.

RELATED PARTY TRANSACTIONS

See note 24 Related parties to the Consolidated financial statements for information concerning related parties.

INSURANCE

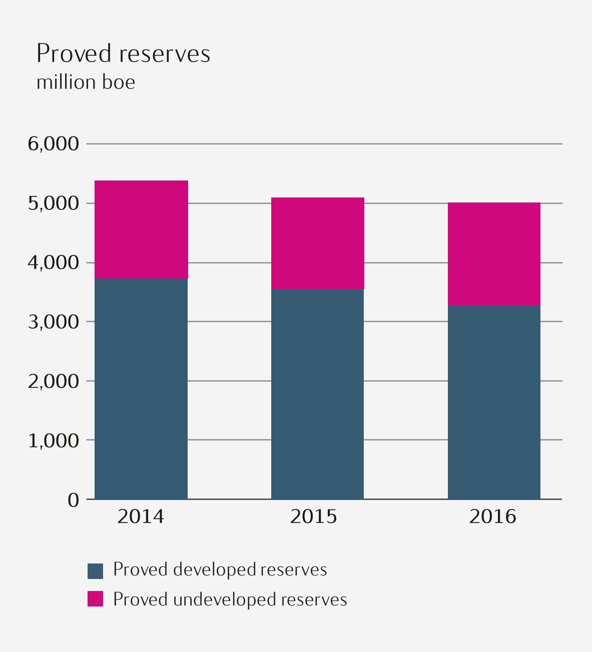
Statoil maintains insurance coverage that includes coverage for physical damage to its oil and gas properties, third-party liability, workers' compensation and employers' liability, general liability, sudden pollution and other coverage.

Statoil's insurance coverage includes deductibles that must be met prior to recovery. Statoil's external insurance is subject to caps, exclusions and limitations, and there is no assurance that such coverage will adequately protect Statoil against liability from all potential consequences and damages.

2.8 OPERATING AND FINANCIAL PERFORMANCE

PROVED OIL AND GAS RESERVES

Proved oil and gas reserves were estimated to be 5,013 mmboe at year end 2016, compared to 5,060 mmboe at the end of 2015.



Statoil's proved reserves are estimated and presented in accordance with the Securities and Exchange Commission (SEC) Rule 4-10 (a) of Regulation S-X, revised as of January 2009, and relevant Compliance and Disclosure Interpretations (C&DI) and Staff Accounting Bulletins, as issued by the SEC staff. For additional information, see Proved oil and gas reserves in note 2 Significant accounting policies to the Consolidated financial statements. For further details on proved reserves, see also note 27 Supplementary oil and gas information (unaudited) in the Consolidated financial statements.

Changes in proved reserves estimates are most commonly the result of revisions of estimates due to observed production performance, extensions of proved areas through drilling activities or the inclusion of proved reserves in new discoveries through the sanctioning of new development projects. These are sources of additions to proved reserves that are the result of continuous business processes and can be expected to continue to add reserves in the future.

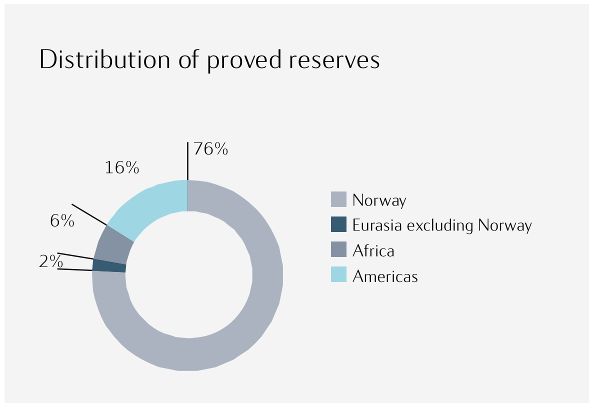
Proved reserves can also be added or subtracted through the acquisition or disposal of assets. Changes in proved reserves can also be due to factors outside management control, such as changes in oil and gas prices. Lower oil and gas prices normally allow less oil and gas to be recovered from the accumulations. However, for fields with PSAs and similar contracts, a reduced oil price may result in higher entitlement to the produced volume. These changes are included in the revisions category in the table below.

The principles for booking proved gas reserves are limited to contracted gas sales or gas with access to a robust gas market.

In Norway and the UK, Statoil recognises reserves as proved when a development plan is submitted, as there is reasonable certainty that such a plan will be approved by the regulatory authorities. Outside these territories, reserves are generally booked as proved when regulatory approval is received, or when such approval is imminent. Reserves from new discoveries, upward revisions of reserves and purchases of proved reserves are expected to contribute to maintaining proved reserves in future years. Undrilled well locations US onshore are generally booked as proved undeveloped reserves when a development plan has been adopted and the well locations are scheduled to be drilled within five years,

Approximately 91% of our proved reserves are located in OECD countries. Norway is by far the most important contributor in this category, followed by the United States (US), Canada and Ireland.

Of Statoil's total proved reserves, 7% are related to PSAs in non-OECD countries such as Azerbaijan, Angola, Algeria, Nigeria, Libya and Russia. Other non-OECD reserves are related to concessions in Brazil and Venezuela, representing less than 2% of Statoil's total proved reserves. These are included in proved reserves in the Americas.



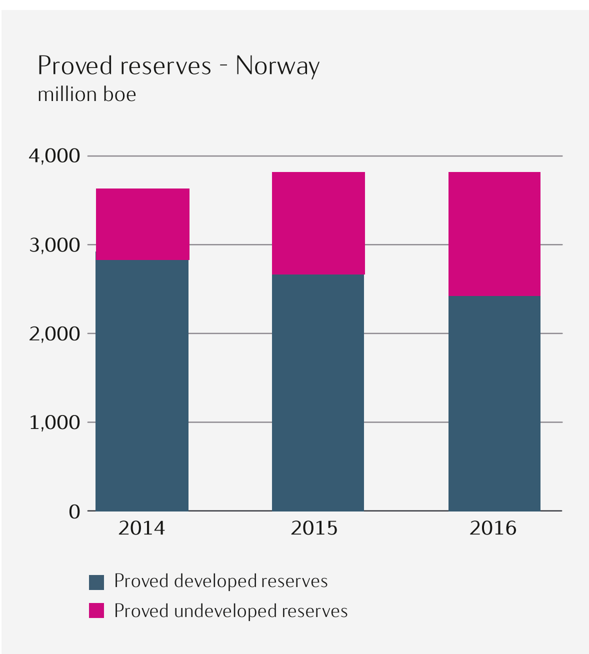
Significant changes in our proved reserves in 2016 were:

- Negative revisions due to lower commodity prices compared to last year, resulted in a reduction of approximately 60 million boe
- The negative revisions are more than offset by positive revisions due to better performance of producing fields, maturing of improved recovery projects, and reduced uncertainty due to further drilling and production experience. The net effect of the positive and negative revisions is an increase of 409 million boe in 2016. A significant part of these positive revisions are related to large, producing fields offshore Norway where production is declining less than previously assumed for the proved reserves due to continuous improvement activities

- Proved reserves from new discoveries have also been added through the sanctioning of new field development projects in 2016, Svale Nord, Trestakk and Utgard in Norway and Julia in US. The new projects added a total of 66 million boe. New discoveries with proved reserves booked in 2016 are all expected to start production within a period of five years
- Further drilling in the Bakken, Marcellus and Eagle Ford onshore plays in the US increased the proved reserves in 2016, and some of these additions are presented as extensions. Extension of proved area on existing fields added a total of 112 million boe of new proved reserves in 2016
- The net effect of purchase and sale increased the reserves by 39 million boe in 2016

The 2016 entitlement production was 673 million boe, an increase of 1.6% compared to 2015.

Proved reserves as of 31 December 2016	Proved reserves Oil and Condensate (mmboe)	NGL (mmboe)	Natural Gas (bcf)	Total oil and gas (mmboe)
Developed				
Norway	543	213	9,223	2,399
Eurasia excluding Norway	43	-	188	76
Africa	200	10	171	240
Americas	320	53	1,002	552
Total Developed proved reserves	1,105	277	10,584	3,268
Undeveloped				
Norway	689	76	3,628	1,411
Eurasia excluding Norway	28	-	-	28
Africa	22	6	110	47
Americas	190	14	316	260
Total Undeveloped proved reserves	928	95	4,054	1,746
Total proved reserves	2,033	372	14,637	5,013



Proved reserves in Norway
A total of 3,811 million boe is recognised as proved reserves in 61 fields and field development projects on the NCS, representing 76% of Statoil's total proved reserves. Of these, 54 fields and field areas are currently in production, 35 of which are operated by Statoil.

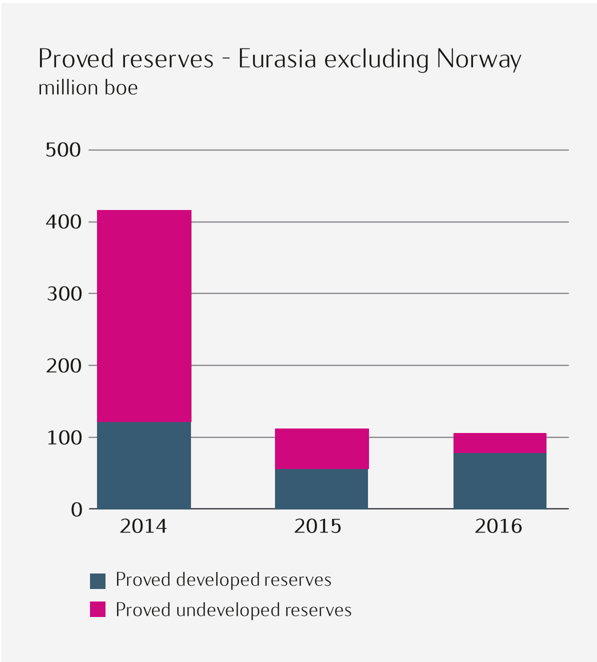
Three new field development projects added reserves categorised as extensions and discoveries during 2016, Svale Nord, Trestakk and Utgard. Production experience, further drilling and improved recovery on several of Statoil's producing fields in Norway also contributed positively to the revisions of the proved reserves in 2016.

The net effect of the transaction with Lundin Petroleum AB (Lundin), including sale of Statoil's equity share in the Edvard Grieg field and acquisition of a 20.1% share in Lundin, results in an increase in Statoil's proved reserves of 50 million boe. The volume corresponding to our relative share of Lundin's share in fields carrying proved reserves is included as reserves in an equity accounted company.

Of the proved reserves on the NCS, 2,399 million boe, or 63%, are proved developed reserves. Of the total proved reserves in this area, 60% are gas reserves related to large offshore gas fields such as Troll, Snøhvit, Oseberg, Ormen Lange, Tyrihans, Visund, Aasta Hansteen and Åsgard and 40% are liquid reserves.

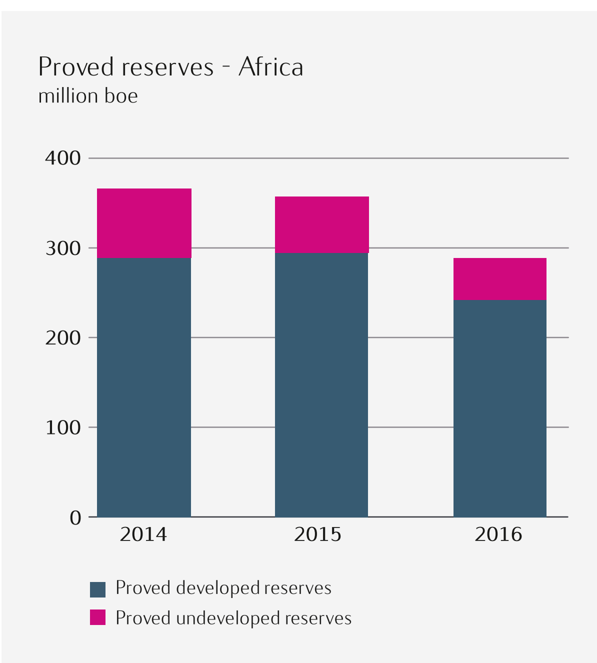
Proved reserves in Eurasia, excluding Norway
In this area, Statoil has proved reserves of 104 million boe related to three fields and field developments in Azerbaijan, Ireland and Russia. Eurasia excluding Norway represents 2% of Statoil's total proved reserves, Azerbaijan being the main contributor with the Azeri-Chirag-Gunashli fields. All fields are producing. Of the proved reserves in Eurasia, 76 million boe or 73% are proved developed reserves.

Of the total proved reserves in this area, 68% are liquid reserves and 32% are gas reserves.



Proved reserves in Africa

Statoil recognises proved reserves of 287 million boe related to 28 fields and field developments in several West and North African countries, including Algeria, Angola, Libya and Nigeria. Africa represents 6% of Statoil's total proved reserves. Angola is the primary contributor to the proved reserves in this area, with 24 of the 28 fields.



In Angola, Statoil has proved reserves in Block 15, Block 17 and Block 31, with production from all three blocks.

In Algeria and Nigeria, all fields are in production. Murzuq and Mabruk did not have any production in 2016 due to the political unrest in Libya.

The disputed equity determination at Agbami will potentially alter Statoil's equity share in this field. The effect on the proved reserves will be included once the redetermination is finalised and the effect is known.

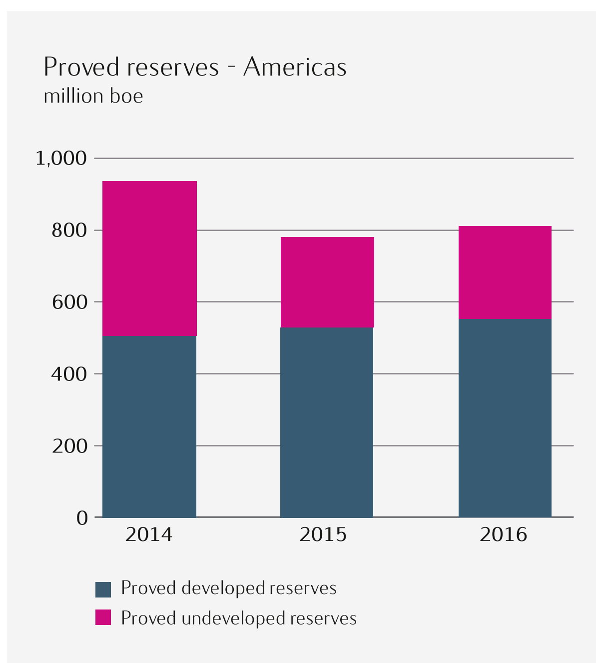
Of the total proved reserves in Africa, 240 million boe, or 84%, are proved developed reserves. Of the total proved reserves in this area, 83% are liquid reserves and 17% are gas reserves.

