The corporate assembly is responsible for electing Statoil's board of directors. It also makes recommendations to the general meeting concerning the board of directors' proposals relating to the company's annual accounts, balance sheet, allocation of profit and coverage of loss. The interests of the Norwegian State in deciding these and other matters and the factors it considers when casting its votes, especially under the coordinated ownership strategy for the SDFI and Statoil's shares held by the Norwegian State, could be different from the interests of Statoil's other shareholders.

If the Norwegian State's coordinated ownership strategy is not implemented and pursued in the future, then Statoil's mandate to continue to sell the Norwegian State's oil and gas together with its own oil and gas as a single economic unit is likely to be prejudiced. Loss of the mandate to sell the SDFI's oil and gas could have an adverse effect on Statoil's position in the markets in which it operates.

For further information about the mandate to sell the Norwegian State's oil and gas, see SDFI oil and gas marketing and sale in section 2.7 Corporate.

RISK MANAGEMENT

Statoil's overall risk management approach includes identifying, evaluating and managing risk in all its activities. In order to achieve optimal corporate solutions, Statoil bases its risk management on an enterprise-wide risk management approach. Statoil defines risk as a deviation from a specified reference value and the uncertainty associated with it. A positive deviation is defined as an upside risk, while a negative deviation is a downside risk. The reference value is most commonly a forecast, percentile or target. Statoil has an enterprise risk management (ERM) approach, which means that:

- focus is on the value impact for Statoil
- risk is managed to make sure that Statoil's operations are safe and in compliance with Statoil's requirements and
- focus is on risk and reward at all levels in the organisation

Risk is managed in the business line and is an integral part of any manager's responsibility. However, some risks are managed at corporate level. This includes oil and natural gas price risks, interest and currency risks, risk dimension in the strategy work, prioritisation processes and capital structure discussions.

Statoil's corporate risk committee (CRC) is headed by the chief financial officer and its members include representatives of the principal business areas. It is an enterprise risk management advisory body that primarily advises the chief financial officer, but also the business areas' management on specific issues. The CRC assesses and advises on measures aimed at managing the overall risk to the group, and it proposes appropriate measures to adjust risk at the corporate level. The CRC is also involved in reviewing and developing Statoil's risk policies. The committee meets regularly during the year to support Statoil's risk management strategies, including hedging and trading strategies, as well as risk management methodologies. It regularly receives risk information that is relevant to it from Statoil's corporate risk department.

- The following section describes how Statoil manages the market risks to which Statoil is exposed

Managing operational risk

Statoil manages risk in order to ensure safe operations and to achieve its corporate goals in compliance with its requirements

- All risks are related to Statoil's value chain, which denotes the value that is added in each step - from access, maturing, project execution and operation to market. In addition to the economic impact these risks could have on Statoil's cash flows, Statoil has a strong focus on avoiding HSE and integrity-related incidents (such as accidents, fraud and corruption). Most of the risks are managed by the principal business area line managers. Some operational risks are insurable and insured by Statoil's captive insurance company operating in the Norwegian and international insurance markets
- Statoil's risk management process is based on ISO31000 Risk management – principles and guidelines. The process provides a standardised framework and methodology for assessing and managing risk. A standardisation of the process across Statoil ASA and its subsidiaries allows for comparable risk levels and efficiency in decisions and it enables the organisation to create sustainable value while seeking to avoid incidents. The process seeks to ensure that risks are identified, analysed, evaluated and managed. Risk adjusting actions are subject to a cost benefit evaluation (except certain safety related risks which are subject to specific regulations)

Managing financial risk

The results of Statoil's operations depend on a number of factors, most significantly those that affect the price it receives for the products

Statoil has developed policies aimed at managing the financial volatility inherent in some of the business exposures. In accordance with these policies, Statoil enters into various financial and commodity-based transactions (derivatives). While the policies and mandates are set at the company level, the business areas are responsible for marketing and trading commodities and for managing commodity-based price risks within mandates. Interest, liquidity, liability and credit risks are managed by the company's central finance department.

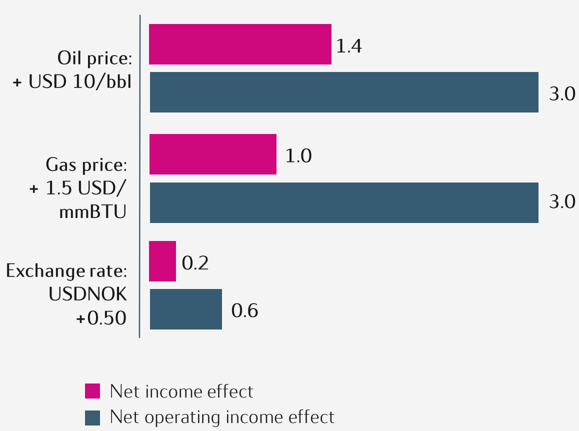
The factors that influence the results of Statoil's operations include: the level of crude oil and natural gas prices, trends in the exchange rate between mainly the USD, EUR, GBP and NOK; Statoil's oil and natural gas production volumes, which in turn depend on entitlement volumes under PSAs and available petroleum reserves, and Statoil's own, as well as partners' expertise and cooperation in recovering oil and natural gas from those reserves; and changes in Statoil's portfolio of assets due to acquisitions and disposals.

Statoil's results will also be affected by trends in the international oil industry, including possible actions by governments and other regulatory authorities in the jurisdictions in which Statoil operates, or possible or continued actions by members of the Organization of Petroleum Exporting Countries (OPEC) and/or other producing nations that affect price levels and volumes, refining margins, the cost of oilfield services, supplies and equipment, competition for exploration opportunities and operatorships, and deregulation of the natural gas markets, all of which may cause substantial changes to existing market structures and to the overall level and volatility of prices and price differentials.

The following table shows the yearly averages for quoted Brent Blend crude oil prices, natural gas average sales prices, refining reference margins and the USD/NOK exchange rates for 2016, 2015 and 2014.

Yearly average	2016	2015	2014
Average Brent oil price (USD/bbl)	43.7	52.4	98.9
Average invoiced gas prices - Europe (USD/mmbtu)	5.2	7.1	9.5
Refining reference margin (USD/bbl)	4.8	8.0	4.7
USD/NOK average daily exchange rate	8.4	8.1	6.3

Indicative effects on 2017 results
(USD billion)



The sensitivity analysis shows the estimated 12-month effects on net operating income and net income from change in parameters. The sensitivities do not have the same probability.

The illustration shows the indicative full-year effect on the financial result for 2017 given certain changes in the crude oil price, natural gas contract prices and the USD/NOK exchange rate. The estimated price sensitivity of Statoil's financial results to each of the factors has been estimated based on the assumption that all other factors remain unchanged. The estimated indicative effects of the negative changes in these factors are not expected to be materially asymmetric to the effects shown in the illustration.

Significant downward adjustments of Statoil's commodity price assumptions will result in impairment losses on certain producing and development assets in the portfolio. See note 10 Property, plant and equipment and note 11 Intangible assets to the Consolidated financial statements for sensitivity analysis related to impairment losses.

Statoil assesses oil and gas price hedging opportunities on a regular basis as a tool with regard to financial robustness and flexibility.

Fluctuating foreign exchange rates can have a significant impact on the operating results. Statoil's revenues and cash flows are mainly denominated in or driven by USD, while a large portion of the operating expenses, capital expenditures and income taxes payable accrue in NOK. Statoil seeks to manage this currency mismatch by issuing or swapping non-current financial debt in USD. This long-term funding policy is an integrated part of our total risk management programme. Statoil also engages in foreign currency management in order to cover the non-USD needs, which are primarily in NOK. In general, an increase in the value of USD in relation to NOK can be expected to increase Statoil's reported earnings.

Historically, Statoil's revenues have largely been generated by the production of oil and natural gas on the NCS. Norway imposes a 78% marginal tax rate on income from offshore oil and natural gas activities (a symmetrical tax system). For further information, see Taxation of Statoil in section 2.7 Corporate.

Statoil's earnings volatility is moderated as a result of the significant proportion of its Norwegian offshore income that is subject to a 78% tax rate in profitable periods, and the significant tax assets generated by its Norwegian offshore operations in any loss-making periods. The basis for taxation is 3% of the dividend received, which is subject to the standard income tax rate (reduced from 25% in 2016 to 24% in 2017). Dividends received from Norwegian companies and from similar companies resident in the EEA for tax purposes, in which the recipient holds more than 90% of the shares and votes, are fully exempt from tax. Dividends from companies resident in the EEA that are not similar to Norwegian companies, companies in low-tax countries and portfolio investments outside the EEA will, under certain circumstances, be subject to the standard income tax rate (reduced from 25% in 2016 to 24% in 2016) based on the full amounts received.

Financial risk management

Statoil's business activities naturally expose the group to financial risk. The group's approach to risk management includes identifying, evaluating and managing risk in all activities using a top-down approach for the purpose of avoiding sub-optimisation and utilising correlations observed from a group perspective. Summing up the different market risks without including the correlations will overestimate Statoil's total market risk. For this reason, Statoil utilises correlations between all of the most important market risks, such as oil and natural gas prices, product prices, currencies and interest rates, to assess the overall market risk. This approach also reduces the number of unnecessary transactions, which reduces transaction costs and avoids sub-optimisation.

In order to achieve the above effects, Statoil has centralised trading mandates (financial positions taken to achieve financial gains, in addition to established policies) so that all major/strategic transactions are coordinated through the CRC. Local trading mandates are therefore relatively small.

Statoil's activities expose the company to the following financial risks: market risks (including commodity price risk, interest rate risk and currency risk), liquidity risk and credit risk. For a discussion of financial risk management see note 5 Financial risk management in the Consolidated financial statements.

Disclosures about market risk

Statoil uses financial instruments to manage commodity price risks, interest rate risks, currency risks and liquidity risks. Significant amounts of assets and liabilities are accounted for as financial instruments.

See note 25 Financial instruments: fair value measurement and sensitivity analysis of market risk in the Consolidated financial statements, for details of the nature and extent of such positions, and for qualitative and quantitative disclosures of the risks associated with these instruments.

2.11 SAFETY, SECURITY AND SUSTAINABILITY

Safety and security
Safety and security risks are particularly relevant for the oil and gas industry, because our core activities involve the risk of accidents and incidents. We work with flammable hydrocarbons at high pressure, often in harsh offshore environments and at height or depths. Oil spills are a major risk we need to handle in both our offshore and onshore oil and gas operations. To this end we have established a global oil spill response system, which includes close collaboration with industry peers and national and local communities.

We focus on identifying safety and security risks and having in place procedures and work processes to control them. Our objective is to be an industry leader in ensuring safe and secure operations that protect our people, the environment, the communities we work with and our assets.

For Statoil, 2016 was marked by two accidents with fatalities. A helicopter accident, in April, at Turøy in Norway in which 13 people were killed while travelling from the Gullfaks B platform in the North Sea. In May, one person was killed in an accident while working on the fabrication of a Statoil rig at the Samsung shipyard in Geoje, South Korea.

We also experienced a number of serious incidents in 2016, two of which had a major accident potential. At the Sture terminal (Norway) five people were exposed to H_2S gas (hydrogen sulphide) in October while working at a treatment facility for oily water inside the terminal area. All affected workers have since recovered after this incident. Statoil implemented immediate actions to avert this problem at all Statoil onshore plants where H_2S could cause a hazard.

Also in October, complications occurred during work to remove the production string from a well on the drilling rig Songa Endurance in the Troll field (Norway). There were no personal injuries, but drill mud containing gas was released. Procedures for handling well barriers have been strengthened.

All serious incidents are investigated in order to understand the causes and extract lessons learned to improve safety in the future. We use serious incident frequency (SIF) as a key indicator to monitor safety performance.

Our total serious incident frequency (SIF), including both actual and potential incidents, increased in 2016, with 0.8 incidents per million hours worked, compared to 0.6 in 2014 and 2015.

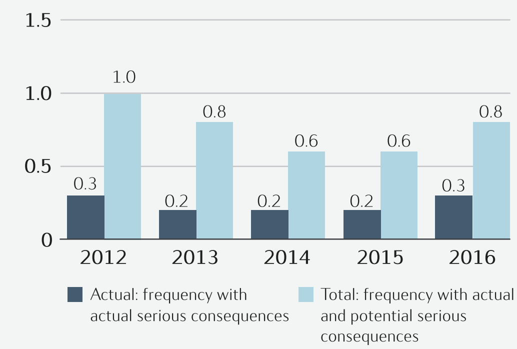
Total recordable injuries per million hours worked (TRIF) was 2.9 in 2016, compared to 2.7 in 2015.

The decline in our safety performance experienced in 2016 follows a decade of solid safety improvement.

Statoil has implemented a safety performance improvement programme to deal with this development. The main elements of the programme address risk management, safety guidance and practice, working safely with suppliers, safety leadership and engagement of the whole organisation.

In 2016, the total number of serious oil and gas leakages (with a leakage rate above 0.1 kg per second) was 18, down from 21 in 2015. Preventing oil and gas leakages is important to avoid of major accidents.

Total and actual serious incident frequency
(number per million hours worked)



Our performance over the past five years, related to oil spills, shows a significant reduction in the number of oil spills per year. From 2015 to 2016 there was a reduction in the number of oil spills from 172 to 148 spills. However, the total volume of oil spilt increased from 31 m³ in 2015 to 61 m³ in 2016. The largest oil spills in 2016 were in Norway. They included a 35 m³ oil spill from the Mongstad refinery, due to corrosion in a pipe and a 7 m³ oil spill from a leak in the export pipeline from Troll B.

Security is an important consideration for the energy industry. We assess security threats and risks on a continuous basis in order to achieve effective and proportionate security risk management. The terrorist attack against the Krechba plant in Algeria, in March, highlighted the security situation in North Africa. This was the single incident with the most significant impact for Statoil during 2016. In 2016 we continued our improvement programme in accordance with our road map to further strengthen our security culture and capabilities by 2020, focusing on areas such as competence and awareness, working with our suppliers and improving compliance.

Health and work environment
Statoil is committed to providing a healthy working environment for its employees. Systematic efforts are made to design and improve working conditions in order to prevent occupational injuries, work-related illness and sickness absence, due to both physical and psychosocial risk factors. A proactive psychosocial risk indicator is used to monitor health and work environment risk factors, in addition to the work related illness frequency indicator.

The most significant risk factors related to the work environment are noise, ergonomics, chemical risk as well as psychosocial conditions. In 2016, Statoil continued to fund research into exposure control for noise and chemicals, and research in to stroke treatment during evacuation from offshore facilities.