Proved reserves in the Americas

In North and South America, Statoil has proved reserves equal to 812 million boe in a total of 18 fields and field development projects. This represents 16% of Statoil's total proved reserves. Eleven of these fields are located in the US, eight of which are offshore field developments in the Gulf of Mexico and three are onshore tight reservoir assets. Five are located in Canada and two in South America.

In the US, six of the eight fields in the Gulf of Mexico are producing. Field development is ongoing on Big Foot and Stampede. The onshore tight reservoir assets Marcellus, Eagle Ford and Bakken are all in production. In Canada, proved reserves are related both to offshore field developments, and to the Leismer field in the Kai Kos Dehseh oil sands project in Alberta. The effect of the divestment of the oil sands projects will be included in 2017.

Of the total proved reserves in the Americas, 552 million boe, or 68%, are proved developed reserves. Of the total proved reserves in this area, 71% are liquid reserves and 29% gas reserves.



Reserves replacement

The reserves replacement ratio is defined as the sum of additions and revisions of proved reserves divided by produced volumes in any given period. The following table presents the changes in reserves in each category relating to the reserve replacement ratio for the years 2016, 2015 and 2014. For additional information regarding changes in proved reserves, see note 27 Supplemental oil and gas information (unaudited) to the Consolidated financial statements. The usefulness of the reserves replacement ratio is limited by the volatility of oil prices, the influence of oil and gas prices on PSA reserve booking, sensitivity related to the timing of project sanctions and the time lag between exploration expenditure and the booking of reserves.

	For the year ended 31 December		
Change in proved reseres (million boe)	2016	2015	2014
Revisions and improved recovery	**409**	(42)	356
Extensions and discoveries	**179**	627	253
Purchase of petroleum-in-place	**65**	13	20
Sales of petroleum-in-place	**(27)**	(235)	(233)
Total reserve additions	**626**	363	395
Production	**(673)**	(662)	(635)
Net change in proved reserves	**(47)**	(299)	(240)

	For the year ended 31 December		
Reserves replacement ratio (including purchases and sales)	2016	2015	2014
Annual	**0.93**	0.55	0.62
Three-year-average	**0.70**	0.81	0.97

Development of reserves

In 2016, approximately 299 million boe were converted from undeveloped to developed proved reserves. The start-up of production from Ivar Aasen, Goliat, Gullfaks Rimfaksdalen and Svale Nord in Norway, together with Julia and Heidelberg in the US increased the proved developed reserves by 127 million boe during 2016. The remaining 172 million boe of the converted volume is related to development activities on producing fields. Over the last five years Statoil has converted 1,962 million boe of proved undeveloped reserves to proved developed reserves.

Net proved reserves in million barrels oil equivalent	Total	Developed	Undeveloped
At 31 December 2015	5,060	3,515	1,546
Revisions and improved recovery	409	138	271
Extensions and discoveries	179	-	179
Purchase of reserves-in-place	65	2	63
Sales of reserves-in-place	(27)	(13)	(14)
Production	(673)	(673)	-
Moved from undeveloped to developed	-	299	(299)
At 31 December 2016	5,013	3,268	1,746

The new development projects added a total of 66 million boe of proved undeveloped reserves in 2016. Further drilling in the Bakken, Marcellus and Eagle Ford onshore plays in the US increased the proved area and added proved undeveloped reserves. These additions are categorized as extensions and together with extensions on other existing fields, this added a total of 112 million boe of proved undeveloped reserves. In total this adds up to an increase of 179 million boe from Extensions and discoveries.

Lower commodity prices had an effect on both undeveloped and developed reserves resulting in earlier economic cut-off. The negative revisions are more than offset by positive revisions based on new information available either from drilling of new wells or from production experience, resulting in an improved understanding of the fields. The net effect of revision of estimate on existing fields added 138 million boe proved developed reserves and 271 million boe proved undeveloped reserves.

The net effect of the purchase and sale transactions done in 2016, increased the proved undeveloped reserves by 49 million boe.

		Oil and Condensate (mmboe)	NGL (mmboe)	Natural gas (bcf)	Total (mmboe)
2016	**Proved reserves end of year**	**2,033**	**372**	**14,637**	**5,013**
	Developed	1,105	277	10,584	3,268
	Undeveloped	928	95	4,054	1,746
2015	**Proved reserves end of year**	**2,091**	**364**	**14,624**	**5,060**
	Developed	1,104	290	11,901	3,515
	Undeveloped	987	74	2,723	1,546
2014	**Proved reserves end of year**	**1,942**	**403**	**16,919**	**5,359**
	Developed	1,156	310	12,677	3,725
	Undeveloped	786	93	4,242	1,635

As of 31 December 2016, the total proved undeveloped reserves amounted to 1,746 million boe, 81% of which are related to fields in Norway. The Troll and Snøhvit fields, which have continuous development activities, represent the largest undeveloped assets in Norway together with fields not yet in production, such as Johan Sverdrup, Aasta Hansteen and Gina Krogh. The largest assets with respect to proved undeveloped reserves outside Norway are Stampede, Marcellus and Bakken in the US.

All these fields are either producing, or will start production within the next five years. For fields with proved reserves where production has not yet started, investment decisions have already been sanctioned and investments in infrastructure and facilities have commenced. Some development activities will take place more than five years from the disclosure date, but these are mainly related to incremental type of spending, such as drilling of additional wells from existing facilities, in order to secure continued production. There are no material development projects, which would require a separate future investment decision by management, included in our proved reserves. For our onshore plays in the USA, Marcellus, Eagle Ford and Bakken, all proved undeveloped reserves are limited to wells that are scheduled to be drilled within five years.

In 2016, Statoil incurred USD 8,115 million in development costs relating to assets carrying proved reserves, USD 6,188 million of which was related to proved undeveloped reserves.

Additional information about proved oil and gas reserves is provided in note 27 Supplementary oil and gas information (unaudited) to the Consolidated financial statements.

Preparations of reserves estimates

Statoil's annual reporting process for proved reserves is coordinated by a central corporate reserves management (CRM) team consisting of qualified professionals in geosciences, reservoir and production technology and financial evaluation. The team has an average of more than 21 years' experience in the oil and gas industry. CRM reports to the senior vice president of finance and control in the Technology, Drilling and Projects business area and is thus independent of the Development & Production business areas in Norway, North America and International. All the reserves estimates have been prepared by Statoil's technical staff.

Although the CRM team reviews the information centrally, each asset team is responsible for ensuring that it is in compliance with the requirements of the SEC and Statoil's corporate standards. Information about proved oil and gas reserves, standardised measures of discounted net cash flows related to proved oil and gas reserves and other information related to proved oil and gas reserves, is collected from the local asset teams and checked by CRM for consistency and conformity with applicable standards. The final numbers for each asset are quality-controlled and approved by the responsible asset manager, before aggregation to the required reporting level by CRM.

The aggregated results are submitted for approval to the relevant business area management teams and the corporate executive committee.

The person with primary responsibility for overseeing the preparation of the reserves estimates is the manager of the CRM team. The person who presently holds this position has a bachelor's degree in earth sciences from the University of Gothenburg, and a master's degree in petroleum exploration and exploitation from Chalmers University of Technology in Gothenburg, Sweden. She has 31 years' experience in the oil and gas industry, 30 of them with Statoil. She is a member of the Society of Petroleum Engineering (SPE) and vice-chair of the UNECE Expert Group on Resource Classification (EGRC).

DeGolyer and MacNaughton report

Petroleum engineering consultants DeGolyer and MacNaughton have carried out an independent evaluation of Statoil's proved reserves as of 31 December 2016 using Statoil provided data. The evaluation accounts for 100% of Statoil's proved reserves. The aggregated net proved reserves estimates prepared by DeGolyer and MacNaughton do not differ materially from those prepared by Statoil when compared on the basis of net equivalent barrels.

Net proved reserves at 31 December 2016	Oil and Condensate (mmbbls)	NGL/LPG (mmbbl)	Sales Gas (bcf)	Oil Equivalent (mmboe)
Estimated by Statoil	2,033	372	14,637	5,013
Estimated by DeGolyer and MacNaughton	2,244	324	13,685	5,007

A reserves audit report summarising this evaluation is included as Exhibit 15 (a)(iii).

Operational statistics

Developed and undeveloped acreage

The table below shows the total gross and net developed and undeveloped oil and gas acreage, in which Statoil had interests at 31 December 2016.

A gross value reflects wells or acreage in which Statoil has interests (presented as 100%). The net value corresponds to the sum of the fractional working interests owned in gross wells or acreages.

At 31 December 2016 (in thousands of acres)		Norway	Eurasia excluding Norway	Africa	Americas	Oceania 1)	Total
Developed and undeveloped oil and gas acreage							
Acreage developed	- gross	915	90	823	845	-	2,673
	- net	339	21	267	240	-	868
Acreage undeveloped	- gross	12,485	40,593	17,922	32,665	18,125	121,789
	- net	5,127	18,275	7,420	13,425	9,052	53,299

1) Acreage in Australia

The largest concentrations of developed acreage in Norway are in the Troll, Skarv, Snøhvit, Oseberg area and Ormen Lange. In Africa, the Algerian gas development projects In Amenas and In Salah represent the largest concentrations of developed acreage (gross and net).

Statoil's largest undeveloped acreage concentration is in Russia with 16% of the total acreage and 48% of the total acreage in Eurasia excluding Norway. A large part of the net acreage in Russia represents Statoil's share of a joint venture with Rosneft. The largest concentration of undeveloped acreage in the Americas is Canada, with 33% of the total for this geographic area. In Africa, the largest acreage concentration is in South Africa, representing 38% of the total for this geographic area. In Oceania Statoil holds undeveloped acreage in Australia and New Zealand.

Statoil holds acreage in numerous concessions, blocks and leases. The terms and conditions regarding expiration dates vary significantly from property to property. Work programs are designed to ensure that the exploration potential of any property is fully evaluated before expiration.

Acreage related to several of these concessions, blocks and leases are scheduled to expire within the next three years. Any acreage which has already been evaluated to be non-profitable may be relinquished prior to the current expiration date. In other cases, Statoil may decide to apply for an extension if more time is needed in order to fully evaluate the potential of the properties. Historically, Statoil has generally been successful in obtaining such extensions.

Most of the undeveloped acreage that will expire within the next three years is related to early exploration activities where no production is expected in the foreseeable future. The expiration of these leases, blocks and concessions will therefore not have any material impact on our reserves.

Productive oil and gas wells

The number of gross and net productive oil and gas wells, in which Statoil had interests at 31 December 2016, are shown in the table below.

At 31 December 2016		Norway	Eurasia excluding Norway	Africa	Americas	Total
Number of productive oil and gas wells						
Oil wells	- gross	865	175	480	3,337	4,857
	- net	293.5	25.4	72.4	817.2	1,208.4
Gas wells	- gross	202	6	97	2,049	2,354
	- net	88.6	2.2	37.5	509.8	638.1

The total gross number of productive wells as of end 2016 includes 404 oil wells and 15 gas wells with multiple completions or wells with more than one branch.

Net productive and dry oil and gas wells drilled

The following tables show the net productive and dry exploratory and development oil and gas wells completed or abandoned by Statoil in the past three years. Productive wells include exploratory wells in which hydrocarbons were discovered, and where drilling or completion has been suspended pending further evaluation. A dry well is one found to be incapable of producing sufficient quantities to justify completion as an oil or gas well.

	Norway	Eurasia excluding Norway	Africa	Americas	Oceania	Total
Year 2016						
Net productive and dry exploratory wells drilled	5.5	0.7	-	6.4	-	12.6
- Net dry exploratory wells drilled	1.4	0.7	-	1.9	-	3.9
- Net productive exploratory wells drilled	4.1	-	-	4.6	-	8.7
Net productive and dry development wells drilled	47.4	1.6	5.2	133.5	-	187.8
- Net dry development wells drilled	4.2	0.2	0.2	-	-	4.6
- Net productive development wells drilled	43.3	1.5	4.9	133.5	-	183.2
Year 2015						
Net productive and dry exploratory wells drilled	10.2	1.0	2.5	2.6	-	16.3
- Net dry exploratory wells drilled	4.6	0.4	0.5	0.9	-	6.4
- Net productive exploratory wells drilled	5.6	0.7	2.0	1.7	-	9.9
Net productive and dry development wells drilled	32.1	4.1	10.6	228.8	-	275.6
- Net dry development wells drilled	3.6	-	4.3	0.3	-	8.2
- Net productive development wells drilled	28.6	4.1	6.3	228.5	-	267.4
Year 2014						
Net productive and dry exploratory wells drilled	12.0	1.0	4.7	3.4	3.6	24.7
- Net dry exploratory wells drilled	3.4	1.0	2.7	1.6	3.6	12.2
- Net productive exploratory wells drilled	8.6	-	2.0	1.9	-	12.5
Net productive and dry development wells drilled	26.9	2.7	8.5	386.1	-	424.2
- Net dry development wells drilled	3.5	-	1.1	1.2	-	5.8
- Net productive development wells drilled	23.4	2.7	7.4	384.9	-	418.4

Exploratory and development drilling in process

The following table shows the number of exploratory and development oil and gas wells in the process of being drilled by Statoil at 31 December 2016.

At 31 December 2016		Norway	Eurasia excluding Norway	Africa	Americas	Total
Number of wells in progress						
Development wells	- gross	52	8	16	355	431
	- net	18.6	0.9	3.6	113.7	136.8
Exploratory wells	- gross	3	-	-	1	4
	- net	1.6	-	-	0.2	1.8

Delivery commitments

On behalf of the Norwegian State's direct financial interest (SDFI), Statoil is responsible for managing, transporting and selling the Norwegian state's oil and gas from the Norwegian continental shelf (NCS). These reserves are sold in conjunction with Statoil's own reserves. As part of this arrangement, Statoil delivers gas to customers under various types of sales contracts. In order to meet the commitments, we utilize a field supply schedule that ensures the highest possible total value for Statoil and SDFI's joint portfolio of oil and gas.

The majority of our gas volumes in Norway are sold under long-term contracts with take-or-pay clauses. Statoil's and SDFI's annual delivery commitments under these agreements are expressed as the sum of the expected off-take under these contracts. As of 31 December 2016, the long-term commitments from NCS for the Statoil/SDFI arrangement totaled approximately 329 bcm.

Statoil and SDFI's delivery commitments, expressed as the sum of expected off-take for the calendar years 2017, 2018, 2019 and 2020, are 57.2, 44.6, 39.3 and 37.3 bcm, respectively. Any remaining volumes after covering our bilateral agreements, will be sold by trading activities at the hubs.

Statoil's currently developed gas reserves in Norway are more than sufficient to meet our share of these commitments for the next four years.

PRODUCTION VOLUMES AND PRICES

The business overview is in accordance with our segment's operations as of 31 December 2016, whereas certain disclosures on oil and gas reserves are based on geographical areas as required by the Securities and Exchange Commission (SEC). For further information about extractive activities, see sections 2.3 DPN - Development and Production Norway and 2.4 DPI - Development and Production International.

Statoil prepares its disclosures for oil and gas reserves and certain other supplemental oil and gas disclosures by geographical area, as required by the SEC. The geographical areas are defined by country and continent. They are Norway, Eurasia excluding Norway, Africa and the Americas.

For further information about disclosures concerning oil and gas reserves and certain other supplemental disclosures based on geographical areas as required by the SEC, see note 27 Supplementary Oil and Gas Information (unaudited) to the Consolidated financial statements.

Entitlement production

The following table shows Statoil's Norwegian and international entitlement production of oil and natural gas for the periods indicated. The stated production volumes are the volumes to which Statoil is entitled, pursuant to conditions laid down in licence agreements and production-sharing agreements. The production volumes are net of royalty oil paid in kind, and of gas used for fuel and flaring. Our production is based on our proportionate participation in fields with multiple owners and does not include production of the Norwegian State's oil and natural gas. Production of an immaterial quantity of bitumen is included as oil production. NGL includes both LPG and naphtha. For further information on production volumes see section 5.6 Terms and abbreviations.

	Consolidated companies					Equity accounted				
	Norway	Eurasia excluding Norway	Africa	Americas	Subtotal	Norway	Eurasia excluding Norway	Americas	Subtotal	Total
Oil and Condensate (mmbbls)										
2014	173	14	64	51	301	-	-	4	4	306
2015	174	13	75	57	319	-	-	4	4	324
2016	169	12	72	60	313	2	0	4	6	320

Sales prices

The following tables present realised sales prices.

	Norway	Eurasia excluding Norway	Africa	Americas
Year ended 31 December 2016				
Average sales price oil and condensate in USD per bbl	43.1	42.0	41.4	32.9
Average sales price NGL in USD per bbl	24.4	-	21.9	13.1
Average sales price natural gas in USD per mmbtu	5.2	4.8	4.0	2.1
Year ended 31 December 2015				
Average sales price oil and condensate in USD per bbl	52.2	50.7	49.4	39.4
Average sales price NGL in USD per bbl	30.1	-	26.2	12.5
Average sales price natural gas in USD per mmbtu	7.1	4.6	5.6	2.6
Year ended 31 December 2014				
Average sales price oil and condensate in USD per bbl	98.3	101.3	95.6	78.3
Average sales price NGL in USD per bbl	59.3	-	59.7	37.3
Average sales price natural gas in USD per mmbtu	9.5	5.4	9.2	4.4

Sales volumes

Sales volumes include lifted entitlement volumes, the sale of SDFI volumes and marketing of third-party volumes. In addition to Statoil's own volumes, we market and sell oil and gas owned by the Norwegian State through the Norwegian State's share in production licences. This is known as the State's Direct Financial Interest or SDFI. For additional information, see section SDFI oil and gas marketing and sale in Applicable laws and regulations in section 2.7 Corporate. The following table shows the SDFI and Statoil sales volume information on crude oil and natural gas for the periods indicated. The Statoil natural gas sales volumes include equity volumes sold by the MMP segment, natural gas volumes sold by the DPI segment and ethane volumes.

	For the year ended 31 December		
Sales Volumes	2016	2015	2014
Statoil:[1]			
Crude oil (mmbbls)[2]	**372**	378	353
Natural gas (bcm)	**48**	47	45
Combined oil and gas (mmboe)	**674**	671	637
Third party volumes:[3]			
Crude oil (mmbbls)[2]	**294**	290	304
Natural gas (bcm)	**9**	9	8
Combined oil and gas (mmboe)	**348**	344	355
SDFI assets owned by the Norwegian State:[4]			
Crude oil (mmbbls)[2]	**148**	149	148
Natural gas (bcm)	**40**	42	37
Combined oil and gas (mmboe)	**398**	412	379
Total:			
Crude oil (mmbbls)[2]	**814**	816	805
Natural gas (bcm)	**96**	97	90
Combined oil and gas (mmboe)	**1,420**	1,427	1,371

1) The Statoil volumes included in the table above are based on the assumption that volumes sold were equal to lifted volumes in the relevant year. Volumes lifted by DPI but not sold by MMP, and volumes lifted by DPN or DPI and still in inventory or in transit may cause these volumes to differ from the sales volumes reported elsewhere in this report by MMP.

2) Sales volumes of crude oil include NGL and condensate. All sales volumes reported in the table above include internal deliveries to our manufacturing facilities.

3) Third party volumes of crude oil include both volumes purchased from partners in our upstream operations and other cargos purchased in the market. The third party volumes are purchased either for sale to third parties or for our own use. Third party volumes of natural gas include third party LNG volumes related to our activities at the Cove Point regasification terminal in the US.

4) SDFI volumes in columns 2015 and 2014 are updated to reflect total sales volumes natural gas (bcm). Previously third party volumes sold from storage were excluded.

FINANCIAL REVIEW - GROUP PROFIT AND LOSS ANALYSIS

Our **results** over the last years have been heavily influenced by the drop in prices, leading to lower earnings and impairment losses, while at the same time achievements from our improvement programme affected earnings positively.
Total equity liquids and gas production was 1,978 mboe, 1,971 mboe, 1,927 mboe per day in 2016, 2015 and 2014, respectively.

From 2015 to 2016, the average daily total equity production level was maintained. Increased production from new fields coming on stream, ramp-up on various existing fields and high operational performance, was offset by reduced ownership shares as a result of divestments, expected natural decline at mature fields and operational challenges. The 2% increase in total equity production from 2014 to 2015 was primarily due to start-up and ramp-up on various fields and higher gas sales from the NCS, partially offset by expected natural decline and divestments and redeterminations.

Total entitlement liquids and gas production was 1,827 mboe per day in 2016 compared to 1,812 mboe in 2015 and 1,729 mboe per day in 2014. The total entitlement production in 2016 was up 1% and the development was almost flat for the same reasons as described above. The benefit of a lower effect from production sharing agreements (PSA effect) mainly driven by the reduction in prices, added to the slight increase in entitlement production. From 2014 to 2015, entitlement production was up 5% for the same reasons as described above and the benefit from lower PSA effects.

The PSA effect was 109 mboe, 116 mboe and 157 mboe per day in 2016, 2015 and 2014, respectively. Over time, the volumes lifted and sold will equal the entitlement production, but they may be higher or lower in any period due to differences between the capacity and timing of the vessels lifting our volumes and the actual entitlement production during the period.

Income statement under IFRS (in USD million)	For the year ended 31 December 2016	2015	2014	16-15 change	15-14 change
Revenues	**45,688**	57,900	96,708	(21%)	(40%)
Net income from equity accounted investments	**(119)**	(29)	(34)	>(100%)	17%
Other income	**304**	1,770	2,590	(83%)	(32%)
Total revenues and other income	**45,873**	59,642	99,264	(23%)	(40%)
Purchases [net of inventory variation]	**(21,505)**	(26,254)	(47,980)	(18%)	(45%)
Operating expenses and selling, general and administrative expenses	**(9,787)**	(11,433)	(12,815)	(14%)	(11%)
Depreciation, amortisation and net impairment losses	**(11,550)**	(16,715)	(15,925)	(31%)	5%
Exploration expenses	**(2,952)**	(3,872)	(4,666)	(24%)	(17%)
Net operating income	**80**	1,366	17,878	(94%)	(92%)
Net financial items	**(258)**	(1,311)	20	80%	N/A
Income before tax	**(178)**	55	17,898	N/A	(100%)
Income tax	**(2,724)**	(5,225)	(14,011)	(48%)	(63%)
Net income	**(2,902)**	(5,169)	3,887	44%	N/A

On 1 January 2016 Statoil changed its presentation currency from Norwegian kroner (NOK) to US dollar (USD), mainly in order to better reflect the underlying USD exposure of Statoil's business activities and to align with industry practice.

Total revenues and other income amounted to USD 45,873 million in 2016 compared to USD 59,642 million in 2015 and USD 99,264 million in 2014.

Revenues are generated from both the sale of lifted crude oil, natural gas and refined products produced and marketed by Statoil, and from the sale of liquids and gas purchased from third parties. In addition, we market and sell the Norwegian State's share of liquids from the NCS. All purchases and sales of the Norwegian State's production of liquids are recorded as purchases [net of inventory variations] and revenues, respectively, while sales of the Norwegian State's share of gas from the NCS are recorded net. For additional information regarding sales, see the Sales volume table in section 2.8 above.

The 21% decrease in **revenues** from 2015 to 2016 was mainly due to the drop in liquids and gas prices, lower refinery margins and increased losses from reflecting the changes in fair value of derivatives and market value of storage and physical contracts. The 40% decrease in revenues from 2014 to 2015 was mainly due to the significant reduction in both liquids and gas prices. Stronger refinery margins in 2015 and higher volumes of both liquids and gas sold partially offset the decrease.

Other income was USD 304 million in 2016 compared to USD 1,770 million in 2015 and USD 2,590 million in 2014. Other income in 2016 was mainly related to gain from sale of the Edvard Grieg field on the NCS and proceeds from an insurance settlement. In both 2015 and 2014, other income mainly consisted of gain from the two step divestments of the ownership interest in the Shah Deniz project in Azerbaijan. In addition, a settlement following an arbitration ruling in Statoil's favour, impacted other income in 2014.

As a result of the factors explained above, **total revenue and other income** decreased by 23% in 2016. In 2015, the decrease was 40%.

Purchases [net of inventory variation] include the cost of liquids purchased from the Norwegian State, which is pursuant to the Owner's instruction, and the cost of liquids and gas purchased from third parties. See SDFI oil and gas marketing and sale in section 2.7 Corporate for more details.

Purchases [net of inventory variation] amounted to USD 21,505 million in 2016 compared to USD 26,254 million in 2015 and USD 47,980 million in 2014. The 18% decrease from 2015 to 2016 was mainly related to the decrease in liquids and gas prices. The 45% decrease from 2014 to 2015 was mainly related to the decrease in prices for liquids and gas and other oil products and lower volumes of crude, other oil products and gas sold.

Operating expenses and selling, general and administrative expenses amounted to USD 9,787 million in 2016 compared to USD 11,433 million in 2015, and USD 12,815 million in 2014.

The 14% decrease from 2015 to 2016 was mainly as a result of the on-going cost improvement initiatives and the NOK/USD exchange rate development. Lower operation and maintenance costs, decreased diluent cost and reduced transportation costs added to the decrease. Higher provisions, ramp-up and start-up of production on new fields partially offset the decrease in operating costs.

The 11% decrease from 2014 to 2015 was mainly due to lower operation and maintenance costs, reduced royalties due to lower liquids prices, decreased transportation costs in addition to positive effects from on-going cost initiatives. A curtailment gain related to the change of pension plan included in 2014, partially offset the decrease.

Depreciation, amortisation and net impairment losses amounted to USD 11,550 million in 2016 compared to USD 16,715 million in 2015 and USD 15,925 million in 2014. Included in these totals were net impairment losses of USD 1,301 million, USD 5,526 million and USD 4,134 million for 2016, 2015 and 2014 respectively, primarily triggered by the reduced commodity price assumption and commodity forward prices.

The net impairment losses of USD 1,301 million in 2016 were mainly related to impairment of unconventional onshore assets in the USA, including an impairment of the held for sale Kai Kos Dehseh oil sands project in Canada, and conventional offshore assets in the development phase in the DPN segment. Net reversals related to other conventional assets in the DPI segment (USD 19 million) and a refinery in the MMP segment (USD 74 million) had an offsetting effect. See note 10 Property, plant and equipment to the Consolidated financial statements.

Compared to 2015, the 31% decrease was mainly due to lower impairment of assets in 2016 and reduced depreciation on mature fields. Higher proved reserves estimate and the NOK/USD exchange rate development in 2016 added to the decrease, partially offset by start-up and ramp-up of production on several fields.

Compared to 2014, the 5% increase in 2015 was mainly due to increased impairment charges and start-up and ramp-up of production of several fields. Reduced overall depreciation because of net impairments of assets in both 2014 and 2015 with a corresponding lower basis for depreciation partially offset the increase.

Exploration expenses (in USD million)	For the year ended 31 December 2016	2015	2014	16-15 change	15-14 change
Exploration expenditures (activity)	**1,437**	2,860	3,730	(50%)	(23%)
Expensed, previously capitalised exploration expenditures	**808**	213	369	>100%	(42%)
Capitalised share of current period's exploration activity	**(285)**	(1,151)	(1,161)	(75%)	(1%)
Impairments, net of reversals	**992**	1,951	1,728	(49%)	13%
Exploration expenses	**2,952**	3,872	4,666	(24%)	(17%)

In 2016, **exploration expenses** were USD 2,952 million, a 24% decrease compared with 2015 when exploration expenses were USD 3,872 million. Exploration expenses were USD 4,666 million in 2014.

The 24% decrease in exploration expenses in 2016 was mainly due to lower net impairment of exploration prospects and signature bonuses, lower drilling activity and less expensive wells being drilled. The decrease was partially offset by a higher portion of expenditures capitalised in previous years being expensed in 2016 and a lower capitalisation rate on exploration expenditures incurred in 2016 compared to 2015.

In 2015, exploration expenses were down 17% compared to 2014 mainly due to a lower level of drilling activity and a lower portion of previously capitalised expenditures being expensed in 2015. Increased impairment of exploration prospects and signature bonuses in 2015 compared to 2014 partially offset the increase.

As a result of the factors explained above, **net operating income** was USD 80 million in 2016, compared to USD 1,366 million in 2015. In 2014, net operating income was USD 17,878 million. The significant decrease in 2016 was primarily driven by the drop in liquids and gas prices, lower refinery margins and lower gains on sale of assets. The decrease was partially offset by lower net impairment charges in 2016 compared to 2015 and a reduction in operating, depreciation and exploration costs. The decrease in net operating income from 2014 to 2015 was mainly due to the drop in prices in 2015 leading to lower earnings and increased impairment charges.

Net financial items amounted to a loss of USD 258 million in 2016, compared to a loss of USD 1,311 million in 2015 and a gain of USD 20 million in 2014. The reduced loss of USD 1,053 million in 2016 is mainly due to gain on derivatives due to decrease in EUR and GBP interest rates related to our long term debt portfolio of USD 470 million for 2016, compared to a loss of USD 491 million for 2015. The decrease in 2015 was mainly related to loss of USD 491 million on derivatives related to the long term debt portfolio in 2015, compared to a gain of USD 904 million in 2014, mainly due to changes in the interest yield curves.