The sickness absence rate for Statoil ASA employees increased slightly from 4.1% in 2015 to 4.3% in 2016.

Climate change

Statoil supports the ambition set by the Paris Climate Agreement of December 2015 to limit the average global temperature rise to well below two degrees centigrade compared to pre-industrial levels by 2100. Our corporate ambition is to develop our business in support of the Paris Climate Agreement

Statoil's approach to climate change as outlined in our climate roadmap focuses on:

- building a high value, low carbon oil and gas portfolio
- creating a material industrial position in new energy solutions
- accountability and collaboration.

Climate change is complex and requires global and cross sector cooperation. We are committed to working with our suppliers, customers, governments and peers to find innovative and commercially viable ways to reduce emissions across the oil and gas value chain. To spur technology development, for example, we continued through 2016 with our research and development (R&D) partnership with GE. In November 2016 we launched the USD 1 billion Climate Investments partnership with our global peers through the CEO-led Oil and Gas Climate Initiative (OGCI). And through our participation in the government-led Climate and Clean Air Coalition's Oil and Gas Methane Partnership (OGMP) we continued our efforts to systematically address methane emissions and report on annual progress.

We work with governments and other organisations to support climate and energy policies that encourage fuel switching from coal to gas, growth in renewables, the deployment of carbon capture usage and storage (CCUS) and other low carbon solutions, and efficient production, distribution and use of energy globally. We have also teamed up with global peers through OGCI to help shape the industry's climate response. Through the World Bank led Carbon Pricing Leadership Coalition and our membership of the International Emission Trading Association we continued our advocacy for a price on carbon during 2016. And through our membership in the OGCI and World Business Council for Sustainable Development (WBCSD) we expressed our continued support for the ambitions of the Paris climate agreement. Statoil is an endorser of the World Bank Global Gas Flaring Reduction Partnership and we have made a commitment to contribute to stopping routine flaring by 2030 through the World Bank Zero Routine Flaring by 2030 initiative.

The corporate executive committee and board of directors' review climate change related business risks and opportunities, including market, regulatory and physical risk factors. We use tools such as internal carbon pricing, scenario planning and stress testing of projects against various oil and gas price assumptions. Statoil routinely tracks technology developments and changes in regulations, including the introduction of stringent climate policies, and assesses how these may impact the oil price, the costs of developing new oil and gas assets, and the demand for oil and gas.

Statoil initiated stress testing of our project portfolio against the International Energy Agency (IEA) and our own energy scenarios, in 2015, in response to a shareholder request. The stress test includes a range of price assumptions for oil, gas and carbon. Both Statoil's and the IEA's price assumptions may differ from actual and future oil, gas and carbon prices. As such, there can be no assurance that the analysis is a reliable indicator of the actual future impact of climate change on Statoil.

Statoil's efforts to reduce direct greenhouse gas emissions include improving energy efficiency; reducing methane emissions; eliminating routine flaring and scaling up carbon capture usage and storage (CCUS).

One of the most significant contributions to our emissions reductions in 2016 has been our efforts to reduce flaring at our Bakken (USA) asset. This contributed around 100 thousand tonnes to the total emission reductions. Energy efficiency improvements at our onshore facilities in Norway and the Kalundborg refinery in Denmark realised an additional 100 thousand tonnes in carbon dioxide (CO_2) reductions in 2016.

For our offshore operations in Norway we set a target in 2008 to achieve improved energy efficiency by 2020 equivalent to 800 thousand tonnes of CO_2 emissions (the so called Konkraft target). This was already achieved during 2015 through the implementation of energy efficiency projects. So we have raised the target to a total of 1.2 million tonnes of CO_2 emissions for the period 2008 to 2020.

The production from Statoil operated assets decreased from 1,073 million boe in 2015 to 1,030 million boe in 2016[1]. The corresponding greenhouse gas emissions (so called Scope 1 emissions) decreased from 16.3 million tonnes CO_2 equivalents in 2015 to 15.4 million tonnes in 2016. Greenhouse gas emissions include carbon CO_2 and methane (CH_4), where CO_2 constitutes the largest part (14.8 million tonnes in 2016 compared to 15.4 tonnes in 2015). Methane (CH_4) emissions decreased from 36.3 thousand tonnes in 2015 to 24.2 thousand tonnes in 2016.

The decrease in CO_2 emissions in 2016, relative to 2015, was the result of emissions reductions efforts, reduced exploration activity and operational disruptions associated with turnarounds at our facilities on the Norwegian continental shelf and our onshore oil refining and gas processing facilities in Norway and Denmark. The 33% decrease in methane emissions in 2016, compared to 2015, was largely due to a change in methodology for the estimation of fugitive emissions for our Norwegian continental shelf assets, and updated fugitive emissions measurements for our oil refining and gas processing facilities.

In 2016, we introduced a 2030 carbon intensity target of 8 kg CO_2 per boe for our upstream exploration and production activities. This supplements the 2020 carbon intensity target of 9 kg of CO_2 per boe by 2020 established in 2015. These targets are based on production and emission forecasts and emission reduction targets for each business area. Our targets are subject to significant uncertainty because they relate to events and circumstances that will occur in the future. Changes in our asset portfolio and production can also affect the result for a particular year.

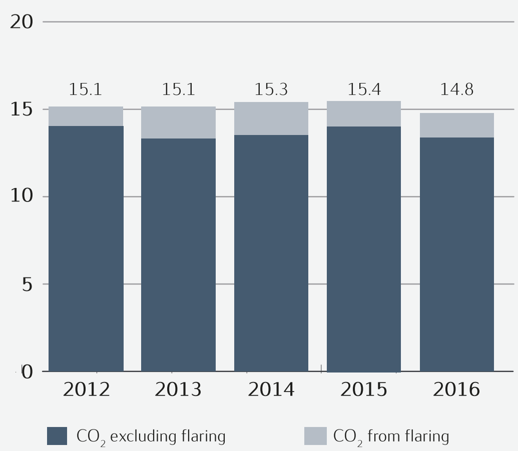
Upstream carbon intensity was established as a corporate-wide key performance indicator in 2016. It was included in the assessment of reward for the CEO. Statoil's upstream carbon intensity in 2016 was

[1] Climate and environmental performance data represent the total for Statoil operated assets (i.e. reflecting operational control rather than equity share), except for scope 3 emissions.

10 kg CO_2 per boe, less than 60% of the industry average of 17 kg as measured by the International Association of Oil and Gas Producers (Environmental Performance Indicators, 2015 data).

Statoil's operations in Europe are subject to emissions allowances according to the EU Emissions Trading System (EU ETS). Statoil's Norwegian operations are subject to both the Norwegian offshore CO_2 tax and EU ETS quotas. In 2016, Statoil paid some USD 496 million in CO_2 tax and quotas compared to USD 476 million in 2015.

CO_2 emissions from Statoil operated assets
(million tonnes)



Growth opportunities for Statoil within renewables and new energy solutions include both commercial investments and research and development (R&D). To date Statoil has invested USD 2.3 billion in offshore wind projects and is engaged in carbon capture usage and storage. In 2016 approximately 17% (USD 52.4 million) of Statoil's spend on R&D efforts addressed energy efficiency, carbon capture and renewables.

Environmental impact and resource efficiency
Statoil is committed to using resources efficiently and responsible management of waste, emissions to air and impacts on ecosystems. This reduces the impact on the local environment and can also save costs.

Responsible water management is important for Statoil. Total *fresh water consumption* decreased from 14.5 million cubic metres in 2015 to 13.5 million cubic metres in 2016. The main contributor to this decrease in water consumption was the lower number of wells fracked, relative to 2015, in our US onshore shale and tight oil assets. We work actively to improve water efficiency in our onshore activities in North America, through means such as water recycling and substituting fresh water with brackish water.

Nitrogen oxide emissions were 39 thousand tonnes in 2016, down from 42 thousand tonnes in 2015. *Sulphur oxide emissions* were 1.8 thousand tonnes, down from 2.5 thousand tonnes in 2015. Total emissions of *non-methane volatile organic compounds were 49 thousand tonnes in 2016, down from 60* thousand tonnes in 2015.

Statoil is concerned with valuing and protecting biodiversity and ecosystems and follows precautionary principles to minimise potential negative effects of the company's activities. Statoil supports research programmes to increase knowledge about ecosystems and biodiversity and collaborates with industry peers to share knowledge and develop tools for biodiversity management. In addition, Statoil works with our suppliers to minimise invasive aquatic species and reduce risks pertaining to accidental spills related to shipping transportation.

During 2016 we saw a 42% rise in the volume of hazardous waste generated, from 309 thousand tonnes in 2015 to 438 thousand tonnes in 2016. The main contributor to this volume increase was drilling and well start-up activities, on the Norwegian continental shelf, at locations without treatment facilities for oil contaminated water. As such the untreated oil contaminated water was sent to shore for treatment.

A change was made, in 2016, to the definitions we use for reporting of hazardous waste recovery. Previously, treated oil contaminated water was not included in our categorisation of recovered hazardous waste. From 2016, treated oil contaminated water will be included in our hazardous waste recovery calculations. The rationale for this change is alignment with the way both our peers and the contractors handling our waste are reporting. It also serves to highlight the company's efforts to treat hazardous waste. The impact on our waste recovery rate is significant, with a rise from 16% in 2015 to 84% for 2016.

For our US onshore operations drill cuttings and produced and flow-back water are exempt from hazardous waste regulations. Consequently, these exempt wastes are not included in the hazardous waste generation or recovery figures. For our US onshore operations in 2016 81 thousand tonnes of drill cuttings and solid waste were sent to landfill, and 4.3 million cubic meters of produced and flow back water was directed to deep well disposal.

In 2016 the volume of non-hazardous waste generated for all Statoil operated assets was 50 thousand tonnes, and the recovery rate was 56% in 2016 compared to 63% in 2015. Regular discharges of oil to water were 1.4 thousand tonnes in 2016, the same as for 2015.

Working with suppliers
Statoil is committed to using suppliers who operate in accordance with Statoil's values and who maintain high standards of safety, security and sustainability. These aspects are incorporated in all phases of the procurement process. Potential suppliers must meet Statoil's minimum requirements in order to qualify as a supplier, including those related to safety, security and sustainability.

Statoil expect our suppliers to comply with applicable laws, respect internationally recognised human rights and adhere to ethical standards which are consistent with our ethical requirements, when working for Statoil. Potential suppliers for contracts valued at more than USD 800 thousand are, in addition, required to sign Statoil's *Supplier Declaration*, which establishes minimum requirements for ethics, anti-corruption, environment, health, safety, respect for human rights, and for further promoting these requirements among their own suppliers. Potential suppliers are also screened for integrity risk, in accordance with our procedures for integrity due diligence.

Human rights
Statoil seeks to conduct its business in a way that is consistent with the UN Guiding Principles on Business and Human Rights (the UN Guiding Principles), the ten UN Global Compact principles and the Voluntary Principles on Security and Human Rights. Statoil is committed to respecting internationally recognised human rights as laid out in the International Bill of Human Rights, the International Labour Organization's 1998 Declaration on Fundamental Rights and Principles at Work, and applicable standards of international humanitarian law.

Labour rights and working conditions for our workforce and suppliers, human rights of individuals in communities and human rights in security arrangements are the three broad focus areas for human rights for Statoil's activities.

Human rights aspects are integrated into relevant internal management processes, tools and training. On-going activities, business relationships and new business opportunities are assessed for potential human rights impacts and aspects, following a risk-based approach. In 2016, supplier screening and verification practices were strengthened.

In 2016 Statoil focused on strengthening its processes for managing human rights in our supply chain and on raising awareness through training. We strengthened our human rights risk screening and verification tools and conducted 65 supplier verifications across 21 countries in 2016. Over 800 employees attended classroom training about human rights in the supply chain.

During 2016 Statoil's Human Rights Steering Committee (HRSC), responsible for overseeing the development and implementation of Statoil's human rights policy, closely followed the ongoing implementation efforts and provided guidance on human rights related reporting requirements.

Statoil recognises that a company-wide commitment to respect human rights requires continuous training and awareness raising in order to embed good practices throughout the organisation. To this effect additional human rights training materials, including a human rights e-learning programme were developed in 2016. During 2016 over 3,000 staff and hired contractors have registered for the e-learning course.

The context of Statoil's operations requires that security services are engaged to safeguard Statoil's people and property. Particular focus is needed to ensure respect for human rights in security arrangements, in jurisdictions where security services are not well regulated or security personnel are not adequately trained. Statoil follows international standards of good practices in security and human rights. Statoil's commitment to the *Voluntary Principles on Security and Human Rights* is reflected in policies and procedures for risk assessment, deployment, training and follow-up of private and public security providers.

Transparency, ethics and anti-corruption
Transparency is a cornerstone of good governance. It is embodied in our corporate values. Transparency allows business to prosper in a predictable and competitive environment and enables society to hold governments and business accountable. Statoil supports and promotes effective, transparent and accountable management of wealth derived from the extractives industries.

Statoil supports and engages in global transparency initiatives through its membership in the Extractive Industries Transparency Initiative (EITI), the United Nations Global Compact Anti-Corruption Working Group and the World Economic Forum's Partnering Against Corruption Initiative (PACI). Statoil was one of the first major oil and gas companies to voluntarily start disclosing payments to governments on a country-by-country basis. Our 2016 *Payments to Governments* report discloses payments per project for our extractive activities, in accordance with mandatory requirements in Norway.

Statoil believes that doing business in an ethical and transparent manner is a prerequisite for sustainable business. Statoil's Code of Conduct (the Code) prohibits all forms of corruption, including facilitation payments. Statoil maintains a robust company-wide anti-corruption compliance programme to implement our zero-tolerance policy. A global network of compliance officers is integrated into our business activities to ensure the appropriate consideration is given to ethics and anti-corruption in Statoil's business activities, regardless of where they take place.

The Code reflects Statoil's values and the commitment to high ethical standards in business activities. It describes our requirements in areas such as anti-corruption, fair competition, human rights and a non-discriminatory working environment with equal opportunities. It applies to Statoil employees, board members and hired personnel.

Statoil seeks to work with others who share the company's commitment to business integrity and who have codes of conduct consistent with Statoil's Code. Before entering into a new business relationship, or extending an existing one, the relationship has to satisfy Statoil's integrity due diligence requirements. Statoil have a process to develop in-depth knowledge of our suppliers, partners, and the markets in which we work. Our vetting process is risk-based, allowing us to target resources where we see potential concerns. In joint ventures and business partnerships that are not controlled by Statoil, Statoil encourages the adoption of ethics and anti-corruption policies and procedures that are consistent with the company's standards.

All employees have to confirm annually that they understand and will comply with the Code. The purpose of this confirmation is to remind the individual about their duty to comply with Statoil's values and ethical requirements. Disciplinary measures are in place for anyone working for Statoil who does not comply with the code. This may entail termination of their contract.

The Code requires reporting of possible violations of our ethical requirements or other unethical misconduct. Concerns can be reported through internal channels or through the publicly available Ethics Helpline, which allows for anonymous reporting. The number and types of cases from the helpline is reported quarterly to the board of directors. In 2016 we received 51 cases through the Ethics Helpline.

Other relevant reports
More information about Statoil's policies and approach taken to manage safety and sustainability performance is available on our corporate website. Information on our activities, plans and performance in 2016 is available in Statoil ASA's 2016 Sustainability Report, which has been prepared with reference to the Global Reporting Initiative G4 Guidelines. This report is also available on our corporate website: www.statoil.com.

2.12 OUR PEOPLE

In Statoil we work together to shape the future of energy in a partnership between the organisation and the individual. We all apply our skills and personal commitment to help Statoil towards achieving our vision.

Statoil aims to offer challenging and meaningful job opportunities that attract and retain the right people. Through our engagement, creativity and collaboration, we aim to build a better Statoil for tomorrow. We are committed to creating a caring and inspiring working environment, promoting diversity and equal opportunities for all employees.

At the same time, given the current commercial environment, the company continues to focus on efficiency. We are committed to doing this in a way that is respectful and considerate to those affected. In particular, employees are involved in initiatives to increase efficiency. Employees have demonstrated strong engagement in this process, which is also confirmed by the high employee engagement score of 4.6 (6 being the highest) in the 2016 Global People Survey (GPS).

Learning and development is at the core of Statoil. We encourage our employees to take responsibility for their own learning and development, continuously build new skills and share knowledge. Our corporate university is our platform for learning. It enables the company to build the capabilities needed to deliver on its strategy, continuously improve, and take the lead in developing leadership and technology. People@Statoil is our common process for people development, deployment, performance and reward. It is an integrated part of performance management and applies to all employees.

EMPLOYEES IN STATOIL

The Statoil group employs 20,539 employees. Of these, approximately 18,000 are employed in Norway and approximately 2,500 outside Norway.

Permanent employees and percentage of women in the Statoil group	Number of employees 2016	2015	2014	Women 2016	2015	2014
Norway	18,034	18,977	19,670	30%	30%	30%
Rest of Europe	838	855	909	28%	29%	31%

1) Contractor personnel, defined as third-party service providers who work at our onshore and offshore operations, are not included. These were roughly estimated to be around 30,000 in 2016.

Statoil works systematically to build a diverse workforce by attracting, recruiting, developing and retaining people of both genders and different nationalities and age groups across all types of positions. In 2016, 19% of employees and 23% of our managerial staff held nationalities other than Norwegian. Outside Norway,

Statoil aims to increase the number of people and managers who are locally recruited and to reduce the long-term use of expats in business operations. In 2016, 73% of new hires in Statoil were non-Norwegians and 34% were women.

Our annual intake of apprentices reflects our long-term commitment to the education and training of young technicians and operators in our industry. In 2016, we awarded 132 apprenticeships, of which 45 were to women. The total number of apprentices at year end was 271 (including 81 women).

In Statoil, the total turnover rate for 2016 was 3.6%. On 31 December 2016, the Statoil group employed 20,539 permanent employees and 3% of the workforce worked part-time. In the annual organisational and working environment survey, which continued to have a high response rate of 84%, our employees reported an overall satisfaction of 4.6, maintaining the high score from 2015.

Our people performance data relates to permanent employees in our direct employment. Statoil defines consultants as contracted personnel that are mainly based in our offices. Temporary employees and contractor personnel, defined as third party service providers to our onshore and offshore operations, are not included in the table. These were roughly estimated to be around 30,000 in 2016. The information about people policies applies to Statoil ASA and its subsidiaries.

Equal opportunities

We are committed to building a workplace that promotes diversity and inclusion through its people processes and practices. The importance of diversity is stated explicitly in Statoil's values and Code of Conduct. Our goal is to create the same opportunities for everyone and do not tolerate discrimination or harassment of any kind in our workplace. In 2016, we continued to focus on strengthening women in leadership and professional positions and on building broad international experience in our workforce. The results from the Global People Survey for 2016 indicate that employees strongly agree that there is a zero tolerance for discrimination and harassment in Statoil. The scoring for the 2016 GPS was 5.1 (6 being the highest), maintaining the high score from 2015.

In 2016, the overall percentage of women in the company was 31%. The percentage of women in the board of directors is 50% (67% among the employee representatives and 43% among members elected by the shareholders). In the corporate executive committee, the female representation has increased from last year's 18% to 27% in 2016. We continue to focus on increasing the number of female managers through our development programmes, and in 2016 the share of women in management was 29%, an increase of 1% from 2015. We are committed to maintaining the positive trend in 2017. We pay close attention to male-dominated positions and discipline areas, and in 2016 the proportion of female engineers remained stable at 27% in Statoil ASA.

We reward our people on the basis of their performance, giving equal emphasis to what we deliver and how we deliver. Our approach is transparent, non-discriminatory and supports equal opportunities. Given the same position, experience and performance, our employees will be at the same remuneration level relative to the local market. This is demonstrated in the salary ratio between women and men at different levels, which remained at an average of 98% for Statoil ASA, which represents the 85% of our workforce.

Unions and representatives

We respect our employees' right to freedom of association and thereby their right to negotiate and cooperate through relevant representative bodies. The specific ways in which we involve our employees and/or their appropriate representatives in business and organisational issues may vary according to local laws and practices in specific geographical locations.

In Statoil ASA, 73% of the employees in the parent company are members of a trade union. Work councils and working environment committees are established where required by law or agreement.

In Norway, the formal basis for collaboration with labour unions is established in the Basic Agreements between the Confederation of Norwegian Enterprise (NHO) and the corresponding respective national labour confederations (unions). We have local collective wage agreements with five trade unions in Statoil ASA.

The European Works Council continues to be an important forum for collaboration between the company and our European employees.

Statoil promotes good employee and industrial relations practices through various networks and forums, including IndustriALL Global Union (IndustriAll) and the International Labour Organisation (ILO).

In 2016 we prolonged the temporary collaboration forum set up in 2015 with trade unions and safety delegates in Norway specifically to engage in the Organisational efficiency programme. Under a common framework, we have relied largely on the internal job market to find new employment opportunities and measures such as severance pay and early retirement.

More information about Statoil's people is available in the 2016 Sustainability Report.

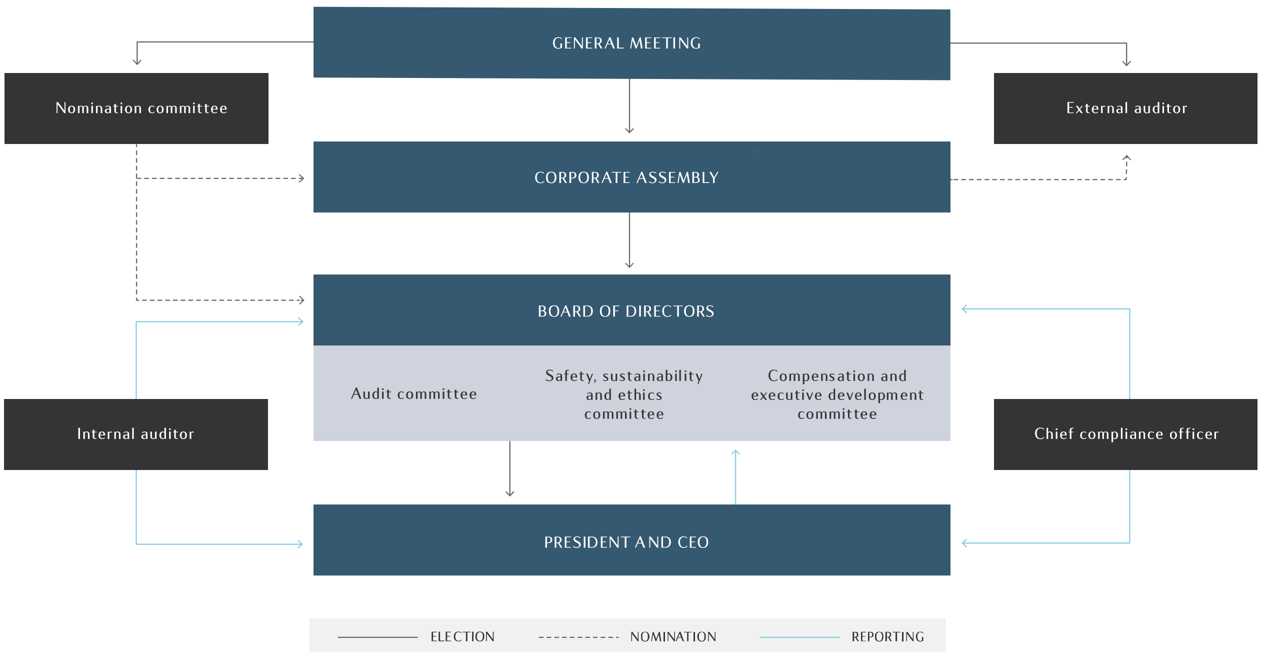
Governance

BOARD STATEMENT ON CORPORATE GOVERNANCE

Nomination and elections in Statoil ASA



Statoil's board of directors actively adheres to good corporate governance standards and will at all times ensure that Statoil either complies with the Norwegian Code of Practice for Corporate Governance (the "Code") or explains possible deviations from the Code. The topic of corporate governance is subject to regular assessment and discussion by the board, which has also considered the text of this chapter at a board meeting. The Code can be found at www.nues.no.

The Code covers 15 topics, and the board statement covers each of these topics and describes Statoil's adherence to the Code. The statement describes the foundation and principles for Statoil's corporate governance structure, more detailed factual information can be found on our website, in our Annual Report on Form 20-F and in our Sustainability Report.

The information concerning corporate governance required to be disclosed according to the Accounting Act Section 3-3b is included in this statement as follows:

1. "An overview of the recommendations and regulations concerning corporate governance that the enterprise is subject to or otherwise chooses to comply with": Described in this introduction as well as in section 1 below, "Implementation and reporting".
2. "Information on where the recommendations and regulations mentioned in no 1 are available to the public": Described in this introduction.
3. "Reasons for any non-conformance with recommendations and regulations mentioned in no 1"; There are two deviations from the Code's recommendations, one in section 6 "General meetings" and the other in section 14 "Take-overs". The reasons for these deviations are described under the respective sections of this statement.
4. "A description of the main elements in the enterprise's, and for entities that prepare consolidated financial statements, also the Group's (if relevant) internal control and risk management systems linked to the financial reporting process": Described in section 10 "Risk management and internal control".
5. "Articles of Association which entirely or partly expand or depart from provisions of Chapter 5 of the Public Limited Liability Companies Act": Described in section 6 "General meetings".
6. "The composition of the board of directors, the Corporate Assembly, the Committee of Shareholders' Representatives and the Control Committee and any working committees related to these bodies, as well as a description of the main instructions and guidelines that apply to the work of the bodies and any committees": Described in section 8 "Corporate assembly and board" and section 9 "The work of the board of directors".
7. "Articles of Association governing the appointment and replacement of Directors": Described in section 8 "Corporate assembly and board" under the sub-heading "Composition of the board of directors".
8. "Articles of Association and authorisations empowering the board of directors to decide that the enterprise is to buy back or issue its own shares or equity certificates": Described in section 3 "Equity and dividends".

3.1 IMPLEMENTATION AND REPORTING

Introduction

Statoil ASA is a Norwegian-registered public limited liability company with its primary listing on Oslo Børs, and the foundation for the Statoil group's governance structure is Norwegian law. Our share is also listed on the New York Stock Exchange (NYSE), and we are subject to the listing requirements of NYSE and the requirements of the US Securities and Exchange Commission.

The board of directors focuses on maintaining a high standard of corporate governance in line with Norwegian and international standards of best practice. Good corporate governance is a prerequisite for a sound and sustainable company, and our corporate governance is based on openness and equal treatment of our shareholders. Our governing structures and controls help to ensure that we run our business in a justifiable and profitable manner for the benefit of our employees, shareholders, partners, customers and society. We continuously consider prevailing international standards of best practice when defining and implementing company policies, as we believe that there is a clear link between high-quality governance and the creation of shareholder value.

At Statoil, the way we deliver is as important as what we deliver. The Statoil Book, which addresses all Statoil employees, sets the standards for our behaviour, our delivery and our leadership.

Our values guide the behaviour of all Statoil employees. Our corporate values are "courageous", "open", "collaborative" and "caring". Both our values and ethics are treated as an integral part of our business activities. Our Ethics Code of Conduct is further described under the heading Risk management and internal control.

We also focus on managing the impacts of our activities on people, society and the environment, in line with our corporate policies for health, safety, security, human rights, ethics and sustainability, including corporate social responsibility (CSR). Areas covered by these policies include labour standards, transparency and anti-corruption, local hiring and procurement, health and safety, the working environment, security and broader environmental issues.

Our governance and management system is further elaborated on our website at www.statoil.com/cg, where shareholders and other stakeholders can explore any topic of particular interest in more detail and easily navigate to related documentation.

Statoil's objective and principles

Statoil's objective is to create long-term value for its shareholders through the exploration for and production, transportation, refining and marketing of petroleum and petroleum-derived products and other forms of energy.

In pursuing its corporate objective, Statoil is committed to the highest standard of governance and to cultivating a values-based performance culture that rewards exemplary ethical practices, respect for the environment and personal and corporate integrity. Statoil believes that there is a link between high-quality governance and the creation of shareholder value.

The work of the board of directors is based on the existence of a clearly defined division of roles and responsibilities between the shareholders, the board of directors and the company's management.

Statoil's governing structures and controls help to ensure that Statoil runs its business in a profitable manner for the benefit of shareholders, employees and other stakeholders in the societies in which Statoil operates.

The following principles underline Statoil's approach to corporate governance:

- All shareholders will be treated equally
- Statoil will ensure that all shareholders have access to up-to-date, reliable and relevant information about its activities
- Statoil will have a board of directors that is independent (as defined by Norwegian Standards) of the group's management. The board focuses on preventing conflicts of interest between shareholders, the board of directors and the company's management
- The board of directors will base its work on the principles for good corporate governance applicable at all times

Corporate governance in Statoil is subject to regular review and discussion by the board of directors.

Articles of association

Statoil's current articles of association were adopted at the annual general meeting of shareholders on 14 May 2013, and last changed on 26 October 2016 following a share capital increase in connection to Statoil's scrip dividend program.