Income taxes were USD 2,724 million in 2016, equivalent to an effective tax rate of more than 100%, compared to USD 5,225 million, equivalent to an effective tax rate of more than 100% in 2015. In 2014, income taxes were USD 14,011 million, equivalent to an effective tax rate of 78%.

In 2016 and 2015 our group income before tax (a loss of USD 178 million in 2016 and a profit of USD 55 million in 2015) is a combination of large profits in territories with higher statutory tax rates (taking account of Norwegian Petroleum Tax including uplift) and approximately the same amount of losses in territories with lower statutory tax rates and so our effective tax rate is distorted. In addition, the "weighted average statutory tax rate" (which we calculate before taking into account Norwegian Petroleum Tax including uplift for comparability) is also distorted.

In 2016, the effective rate of tax on the profit earned by our DPN business approximated the statutory tax rate (taking account of Norwegian Petroleum Tax including uplift) but the effective tax rate on DPI losses was negative due to the inability to currently recognise tax losses and other deferred tax assets arising from those losses, primarily in the USA. Overall this results in a significant income tax charge on a relatively small group loss before tax.

The **effective tax rate** in 2015 was primarily influenced by losses, mainly caused by impairments recognised in countries where deferred tax assets could not be recognised, partially offset by tax exempted gains on sale of assets including Statoil's interest in the Shah Deniz project. The effective tax rate in 2015 was also influenced by the de-recognition of deferred tax assets within the DPI segment due to uncertainty related to future taxable income.

The decrease from 2014 to 2015 was mainly caused by losses, impairments and provisions in entities with higher than average statutory tax rates. Effective tax rate in 2014 was primarily influenced by losses, mainly caused by impairments, recognised in countries where deferred tax assets could not be recognised partially offset by tax exempted gains on sale of assets. The effective tax rate in 2014 was also influenced by the recognition of a non-cash tax income following a verdict in the Norwegian Supreme Court in February 2014.

The effective tax rate is calculated as income taxes divided by income before taxes. Fluctuations in the effective tax rates from year to year are principally the result of non-taxable items (permanent differences) and changes in the relative composition of income between Norwegian oil and gas production, taxed at a marginal rate of 78%, and income from other tax jurisdictions. Other Norwegian income, including the onshore portion of net financial items, is taxed at 25% (27% in 2014 and 2015), and income in other countries is taxed at the applicable income tax rates in the various countries.

In 2016, **net income** was negative USD 2,902 million compared to negative USD 5,169 million in 2015 and positive USD 3,887 million in 2014. The increase was mainly due to lower income taxes and lower loss on net financial items, partially offset by the decrease in net operating income as explained above. The significant decrease from 2014 to 2015 was mainly due to the drop in prices, leading to lower earnings and impairment losses. Increased losses on net financial items related to derivatives added to the decrease, which was partially offset by the reduction in income taxes.

The board of directors proposes to the annual general meeting (AGM) to maintain a **dividend** of USD 0.2201 per ordinary share for the fourth quarter, and continue the scrip programme giving shareholders the option to receive the dividend for the fourth quarter in cash or newly issued shares in Statoil at a 5% discount. The **Annual ordinary dividends** for 2016 amounted to an aggregate total of USD 1,934 million. Considering the proposed dividend, USD 4,543 million will be transferred from retained earnings in the parent company. For 2015, annual ordinary dividends amounted to an aggregate total of USD 2,860 million and USD 3,628 million in 2014.

In 2014, following a regular review process of Statoil's 2012 Consolidated financial statements, the Financial Supervisory Authority of Norway (the FSA), ordered Statoil to change the timing of a Cove Point related onerous contract provision to a financial period prior to the first quarter of 2013, in which Statoil originally reflected the provision. Statoil did not accept the FSA's conclusion and appealed the order to the Norwegian Ministry of Finance in accordance with due process for such matters under Norwegian regulation. In 2016, the Norwegian Ministry of Finance denied Statoil's appeal. Statoil has decided not to pursue the matter further, as it does not impact any comparative financial periods presented in the annual Consolidated financial statements of 2016. Further reference is made to Note 23 Other commitments, contingent liabilities and contingent assets of Statoil's 2015 Financial Statements.

In accordance with §3-3 of the Norwegian Accounting Act, the board of directors confirms that the going concern assumption on which the financial statements have been prepared, is appropriate.

FINANCIAL REVIEW – SEGMENTS PERFORMANCE

DPN profit and loss analysis

Net operating income in 2016 was USD 4,451 million, compared to USD 7,161 million in 2015 and USD 17,753 million in 2014. The USD 2,710 million decrease from 2015 to 2016 was mainly due to lower prices on liquids and gas, partly offset by reduced operating expenses, decreased depreciation and net impairment losses. The USD 10,592 million decrease from 2014 to 2015 was mainly due to lower prices on liquids and increased depreciation and net impairment losses.

The average daily production of liquids and gas was 1,235 mboe, 1,232 mboe and 1,184 mboe per day in 2016, 2015 and 2014, respectively.

The average daily total production level was maintained from 2015 to 2016 by high operational performance, new fields on stream and new wells from existing fields.

The average daily total production of liquids and gas increased by 4% from 2014 to 2015, mainly due to ramp up of new fields, increased sales gas and good operational performance, partly offset by expected natural decline and divestments.

Over time, the volumes lifted and sold will equal entitlement production, but may be higher or lower in any period due to differences between the capacities and timing of the vessels lifting the volumes and the actual entitlement production during the period.

Income statement under IFRS (in USD million)	For the year ended 31 December 2016	2015	2014	16-15 change	15-14 change
Revenues	**13,036**	17,170	27,914	(24%)	(38%)
Net income from equity accounted investments	**(78)**	3	11	N/A	(70%)
Other income	**119**	166	1,002	(28%)	(83%)
Total revenues and other income	**13,077**	17,339	28,926	(25%)	(40%)
Operating expenses and selling, general and administrative expenses	**(2,547)**	(3,223)	(4,034)	(21%)	(20%)
Depreciation, amortisation and net impairment losses	**(5,698)**	(6,379)	(6,301)	(11%)	1%
Exploration expenses	**(383)**	(576)	(838)	(34%)	(31%)
Net operating income	**4,451**	7,161	17,753	(38%)	(60%)

Total revenues and other income were USD 13,077 million in 2016, USD 17,339 million in 2015 and USD 28,926 million in 2014.

The 24% decrease in **revenues** from 2015 to 2016 was mainly due to reduced liquids and gas prices. The 38% decrease in **revenues** from 2014 to 2015 was mainly due to reduced liquids prices and exchange rate development (NOK/USD). In addition, in 2015 a re-assessed valuation estimate of earn-out derivatives resulted in an unrealised fair value loss on derivatives and impacted revenues negatively.

Other income in 2016 was impacted by gain from sale of Edvard Grieg of USD 114 million. Other income in 2015 was impacted by gain from the sale of certain ownership interests on the NCS to Repsol of USD 142 million. Other income in 2014 was impacted by gain from the sale of certain ownership interests on the NCS to Wintershall of USD 861 million.

Operating expenses and selling, general and administrative expenses were USD 2,547 million in 2016, compared to USD 3,223 million in 2015 and USD 4,034 million in 2014. In 2016, expenses decreased compared to 2015 mainly due to cost improvements and exchange rate development (NOK/USD). In 2015, expenses decreased compared to 2014 mainly due to exchange rate development (NOK/USD), cost improvements and reduced turnaround activity. This was partly offset by gain related to changes in pension scheme in 2014 and ramp up of new fields during 2015.

Depreciation, amortisation and net impairment losses were USD 5,698 million in 2016, compared to USD 6,379 million in 2015 and USD 6,301 million in 2014. The decrease of 11% from 2015 to 2016 was mainly due to reduced net impairments, exchange rate development (NOK/USD) and increased reserves, partly offset by ramp up of new fields in 2016. The increase from 2014 to 2015 was mainly due to net impairments of USD 1,074 million in 2015 and ramp-up of new fields in 2015, offset by exchange rate development (NOK/USD).

Exploration expenses were USD 383 million in 2016, compared to USD 576 million in 2015 and USD 838 million in 2014. The reduction from 2015 to 2016 was mainly due to lower drilling activity and more expensive wells being drilled in 2015, partially offset by a lower portion of current exploration expenditures being capitalised. The reduction in exploration expenses from 2014 to 2015 was mainly due to lower drilling activity, a lower portion of previously capitalised exploration expenditures being expensed in 2015 and idle rig costs in 2014.

DPI profit and loss analysis

Net operating income in 2016 was negative USD 4,352 million, compared to negative USD 8,729 million in 2015 and negative USD 2,703 million in 2014. The positive development from 2015 to 2016 was caused primarily by less impairment losses, and also by lower operating expenses. The negative development from 2014 to 2015 was caused primarily by lower realised liquids and gas prices and more impairment losses.

The average daily equity liquids and gas production (see section 5.6 Terms and abbreviations) was 743 mboe per day in 2016, compared to 739 mboe per day in 2015 and 744 mboe per day in 2014. The increase of 0.5% from 2015 to 2016 was driven primarily by the effect of the ramp-up of fields, mainly in Ireland, Algeria, and the US. The increase was partly offset by the divestment of Shah Deniz (Azerbaijan), natural decline primarily at mature fields in Angola as well as some operational challenges in 2016. The decrease of 0.7% from 2014 to 2015 was driven primarily by the effect of the divestment of Shah Deniz and a portion of Marcellus (US), and natural decline, primarily at mature fields in Angola. The decrease was partly offset by the ramp-up of fields in Angola and the US. Divestment of Shah Deniz occurred in both 2014 and 2015.

The average daily entitlement liquids and gas production (see section 5.6 Terms and abbreviations) was 592 mboe per day in 2016, compared to 580 mboe per day in 2015, and 546 mboe per day in 2014. Entitlement production in 2016 was up by 2% due to the increased equity production as described above and a relatively lower effect from production sharing agreements (PSA effect), mainly driven by the decrease in prices. The increase from 2014 to 2015 was driven by lower PSA effect. The PSA effect was 109 mboe, 116 mboe and 157 mboe per day in 2016, 2015 and 2014, respectively.

Over time, the volumes lifted and sold will equal our entitlement production, but they may be higher or lower in any period due to differences between the capacity and timing of the vessels lifting our volumes and the actual entitlement production during the period. See section 5.6 Terms and abbreviations for more information.

Income statement under IFRS (in USD million)	For the year ended 31 December 2016	2015	2014	16-15 change	15-14 change
Revenues	**6,623**	7,135	12,823	(7%)	(44%)
Net income from equity accounted investments	**(100)**	(91)	(113)	(10%)	20%
Other income	**134**	1,156	951	(88%)	22%
Total revenues and other income	**6,657**	8,200	13,661	(19%)	(40%)
Purchases [net of inventory]	**(7)**	(10)	(2)	(28%)	>100%
Operating expenses and selling, general and administrative expenses	**(2,923)**	(3,391)	(3,654)	(14%)	(7%)
Depreciation, amortisation and net impairment losses	**(5,510)**	(10,231)	(8,885)	(46%)	15%
Exploration expenses	**(2,569)**	(3,296)	(3,824)	(22%)	(14%)
Net operating income	**(4,352)**	(8,729)	(2,703)	50%	>(100%)

DPI generated **total revenues and other income** of USD 6,657 million in 2016 compared to USD 8,200 million in 2015 and USD 13,661 million in 2014.

Revenues in 2016 were negatively impacted by lower realised liquids and gas prices, partly offset by lower provisions relating to commercial disputes in 2016 compared to 2015. The decrease from 2014 to 2015 was mainly caused by lower realised liquids and gas prices, partly offset by an increase in lifted volumes. In addition, higher provisions relating to commercial disputes in 2015 compared to 2014 negatively impacted revenues. For information related to the disputes see note 23 Other commitments and contingencies to the Consolidated financial statements.

Other income was positively impacted by gains from sales of assets of USD 1,156 million in 2015 and USD 961 million in 2014, related primarily to the sale of ownership interest in the Shah Deniz project and the South Caucasus Pipeline.

As a result of the factors explained above, **total revenues and other income** decreased by 19% in 2016. In 2015, total revenues and other income decreased by 40%.

Operating expenses and selling, general and administrative expenses were USD 2,923 million in 2016, compared to USD 3,391 million in 2015 and USD 3,654 million in 2014. The 14% decrease from 2015 to 2016 was mainly due to lower operating and maintenance costs for various fields, in addition to lower diluent expenses. The decreases were partially offset by operating and transportation costs for the new fields coming on stream. The 7% decrease from 2014 to 2015 was mainly due to reduced operations and maintenance costs, lower royalties caused by lower prices, and portfolio changes. Production ramp-up and start-up of new fields partially offset the decrease.

Depreciation, amortisation and net impairment losses were USD 5,510 million in 2016, compared to USD 10,231 million in 2015 and USD 8,885 million in 2014. The 46% decrease was primarily caused by lower net impairment losses in 2016 compared to 2015. Net impairment losses amounted to USD 541 million in 2016, and resulted mainly from reduced long-term price assumptions with the largest effect being on the unconventional onshore assets in North America. In addition, depreciations decreased due to higher reserves estimates. The decreases were partially offset by start-up and ramp-up of production from new fields.

The 15% increase from 2014 to 2015 was primarily caused by net impairment losses of USD 5,416 million in 2015, mainly related to unconventional onshore assets in North America and certain conventional upstream assets. The impairment losses resulted primarily from reduced short-term forward prices in combination with reduced long-term oil price forecasts. In addition, depreciation increased due to higher production from start-up and ramp-up on various fields. The increases were partly offset by effect on depreciations from net impairments in 2014 and 2015 and reduced depreciations from higher reserves estimates.

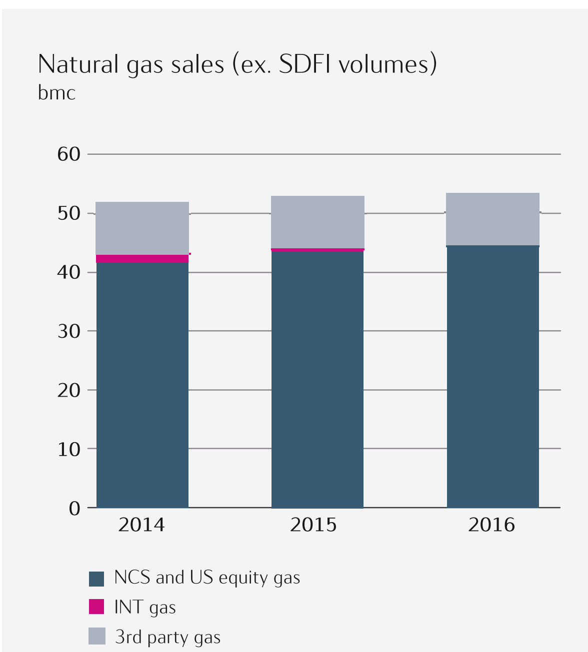
Exploration expenses were USD 2,569 million in 2016, compared to USD 3,296 million in 2015 and USD 3,824 million in 2014. The 22% reduction from 2015 to 2016 was primarily due to lower impairments, lower drilling activity and lower well costs in 2016. Higher portion of wells capitalised in previous periods being expensed this year and a lower capitalisation rate in 2016 partially offset the decrease. The reduction from 2014 to 2015 was mainly due to lower drilling activity partly offset by increased impairments of oil and gas prospects in the Gulf of Mexico.

MMP profit and loss analysis

Net operating income was USD 623 million, USD 2,931 million and USD 2,608 million in 2016, 2015 and 2014, respectively. 2016 net operating income was positively impacted by solid liquids trading results as in 2015. The decrease of USD 2,308 million from 2015 to 2016 was mainly due to lower fair value of certain derivatives of USD 713 million as a result of increased forward curve. In addition, refining and gas marketing margins were reduced and production from processing plants lower than in 2015.

The increase of USD 324 million from 2014 to 2015 was mainly due to higher refining margins and solid liquids trading results and net reversal of impairment charges of USD 421 million. These increases were partially offset by the impact by Sonatrach Arbitration Settlement of USD 463 million in Statoil's favour in 2014.

Total natural gas sales volumes were 52.9 bcm in 2016, 52.6 bcm in 2015 and 51.2 bcm in 2014. The 0.5% increase in total gas volumes sold from 2015 to 2016 was related to higher entitlement production on the NCS, partially offset by lower entitlement production internationally. The 3% increase in total gas volumes sold from 2014 to 2015 was related to higher entitlement production on the NCS in addition to higher third party volumes in Europe, partially offset by lower entitlement production internationally and lower third party volumes in the US. The chart does not include any volumes sold on behalf of the Norwegian State's direct financial interest (SDFI).

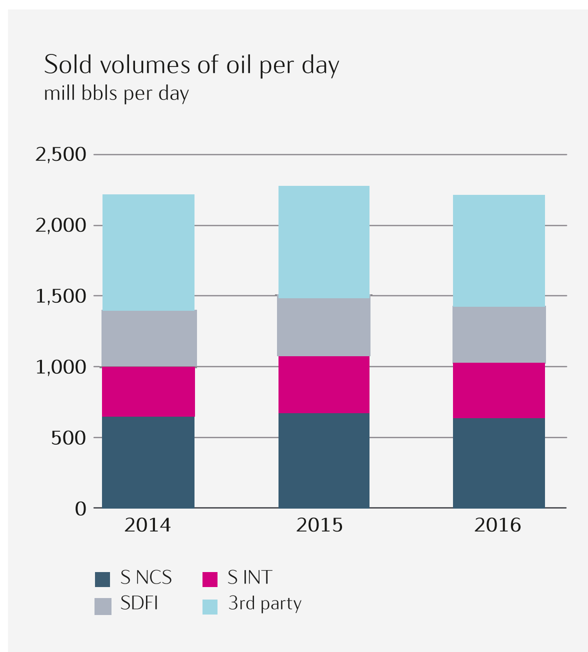


In 2016, the average invoiced natural gas sales price in Europe was USD 5.17 per MMBtu compared to USD 7.08 per MMBtu in 2015, a decrease of 27%. Abundant gas supply in the first three quarters together with a mild winter had a negative influence on the prices. For the fourth quarter the market situation tightened and prices increased. LNG price has continued its downward trend, and only had a marginal positive effect on the European gas price in 2016. The average invoiced natural gas sales price in Europe was approximately 26% lower in 2015 than in 2014, mainly due to higher share of gas indexation in the gas contract portfolio.

In 2016, the average invoiced natural gas sales price in North Americas was USD 2.12 per MMBtu compared to USD 2.62 per MMBtu in 2015, a decrease of 19% due to significantly warmer weather first quarter 2016 than in 2015, and an abundant gas supply in the second quarter. In the third and fourth quarter prices rose due to cooler weather in New York and Toronto. The average invoiced natural gas sales price in North Americas was approximately 40% lower in 2015 than in 2014, mainly due to high market prices in first quarter 2014 as a result of exceptionally cold weather in North East combined with long term pipeline capacity agreements enabling access to premium markets in Toronto and Manhattan.

All of Statoil's gas produced on the NCS is sold by MMP, purchased from DPN at the fields' lifting point at a market-based internal price with deduction for the cost of bringing gas from the field to market and a marketing fee element. Our average internal purchase price for gas was USD 3.42 per MMBtu in 2016, a decrease of 34% compared to USD 5.17 per MMBtu in 2015.

Average crude, condensate and NGL sales were 2.2 mmbbl per day in 2016 of which approximately 1.01 mmbbl were sales of our equity volumes, 0.80 mmbbl sales of third-party volumes and 0.40 mmbbl sales of volumes purchased from SDFI. Our average sales volumes were 2.3 and 2.2 mmbbl per day in 2015 and 2014. The average daily third-party volumes sold were 0.79 and 0.83 mmbbl in 2015 and 2014.



MMPs refining margins were considerably lower the first three quarters 2016 compared to 2015, and results were impacted by lower production from the refineries. The average refining margin was at the same level in fourth quarter 2015 and 2016. Statoil's refining reference margin was 4.8 USD/bbl in 2016, compared to 8.0 USD/bbl in 2015, a decrease of 40%. The refining reference margin was 4.7 USD/bbl in 2014.

Income statement under IFRS (in USD million)	For the year ended 31 December 2016	2015	2014	16-15 change	15-14 change
Revenues	**44,847**	57,873	94,483	(23%)	(39%)
Net income from equity accounted investments	**61**	55	73	12%	(25%)
Other income	**72**	178	615	(60%)	(71%)
Total revenues and other income	**44,979**	58,106	95,171	(23%)	(39%)
Purchases [net of inventory]	**(39,696)**	(50,547)	(86,689)	(21%)	(42%)
Operating expenses and selling, general and administrative expenses	**(4,439)**	(4,664)	(5,287)	(5%)	(12%)
Depreciation, amortisation and net impairment losses	**(221)**	37	(583)	>(100%)	>(100%)
Net operating income	**623**	2,931	2,608	(79%)	12%

Total revenues and other income were USD 44,979 million in 2016, compared to USD 58,106 million in 2015 and USD 95,171 million in 2014.

The decrease in **revenues** from 2015 to 2016 was mainly due to decrease in crude and gas prices. The average crude price in USD declined by approximately 17% in 2016 compared to 2015. Revenues in 2016 were negatively impacted by loss from derivatives mainly related to hedges of physical positions due to significant increase in the forward curve in the oil and gas market.

The decrease in revenues from 2014 to 2015 was mainly due to decrease in crude and gas prices, partially offset by higher volumes for crude, other oil products and gas sold. The average crude price in USD declined by approximately 47% in 2015 compared to 2014. Revenues in 2015 were positively impacted by gains from derivatives, mainly due to significant drop in the forward curve in the oil and gas market.

Other income in 2016 was positively impacted by gain on sale of assets of USD 72 million. In 2015, other income was positively impacted by gain on sale of assets of USD 178 million.

As a result of the factors explained above, **total revenues and other income** decreased by 23% and 39% in 2016 and 2015, respectively.

Purchases [net of inventory] were USD 39,696 million in 2016, compared to USD 50,547 million in 2015 and USD 86,689 million in 2014. The decrease from 2015 to 2016 was mainly due to decrease in crude and gas prices. The decrease from 2014 to 2015 was mainly due to decrease in gas and crude prices and lower volumes of crude, other oil products and gas sold.

Operating expenses and selling, general and administrative expenses were USD 4,439 million in 2016, compared to USD 4,664 million in 2015 and USD 5,287 million in 2014. The decrease from 2015 to 2016 was mainly due to lower transportation cost and the ongoing cost reduction initiatives in 2016.

The decrease from 2014 to 2015 was mainly due to the ongoing cost reduction initiatives and a positive USD/NOK currency effect added to the decrease of USD 622 million.

Depreciation, amortisation and net impairment losses amounted to a loss of USD 221 million in 2016, compared to an income of USD 37 million in 2015 and a loss of USD 583 million in 2014. The increase in depreciation, amortisation and net impairment losses from 2015 to 2016 was mainly caused by lower reversal of impairments in 2016 compared to 2015. Net reversal of impairments in 2016 was mainly related to a refinery asset, impacted by expected lower cost base in the future cash flows. The decrease in depreciation, amortisation and net impairment losses from 2014 to 2015 was mainly caused by net reversal of impairment charges of USD 421 million in 2015 triggered by increased refinery margins and operational improvement.

Other operations

The Other reporting segment includes activities within New Energy Solutions; Global Strategy and Business Development; Technology, Projects and Drilling; and Corporate staffs and support functions.

In 2016, the Other reporting segment recorded a net operating loss of USD 423 million compared to a net operating loss of USD 129 million in 2015 and a net operating loss of USD 199 million in 2014.

2.9 LIQUIDITY AND CAPITAL RESOURCES

REVIEW OF CASH FLOWS

Statoil`s cash flows in 2016 reflect a solid cash flow in a low price environment.

CONSOLIDATED STATEMENT OF CASH FLOWS

(in USD million)	Note	2016	Full year 2015	2014
Income before tax		(178)	55	17,898
Depreciation, amortisation and net impairment losses	10, 11	11,550	16,715	15,925
Exploration expenditures written off	11	1,800	2,164	2,097
(Gains) losses on foreign currency transactions and balances		(137)	1,166	883
(Gains) losses on sales of assets and businesses	4	(110)	(1,716)	(1,998)
(Increase) decrease in other items related to operating activities		1,076	558	(1,671)
(Increase) decrease in net derivative financial instruments	25	1,307	1,551	254
Interest received		280	363	341
Interest paid		(548)	(443)	(551)
Cash flows provided by operating activities before taxes paid and working capital items		15,040	20,414	33,178
Taxes paid		(4,386)	(8,078)	(15,308)
(Increase) decrease in working capital		(1,620)	1,292	2,335
Cash flows provided by operating activities		9,034	13,628	20,205
Additions through business combinations	4	0	(398)	0
Capital expenditures and investments		(12,191)	(15,518)	(19,497)
(Increase) decrease in financial investments		877	(2,813)	(1,919)
(Increase) decrease in other non-current items		107	(22)	128
Proceeds from sale of assets and businesses	4	761	4,249	3,514

Cash flows provided by (used in) financing activities		(1,959)	(729)	(4,028)
Net increase (decrease) in cash and cash equivalents		(3,371)	(1,602)	(1,598)
Effect of exchange rate changes on cash and cash equivalents		(152)	(871)	(1,329)
Cash and cash equivalents at the beginning of the period (net of overdraft)	16	8,613	11,085	14,013
Cash and cash equivalents at the end of the period (net of overdraft)	16	5,090	8,613	11,085

Cash flows provided by operations
The most significant drivers of cash flows provided by operations were the level of production and prices for liquids and natural gas that impact revenues, purchases [net of inventory], taxes paid and changes in working capital items.

Cash flows provided by operating activities were reduced by USD 4,594 million compared to the full year 2015. The decrease was mainly due to reduced liquids and gas prices, partially offset by lower taxes paid.

Cash flows provided by operating activities were USD 13,628 million in 2015 compared to USD 20,205 million in 2014, which is a decrease of USD 6,577 million driven by a significant reduction in both liquids and gas prices. The decrease was partially offset by positive changes in working capital and lower taxes paid in 2015 compared to 2014.

Cash flows used in investing activities
Cash flows used in investing were reduced by USD 4,055 million compared to the full year 2015. The decrease was due to significantly lower capital expenditures, lower financial investments and reduced proceeds from sale of assets.

Cash flows used in investing activities were USD 14,501 million in 2015 compared to USD 17,775 million in 2014, a decrease of USD 3,274 million mainly due to reduced capital expenditures. The proceeds from sale of assets in 2015 of USD 4,249 million were mainly related to the divestment of the remaining interests in the Shah Deniz field and the South Caucasus pipeline, sale of office buildings, sale of interest in the Marcellus onshore play, sale of interests in Trans Adriatic pipeline AG and the sale of interests in licenses on the NCS.

Cash flows provided by (used in) financing activities
Cash flows used in financing activities increased by USD 1,230 million compared to the full year 2015. The change is mainly due to reduced cash flow from finance debt, partially offset by reduced cash dividend due to the scrip dividend.

Cash flows used in financing activities were USD 729 million in 2015 and were mainly related to payments of dividends USD 2,836 million and repayments of debt USD 1,464 million, partially offset by issuance of new debt of USD 4,272 million. Cash flows used in financing activities were USD 4,028 million in 2014 and were mainly related to payments of dividends and repayments of debt, partly offset by issuance of new debt in November 2014 of USD 3,010 million.

FINANCIAL ASSETS AND DEBT

Statoil's financial position is strong although its net debt to capital employed ratio before adjustments at year end increased from 25.6% in 2015 to 34.4% in 2016. See section 5.2 for non-GAAP measures for net debt ratio. Net interest-bearing debt increased from USD 13.9 billion to USD 18.4 billion. During 2016 Statoil's total equity decreased from USD 40.3 billion to USD 35.1billion, mainly due to impairments recognised in 2016 and dividend paid. Cash flows provided by operating activities were reduced in 2016 mainly due to lower prices. Cash flows used in investing activities reduced in 2016. Statoil has paid out four quarterly dividends in 2016. For the fourth quarter of 2016 the board of directors will propose to the annual general meeting (AGM) to maintain a dividend of USD 0.2201 per share and to maintain the scrip dividend program initiated from the fourth quarter 2015. For details, see note 17 Shareholders equity and dividends to the Consolidated financial statements.

Statoil believes that, given its current liquidity reserves, including committed credit facilities of USD 5.0 billion and its access to various capital markets, Statoil has sufficient funds available to meet its liquidity needs, including working capital.

Funding needs arise as a result of Statoil's general business activities. Statoil generally seeks to establish financing at the corporate (top company) level. Project financing may also be used in cases involving joint ventures with other companies. Statoil aims to have access at all times to a variety of funding sources in respect of markets and instruments; as well as maintaining relationships with a core group of international banks that provide a wide range of banking services.