Summary of Statoil's articles of association:

Name of the company
The registered name is Statoil ASA. Statoil is a Norwegian public limited company.

Registered office
Statoil's registered office is in Stavanger, Norway, registered with the Norwegian Register of Business Enterprises under number 923 609 016.

Objective of the company
The objective of Statoil is, either by itself or through participation in or together with other companies, to engage in the exploration, production, transportation, refining and marketing of petroleum and petroleum-derived products, and other forms of energy, as well as other business.

Share capital
Statoil's share capital is NOK 8,112,623,528 divided into 3,245,049,411 ordinary shares.

Nominal value of shares
The nominal value of each ordinary share is NOK 2.50.

Board of directors
Statoil's articles of association provide that the board of directors shall consist of nine to 11 directors. The board, including the chair and the deputy chair, shall be elected by the corporate assembly for a period of up to two years.

Corporate assembly
Statoil has a corporate assembly comprising 18 members who are normally elected for a term of two years. The general meeting elects 12 members with four deputy members, and six members with deputy members are elected by and from among the employees.

General meetings of shareholders
Statoil's annual general meeting is held no later than 30 June each year. The meeting will consider the annual report and accounts, including the distribution of any dividend, and any other matters required by law or the articles of association.

Documents relating to matters to be dealt with at general meetings do not need to be sent to all shareholders if the documents are accessible on Statoil's website. A shareholder may nevertheless request that such documents be sent to him/her.

Shareholders may vote in writing, including through electronic communication, for a period before the general meeting. In order to practise advance voting, the board of directors must stipulate applicable guidelines. Statoil's board of directors adopted guidelines for such advance voting in March 2012, and these guidelines are described in the notices of the annual general meetings.

Marketing of petroleum on behalf of the Norwegian State
Statoil's articles of association provide that Statoil is responsible for marketing and selling petroleum produced under the SDFI's shares in production licences on the Norwegian continental shelf as well as petroleum received by the Norwegian State paid as royalty together with its own production. Statoil's general meeting adopted an instruction in respect of such marketing on 25 May 2001, as most recently amended by authorisation of the annual general meeting on 11 May 2016.

Nomination committee
The tasks of the nomination committee are to make recommendations to the general meeting regarding the election of and fees for shareholder-elected members and deputy members of the corporate assembly, to make recommendations to the corporate assembly regarding the election of and fees for shareholder-elected members of the board of directors, to make recommendations to the corporate assembly regarding the election of the chair and the deputy chair of the board and to make recommendations to the general meeting regarding the election of and fees for members of the nomination committee. The general meeting may adopt instructions for the nomination committee.

The articles of association are available at www.statoil.com/articlesofassociation.

Compliance with NYSE listing rules

Statoil's primary listing is on the Oslo Børs, but Statoil is also registered as a foreign private issuer with the US Securities and Exchange Commission and listed on the New York Stock Exchange.

American Depositary Shares represent the company's ordinary shares listed on the New York Stock Exchange (NYSE). While Statoil's corporate governance practices follow the requirements of Norwegian law, Statoil is also subject to the NYSE's listing rules.

As a foreign private issuer, Statoil is exempted from most of the NYSE corporate governance standards that domestic US companies must comply with. However, Statoil is required to disclose any significant ways in which its corporate governance practices differ from those applicable to domestic US companies under the NYSE rules. A statement of differences is set out below:

Corporate governance guidelines
The NYSE rules require domestic US companies to adopt and disclose corporate governance guidelines. Statoil's corporate governance principles are developed by the management and the board of directors, in accordance with the Norwegian Code of Practice for Corporate Governance and applicable law. Oversight of the board of directors and management is exercised by the corporate assembly.

Director independence
The NYSE rules require domestic US companies to have a majority of "independent directors". The NYSE definition of an "independent director" sets out five specific tests of independence and also requires an affirmative determination by the board of directors that the director has no material relationship with the company.

Pursuant to Norwegian company law, Statoil's board of directors consists of members elected by shareholders and employees. Statoil's board of directors has determined that, in its judgment, all of the shareholder-elected directors, except one, are independent. In making its determinations of independence, the board focuses inter alia on there not being any conflicts of interest between shareholders, the board of directors and the company's management. It does not strictly make its determination based on the NYSE's five specific tests, but take into consideration all relevant circumstances which may in the board's view affect the directors' independence. The directors elected from among Statoil's employees would not be considered independent under the NYSE rules because they are employees of Statoil. None of the employee-elected directors are an executive officer of the company.

For further information about the board of directors, see the section Board of directors.

Board committees
Pursuant to Norwegian company law, managing the company is the responsibility of the board of directors. Statoil has an audit committee, a safety, sustainability and ethics committee and a compensation and executive development committee. They are responsible for preparing certain matters for the board of directors. The audit committee and the compensation and executive development committee operate pursuant to charters that are broadly comparable to the form required by the NYSE rules. They report on a regular basis to, and are subject to, continuous oversight by the board of directors. For further information about the board's sub-committees, see the section Board of directors.

Statoil complies with the NYSE rule regarding the obligation to have an audit committee that meets the requirements of Rule 10A-3 of the US Securities Exchange Act of 1934.

As required by Norwegian company legislation, the members of Statoil's audit committee include an employee-elected director. Statoil relies on the exemption provided for in Rule 10A-3(b)(1)(iv)(C) from the independence requirements of the US Securities Exchange Act of 1934 with respect to the employee-elected director. Statoil does not believe that its reliance on this exemption will materially adversely affect the ability of the audit committee to act independently or to satisfy the other requirements of Rule 10A-3 relating to audit committees. The other members of the audit committee meet the independence requirements under Rule 10A-3.

Among other things, the audit committee evaluates the qualifications and independence of the company's external auditor. However, in accordance with Norwegian law, the auditor is elected by the annual general meeting of the company's shareholders.

Statoil does not have a nominating/corporate governance sub-committee formed from its board of directors. Instead, the roles prescribed for a nominating/corporate governance committee under the NYSE rules are principally carried out by the corporate assembly and the nomination committee which is elected by the general meeting of shareholders. NYSE rules require the compensation committee of US companies to comprise independent directors under the NYSE rules, recommend senior management remuneration and make a determination on the independence of advisors when engaging them. Statoil, as foreign private issuer, is exempt from complying with these rules and is permitted to follow its home country regulations. Statoil considers all, but one, its compensation committee members to be independent (under Statoil's framework which, as discussed above, is not identical to that of NYSE). Statoil's compensation committee makes recommendations to the board about management remuneration, including that of the CEO. The compensation committee assesses its own performance and has the authority to hire external advisors. The nomination committee, which is elected by the general meeting of shareholders, recommends to the corporate assembly the candidates and remuneration of the board of directors. Also, the nomination committee recommends to the general meeting of shareholders the candidates and remuneration of the corporate assembly and the nomination committee.

Shareholder approval of equity compensation plans

The NYSE rules require that, with limited exemptions, all equity compensation plans must be subject to a shareholder vote. Under Norwegian company law, although the issuance of shares and authority to buy back company shares must be approved by Statoil's annual general meeting of shareholders, the approval of equity compensation plans is normally reserved for the board of directors.

Deviations from the Code: None

3.2 BUSINESS

Statoil is an international energy company with headquarters in Stavanger, Norway, and the company has business operations in more than 30 countries and territories and approximately 20,500 employees worldwide. Statoil ASA is a public limited liability company organised under the laws of Norway and subject to the provisions of the Norwegian Public Limited Liability Companies Act. The Norwegian State is the largest shareholder in Statoil ASA, with a direct ownership interest of 67%. Statoil is the leading operator on the Norwegian continental shelf (NCS) and is also expanding its international activities.

Statoil is among the world's largest net sellers of crude oil and condensate and is the second-largest supplier of natural gas to the European market. Statoil also has substantial processing and refining operations, contributes to the development of new energy resources, has on-going offshore wind activities internationally and is at the forefront of the implementation of technology for carbon capture and storage (CCS).

Statoil's objective is defined in the articles of association (www.statoil.com/articlesofassociation). We shall, either on our own or through participation in or together with other companies, engage in exploration, production, transportation, refining and marketing of petroleum and petroleum-derived products, and other forms of energy, as well as other business.

Statoil's vision is to "shape the future of energy". The board and the administration have formulated a corporate strategy to deliver on this vision. It has been translated into concrete objectives and targets to align strategy execution across the company.

To succeed going forward in turning our vision into reality, we pursue a strategy around the following pillars:

- Norwegian continental shelf - Build on unique position to maximise and develop long-term value
- International Oil & Gas - Deepen core areas and develop growth options
- New Energy Solutions - Create a new material industrial position
- Midstream and Marketing - Secure market access and grow value creation through cycles

To enable strategy execution, Statoil will research, develop, and deploy technology to create opportunities and enhance the value of our current and future assets.

In pursuing our vision and strategy, we are committed to the highest standard of governance and to cultivating a values-based performance culture that rewards exemplary ethical practices, respect for the environment and personal and corporate integrity. We believe that there is a link between high-quality governance and the creation of shareholder value.

Deviations from the Code: None

3.3 EQUITY AND DIVIDENDS

It is Statoil's ambition to grow the annual cash dividend, measured in USD per share, in line with long term underlying earnings. Statoil announces dividends on a quarterly basis.

Shareholders' equity

The company's shareholders' equity at 31 December 2016 amounted to USD 35,072 million (excluding USD 27 million in non-controlling interest, minority interest), equivalent to 33.6% of the company's total assets. The board considers this to be satisfactory given the company's requirement for financial soundness in relation to its expressed goals, strategy and risk profile.

Any increase of the company's share capital must be mandated by the general meeting. If a mandate was to be granted to the board of directors to increase the company's share capital, such mandate would be restricted to a defined purpose. If the general meeting is to consider mandates to the board of directors for the issue of shares for different purposes, each mandate would be considered separately by the meeting.

Dividend policy

It is Statoil's ambition to grow the annual cash dividend, measured in USD per share, in line with long term underlying earnings. Statoil announces dividends on a quarterly basis. The board approves first, second and third quarter interim dividends based on an authorisation from the general meeting, while the annual general meeting approves the fourth quarter (and total annual) dividend based on a proposal from the board. When deciding the interim dividends and recommending the total annual dividend level, the board will take into consideration expected cash flow, capital expenditure plans, financing requirements and appropriate financial flexibility. In addition to cash dividend, Statoil might buy back shares as part of total distribution of capital to the shareholders.

The shareholders at the AGM may vote to reduce, but may not increase, the fourth quarter dividend proposed by the board of directors. It is Statoil's intention to have this authorization approved by the AGM. Statoil announces dividend payments in connection with quarterly results. Payment of quarterly dividends is expected to take place approximately five months after the announcement of each quarterly dividend.

From the second quarter of 2015 Statoil started declaring dividends in USD. Dividends in NOK per share will be calculated and communicated four business days after record date for shareholders at Oslo Børs.

The board of directors will propose to the annual general meeting to maintain a dividend of USD 0.2201 per share fourth quarter 2016 and to continue the two-year scrip dividend programme introduced from the fourth quarter 2015. The scrip programme gives shareholders the option to receive quarterly dividends in cash or in newly issued shares in Statoil, at a 5% discount for the fourth quarter 2016. On May 2016, Statoil and the Norwegian state entered into a two-year agreement whereby the Norwegian state shall use its quarterly dividend to subscribe for the number of shares that is required to maintain its ownership of 67%.

Buy-back of own shares for subsequent annulment

In addition to a cash dividend, Statoil might buy back shares as part of the total distribution of capital to the shareholders. In order to be able to buy back shares the board of directors will need an authorisation from the general assembly. Such authorisation must be renewed on an annual basis. At the annual general meeting on 11 May 2016, the board was authorised to acquire in the market, on behalf of the company, Statoil ASA shares with a nominal value of up to NOK 187,500,000. Within minimum and maximum prices of NOK 50 and NOK 500, respectively, the board was authorised to decide at what price and at what time such acquisition should take place. Own shares acquired pursuant to this authorisation could only be used for annulment through a reduction of the company's share capital, pursuant to the Public Limited Companies Act section 12-1. It was also a precondition for the repurchase and the annulment of own shares that the state's ownership interest in Statoil ASA was not changed. In order to achieve this, a proposal for the redemption of a proportion of the state's shares, so that the state's ownership interest in the company remains unchanged, would also be put forward at the later general meeting which was to decide the annulment of the repurchased shares. The authorisation remains valid until the next annual general meeting, but no longer than until 30 June 2017. As of 1 March 2017, the board has not used this authorisation to buy back own shares for subsequent annulment.

Purchase of own shares for use in the share savings programme

Since 2004, Statoil has had a share savings plan for its employees. The purpose of this plan is to strengthen the business culture and encourage loyalty through employees becoming part-owners of the company. The annual general meeting annually authorises the board to acquire Statoil shares in the market in order to continue implementation of the employees share savings plan. The authorisation remains valid until the next annual general meeting, but no longer than until 30 June the following year.

On 11 May 2016, the board was authorised on behalf of the company to acquire Statoil ASA shares for a total nominal value of up to NOK 42,000,000 for use in the share savings plan for own employees.

Deviations from the Code: None

3.4 EQUAL TREATMENT OF SHAREHOLDERS AND TRANSACTIONS WITH CLOSE ASSOCIATES

Equal treatment of all shareholders is a core governance principle in Statoil. Statoil has one class of shares, and each share confers one vote at the general meeting. The articles of association contain no restrictions on voting rights and all shares have equal rights. The nominal value of each share is NOK 2.50. The repurchase of own shares for use in the share savings programme for employees (or, if applicable, for subsequent cancellation) is carried out through the Oslo Børs.

The Norwegian State as majority owner

The Norwegian State is the majority shareholder of Statoil and also holds major investments in other Norwegian companies. As of 31 December 2016 the Norwegian State had an ownership interest in Statoil of 67% (excluding Folketrygdfondet's (Norwegian national insurance fund) ownership interest of 3.22%). This ownership structure means that Statoil participates in transactions with many parties that are under a common ownership structure and therefore meet the definition of a related party. All transactions are considered to be on an arm's length basis. The State's ownership interest in Statoil is managed by the Norwegian Ministry of Petroleum and Energy.

The Norwegian State's ownership policy is that the principles in the Norwegian Code of Practice for Corporate Governance will apply to state ownership and the Government has stated that it expects companies in which the State has ownership interests to adhere to the Code. The principles are presented in the State's annual ownership reports.

Contact between the State as owner and Statoil takes place in the same manner as for other institutional investors. In all matters in which the State acts in its capacity as shareholder, exchanges with the company are based on information that is available to all shareholders. We ensure that, in any interaction between the Norwegian State and Statoil, a distinction is drawn between the State's different roles.