Moody's and Standard & Poor's (S&P) provide credit ratings on Statoil. Statoil's current long-term ratings are A+ and Aa3 from S&P and Moody's, respectively. The rating from S&P was revised from AA- credit watch negative to A+ with a stable outlook on 22 February 2016 while the rating from Moody's was revised from Aa2 on review for downgrade to Aa3 with stable outlook on 21 March 2016. Both rating agency revisions were triggered by the low commodity price environment, and similar downgrades were seen across the sector around that time. The short-term ratings are P-1 from Moody's and A-1 from S&P. In order to maintain financial flexibility going forward, Statoil intend to keep key financial ratios at levels consistent with our objective of maintaining Statoil's long-term credit rating at least within the single A category on a stand-alone basis.

The management of financial assets and liabilities takes into consideration funding sources, the maturity profile of non-current debt, interest rate risk, currency risk and available liquid assets. Statoil's borrowings are denominated in various currencies and normally swapped into USD. In addition, interest rate derivatives, primarily interest rate swaps, are used to manage the interest rate risk of our long-term debt portfolio. The Group's Capital Markets unit manages the funding and liquidity activities at Group level.

Statoil has diversified its cash investments across a range of financial instruments and counterparties to avoid concentrating risk in any one type of investment or any single country. As of 31 December 2016, approximately 7% of Statoil's liquid assets were held in USD-denominated assets, 21% in NOK, 58% in EUR, 5% in DKK and 9% in SEK, before the effect of currency swaps and forward contracts. Approximately 56% of Statoil's liquid assets were held in treasury bills and commercial paper, 42% in time deposits, 1% in money market funds and 1% at in bank deposits. As of 31 December 2016, approximately 4.7% of Statoil's liquid assets were classified as restricted cash (including collateral deposits).

Statoil's general policy is to keep a liquidity reserve in the form of cash and cash equivalents or other current financial investments in Statoil's balance sheet, as well as committed, unused credit facilities and credit lines in order to ensure that Statoil has sufficient financial resources to meet short-term requirements.

Long-term funding is raised when a need is identified for such financing based on Statoil's business activities, cash flows and required financial flexibility or when market conditions are considered to be favourable.

The Group's borrowing needs are usually covered through the issuance of short-, medium- and long-term securities, including utilisation of a US Commercial Paper Programme (programme limit USD 5.0 billion) and a Shelf Registration Statement (unlimited) filed with the Securities and Exchange Commission (SEC) in the USA as well as through issues under a Euro Medium-Term Note (EMTN) Programme (updated 28 October 2016 with a limit of EUR 20.0 billion) listed on the London Stock Exchange. Committed credit facilities and credit lines may also be utilised. After the effect of currency swaps, the major part of Statoil's borrowings is in USD.

During 2016, Statoil issued bonds with 10 and 20 year maturities for a total amount of EUR 1.2 billion (USD 1.3 billion). All the bonds are unconditionally guaranteed by Statoil Petroleum AS. For more information, see note 18 Finance debt to the Consolidated financial statements.

Statoil issued new debt securities in 2015 equivalent to USD 4.3 billion and in 2014 equivalent to USD 3.0 billion.

Financial indicators

Financial indicators (in USD million)	For the year ended 31 December 2016	2015	2014
Gross interest-bearing financial liabilities [1]	**31,673**	32,291	31,154
Net interest-bearing liabilities before adjustments	**18,372**	13,852	12,004
Net debt to capital employed ratio [2]	**34.4%**	25.6%	19.0%
Net debt to capital employed ratio adjusted [3]	**35.6%**	26.8%	20.0%
Cash and cash equivalents	**5,090**	8,623	11,182
Current financial investments	**8,211**	9,817	7,968
ROACE [4]	**(8.0%)**	2.7%	11.3%
Ratio of earnings to fixed charges [5]	**0.9**	1.0	7.0

1) Defined as non-current and current finance debt.

2) As calculated according to IFRS. Net debt to capital employed ratio is the net debt divided by capital employed. Net debt is interest-bearing debt less cash and cash equivalents and current financial investments. Capital employed is net debt, shareholders' equity and minority interest.

3) In order to calculate the net debt to capital employed ratio adjusted, Statoil makes adjustments to capital employed as it would be reported under IFRS. Restricted funds held as financial investments in Statoil Forsikting AS and Collateral deposits has been added to the net debt whilst the SDFI part of the financial lease in the Snøhvit vessel has been taken out of the net debt. See section 5.2 Net debt to capital employed ratio for a reconciliation of capital employed and a description of why Statoil considers this measure to be useful.

4) ROACE is equal to net income adjusted for financial items after tax, divided by average capital employed over the last 12 months. See section 5.2 Return on average capital employed (ROACE) for a reconciliation of ROACE and a description of why Statoil considers this measure to be useful.

5) Based on IFRS. For the purpose of these ratios, earnings consist of the income before (i) tax, (ii) minority interest, (iii) amortisation of capitalised interest and (iv) fixed charges (which have been adjusted for capitalised interest) and after adjustment for unremitted earnings from equity accounted entities. Fixed charges consist of interest (including capitalised interest) and estimated interest within operating leases.

Gross interest-bearing debt

Gross interest-bearing debt was USD 31.7 billion, USD 32.3 billion and USD 31.2 billion at 31 December 2016, 2015 and 2014, respectively. The USD 0.6 billion net decrease from 2015 to 2016 was due to a decrease in non-current finance debt of USD 2.0 billion, offset by an increase in current finance debt of USD 1.4 billion. The USD 1.1 billion increase from 2014 to 2015 was due to an increase in non-current finance debt of USD 2.4 billion offset by a decrease in current finance debt of USD 1.3 billion. Our weighted average annual interest rate was 3.41%, 3.39% and 3.78% at 31 December 2016, 2015 and 2014, respectively. Statoil's weighted average maturity on finance debt was nine years at 31 December 2016, nine years at 31 December 2015 and nine years at 31 December 2014.

Net interest-bearing debt

Net interest-bearing debt before adjustments were USD 18.4 billion, USD 13.9 billion and USD 12.0 billion at 31 December 2016, 2015 and 2014, respectively. The increase of USD 4.5 billion from 2015 to 2016 was mainly related to a decrease in cash and cash equivalents of USD 3.5 billion, a decrease of current financial investments of USD 1.6 billion offset by a USD 0.6 billion decrease in gross interest-bearing debt. Negative cash flow in 2016 is the main reason. The increase of USD1.8 billion from 2014 to 2015 was related to an increase in gross interest-bearing debt of USD 1.1 billion offset and a decrease in cash and cash equivalents and current financial investments of USD 0.7 billion.

The net debt to capital employed ratio

The net debt to capital employed ratio before adjustments was 34.4%, 25.6% and 19.0% in 2016, 2015 and 2014 respectively.

The net debt to capital employed ratio adjusted (non-GAAP financial measure, see footnote three above) was 35.6%, 26.8% and 20.0% in 2016, 2015, and 2014, respectively.

The 8.8 percentage points increase in net debt to capital employed ratio before adjustments from 2015 to 2016 was related to the increase in net interest-bearing debt adjusted of USD 4.5 billion in combination with a decrease in capital employed adjusted of USD 0.7 billion. The 6.6 percentage points increase in net debt to capital employed ratio before adjustments from 2014 to 2015 was related to an increase in net interest-bearing debt adjusted of USD 1.8

billion in combination with a decrease in capital employed adjusted of USD 9.1 billion.

The 8.8 percentage points increase in net debt to capital employed ratio adjusted from 2015 to 2016 was related to the increase in net interest-bearing debt adjusted of USD 4.6 billion in combination with a decrease in capital employed adjusted of USD 0.6 billion. The 6.8 percentage points increase in net debt to capital employed ratio adjusted from 2014 to 2015 was related to an increase in net interest-bearing debt adjusted of USD 1.9 billion in combination with a decrease in capital employed adjusted of USD 9.1 billion.

Cash, cash equivalents and current financial investments
Cash and cash equivalents were USD 5.1 billion, USD 8.6 billion and USD 11.2 billion at 31 December 2016, 2015 and 2014 respectively. See note 16 Cash and cash equivalents to the Consolidated financial statements for information concerning restricted cash. Current financial investments, which are part of Statoil's liquidity management, amounted to USD 8.2 billion, USD 9.8 billion and USD 8.0 billion at 31 December 2016, 2015 and 2014, respectively.

INVESTMENTS

In 2016, capital expenditures, defined as additions to property, plant and equipment (including capitalised financial leases), capitalised exploration expenditures, intangible assets, long-term share investments and investments in equity accounted companies, amounted to USD 14.1 billion, of which USD 10.1 billion were organic capital expenditures (excluding acquisitions, capital leases and other investments with significant different cash flow pattern). Among items excluded from the organic capital expenditure in 2016 were investment in ownership in Lundin Petroleum AB, acquisition of a 66% operated interest in the offshore licence BM-S-8 in Brazil and acquisition of a 50% stake in the Arkona offshore wind farm in Germany.

In 2015, capital expenditures were USD 15.5 billion, of which organic capital expenditures amounted to USD 14.7 billion.

In Norway, a substantial proportion of our 2017 capital expenditures will be spent on ongoing development projects such as Johan Sverdrup, Gina Krog and Aasta Hansteen, in addition to various extensions, modifications and improvements on currently producing fields like Gullfaks, Oseberg and Troll.

Internationally, we currently estimate that a substantial proportion of our 2017 capital expenditure will be spent on the following ongoing and planned development projects: Mariner in UK, Peregrino in Brazil, Stampede and onshore activity in the US.

In the area of renewable energy, a substantial proportion of our 2017 capital expenditure is expected to be spent on the following offshore wind projects: Arkona in Germany and Hywind in the UK.

Statoil finances its capital expenditures both internally and externally. For more information, see Financial assets and debt earlier in this section.

As illustrated in Principal contractual obligations later in this section, Statoil have committed to certain investments in the future. The further into the future, the more flexibility we will have to revise expenditure. This flexibility is partly dependent on the expenditure our partners in joint ventures agree to commit to. A large part of the capital expenditure for 2017 is committed.

Statoil may alter the amount, timing or segmental or project allocation of our capital expenditures in anticipation of or as a result of a number of factors outside our control.

IMPACT OF REDUCED PRICES

Our results are affected by the development in the price of raw materials and services that are necessary for the development and operation of oil and gas producing assets.

Cost development in the prices of goods, raw materials and services that are necessary for the development and operation of oil and gas producing assets can vary considerably over time and between each market segment.

Prices in supplier markets have been reduced and in several supplier market segments Statoil has achieved reduced rates compared to the 2014/2015 level. Such savings have been achieved both in new and renegotiated contracts.

See the analysis of profit and loss in section 2.8 Operating and financial performance as well section 2.1 Group Outlook.

PRINCIPAL CONTRACTUAL OBLIGATIONS

The table summarises our principal obligations and includes contractual obligations, but excludes derivatives and other hedging instruments as well as asset retirement obligations, as these obligations for the most part are expected to lead to cash disbursements more than five years in the future. Obligations payable by Statoil to unconsolidated equity affiliates are included gross in the table. Where Statoil includes both an ownership interest and the transport capacity cost for a pipeline in the consolidated accounts, the amounts in the table include the transport commitments that exceed Statoil's ownership share. See Disclosures about market risk in section 2.10 Risk review for more information.

Contractual obligations (in USD million)	As at 31 December 2016 Payment due by period [1] Less than 1 year	1-3 years	3-5 years	More than 5 years	Total
Undiscounted non-current finance debt	3,554	4,641	9,133	23,822	41,151
Minimum operating lease payments	1,993	2,693	1,657	2,306	8,649
Nominal minimum other long-term commitments[2]	1,483	2,657	2,200	5,513	11,853
Total contractual obligations	7,030	9,992	12,990	31,642	61,653

1) "Less than 1 year" represents 2016; "1-3 years" represents 2017 and 2018, "3-5 years" represents 2019 and 2020, while "More than 5 years" includes amounts for later periods.

2) For further information see note 23 Other commitments and contingencies to the Consolidated financial statements.

Non-current finance debt in the table represents principal payment obligations. For information on interest commitments relating to long-term debt, reference is made to note 18 Finance debt and note 22 Leases to the Consolidated financial statements.

Statoil had contractual commitments of USD 6,889 million at 31 December 2016. The contractual commitments reflect Statoil's share and mainly comprise construction and acquisition of property, plant and equipment.

Statoil's projected pension benefit obligation was USD 7,791 million, and the fair value of plan assets amounted to USD 5,250 million as of 31 December 2016. Company contributions are mainly related to employees in Norway. See note 19 Pensions to the Consolidated financial statements for more information.

OFF BALANCE SHEET ARRANGEMENTS

Statoil is party to various agreements, such as operational leases and transportation and processing capacity contracts, that are not recognised in the balance sheet. For more information, see Principal contractual obligations in section 2.9 Liquidity and capital resources, and note 22 Leases to the Consolidated financial statements. Statoil is also party to certain guarantees, commitments and contingencies that, pursuant to IFRS, are not necessarily recognised in the balance sheet as liabilities. See note 23 Other commitments and contingencies to the Consolidated financial statements for more information.

2.10 RISK REVIEW

Statoil's overall risk management includes identifying, evaluating and managing risk in all its activities to ensure safe operations and to achieve Statoil's corporate goals.

RISK FACTORS

Statoil is exposed to a number of risks that could affect its operational and financial performance. In this section, some of the key risk factors are addressed.

Risks related to our business

This section describes the most significant potential risks relating to Statoil's business:

A prolonged period of low oil and/or natural gas prices would have a material adverse effect on Statoil

The prices of oil and natural gas have fluctuated greatly in response to changes in many factors. We have experienced a situation where oil and natural gas prices declined substantially compared to levels seen over the last few years. There are several reasons for this decline, but fundamental market forces beyond the control of Statoil or other similar market participants have impacted and can continue to impact oil and natural gas prices in the future. Recently, as a consequence of agreements within Opec and also between Opec and some non-Opec countries, oil prices have increased due to expectations of an earlier tightening of market balances. However, the uncertainty about future developments still prevails.