The State has no appointed board members or members of the corporate assembly in Statoil. As majority shareholder, the State has appointed a member of Statoil's nomination committee.

Sale of the State's oil and gas
Pursuant to Statoil's articles of association, Statoil markets and sells the Norwegian State's share of oil and gas production from the Norwegian continental shelf together with its own production. The Norwegian State has a common ownership strategy aimed at maximising the total value of its ownership interests in Statoil and its own oil and gas interests. This is incorporated in the marketing instruction, which obliges Statoil, in its activities on the Norwegian continental shelf, to emphasise these overall interests in decisions that may be of significance to the implementation of the sales arrangements.

The state-owned oil company Petoro AS handles commercial matters relating to the Norwegian State's direct involvement in petroleum activities on the Norwegian continental shelf and pertaining activities.

Other transactions
In relation to its ordinary business operations such as pipeline transport, gas storage and processing of petroleum products, Statoil also has regular transactions with certain entities in which Statoil has ownership interests. Such transactions are carried out on an arm's length basis.

Requirements for board members and management
It follows from our Code of Conduct, which applies to both management, employees and board members, that individuals must behave impartially in all business dealings and not give other companies, organisations or individuals improper advantages. The importance of openness is underlined, and any situations that might lead to an actual or perceived conflict of interest should be discussed with the individual's leader. All external directorships or other material assignments held or carried out by Statoil employees must be approved by Statoil.

The board's rules of procedures state that members of the board and the chief executive officer may not participate in the discussion or decision of issues which are of special personal importance to them, or to any closely-related party, so that the individual must be regarded as having a major personal or special financial interest in the matter. Each board member and the chief executive officer are individually responsible for ensuring that they are not disqualified from discussing any particular matter. Members of the board are obliged to disclose any interests they themselves or their closely-related parties may have in the outcome of a particular issue. The board must approve any agreement between the company and a member of the board or the chief executive officer. The board must also approve any agreement between the company and a third party in which a member of the board or the chief executive officer may have a special interest. Each member of the board shall also continually assess whether there are circumstances which could undermine the general confidence in the board member's independence. It is incumbent on each board member to be especially vigilant when making such assessments in connection with the board's handling of transactions, investments and strategic decisions. The board member shall immediately notify the chair of the board if such circumstances are present or arise and the chair of the board will determine how the matter will be dealt with.

Deviations from the Code: None

3.5 FREELY NEGOTIABLE SHARES

Statoil's primary listing is on the Oslo Børs. Our American Depository Rights (ADRs) are traded on the New York Stock Exchange. Each Statoil ADR represents one underlying ordinary share.

Statoil's articles of association contain no form of restriction on the negotiability of its shares and the shares and ADRs are freely negotiable.

Deviations from the Code: None

3.6 GENERAL MEETING OF SHAREHOLDERS

The general meeting of shareholders is Statoil's supreme corporate body. It serves as a democratic and effective forum for interaction between the company's shareholders, board of directors and management.

The next annual general meeting (AGM) is scheduled for 11 May 2017 in Stavanger, Norway, with simultaneous transmission by webcast through our website. The AGM is conducted in Norwegian, with simultaneous English translation during the webcast. At Statoil's AGM on 11 May 2016, 76.79% of the share capital was represented either by advance voting, in person or by proxy.

The main framework for convening and holding Statoil's AGM is as follows:
Pursuant to Statoil's articles of association, the AGM must be held by the end of June each year. Notice of the meeting and documents relating to the AGM are published on Statoil's website and notice is sent to all shareholders with known addresses at least 21 days prior to the meeting. All shareholders who are registered in the Norwegian Central Securities Depository (VPS) will receive an invitation to the AGM. Other documents relating to Statoil's AGMs will be made available on Statoil's website. A shareholder may nevertheless request that documents that relate to matters to be dealt with at the AGM be sent to him/her.

Shareholders are entitled to have their proposals dealt with at the AGM if the proposal has been submitted in writing to the board of directors in sufficient time to enable it to be included in the notice of meeting, i.e. no later than 28 days before the meeting. Shareholders who are unable to attend may vote by proxy.

As described in the notice of the general meeting, shareholders may vote in writing, including through electronic communication, for a period before the general meeting.

The AGM is normally opened and chaired by the chair of the corporate assembly. If there is a dispute concerning individual matters and the chair of the corporate assembly belongs to one of the disputing parties, or is for some other reason not perceived as being impartial, another person will be appointed to chair the AGM. This is in order to ensure impartiality in relation to the matters to be considered. As Statoil has a large number of shareholders with a wide geographic distribution, Statoil offers shareholders the opportunity to follow the AGM by webcast.

The following matters are decided at the AGM:

- Approval of the board of directors' report, the financial statements and any dividend proposed by the board of directors and recommended by the corporate assembly
- Election of the shareholders' representatives to the corporate assembly and approval of the corporate assembly's fees
- Election of the nomination committee and approval of the nomination committee's fees
- Election of the external auditor and approval of the auditor's fee
- Any other matters listed in the notice convening the AGM

All shares carry an equal right to vote at general meetings. Resolutions at general meetings are normally passed by simple majority. However, Norwegian company law requires a qualified majority for certain resolutions, including resolutions to waive preferential rights in connection with any share issue, approval of a merger or demerger, amendment of the articles of association or authorisation to increase or reduce the share capital. Such matters require the approval of at least two-thirds of the aggregate number of votes cast as well as two-thirds of the share capital represented at the general meeting.

If shares are registered by a nominee in the Norwegian Central Securities Depositary (VPS), cf. section 4-10 of the Norwegian Public Limited Liability Companies Act, and the beneficial shareholder wants to vote for their shares, the beneficial shareholder must re-register the shares in a separate VPS account in their own name prior to the general meeting. If the holder can prove that such steps have been taken and that the holder has a de facto shareholder interest in the company, the company will allow the shareholder to vote for the shares. Decisions regarding voting rights for shareholders and proxy holders are made by the person opening the meeting, whose decisions may be reversed by the general meeting by simple majority vote.

The minutes of the AGM are made available on Statoil's website immediately after the AGM.

As regards to extraordinary general meetings (EGM), an EGM will be held in order to consider and decide a specific matter if demanded by the corporate assembly, the chair of the corporate assembly, the auditor or shareholders representing at least 5% of the share capital. The board must ensure that an EGM is held within a month of such demand being submitted.

In the following, certain types of resolutions by the general meeting of shareholders are outlined:

New share issues

If Statoil issues any new shares, including bonus shares, the articles of association must be amended. This requires the same majority as other amendments to the articles of association. In addition, under Norwegian law, the shareholders have a preferential right to subscribe for new shares issued by Statoil. The preferential right to subscribe for an issue may be waived by a resolution of a general meeting passed by the same percentage majority as required to approve amendments to the articles of association. The general meeting may, with a majority as described above, authorise the board of directors to issue new shares, and to waive the preferential rights of shareholders in connection with such share issues. Such authorisation may be effective for a maximum of two years, and the par value of the shares to be issued may not exceed 50% of the nominal share capital when the authorisation was granted.

The issuing of shares through the exercise of preferential rights to holders who are citizens or residents of the USA may require Statoil to file a registration statement in the USA under US securities laws. If Statoil decides not to file a registration statement, these holders may not be able to exercise their preferential rights.

Right of redemption and repurchase of shares

Statoil's articles of association do not authorise the redemption of shares. In the absence of authorisation, the redemption of shares may nonetheless be decided upon by a general meeting of shareholders by a two-thirds majority on certain conditions. However, such share redemption would, for all practical purposes, depend on the consent of all shareholders whose shares are redeemed.

A Norwegian company may purchase its own shares if authorisation to do so has been granted by a general meeting with the approval of at least two-thirds of the aggregate number of votes cast as well as two-thirds of the share capital represented at the general meeting. The aggregate par value of such treasury shares held by the company must not exceed 10% of the company's share capital, and treasury shares may only be acquired if, according to the most recently adopted balance sheet, the company's distributable equity exceeds the consideration to be paid for the shares. Pursuant to Norwegian law, authorisation by the general meeting cannot be granted for a period exceeding 18 months.

Distribution of assets on liquidation

Under Norwegian law, a company may be wound up by a resolution of the company's shareholders at a general meeting passed by both a two-thirds majority of the aggregate votes cast and a two-thirds majority of the aggregate share capital represented at the general meeting. The shares are ranked equally in the event of a return on capital by the company upon winding up or otherwise.

Deviations from the Code:

The Code recommends that the board of directors, the nomination committee and the company's auditor are present at the general meetings. Due to the nature of the discussions at general meetings, Statoil has not deemed it necessary to require the presence of all members of the board of directors and the nomination committee. The chair of the board, our external auditor, the chair of the nomination committee, as well as the chair of the corporate assembly, the CEO and other members of management, are, however, always present at general meetings.

3.7 NOMINATION COMMITTEE

Pursuant to Statoil's articles of association, the nomination committee shall consist of four members who are shareholders or representatives of shareholders. The duties of the nomination committee are set forth in the articles of association, and the instructions for the committee are adopted by the general meeting of shareholders.

The duties of the nomination committee are to submit recommendations to:

- the annual general meeting for the election of shareholder-elected members and deputy members of the corporate assembly, and the remuneration of members of the corporate assembly
- the annual general meeting for the election and remuneration of members of the nomination committee
- the corporate assembly for the election of shareholder-elected members of the board of directors and remuneration of the members of the board of directors and
- the corporate assembly for the election of the chair and deputy chair of the corporate assembly

The nomination committee would like to ensure that the shareholders' views are taken into consideration when candidates to the governing bodies of Statoil ASA are proposed. The nomination committee invites in writing Statoil's largest shareholders to propose shareholder-elected candidates of the corporate assembly and the board of directors, as well as members of the nomination committee. The shareholders are also invited to provide input to the nomination committee in respect of the composition and competence of Statoil's governing bodies in light of Statoil's strategies and challenges going forward. The deadline for providing input is normally set to early January in order to secure that the response is taken into account in the upcoming nominations. In addition, all shareholders have an opportunity to submit proposals through an electronic mailbox as described on Statoil's website. In the board nomination process, the board shares with the nomination committee the results from the annual, normally externally facilitated board evaluation with input from both management and the board. Separate meetings are held between the nomination committee and each board member, including employee-elected board members. The chair of the board and the chief executive officer are invited, without having the right to vote, to attend at least one meeting of the nomination committee before it makes its final recommendations. The committee regularly utilises external expertise in its work.

The members of the nomination committee are elected by the annual general meeting. The chair of the nomination committee and one other member are elected from among the shareholder-elected members of the corporate assembly. Members of the nomination committee are normally elected for a term of two years.

Personal deputy members for one or more of the nomination committee's members may be elected in accordance with the same criteria as described above. A deputy member normally only meets for the permanent member if the appointment of that member terminates before the term of office has expired.

Statoil's nomination committee consists of the following members as per 31 December 2016 and are elected for the period up to the annual general meeting in 2018:

- Tone Lunde Bakker (chair), Global head of cash management at Danske Bank (also chair of Statoil's corporate assembly)
- Tom Rathke, Group executive vice president Wealth Management at DnB
- Elisabeth Berge, Secretary general, Norwegian Ministry of Petroleum and Energy (personal deputy for Elisabeth Berge is Bjørn Ståle Haavik, Director at the Norwegian Ministry of Petroleum and Energy)
- Jarle Roth, CEO of Arendals Fossekompani ASA (also a member of Statoil's corporate assembly)

The board considers all members of the nomination committee to be independent of Statoil's management and board of directors. The general meeting decides the remuneration of the nomination committee.

The nomination committee held 15 ordinary meetings and four telephone meetings in 2016.

The instructions for the nomination committee are available at www.statoil.com/nominationcommittee.

Deviations from the Code: None

3.8 CORPORATE ASSEMBLY, BOARD OF DIRECTORS AND MANAGEMENT

Corporate assembly

Pursuant to the Norwegian Public Limited Liability Companies Act, companies with more than 200 employees must elect a corporate assembly unless otherwise agreed between the company and a majority of its employees.

In accordance with Statoil's articles of association, the corporate assembly normally consists of 18 members, 12 of whom (with four deputy members) are nominated by the nomination committee and elected by the annual general meeting. They represent a broad cross-section of the company's shareholders and stakeholders. Six members, with deputy members, and three observers are elected by and among our employees. Such employees are non-executive personnel. The corporate assembly elects its own chair and deputy chair from and among its members.

Members of the corporate assembly are normally elected for a term of two years. Members of the board of directors and management cannot be members of the corporate assembly, but they are entitled to attend and to speak at meetings of the corporate assembly unless the corporate assembly decides otherwise in individual cases. All members of the corporate assembly live in Norway. Members of the corporate assembly do not have service contracts with the company or its subsidiaries providing for benefits upon termination of office.

An overview of the members and observers of the corporate assembly as of 31 December 2016 follows below.

Name	Occupation	Place of residence	Year of birth	Position	Family relations to corporate executive committee, board or corporate assembly members	Share ownership for members as of 31.12.2016	Share ownership for members as of 08.03.2017	First time elected	Expiration date of current term

Total						24,578	25,331		

An election of shareholder-elected members of the corporate assembly was held at Statoil's annual general meeting 11 May 2016. Effective as of 12 May 2016, Nils Bastiansen, Birgitte Ringstad Vartdal (former deputy member), Jarle Roth and Kathrine Næss were elected as new members of the corporate assembly, while Kjerstin Fyllingen, Håkon Volldal and Kari Skeidsvoll Moe were elected as new deputy members. Olaug Svarva (chair), Idar Kreutzer (deputy chair), Karin Aslaksen (member), Barbro Hætta (member), Arthur Sletteberg (deputy member) and Bassim Haj (deputy member) left the corporate assembly as of the same date. On 7 June 2016 the corporate assembly elected Tone Lunde Bakker as chair, and Nils Bastiansen as deputy chair, of the corporate assembly.

The duties of the corporate assembly are defined in section 6-37 of the Norwegian Public Limited Liability Companies Act. The corporate assembly elects the board of directors and the chair of the board and can vote separately on each nominated candidate. Its responsibilities also include overseeing the board and the CEO's management of the company, making decisions on investments of considerable magnitude in relation to the company's resources, and making decisions involving the rationalisation or reorganisation of operations that will entail major changes in or reallocation of the workforce.

Statoil's corporate assembly held four ordinary meetings in 2016, and visited Statoil's operation center for logistics and emergency response in Bergen in connection with one of the meetings. The chair of the board participated at four meetings, and the CEO at three meetings (with the CFO acting on his behalf at one meeting). Other members of management were also present at the meetings.

The procedure for the work of the corporate assembly, as well as an updated overview of its members, is available at www.statoil.com/corporateassembly.

Board of directors

Pursuant to Statoil's articles of association, the board of directors consists of between nine and 11 members elected by the corporate assembly. The chair of the board and the deputy chair of the board are also elected by the corporate assembly. At present, Statoil's board of directors consists of 10 members. As required by Norwegian company law, the company's employees are represented by three board members.

The employee-elected board members, but not the shareholder-elected board members, have four deputy members who attend board meetings in the event an employee-elected member of the board is unable to attend. The management is not represented on the board of directors. Members of the board are elected for a term of up to two years, normally for one year at a time. There are no board member service contracts that provide for benefits upon termination of office.

The board considers its composition to be diverse and competent with respect to the expertise, capacity and diversity appropriate to attend to the company's goals, main challenges, and the common interest of all shareholders. The board also deems its composition to be made up of individuals who are willing and able to work as a team, resulting in the board working effectively as a collegiate body. At least one board member qualifies as "audit committee financial expert", as defined in the US Securities and Exchange Commission requirements. Five board members are women and three board members are non-Norwegians resident outside of Norway.

Statoil's board of directors has determined that, in its judgment, all of the shareholder representatives on the board, except for Wenche Agerup, are considered independent. Under the NYSE rules, a director will not be considered independent if the director is, or was within the past three years, an executive officer of another company at which any of the listed company's current executive officers are, or were within the past three years, members of the compensation committee. Wenche Agerup was a member of Norsk Hydro ASA's management team while Irene Rummelhoff, Executive Vice President of New Energy Solutions in Statoil, was member of the board's compensation committee in Norsk Hydro. Agerup is therefore deemed as a non-independent board member until 31 December 2017.

The board held eight ordinary board meetings and two extraordinary meetings in 2016. Average attendance at these board meetings was 98,1%.

Further information about the members of the board and its sub-committees, including information about expertise, experience, other directorships, independence, share ownership and loans, is available below as well as on our website at www.statoil.com/board which is regularly updated.

Members of the board of directors as of 31 December 2016:

Øystein Løseth
Born: 1958
Position: Shareholder-elected chair of the board and chair of the board's compensation and executive committee.
Term of office: Member of the board of directors of Statoil ASA since 1 October 2014, and since 1 July 2015, also chair of the board and chair of the board's compensation and executive development committee. Up for election in 2017.
Independent: Yes
Other directorships: Chair of the board of Eidsiva Energi AS and Hunton Fiber AS.
Number of shares in Statoil ASA as of 31 December 2016: 1,040
Loans from Statoil: None
Experience: In the period 2010 - 2014, Løseth was the CEO, and before that First Senior Executive Vice President since 2009, of Vattenfall AB. In the period 2003 - 2009, Løseth worked for NUON, a Dutch energy company, first as Division Managing Director, then as a Managing Director and the CEO, from 2006 and 2008 respectively. From 2002 to 2003, Løseth was the Head of Production, Business Development and R&D of Statkraft. In addition,

he has other extensive management experience from Statkraft and Statoil, within strategy and business development among others.
Education: Løseth graduated as M.Sc. from the Norwegian University of Science and Technology and has a degree in Economics from BI Norwegian School of Management in Bergen.
Family relations: No family relations to other members of the board, members of the corporate executive committee or the corporate assembly.
Other matters: In 2016, Løseth participated in eight ordinary board meetings, two extraordinary board meetings, five meetings of the compensation and executive development committee and one meeting in the safety, sustainability and ethics committee. Løseth is a Norwegian citizen and resident in Norway.

Roy Franklin
Born: 1953
Position: Shareholder-elected deputy chair of the board, chair of the board's safety, sustainability and ethics committee and member of the board's audit committee.
Term of office: Board member and deputy chair of the board of Statoil ASA from 1 July 2015. Franklin was also previously a member of the board of StatoilHydro from October 2007 and Statoil from November 2009 until June 2013. Up for election in 2017.
Independent: Yes
Other directorships: Non-executive chair of the board of Cuadrilla Resources Holdings Limited, a privately held UK company focusing on unconventional energy sources. Board member of the Australian oil and gas company Santos Ltd, the private equity firm Kerogen Capital Ltd and the London-based international engineering company Amec Foster Wheeler.
Number of shares in Statoil ASA as of 31 December 2016: None
Loans from Statoil ASA: None
Experience: Franklin has broad experience from management positions in several countries, including positions with BP, Paladin Resources plc and Clyde Petroleum plc.
Education: Franklin has a Bachelor of Science in Geology from the University of Southampton, UK.
Family relations: No family relations to other members of the board, members of the corporate executive committee or the corporate assembly.
Other matters: In 2016, Franklin participated in eight ordinary board meetings, two extraordinary board meetings, five meetings of the audit committee and six meetings of the safety, sustainability and ethics committee. Franklin is a UK citizen and resident in UK.

Bjørn Tore Godal
Born: 1945
Position: Shareholder-elected member of the board, the board's compensation and executive development committee and the board's safety, sustainability and ethics committee.
Term of office: Member of the board of Statoil ASA from 1 September 2010. Up for election in 2017.
Independent: Yes
Other directorships: Vice chair of the board of the Fridtjof Nansen Institute (FNI).
Number of shares in Statoil ASA as of 31 December 2016: None
Loans from Statoil ASA: None
Experience: Godal was a member of the Norwegian parliament for 15 years during the period 1986-2001. At various times, he served as minister for trade and shipping, minister for defense, and minister of foreign affairs for a total of eight years between 1991 and 2001. From 2007-2010, Godal was special adviser for international energy and climate issues at the Norwegian Ministry of Foreign Affairs. From 2003-2007, Godal was Norway's ambassador to Germany and from 2002-2003 he was senior adviser at the department of political science at the University of Oslo. From 2014-2016, Godal lead a government-appointed committee responsible for the evaluation of the civil and military contribution from Norway in Afghanistan in the period 2001 - 2014.
Education: Godal has a bachelor of arts degree in political science, history and sociology from the University of Oslo.
Family relations: No family relations to other members of the board, members of the corporate executive committee or the corporate assembly.
Other matters: In 2016, Godal participated in eight ordinary board meetings, two extraordinary board meetings, five meetings of the compensation and executive development committee and three meetings of the safety, sustainability and ethics committee. Godal is a Norwegian citizen and resident in Norway.

Maria Johanna Oudeman
Born: 1958
Position: Shareholder-elected member of the board and member of the board's compensation and executive development committee.
Term of office: Member of the board of Statoil ASA since 15 September 2012. Up for election in 2017.
Independent: Yes
Other directorships: Oudeman is a member of the boards of Solvay SA, Het Concertgebouw, Rijksmuseum and SHV Holdings.
Number of shares in Statoil ASA as of 31 December 2016: None
Loans from Statoil: None
Experience: Oudeman is the President of Utrecht University in the Netherlands, one of Europe's leading universities. From 2010 to 2013, Oudeman was a member of the Executive Committee of Akzo Nobel, responsible for HR and Organisational Development. Akzo Nobel is the world's largest paint and coatings company and major producer of specialty chemicals, with operations in more than 80 countries. Before joining Akzo Nobel, she was Executive Director Strip Products Division at Corus Group, now Tata Steel Europe. Oudeman has extensive experience as a line manager in the steel industry and considerable international business experience.
Education: Oudeman has a law degree from Rijksuniversiteit Groningen in the Netherlands and an MBA in business administration from the University of Rochester, New York, USA and Erasmus University, Rotterdam, the Netherlands.
Family relations: No family relations to other members of the board, members of the corporate executive committee or the corporate assembly.
Other matters: In 2016, Oudeman participated in eight ordinary board meetings, two extraordinary board meetings and four meetings of the compensation and executive development committee. Oudeman is a Dutch citizen and resident in the Netherlands.

Rebekka Glasser Herlofsen
Born: 1970
Position: Shareholder-elected member of the board and the board's audit committee.
Term of office: Member of the board of Statoil ASA since 19 March 2015. Up for election in 2017.
Independent: Yes
Other directorships: Member of the board of directors of DNV Foundation, DNV Holding, DNV GL, and member of the committee for tax and capital in the Norwegian Shipowners' Association.
Number of shares in Statoil ASA as of 31 December 2016: None
Loans from Statoil: None
Experience: Since 2012, Herlofsen has been the Chief Financial Officer in the shipping company Torvald Klaveness. She will during the first half of 2017 take on a new position as Chief Financial Officer in WWL ASA, an international shipping company under establishment. She has broad financial and strategic experience from several corporations and board directorships. Herlofsen's professional career began in the Nordic Investment Bank, Enskilda Securities, where she worked with corporate finance from 1995 to 1999 in Oslo and London. During the next ten years Herlofsen worked in the Norwegian shipping company Bergesen d.y. ASA (later BW Group). During her period with Bergesen d.y. ASA/BW Group Herlofsen held leading positions within M&A, strategy and corporate planning and was part of the group management team.
Education: MSc in Economics and Business Administration (Siviløkonom) and Certified Financial Analyst Program (AFA), the Norwegian School of Economics (NHH). Breakthrough Program for Top Executives at IMD business school, Switzerland.
Family relations: No family relations to other members of the board, members of the corporate executive committee or the corporate assembly.
Other matters: In 2016, Herlofsen participated in eight ordinary board meetings, two extraordinary board meeting and six meetings of the audit committee. Herlofsen is a Norwegian citizen and resident in Norway.

Wenche Agerup
Born: 1964
Position: Shareholder-elected member of the board, the board's compensation and executive development committee and the board's safety, sustainability and ethics committee.
Term of office: Member of the board of Statoil ASA since 21 August 2015. Up for election in 2017.
Independent: No.
Under the NYSE rules, a director will not be considered independent under the NYSE rules if the director is, or was within the past three years, an executive officer of another company at which any of the listed company's current executive officers are, or were within the past three years, members of the compensation committee. Agerup was a member of Norsk Hydro ASA's management team while Irene Rummelhoff, Executive Vice President of New Energy Solutions in Statoil, was member of the board's compensation committee in Norsk Hydro. Agerup is therefore deemed as a non-independent board member in Statoil until 31 December 2017.
Other directorships: Agerup is a member of the board of the seismic company TGS ASA and a member of Det Norske Veritas Council.
Number of shares in Statoil ASA as of 31 December 2016: 2,522
Loans from Statoil: None
Experience: Agerup is an Executive Vice President (Corporate Affairs) and General Counsel in Telenor ASA. Agerup was the Executive Vice President for Corporate Staffs and the General Counsel of Norsk Hydro ASA from 2010 to 31 December 2014. She has held various executive roles in Hydro since 1997, including within the company's M&A-activities, the business area Alumina, Bauxite and Energy, as a plant manager at Hydro's metal plant in Årdal and as a project director for a Joint Venture in Australia where Hydro cooperated with the Australian listed company UMC.
Education: MA in Law from the University of Oslo, Norway (1989) and a Master of Business Administration from Babson College, USA (1991).
Family relations: No family relations to other members of the board, members of the corporate executive committee or the corporate assembly.
Other matters: In 2016, Agerup participated in seven ordinary board meetings, two extraordinary board meetings, five meetings of the compensation and executive development committee and five meetings of the safety, sustainability and ethics committee. Agerup is a Norwegian citizen and resident in Norway.

Jeroen van der Veer
Born: 1947
Position: Shareholder-elected member of the board and chair of the board's audit committee.
Term of office: Member of the board of Statoil ASA since 18 March 2016. Up for election in 2017.
Independent: Yes
Other directorships: Van der Veer is the chair of the supervisory boards of ING Bank NV and Royal Philips Electronics, chair of the supervisory council of Technical University of Delft and Platform Betatechniek, chair of the advisory board of the Rotterdam Climate Initiative as well as a board member in Boskalis Westminster Groep NV and Het Concertbebouw.
Number of shares in Statoil ASA as of 31 December 2016: None
Loans from Statoil: None
Experience: Van der Veer was the Chief Executive Officer in the international oil and gas company Royal Dutch Shell Plc (Shell) in the period 2004 to 2009 when he retired. Van der Veer thereafter continued as a non-executive director on the board of Shell until 2013. He started to work for Shell in 1971 and has experience within all sectors of the business and has significant competence within corporate governance.
Education: Van der Veer has a degree in Mechanical Engineering (MSc) from Delft University of Technology, Netherlands and a degree in Economics (MSc) from Erasmus University, Rotterdam, Netherlands. Since 2005 he holds an honorary doctorate from the University of Port Harcourt, Nigeria.
Family relations: No family relations to other members of the board, members of the corporate executive committee or the corporate assembly.
Other matters: In 2016, van der Veer participated in six ordinary board meetings, one extraordinary board meetings and three meetings of the audit committee. Van der Veer is a Dutch citizen and resident in Netherlands.

Lill-Heidi Bakkerud
Born: 1963
Position: Employee-elected member of the board and member of the board's safety, sustainability and ethics committee.
Term of office: Member of the board of Statoil ASA from 1998 to 2002, and again since 2004. Up for election in 2017.
Independent: No
Other directorships: Bakkerud is a member of the executive committee of the Industry Energy (IE) trade union and holds a number of offices as a result of this.
Number of shares in Statoil ASA as of 31 December 2016: 342
Loans from Statoil: None
Experience: Bakkerud has worked as a process technician at the petrochemical plant in Bamble and on the Gullfaks field in the North Sea. She is now a full-time employee representative as the leader of the union Industri Energi's Statoil branch.
Education: Bakkerud has a craft certificate as a process/chemistry worker.
Family relations: No family relations to other members of the board, members of the corporate executive committee or the corporate assembly.
Other matters: In 2016, Bakkerud participated in eight ordinary board meetings, two extraordinary board meetings and five meetings of the safety, sustainability and ethics committee. Bakkerud is a Norwegian citizen and resident in Norway.

Ingrid Elisabeth di Valerio
Born: 1964
Position: Employee-elected member of the board and member of the board's audit committee.
Term of office: Member of board of directors of Statoil ASA from 1 July 2013. Up for election in 2017.
Independent: No
Other directorships: Board member of Tekna's central nomination committee.
Number of shares held in Statoil ASA as of 31 December 2016: 3,670
Loans from Statoil: None
Experience: Di Valerio has been employed by Statoil since 2005, and works within materials discipline for Technology, Projects & Drilling. Di Valerio was the union Tekna's main representative in Statoil from 2008 to 2013. She also sat on Tekna's central committee from 2005 to 2013.
Education: Chartered engineer (mathematics and physics) from the Norwegian University of Science and Technology in Trondheim (NTNU).
Familiy relations: No family relationships to other board members, members of the corporate executive committee or the corporate assembly.
Other matters: In 2016, di Valerio participated in eight ordinary board meetings, two extraordinary board meetings and six meetings of the audit committee. Di Valerio is a Norwegian citizen and resident in Norway.