Generally, Statoil does not and will not have control over the factors that affect the prices of oil and natural gas. These factors include:

- economic and political developments in resource-producing regions
- global and regional supply and demand
- the ability of the Organisation of the Petroleum Exporting Countries (Opec) and/or other producing nations to influence global production levels and prices
- prices of alternative fuels that affect the prices realised under Statoil's long-term gas sales contracts
- government regulations and actions; including changes in energy and climate policies
- global economic conditions
- war or other international conflicts
- changes in population growth and consumer preferences
- the price and availability of new technology and
- weather conditions

It is impossible to predict future price movements for oil and/or natural gas with certainty. A prolonged period of low oil and natural gas prices will adversely affect Statoil's business, the results of operations, financial condition, liquidity and Statoil's ability to finance planned capital expenditure, including possible reductions in capital expenditures which could lead to reduced reserve replacement. In addition to the adverse effect on revenues, margins and profitability from any fall in oil and natural gas prices, a prolonged period of low prices or other indicators could, if deemed to have longer term impact, lead to further reviews for impairment of the group's oil and natural gas properties. Such reviews would reflect the management's view of long-term oil and natural gas prices and could result in a charge for impairment that could have a significant effect on the results of Statoil's operations in the period in which it occurs. Changes in management's view on long-term oil and/or natural gas prices or further material reductions in oil, gas and/or product prices could have an adverse impact on the economic viability of projects that are planned or in development.

Statoil's crude oil and natural gas reserves are only estimates and Statoil's future production, revenues and expenditures with respect to its reserves may differ materially from these estimates.

The reliability of proved reserve estimates depends on:

- the quality and quantity of Statoil's geological, technical and economic data
- the production performance of Statoil's reservoirs
- extensive engineering judgments and
- whether the prevailing tax rules and other government regulations, contracts and oil, gas and other prices will remain the same as on the date estimates are made

Proved reserves are calculated based on the U.S. Securities and Exchange Commission (SEC) requirements and may therefore differ substantially from Statoil's view on expected reserves.

Many of the factors, assumptions and variables involved in estimating reserves are beyond Statoil's control and may prove to be incorrect over time. The results of drilling, testing and production after the date of the estimates may require substantial upward or downward revisions in Statoil's reserve data. The prices used for proved reserves are defined by the SEC and are calculated based on a 12 month un-weighted arithmetic average of the first-day-of-the-month price for each month during the reporting year, leading to a forward price strongly linked to last year's price environment. Fluctuations in oil and gas prices will have a direct impact on Statoil's proved reserves. For fields governed by production sharing agreements (PSAs), a lower price may lead to higher entitlement to the production and increased reserves for those fields. Adversely, a lower price environment may also lead to lower activity resulting in reduced reserves. For PSAs these two effects may to some degree offset each other. In addition a low price environment may result in earlier shutdown due to uneconomic production. This will affect both PSAs and fields with concession types of agreement.

Statoil is engaged in global exploration activities that involve a number of technical, commercial and country specific risks. General risks are technical risks related to Statoil's ability to conduct its seismic and drilling operations in a safe and efficient manner and to encounter commercially productive oil and gas reservoirs and commercial risks related to Statoil's ability to secure access to new acreage in an uncertain global competitive and political environment and competent personnel to perform exploration activities and mature resources along the value-chain. Country specific risks are related to security threats and compliance with and understanding of local laws or license agreements. These risks may adversely affect Statoil's current operations and financial results, and its long-term replacement of reserves.

If Statoil fails to acquire or discover and develop additional reserves, its reserves and production will decline materially from their current levels

Successful implementation of Statoil's group strategy for value growth is critically dependent on sustaining its long-term reserve replacement. If upstream resources are not progressed to proved reserves in a timely manner, Statoil's reserve base and thereby future production will gradually decline and future revenue will be reduced.

Statoil's future production is highly dependent on its success in acquiring or finding and developing additional reserves adding value. If unsuccessful, future total proved reserves and production will decline.

If the low price environment continues for a substantial time, this may result in undeveloped acreage not being considered economically viable and consequently discovered resources not being matured to reserves. This may also lead to exploration areas not being explored for new resources and subsequently not being matured for development resulting in less future proved reserves.

In a number of resource-rich countries, national oil companies control a significant proportion of oil and gas reserves that remain to be developed. To the extent that national oil companies choose to develop their oil and gas resources without the participation of international oil companies, or if Statoil is unable to develop partnerships with national oil companies, its ability to find and acquire or develop additional reserves will be more limited.

Statoil is exposed to a wide range of health, safety and environmental risks that could result in significant losses.

Exploration, development, production, processing and transportation related to oil and natural gas, as well as development and operation of renewable energy production, can be hazardous. Technical integrity failures, operational failures, natural disasters or other occurrences can result in: loss of life, oil spills, gas leaks, loss of containment of hazardous materials, water contamination, blowouts, cratering, fires and equipment failure, among other things.

The risks associated with Statoil's activities are affected by the difficult geographies, climate zones and environmentally sensitive regions in which Statoil operates. All modes of transportation of hydrocarbons - including road, rail, sea or pipeline - are particularly susceptible to a loss of containment of hydrocarbons and other hazardous materials, and, given the high volumes involved, these could represent a significant risk to people and the environment. Offshore operations and transportation are subject to marine perils, including severe storms and other adverse weather conditions and vessel collisions. Onshore operations and transportation are subject to adverse weather conditions and accidents. Both onshore and offshore operations and transportation are subject to interruptions, restrictions or termination by government authorities based on safety, environmental or other considerations.

Policy and regulatory change due to rising climate change concerns, and the physical effects of climate change, could impact Statoil's business and related costs

The transition to a low-carbon energy future poses fundamental strategic challenges for the oil and gas industry.

Statoil monitors and assesses risks related to climate change, whether political, regulatory, market or physical, including reputation impact.

Statoil expects and is preparing for policy and regulatory changes targeted at reducing greenhouse gas emissions. This could impact Statoil's financial outlook, whether directly through changes in taxation and regulation, or indirectly through changes in consumer behaviour.

There is continuing uncertainty over climate policy developments in various jurisdiction, and hence the long-term implications to costs and constraints. Statoil expects greenhouse gas emission costs to increase from current levels beyond 2020 and to have a wider geographical range than today.

Climate related policy changes may also reduce access to prospective geographical areas for exploration and production in the future.

Regulatory changes encouraging the development of low-carbon energy technologies such as renewable energy or other potentially disruptive technologies, could impact the demand for oil and gas. As an example, development of battery technologies could allow more intermittent renewables to be used in the power sector. This could impact Statoil's gas sales, particularly if subsidies of renewable energy in Europe were to increase.

Statoil has analysed the sensitivity of its project portfolio (equity production and expected production from accessed exploration acreage) against the assumptions regarding commodity and carbon prices in the International Energy Agency's (IEA) energy scenarios, as laid out in their "World Economic Outlook 2016" report. The analysis demonstrated that the IEA's "450 ppm scenario", which is at large compatible with a global warming of maximum of two degrees Celsius with more than 50% probability, could have a positive impact of approximately 6% on Statoil's net present value compared to Statoil's internal planning assumptions as of December 2016. This assessment is based on Statoil's and the IEA's assumptions which may not be accurate and which are likely to develop over time as new information becomes available. Accordingly, there can be no assurance that the assessment, which is presented in Statoil ASA's 2016 Sustainability report, is a reliable indicator of the actual impact of climate change on Statoil.

Changes in physical climate parameters could impact Statoil's operations, for example through restrained water availability, rising sea level, changes in sea currents and increasing frequency of extreme weather events.

Statoil is exposed to risks as a result of its hydraulic fracturing usage

Statoil's US operations use hydraulic fracturing which is subject to a range of applicable federal, state and local laws, including those discussed under the heading "Legal and Regulatory Risks". Fracturing is an important and common practice that is used to stimulate production of crude oil and/or natural gas from dense subsurface rock formations. Statoil's hydraulic fracturing and fluid handling operations are designed and operated to minimise the risk, if any, of subsurface migration of hydraulic fracturing fluids and spillage or mishandling of hydraulic fracturing fluids, however, a proven case of subsurface migration of hydraulic fracturing fluids or a case of spillage or mishandling of hydraulic fracturing fluids during these activities could potentially subject Statoil to civil and/or criminal liability and the possibility of substantial costs, including environmental remediation, depending on the circumstances of the underground migration, spillage, or mishandling, the nature and scope of the underground migration, spillage, or mishandling, and the applicable laws and regulations.

In addition, various states and local governments have implemented, or are considering, increased regulatory oversight of hydraulic fracturing through additional permit requirements, operational restrictions, disclosure requirements and temporary or permanent bans. New or further changes in laws and regulations imposing reporting obligations on, or otherwise banning or limiting, the hydraulic fracturing process could make it more difficult to complete oil and natural gas wells in shale formations, cause operational delays, increase costs of regulatory compliance or in exploration and production, which could adversely affect Statoil's US onshore business and the demand for fracturing services.

Statoil is exposed to security threats that could have a materially adverse effect on Statoil's results of operations and financial condition

Security threats such as acts of terrorism and cyber-attacks against Statoil's production and exploration facilities, offices, pipelines, means of transportation or computer systems or breaches of Statoil's security system, could result in losses. No assurances can be made that such attacks will not occur in the future and adversely impact its operations. Failure to manage the foregoing risks could result in injury or loss of life, damage to the environment, damage to or the destruction of wells and production facilities, pipelines and other property. Statoil could face, among other things, regulatory action, legal liability, damage to its reputation, a significant reduction in revenues, an increase in costs, a shutdown of operations and a loss of its investments in affected areas.

Statoil's crisis management systems may prove inadequate

Statoil has plans and capability to deal with crisis and emergencies at every level of its operations (ie; plant fires, terror, well instability etc). If Statoil does not respond or is perceived not to have responded in an appropriate manner to either an external or internal crisis, or if its plans to carry on or recover operations following a disruption or incident are not effected quickly enough, its business, operations and reputation could be severely affected. Inability to restore or replace critical capacity to an agreed level within an agreed time frame could prolong the impact of any disruption and could severely affect Statoil's business and operations.

Statoil encounters competition from other oil and gas companies in all areas of its operations

Statoil may experience increased competition from larger players with stronger financial resources and smaller ones with increased agility and flexibility. Gaining access to commercial resources via license acquisition, exploration, or development of existing assets is key to ensuring the long-term economic viability of the business and failure to address this could negatively impact future performance.

Technology is a key competitive advantage in Statoil's industry and our competition may be able to invest more in developing or acquiring intellectual property rights to technology that Statoil may require to remain competitive. Should Statoil's innovation and digitalisation lag behind the industry, its performance could be impeded.

Statoil's development projects and production activities involve many uncertainties and operating risks that can prevent Statoil from realising profits and cause substantial losses

Oil and gas projects may be curtailed, delayed or cancelled for many reasons, including equipment shortages or failures, natural hazards, unexpected drilling conditions or reservoir characteristics, irregularities in geological formations, accidents, mechanical and technical difficulties or challenges due to new technology. This is particularly relevant because of the physical environments in which some of Statoil's projects are situated. Many of Statoil's development and production projects are located in deep waters or other harsh environments or have challenging field characteristics. In US onshore, low regional prices may cause certain areas to be unprofitable and the company may curtail production until prices recover. There is therefore a risk that prolonged low oil and gas prices, combined with the relatively high levels of tax and government take in several jurisdictions, could erode the profitability of some of Statoil's projects.

Statoil faces challenges in achieving its strategic objective of successfully exploiting profitable growth opportunities

Statoil intends to continue to nurture attractive commercial opportunities in order to sustain future growth. This may involve acquisition of new businesses or properties to expand the existing portfolio or to move into new markets. This challenge will grow as global competition for access to new opportunities rises.

Statoil's ability to increase this optionality depends on several factors; including the ability to:

- maintain and impart Statoil's zero-harm safety culture
- identify suitable opportunities
- negotiate favourable terms
- develop new market opportunities or acquire properties or businesses in an agile and efficient way
- effectively integrate acquired properties or businesses into Statoil's operations
- arrange financing, if necessary and
- comply with legal regulations

Statoil anticipates significant investments and costs as it cultivates business opportunities in new and existing markets, and this process may incur or assume unanticipated liabilities, losses or costs associated with assets or businesses acquired. Failure by Statoil to successfully pursue and exploit new business opportunities could result in financial losses and inhibit growth. New projects may have different risk profiles than Statoil's existing portfolio. These and other effects of such acquisitions could result in Statoil having to revise its forecasts either or both with respect to unit production costs and production.

In addition, the pursuit of acquisitions or new business opportunities could divert financial and management resources away from Statoil's day-to-day operations to the integration of acquired operations or properties. Statoil may require additional debt or equity financing to undertake or consummate future acquisitions or projects, and such financing may not be available on terms satisfactory to Statoil, if at all, and it may, in the case of equity, be dilutive to Statoil's earnings per share.

The profitability of Statoil's oil and gas production may be affected by limited transportation infrastructure when a field is in a remote location

Statoil's ability to exploit economically any discovered petroleum resources beyond its proved reserves will depend, among other factors, on the availability of the infrastructure required to transport oil and gas to potential buyers at a commercially acceptable price. Oil is transported by vessels, rail or pipelines to refineries, and natural gas is usually transported by pipeline or by vessels (for liquid natural gas) to processing plants and end users. Statoil may not be successful in its efforts to secure transportation and markets for all of its potential production.

Statoil is exposed to security threats on its information systems and digital infrastructure that could harm its assets and operations
Statoil's security barriers are intended to protect its information systems and digital infrastructure from being compromised by unauthorised parties. Failure to maintain and develop these barriers may affect the confidentiality, integrity and availability of its information systems and digital infrastructure, including those critical to Statoil's operations. Threats to Statoil's information systems could result in significant financial damage to Statoil. Threats to Statoil's industrial control systems are not limited by geography as Statoil's digital infrastructure is accessible globally, and incidents in the industry in recent years have shown that parties who are able to circumvent barriers aimed at securing industrial control systems are capable and willing to perform attacks that destroy, disrupt or otherwise compromise operations. Such attacks could result in material losses or loss of life with consequent financial implications.

Some of Statoil's international interests are located in regions where political, social and economic instability could adversely impact Statoil's business
Statoil has assets and operations located in diverse regions globally where potentially negative economic, social, and political developments could occur. These political risks and security threats require continuous monitoring. Adverse and hostile actions against Statoil's staff, its facilities, its transportation systems and its digital infrastructure (cybersecurity) may cause harm to people and disrupt Statoil's operations and further business opportunities in these or other regions, lead to a decline in production and otherwise adversely affect Statoil's business. This could have a materially adverse effect on Statoil's operations' results and its financial condition.