Stig Lægreid
Born: 1963
Position: Employee-elected member of the board and member of the board's safety, sustainability and ethics committee.
Term of office: Member of the board of directors of Statoil ASA from 1 July 2013. Up for election in 2017.
Independent: No
Other directorships: Member of The Norwegian society for Engineers and Technologists' (NITO) negotiation committee for private sector.
Number of shares held in Statoil ASA as of 31 December 2016: 1,881
Loans from Statoil: None
Experience: Employed in ÅSV and Norsk Hydro since 1985. Mainly occupied as project engineer and constructor for production of primary metals until 2005 and from 2005 as weight estimator for platform design. He is now a full-time employee representative as the leader of the union NITO, Statoil.
Education: Bachelor degree, mechanical construction from OIH.
Family relations: No family relationships to other board members, members of the corporate executive committee or the corporate assembly.
Other matters: In 2016, Lægreid participated in eight ordinary board meetings, two extraordinary board meetings and six meetings of the safety, sustainability and ethics committee. Lægreid is a Norwegian citizen and resident in Norway.

The most recent changes to the composition of the board of directors were the election of Jeroen van der Veer as a new shareholder-elected board member effective as of 18 March 2016, as well as the resignation of shareholder-elected board member Jakob Stausholm effective as of 30 September 2016. Van der Veer replaced Stausholm as chair of the board's audit committee as per 26 October 2016.

Management

The president and CEO has overall responsibility for day-to-day operations in Statoil and appoints the corporate executive committee (CEC). The president and CEO is responsible for developing Statoil's business strategy and presenting it to the board of directors for decision, for the execution of the business strategy and for cultivating a performance-driven, values-based culture.

Members of the CEC have a collective duty to safeguard and promote Statoil's corporate interests and to provide the president and CEO with the best possible basis for deciding the company's direction, making decisions and executing and following up business activities. In addition, each of the CEC members is head of a separate business area or staff function.

Members of Statoil's corporate executive committee as of 31 December 2016:

Eldar Sætre,
President and CEO

Eldar Sætre
Born: 1956
Position: President and chief executive officer of Statoil ASA since 15 October 2014.
External offices: Member of the board of Strømberg Gruppen AS and Trucknor AS.
Number of shares in Statoil ASA as of 31 December 2016: 47,882
Loans from Statoil: None
Experience: Sætre joined Statoil in 1980. Executive vice president and CFO from October 2003 until December 2010. Executive vice president for Marketing, Midstream and Processing (MMP) from 2011 until 2014.
Education: MA in business economics from the Norwegian School of Economics and Business Administration (NHH) in Bergen.
Family relations: No family relations to other members of the CEC, members of the board or the corporate assembly.
Other matters: Sætre is a Norwegian citizen and resident in Norway.

Hans Jakob Hegge,
Chief financial
officer (CFO)

Hans Jakob Hegge
Born: 1969
Position: Executive vice president and chief financial officer (CFO) of Statoil ASA since 1 August 2015.
External offices: None
Number of shares in Statoil ASA as of 31 December 2016: 28,190
Loans from Statoil: None
Experience: Hegge has held several managerial positions in Statoil, including senior vice president (SVP) for Operations North in Development and Production Norway (DPN) (2013-2015), SVP for Operations East (2011-2013) in DPN, SVP for Operational Development in DPN (2009-2011) and SVP for Global Business Services in Chief Financial Officer area (CFO) (2005-2009). From 1995 to 2004 he held various positions in DPN, Natural Gas business area and corporate functions in Statoil.
Education: Master of Science degree from the Norwegian School of Economics and Business Administration (NHH).
Family relations: No family relations to other members of the CEC, members of the board or the corporate assembly.
Other matters: Hegge is a Norwegian citizen and resident in Norway.

Jannicke Nilsson
Chief Operating Officer (COO)

Jannicke Nilsson
Born: 1965
Position: Executive vice president and chief operating officer (COO) of Statoil ASA since 1 December 2016.
External offices: Member of the board of Odfjell SE
Number of shares in Statoil ASA as of 31 December 2016: 35,049
Loans from Statoil: None
Experience: Jannicke Nilsson joined Statoil in 1999 and has held a number of central management positions within upstream operations Norway, including senior vice president for Technical Excellence in Technology, Projects & Drilling, senior vice president for Operations North Sea, vice president for modifications and project portfolio Bergen and platform manager at Oseberg South. In august 2013 she was appointed programme leader for Statoil technical efficiency

programme (STEP), responsible for a project portfolio targeting yearly efficiency gains of 2.5 billion USD from 2016.
Education: MSc in cybernetics and process automation and a BSc in automation from the Rogaland Regional College/University of Stavanger.
Family relations: No family relations to other members of the CEC, members of the board or the corporate assembly.
Other matters: Nilsson is a Norwegian citizen and resident in Norway.

Lars Christian Bacher,
Executive vice president Development and Production International (DPI)

Lars Christian Bacher
Born: 1964
Position: Executive vice president of Statoil ASA since 1 September 2012.
External offices: None
Number of shares in Statoil ASA as of 31 December 2016: 24,896
Loans from Statoil ASA: None
Experience: Bacher joined Statoil in 1991 and has held a number of leading positions in Statoil, including that of platform manager on the Norne and Statfjord fields on the Norwegian continental shelf. He was in charge of the merger process involving the offshore installations of Norsk Hydro and Statoil. Bacher has also been senior vice president for Gullfaks operations and subsequently for the Tampen area. His most recent position, which he held from September 2009, was as senior vice president for Statoil's Canadian operations in Development & Production International (DPI).
Education: Master of science in chemical engineering from the Norwegian Institute of Technology (NTH). He also holds a business degree in Finance from the Norwegian School of Economics and Business Administration (NHH).
Family relations: No family relations to other members of the corporate executive committee, the board of directors or the corporate assembly.
Other matters: Bacher is a Norwegian citizen and resident in Norway.

Torgrim Reitan,
Executive vice president Development and Production USA (DPUSA)

Torgrim Reitan
Born: 1969
Position: Executive vice president of Statoil ASA since 1 January 2011.
External offices: None
Number of shares in Statoil ASA as of 31 December 2016: 32,276
Loans from Statoil: None
Experience: From 1 January 2011 to 1 August 2015 Reitan held the position as executive vice president and chief financial officer of Statoil (CFO). He has held several managerial positions in Statoil, including senior vice president (SVP) in trading and operations in the Natural Gas business area (2009 - 2010), SVP in performance management and analysis (2007 - 2009) and SVP in performance management, tax and M&A (2005 - 2007). From 1995 to 2004, Reitan held various positions in the Natural Gas business area and corporate functions in Statoil.
Education: Master of science degree from the Norwegian School of Economics and Business Administration (Siviløkonom) (NHH).
Family relations: No family relations to other members of the CEC, members of the board or the corporate assembly.
Other matters: Reitan is a Norwegian citizen and resident in the United States.

John Knight,
Executive vice president
Global Strategy and Business Development (GSB)

John Knight
Born: 1958
Position: Executive vice president of Statoil ASA since 1 January 2011.
External offices: Member on the advisory board of the Columbia University Center on Global Energy Policy in New York, and member of the advisory board of Lloyd's Register. Chair of ONS18 Conference Committee in Stavanger, Norway.
Numbers of shares in Statoil ASA as of 31 December 2016: 103,808
Loans from Statoil ASA: None
Experience: Knight held several central managerial positions in International Operations in Statoil since 2002, mainly in business development. Between 1987 and 2002, Knight held various positions in energy investment banking. From 1977 to 1987, he

qualified and worked as a barrister/lawyer, and was employed by Shell Petroleum in London during the period 1985-1987.
Education: Knight has first and post-graduate degrees in law from Cambridge University and the Inns of Court School of Law in London.
Family relations: No family relations to other members of the CEC, members of the board or the corporate assembly.
Other matters: Knight is a British citizen and resident in England.

Tim Dodson.
Executive vice president, Exploration (EXP)

Tim Dodson
Born: 1959
Position: Executive vice president of Statoil ASA since 1 January 2011.
External offices: None
Number of shares in Statoil ASA as of 31 December 2016: 29,418
Loans from Statoil ASA: None
Experience: Dodson has worked in Statoil since 1985 and held central management positions in the company, including the positions of senior vice president for Global Exploration, Exploration & Production Norway and the Technology arena.
Education: Bachelor's degree of science in geology and geography from the University of Keele.
Family relations: No family relations to other members of the CEC, members of the board or the corporate assembly.
Other matters: Dodson is a British citizen and resident in Norway.

Margareth Øvrum.
Executive vice president Technology, Projects and Drilling (TPD)

Margareth Øvrum
Born: 1958
Position: Executive vice president of Statoil ASA since September 2004.
External offices: Member of the board of Atlas Copco AB (Sweden) (until 26 April 2017), Alfa Laval (Sweden) and FMC Corporation (US).
Number of shares in Statoil ASA as of 31 December 2016: 49,227
Loans from Statoil: None
Experience: Øvrum has worked for Statoil since 1982 and has held central management positions in the company, including the position of executive vice president for health, safety and the environment and executive vice president for Technology & Projects. Øvrum was the company's first female platform manager, on the Gullfaks field. She was senior vice president for operations for Veslefrikk and vice president of operations support for the Norwegian continental shelf.
Education: Master's degree in engineering (sivilingeniør) from the Norwegian Institute of Technology (NTH) in Trondheim, specialising in technical physics.
Family relations: No family relations to other members of the CEC, members of the board or the corporate assembly.
Other matters: Øvrum is a Norwegian citizen and resident in Norway.

Arne Sigve Nylund,
Executive vice president Development and production Norway (DPN)

Arne Sigve Nylund
Born: 1960
Position: Executive vice president of Statoil ASA since 1 January 2014.
External offices: Member of the board of directors of The Norwegian Oil & Gas Association (Norsk Olje & Gass).
Number of shares in Statoil ASA as of 31 December 2016: 11,312
Loans from Statoil: None
Experience: Employed by Mobil Exploration Inc. from 1983-1987. Since 1987, Nylund has held several central management positions in Statoil ASA.
Education: Mechanical engineer from Stavanger College of Engineering with further qualifications in operational technology from Rogaland Regional College/University of Stavanger (UiS). Business graduate of the Norwegian School of Business and Management (NHH).
Family relations: No family relations to other members of the CEC, members of the board or the corporate assembly.
Other matters: Nylund is a Norwegian citizen and is resident in Norway.

Jens Økland,
executive vice president Marketing,
Midstream and Processing (MMP)

Jens Økland
Born: 1969
Position: Executive vice president of Statoil ASA since 1 June 2015.
External offices: None
Number of shares in Statoil ASA as of 31 December 2016: 13,937
Loans from Statoil ASA: None
Experience: Økland joined Statoil in 1994 and has mainly worked in the mid and downstream areas. Before becoming executive vice president of MMP, Økland worked as vice president of operations for the Åsgard area in Development and Production Norway. Previously Økland was senior vice president of Statoil's natural gas portfolio and supply business in North America, marketing and developing infrastructure solutions for equity and non-equity production. Before heading up Statoil's downstream gas division in North America, he had senior marketing and business development positions within natural gas in Europe mainly focusing on Germany, Statoil's largest gas market.
Education: MSc in business from BI Norwegian Business School.
Family relations: No family relations to other members of the CEC, members of the board or the corporate assembly.
Other matters: Økland is a Norwegian citizen and resident in Norway.

Irene Rummelhoff,
executive vice president New Energy
Solutions (NES)

Irene Rummelhoff
Born: 1967
Position: Executive vice president of Statoil ASA since 1 June 2015.
External offices: Deputy chair of the board of directors of Norsk Hydro ASA.
Number of shares in Statoil ASA as of 31 December 2016: 21,556
Loans from Statoil ASA: None
Experience: Rummelhoff joined Statoil in 1991. She has held a number of management positions within international business development, exploration, and the downstream business in Statoil.
Education: Master's degree in petroleum geosciences from the Norwegian Institute of Technology (NTH).
Family relations: No family relations to other members of the CEC, members of the board or the corporate assembly.
Other matters: Rummehoff is a Norwegian citizen and resident in Norway.

Statoil has granted loans to the Statoil-employed spouse of certain of the Executive Vice Presidents as part of its general loan arrangement for Statoil employees. Employees in salary grade 12 or higher may take out a car loan from Statoil in accordance with standardised provisions set by the company. The standard maximum car loan is limited to the cost of the car, including registration fees, but not exceeding NOK 300,000. Employees outside the collective labour area are entitled to a car loan up to NOK 575,000 (vice presidents and senior vice presidents) or NOK 475,000 (other positions). The car loan is interest-free, but the tax value, "interest advantage", must be reported as salary. Permanent employees in Statoil ASA may also apply for a consumer loan up to NOK 300.000. The interest rate on consumer loans is corresponding to the standard rate in effect at any time for "reasonable loans" from employer as decided by the Norwegian Ministry of Finance, i.e. the lowest rate an employer may offer without triggering taxation of the advantage for the employee.

Deviations from the Code: None

3.9 THE WORK OF THE BOARD OF DIRECTORS

The board is responsible for managing the Statoil group and for monitoring day-to-day management and the group's business activities. This means that the board is responsible for establishing control systems and for ensuring that Statoil operates in compliance with laws and regulations, with our values as stated in The Statoil Book, the Code of Conduct, as well as in accordance with the owners' expectations of good corporate governance. The board emphasises the safeguarding of the interests of all shareholders, but also the interests of Statoil's other stakeholders.

The board handles matters of major importance, or of an extraordinary nature, and may in addition require the management to refer any matter to it. An important task for the board is to appoint the chief executive officer (CEO) and stipulate his/her job instructions and terms and conditions of employment.

The board has adopted a generic annual plan for its work which is revised with regular intervals. Recurrent items on the board's annual plan are: security, safety and sustainability, corporate strategy, business plans, quarterly and annual results, annual reporting, ethics, management's monthly performance reporting, management compensation issues, CEO and top management leadership assessment and succession planning, project status review, people and organisation strategy and priorities, an annual enterprise risk management review, two yearly discussions of main risks and risk issues and an annual review of the board's governing documentation. In the beginning of each board meeting, the CEO meets separately with the board to discuss key matters in the company. At the end of all board meetings, the board has a closed session with only board members attending the discussions and evaluating the meeting.