Statoil's operations are subject to dynamic political and legal factors in the countries in which it operates
Statoil has assets in a number of countries with emerging or transitioning economies that, in part or in whole, lack well-functioning and reliable legal systems, where the enforcement of contractual rights is uncertain or where the governmental and regulatory framework is subject to unexpected change. Statoil's exploration and production activities in these countries are often undertaken together with national oil companies and are subject to a significant degree of state control. In recent years, governments and national oil companies in some regions have begun to exercise greater authority and to impose more stringent conditions on companies engaged in exploration and production activities. Intervention by governments in such countries can take a wide variety of forms, including:

- restrictions on exploration, production, imports and exports
- the awarding or denial of exploration and production interests
- the imposition of specific seismic and/or drilling obligations
- price and exchange controls
- tax or royalty increases, including retroactive claims
- nationalisation or expropriation of Statoil's assets
- unilateral cancellation or modification of Statoil's licence or contractual rights
- the renegotiation of contracts
- payment delays and
- currency exchange restrictions or currency devaluation

The likelihood of these occurrences and their overall effect on Statoil vary greatly from country to country and are hard to predict. If such risks materialise, they could cause Statoil to incur material costs and/or cause Statoil's production to decrease, potentially having a materially adverse effect on Statoil's operations or financial condition.

Statoil is exposed to potentially adverse changes in the tax regimes of each jurisdiction in which Statoil operates
Statoil has business operations in many countries around the world. Changes in the tax laws of the countries in which Statoil operates could have a material adverse effect on its liquidity and results of operations.

Statoil faces foreign exchange risks that could adversely affect the results of Statoil's operations
Statoil's business faces foreign exchange risks and this is managed with USD as the base currency. Statoil has a large percentage of its revenues and cash receipts denominated in USD and sales of gas and refined products are mainly denominated in EUR and GBP. Further, Statoil pays a large portion of its income taxes, and a share of our operating expenses and capital expenditures, in NOK. The majority of Statoil's long term debt has USD exposure.

Statoil is exposed to risks relating to trading and supply activities
Statoil is engaged in substantial trading and commercial activities in the physical markets. Statoil also uses financial instruments such as futures, options, over-the-counter (OTC) forward contracts, market swaps and contracts for differences related to crude oil, petroleum products, natural gas and electricity in order to manage price volatility. Statoil also uses financial instruments to manage foreign exchange and interest rate risk. Trading activities involve elements of forecasting, and Statoil bears the risk of market movements, the risk of losses if prices develop contrary to expectations, and the risk of default by counterparties.

Non-compliance with anti-bribery, anti-corruption and other applicable laws, including failure to meet Statoil's ethical requirements, exposes Statoil to legal liability and damage to its reputation, business and shareholder value
Statoil has activities in countries which present corruption risks and which may have weak legal institutions, lack of control and transparency. In addition, governments play a significant role in the oil and gas sector, through ownership of resources, participation, licensing and local content which leads to a high level of interaction with public officials. Statoil is, through its international activities, subject to anti-corruption and bribery laws in multiple jurisdictions, including the Norwegian Penal code, the US Foreign Corrupt Practices Act and the UK Bribery Act. A violation of any applicable anti-corruption and bribery laws could expose Statoil to investigations from multiple authorities, and any violations of laws may lead to criminal and/or civil liability with substantial fines. Incidents of non-compliance with applicable anti-corruption and bribery laws and regulations and the Statoil Code of Conduct could be damaging to Statoil's reputation, competitiveness and shareholder value.

Statoil's insurance coverage may not provide adequate protection
Statoil maintains insurance coverage that includes coverage for physical damage to its oil and gas properties, third-party liability, workers' compensation and employers' liability, general liability, sudden pollution and other coverage. Statoil's insurance coverage includes deductibles that must be met prior to recovery. Statoil's

external insurance is subject to caps, exclusions and limitations, and there is no assurance that such coverage will adequately protect Statoil against liability from all potential consequences and damages.

Statoil's future performance depends on efficient operations and the ability to develop and deploy new technologies and new products
Our ability to remain efficient, to develop and adapt to new technology, to seek profitable renewable energy and other low-carbon energy solutions, are key success factors for future business. There is a possibility of Statoil not being able to define and implement the necessary changes due to the organisation's capability, external competition or underestimated cost of implementing new technology. Any of these factors may have an adverse effect on Statoil's future business goals.

Statoil may fail to secure the right level of workforce competence and capacity over the short and medium term
The uncertainty of the future of the oil industry in light of reduced oil and natural gas prices and climate policy changes, creates a risk in ensuring a robust workforce through industry cycles. The oil industry is a long term business and needs to take a long term perspective on workforce capacity and competence. Given the current extensive change agenda there is a risk that Statoil will fail to secure the right level of workforce competence and capacity.

Statoil's activities may be affected by international sanctions and trade restrictions
Statoil, like other major international energy companies, has a geographically diverse portfolio of reserves and operational sites, which may expose its business and financial affairs to political and economic risks, including operations in areas subject to international restrictions and sanctions.

Legislation and rules governing sanctions and trade restrictions are complex and constantly evolving. Moreover, changes in these laws and regulations can be unpredictable and happen swiftly. In addition, Statoil's business will constantly be subject to change. Accordingly, it should be understood that the below description does not reflect all parts of Statoil's business where sanctions and trade restrictions are relevant, and that Statoil in the future could decide to take part in additional business activity where such laws and regulations are particularly relevant. While Statoil remains committed to doing business in compliance with all applicable sanctions and trade restrictions, there can be no assurance that no Statoil entity, officer, director, employee or agent is not in violation of such laws. Any such violation could result in substantial civil and/or criminal penalties and might materially adversely affect Statoil's business and results of operations or financial condition.

Statoil holds an interest in several different oil and gas projects in Russia both onshore and offshore. The majority of these projects result from a strategic cooperation with Rosneft Oil Company (Rosneft) initiated in 2012, some of these projects are located Arctic offshore and/or deepwater. In each of these projects, Rosneft holds the majority interest, while Statoil holds a minority interest. Sanctions imposed by Norway, the EU and the USA target, among others, Russia's financial and energy sectors, including certain companies such as Rosneft and various affiliates, and specific activities related to oil exploration and production in the Arctic offshore area, and in deepwater or shale formation projects. Accordingly, aspects of the sanctions targeting Russia also affect Statoil's business activity in the country. The continued progress of Statoil's projects in Russia is, in part, dependent on various government authorisations and also the future development of sanctions and trade controls. Statoil continues to pursue its Russia business within the limitations of existing sanctions and trade controls. However, due to possible future developments there is no certainty that the projects can be progressed and concluded as initially planned.

Disclosure Pursuant to Section 13 (r) of the Exchange Act

Statoil is providing the following disclosure pursuant to Section 13(r) of the Exchange Act.

Statoil is a party to agreements with the National Iranian Oil Company (NIOC), namely, a Development Service Contract for South Pars Gas Phases 6, 7 & 8 (offshore part), an Exploration Service Contract for the Anaran Block and an Exploration Service Contract for the Khorramabad Block, which are located in Iran. Statoil's operational obligations under these agreements have terminated and the licenses have been abandoned. The cost recovery program for these contracts was completed in 2012, except for the recovery of tax and obligations to the Social Security Organisation (SSO). Since 2013, after closing Statoil's office in Iran, Statoil's activity was focused on a final settlement with the Iranian tax and SSO authorities relating to the above mentioned agreements.

During 2016 Statoil paid the equivalent of USD 0.13 million in tax to Iranian authorities. Also during 2016 Statoil paid the equivalent of USD 153 in stamp duty to Iran Tax Organisation. All payments were made in local currency (Iranian Rials). The funds utilised for these purposes were held by Statoil in EN Bank (Iran). Additionally, NIOC, on behalf of Statoil, in 2016 paid a tax obligation of USD 2.47 million equivalent in Iranian Rial to the local tax authorities. The amount was settled towards recoverable costs from NIOC to Statoil.

Since 2009 Statoil has transparently and regularly provided information about its Iran related activity to the US State Department as well as to the Norwegian Ministry of Foreign Affairs. In a letter from the US State Department of 1 November 2010, Statoil was informed that the company was not considered to be a company of concern based on its previous Iran-related activities.

Statoil generated no net profit from the aforementioned 2016 activities. Payments of the above mentioned nature are expected to be made also in 2017, in relation to Statoil's continued efforts to settle all remaining obligations related to its above mentioned historic activity in Iran.

Legal and regulatory risks

Compliance with health, safety and environmental laws and regulations that apply to Statoil's operations could materially increase its costs. The enactment of such laws and regulations in the future is uncertain.
Statoil incurs, and expects to continue to incur, substantial capital, operating, maintenance and remediation costs relating to compliance with increasingly complex laws and regulations for the protection of the environment and human health and safety, including:

- higher price on greenhouse gas emissions
- costs of preventing, controlling, eliminating or reducing certain types of emissions to air and discharges to the sea
- remediaying of environmental contamination and adverse impacts caused by Statoil's activities
- compensation of cost related to persons and/or entities claiming damages as a result of Statoil's activities

Statoil`s activity is increasingly subject to statutory strict liability in respect of losses or damage suffered as a result of pollution caused by spills or discharges of petroleum from petroleum facilities.

Compliance with laws, regulations and obligations relating to climate change and other environmental regulations could result in substantial capital expenditure, reduced profitability as a result of changes in operating costs, and adverse effects on revenue generation and strategic growth opportunities. Statoil regularly assesses how changes in regulations, including introduction of stringent climate policies, may impact the oil price, the costs of developing new oil and gas assets, and the demand for oil and gas.

Statoil's operations in Norway are subject to emissions taxes as well as emissions allowances granted for Statoil's larger European operations under the EU Emissions Trading System. The agreed strengthening of the European Union's emission trading scheme may result in higher costs for installations at the NCS as the price of the EU ETS emissions allowances is expected to increase significantly towards 2030.

The Paris Agreement on climate change entered into force in November 2016. Norway, collectively with the European Union, intends to deliver 40% reductions in greenhouse gas emissions by 2030. The national targets are intended to be strengthened every five years. Additionally, Norway has set an ambition to achieve close to net zero emissions by 2050. The implications for the industry are not clear, however requirements to reduce emissions could result in increased costs.

Statoil's investments in North American onshore producing assets will be subject to evolving regulations that could affect these operations and their profitability (see also the risks related to hydraulic fracturing above). In the United States, the US Environmental Protection Agency (EPA) has taken steps to regulate greenhouse gas emissions under the Clean Air Act, including methane emissions from upstream oil and gas production. In 2016 the EPA finalized new source performance standards for methane emissions and began a process of information collection to inform further methane-related rulemaking. Statoil could incur higher operating costs in order to comply with any such new regulations and data gathering requirements.

Statoil is exposed to risk of supervision, review and sanctions for violations of regulatory laws at the supranational and national level. These include, among others, competition and antitrust laws and financial and trading.
Statoil's products are marketed and traded worldwide and therefore subject to competition and antitrust laws at the supranational and national level in multiple jurisdictions. Statoil is exposed to investigations from competition and antitrust authorities, and violations of the applicable laws and regulations may lead to substantial fines.

Statoil is also exposed to financial review from financial supervisory authorities such as the Norwegian Financial Supervisory Authority (FSA) and the US Securities and Exchange Commission (the SEC). Reviews performed by these authorities could result in changes to previous accounts and future accounting policies.

Statoil is listed on both the Oslo Børs and New York Stock Exchange (NYSE), and is registered with the SEC. Statoil is required to comply with the continuing obligations of these regulatory authorities, and violation of these obligations may result in imposition of fines or other sanctions.

The Norwegian Petroleum Supervisor (PSA) supervises all aspects of Statoil's operations, from exploration drilling through development and operation, to cessation and removal. Its regulatory authority covers the whole NCS as well as petroleum-related plants on land in Norway. Statoil is exposed to supervision from PSA, and as its business grows internationally other regulators, and such supervision could result in audit reports, orders and investigations.

The formation of a competitive internal gas market within the European Union (EU) and the general liberalisation of European gas markets could adversely affect Statoil's business.
The continuing liberalisation of EU gas markets following legislative instruments rolled out in 2011 and the implementation of these legislative instruments by member states, could affect Statoil's market position or result in a reduction in prices in Statoil's gas sales contracts. Statoil's exposure to hub gas prices has increased and correspondingly increased Statoil's exposure to price volatility. Statoil continually monitors its contractual obligations and makes efforts to negotiate the most competitive pricing and other conditions available in the market.

The EU-wide quantity of carbon allowances issued each year under the Emission Trading Scheme (ETS) for greenhouse gas emission allowances began to decrease in a linear manner in 2013. The ETS can have a positive or negative impact on Statoil, depending on the price of carbon, which will consequently have an impact on the development of gas-fired power generation in the EU. Until now, the carbon price has been too low to replace coal with gas fired generation capacity. This effect has been worsened by heavy subsidising of renewables which has caused gas fired power plants to shut down. Current EU climate and energy policies do not address this problem, but there is a tendency towards more market based subsidies in the new guidelines on environment and energy aid.

Political and economic policies of the Norwegian State could affect Statoil's business.
The Norwegian State plays an active role in the management of NCS hydrocarbon resources. In addition to its direct participation in petroleum activities through the State's direct financial interest (SDFI) and its indirect impact through legislation, such as tax and environmental laws and regulations, the Norwegian State, among other things, awards licences for exploration, production and transportation, approves exploration and development projects and applications for production rates for individual fields and may, if important public interests are at stake, also instruct Statoil and other oil companies to reduce petroleum production. Furthermore, in the production licences in which the SDFI holds an interest, the Norwegian State has the power to direct petroleum licences' actions in certain circumstances.

If the Norwegian State were to take additional action under its activities on the NCS or to change laws, regulations, policies or practices relating to the oil and gas industry, Statoil's NCS exploration, development and production activities and the results of its operations could be affected.

Risks related to state ownership

This section discusses some of the potential risks relating to Statoil's business that could derive from the Norwegian State's majority ownership and from Statoil's involvement in the SDFI.

The interests of Statoil's majority shareholder, the Norwegian State, may not always be aligned with the interests of Statoil's other shareholders, and this may affect Statoil's decisions relating to the NCS

The Norwegian Parliament, known as the Storting, and the Norwegian State have resolved that the Norwegian State's shares in Statoil and the SDFI's interest in NCS licences must be managed in accordance with a coordinated ownership strategy for the Norwegian State's oil and gas interests. Under this strategy, the Norwegian State has required Statoil to continue to market the Norwegian State's oil and gas together with Statoil's own oil and gas as a single economic unit.

Pursuant to this coordinated ownership strategy, the Norwegian State requires Statoil, in its activities on the NCS, to take account of the Norwegian State's interests in all decisions that may affect the development and marketing of Statoil's own and the Norwegian State's oil and gas.

The Norwegian State directly held 67% of Statoil's ordinary shares as of 31 December 2016. Based on the Norwegian Public Limited Companies Act, the Norwegian State effectively has the power to influence the outcome of any vote of shareholders due to the percentage of Statoil's shares it owns, including amending its articles of association and electing all non-employee members of the corporate assembly. The employees are entitled to be represented by up to one-third of the members of the board of directors and one third of the corporate assembly.