The work of the board is based on rules of procedure that describe the board's responsibilities, duties and administrative procedures, and determines which cases are to be handled by the board. The rules of procedure also determines the handling of matters in which individual board members or a closely related party have a major personal or financial interest. The rules of procedure further describe the duties of the CEO and his/her duties vis-à-vis the board of directors. The board's rules of procedure are available on our website at www.statoil.com/board. In addition to the board of directors, the CEO, the CFO, the COO, the senior vice president for communication, the general counsel and the company secretary attend all board meetings. Other members of the executive committee and senior management attend board meetings by invitation in connection with specific matters.

New members of the board are offered an induction program where meetings with key members of the management are arranged, an introduction to Statoil's business is given and relevant information about the company and the board's work is made available through the company's web based board portal.

The board carries out an annual board evaluation, with input from various sources and as a main rule with external facilitation. The evaluation report is discussed in a board meeting and is made available to the nomination committee as input to the committee's work.

The entire board, or part of it, regularly visits several Statoil locations in Norway and globally, and a longer board trip for all board members to an international location is made at least on a biennial basis. When visiting Statoil locations globally, the board emphasises the importance of improving its insight into, and knowledge about, safety and security in Statoil's operations, Statoil's technical and commercial activities as well as the company's local organisations. In 2016, whole or parts of the board visited Statoil's operations in Brazil, Tanzania, Russia and the United States.

Statoil's board has established three sub-committees: the audit committee; the compensation and executive development committee; and the safety, sustainability and ethics committee. The committees prepare items for consideration by the board and their authority is limited to making such recommendations. The committees consist entirely of board members and are answerable to the board alone for the performance of their duties. Minutes of the committee meetings are sent to the whole board, and the chair of each committee regularly informs the board at board meetings about the committee's work. The composition and work of the committees are further described below.

Audit committee

The board of directors elects at least three of its members to serve on the board of directors' audit committee and appoints one of them to act as chair. The employee-elected members of the board of directors may nominate one audit committee member.

At year-end 2016, the audit committee members were Jeroen van der Veer (chair), Roy Franklin, Rebekka Glasser Herlofsen and Ingrid di Valerio (employee-elected board member). Jakob Stausholm chaired the audit committee from September 2009 and until his resignation as board member 30 September 2016.

The audit committee is a sub-committee of the board of directors, and its objective is to act as a preparatory body in connection with the board's supervisory roles with respect to financial reporting and the effectiveness of the company's internal control system. It also attends to other tasks assigned to it in accordance with the instructions for the audit committee adopted by the board of directors. The audit committee is instructed to assist the board of directors in its supervising of matters such as:

- Approving the internal audit plan on behalf of the board of directors
- Monitoring the financial reporting process, including oil and gas reserves, fraudulent issues and reviewing the implementation of accounting principles and policies
- Monitoring the effectiveness of the company's internal control, internal audit and risk management systems
- Maintaining continuous contact with the external auditor regarding the annual and consolidated accounts
- Reviewing and monitoring the independence of the company's internal auditor and the independence of the external auditor, reference is made to the Norwegian Auditors Act chapter 4, and, in particular, whether services other than audits provided by the external auditor or the audit firm are a threat to the external auditor's independence

The audit committee supervises implementation of and compliance with the group's Code of Conduct in relation to financial reporting.

The internal audit function reports directly to the board of directors' audit committee and to the chief executive officer.

Under Norwegian law, the external auditor is appointed by the shareholders at the annual general meeting based on a proposal from the corporate assembly. The audit committee issues a statement to the annual general meeting relating to the proposal.

The audit committee meets at least five times a year and both the board and the board's audit committee hold meetings with the internal auditor and the external auditor on a regular basis without the company's management being present.

The audit committee is also charged with reviewing the scope of the audit and the nature of any non-audit services provided by external auditors.

The audit committee is tasked with ensuring that the company has procedures in place for receiving and dealing with complaints received by the company regarding accounting, internal control or auditing matters, and procedures for the confidential and anonymous submission, via the group's ethics helpline, by company employees of concerns regarding accounting or auditing matters, as well as other matters regarded as being in breach of the group's Code of Conduct, a material violation of an applicable US federal or state securities law, a material breach of fiduciary duties or a similar material violation of any other US or Norwegian statutory provision. The audit committee is designated as the company's qualified legal compliance committee for the purposes of Part 205 in Title 17 of the U.S. Code of Federal Regulations.

In the execution of its tasks, the audit committee may examine all activities and circumstances relating to the operations of the company. In this regard, the audit committee may request the chief executive officer or any other employee to grant it access to information, facilities and personnel and such assistance as it requests. The audit committee is authorised to carry out or instigate such investigations as it deems necessary in order to carry out its tasks and it may use the company's internal audit or investigation unit, the external auditor or other external advice and assistance. The costs of such work will be covered by the company.

The audit committee is only responsible to the board of directors for the execution of its tasks. The work of the audit committee in no way alters the responsibility of the board of directors and its individual members, and the board of directors retains full responsibility for the audit committee's tasks.

The audit committee held six meetings in 2016. There was 96% attendance at the committee's meetings.

The board of directors has decided that a member of the audit committee, Jeroen van der Veer, qualifies as an "audit committee financial expert", as defined in Item 16A of Form 20-F. The board of directors has also concluded that Jeroen van der Veer, Roy Franklin and Rebekka Glasser Herlofsen are independent within the meaning of Rule 10A-3 under the Securities Exchange Act.

The committee's mandate is available at www.statoil.com/auditcommittee.

Compensation and executive development committee

The compensation and executive development committee is a sub-committee of the board of directors that assists the board in matters relating to management compensation and leadership development. The main responsibilities of the compensation and executive development committee are:

(1) as a preparatory body for the board, to make recommendations to the board in all matters relating to principles and the framework for executive rewards, remuneration strategies and concepts, the CEO's contract and terms of employment, and leadership development, assessments and succession planning;

(2) to be informed about and advise the company's management in its work on Statoil's remuneration strategy for senior executive and in drawing up appropriate remuneration policies for senior executives; and

(3) to review Statoil's remuneration policies in order to safeguard the owners' long-term interests.

The committee consists of up to four board members. At year-end 2016, the committee members were Øystein Løseth (chair), Bjørn Tore Godal, Maria Johanna Oudeman and Wenche Agerup. All of the committee members are non-executive directors. All members, except for Wenche Agerup, are independent.

The committee held five meetings in 2016 and attendance was 95%.

For a more detailed description of the objective and duties of the compensation and executive development committee, please see the instructions for the committee available at www.statoil.com/compensationcommittee.

Safety, sustainability and ethics committee

The safety, sustainability and ethics committee is a sub-committee of the board of directors that assists the board in matters relating to safety, sustainability and ethics.

The safety, sustainability and ethics committee is chaired by Roy Franklin and the other members are Bjørn Tore Godal, Wenche Agerup, Stig Lægreid (employee-elected board member) and Lill-Heidi Bakkerud (employee-elected board member).

In its business activities, Statoil is committed to comply with applicable laws and regulations and to act in an ethical, environmental, safe and socially responsible manner. The committee has been established to support our commitment in this regard, and it assists the board of directors in its supervision of the company's safety, sustainability and ethics policies, systems and principles with the exception of aspects related to "financial matters".

Establishing and maintaining a committee dedicated to safety, sustainability and ethics is intended to ensure that the board of directors has a strong focus on and knowledge of these complex, important and constantly evolving areas. The committee acts as a preparatory body for the board of directors and, among other things, monitors and assesses the effectiveness, development and implementation of policies, systems and principles in the areas of safety, sustainability and ethics, with the exception of aspects related to "financial matters".

The committee held six meetings in 2016, and attendance was 83%.

For a more detailed description of the objective, duties and composition of the committee, please see the instructions for the committee available at www.statoil.com/ssecommittee.

Deviations from the Code: None

3.10 RISK MANAGEMENT AND INTERNAL CONTROL

Risk management

The board focuses on ensuring adequate control of the company's internal control and overall risk management. The board conducts an annual enterprise risk management review and two times pr. year the board is presented with and discusses the main risks and risk issues Statoil is facing. The board's audit committee assists the board and act as a preparatory body in connection with monitoring of the company's internal control, internal audit and risk management systems. The board's safety, sustainability and ethics committee monitors and assesses safety and sustainability risks which are relevant for Statoil's operations and both committees report regularly to the full board.

Statoil manages risk to make sure that our operations are safe and in compliance with our requirements. Our overall risk management approach includes continuously assessing and managing risks related to our value chain in order to support the achievement of our principal objectives, i.e. value creation and avoiding incidents.

The company has a separate Corporate Risk Committee chaired by the chief financial officer. The committee meets at least five times a year to give advice and make recommendations on Statoil's enterprise risk management. Further information about the company's risk management is presented in section 2.10 Risk review.

All risks are related to Statoil's value chain - from access, maturing, project execution and operations to market. In addition to the financial impact these risks could have on Statoil's cash flows, we have also implemented procedures and systems to reduce safety, security and integrity incidents (such as fraud and corruption), as well as any reputation impact resulting from human rights, labour standards and transparency issues. Most of the risks are managed by our principal business area line managers. Some operational risks are insured by our captive insurance company, which operates in the Norwegian and international insurance markets.

Controls and procedures

This section describes controls and procedures relating to our financial reporting.

Evaluation of disclosure controls and procedures

The management, with the participation of our chief executive officer and chief financial officer, has evaluated the effectiveness of the design and operation of our disclosure controls and procedures pursuant to Exchange Act Rule 13a-15(b) as of the end of the period covered by the Form 20-F. Based on that evaluation, the chief executive officer and chief financial officer have concluded that these disclosure controls and procedures are effective at a reasonable level of assurance.

In order to facilitate the evaluation, the disclosure committee reviews material disclosures made by Statoil for any errors, misstatements and omissions. The disclosure committee is chaired by the chief financial officer. It consists of the heads of investor relations, accounting and financial compliance, performance management and risk, tax and the general counsel and it may be supplemented by other internal and external personnel. The head of the internal audit is an observer at the committee's meetings.

In designing and evaluating our disclosure controls and procedures, our management, with the participation of the chief executive officer and chief financial officer, recognised that any controls and procedures, no matter how well designed and operated, can only provide reasonable assurance that the desired control objectives will be achieved, and that the management must necessarily exercise judgment when evaluating the cost-benefit aspects of possible controls and procedures. Because of the limitations inherent in all control systems, no evaluation of controls can provide absolute assurance that all control issues and any instances of fraud in the company have been detected.

The management's report on internal control over financial reporting

The management of Statoil ASA is responsible for establishing and maintaining adequate internal control over financial reporting. Our internal control over financial reporting is a process designed, under the supervision of the chief executive officer and chief financial officer, to provide reasonable assurance regarding the reliability of financial reporting and the preparation of Statoil's financial statements for external reporting purposes in accordance with International Financial Reporting Standards (IFRS) as adopted by the European Union (EU). The accounting policies applied by the group also comply with IFRS as issued by the International Accounting Standards Board (IASB).

The management has assessed the effectiveness of internal control over financial reporting based on the Internal Control - Integrated Framework (2013) issued by the Committee of Sponsoring Organizations of the Treadway Commission (COSO). Based on this assessment, the management has concluded that Statoil's internal control over financial reporting as of 31 December 2016 was effective.

Statoil's internal control over financial reporting includes policies and procedures that pertain to the maintenance of records that, in reasonable detail, accurately and fairly reflect transactions and dispositions of assets, provide reasonable assurance that transactions are recorded in the manner necessary to permit the preparation of financial statements in accordance with IFRS, and that receipts and expenditures are only carried out in accordance with the authorisation of the management and directors of Statoil; and provide reasonable assurance regarding the prevention or timely detection of any unauthorised acquisition, use or disposition of Statoil's assets that could have a material effect on our financial statements.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect all misstatements. Moreover, projections of any evaluation of the effectiveness of internal control to future periods are subject to a risk that controls may become inadequate because of changes in conditions and that the degree of compliance with the policies or procedures may deteriorate.

The effectiveness of internal control over financial reporting as of 31 December 2016 has been audited by KPMG AS, an independent registered public accounting firm that also audits the Consolidated financial statements included in this annual report. Their audit report on the internal control over financial reporting is included in section 4.1 Consolidated financial statements in this report.

No changes occurred in our internal control over financial reporting during the period that have materially affected, or are reasonably likely to materially affect, our internal control over financial reporting.

We continuously make improvement to our internal control environment.

Code of Conduct

Ethics - Statoil's approach

Statoil believes that responsible and ethical behaviour is a necessary condition for a sustainable business. Statoil's Code of Conduct (the Code) is based on its values and reflects Statoil's commitment to high ethical standards in all its activities.

Our Code of Conduct

The Code describes Statoil's code of business practice and the requirements to expected behaviour in areas such as anti-corruption, fair competition, human rights and non-discrimination working environments with equal opportunities. The Code applies to Statoil's board members, employees and hired personnel.

Statoil seeks to work with others who share its commitment to ethics and compliance, and Statoil manages its risks through in-depth knowledge of suppliers, business partners and markets. Statoil expects its suppliers and business partners to comply with applicable laws, respect internationally recognised human rights and adhere to ethical standards which are consistent with Statoil's ethical requirements when working for or together with Statoil. In joint ventures and entities where Statoil does not have control, Statoil makes good faith efforts to encourage the adoption of ethics and anti-corruption policies and procedures that are consistent with its standards. Anyone working for Statoil who does not comply with the Code faces disciplinary action, up to and including summery dismissal or termination of their contract.

Training and Certifying the Code
Code of Conduct training and comprehensive trainings on specific issues, including anti-corruption and anti-trust, is carried out to explain how the Code applies and to describe the tools that Statoil has made available to address risk.

All Statoil employees have to annually confirm electronically that they understand and will comply with the Code (Code certification). The Code certification reminds the individuals of their duty to comply with Statoil's values and ethical requirements and creates an environment with open dialog on ethical issues, both internally and externally.

Anti-corruption compliance programme
Statoil is against all forms of corruption including bribery, facilitation payments and trading in influence and has a company-wide anti-corruption compliance programme which implements its zero-tolerance policy. The programme includes mandatory procedures designed to comply with applicable laws and regulations and training on relevant issues such as gifts, hospitality and conflicts of interest. Compliance officers, who are responsible for ensuring that ethics and anti-corruption considerations are integrated into Statoil's business activities, constitute an important part of the programme.

In 2016, Statoil introduced and rolled out an updated and more user-friendly Code of Conduct, which included new information on international trade restrictions and money laundering. Statoil continued to develop its implementation of the Code including focus on supplier monitoring and follow-up and integrating risk assessments more deeply into the business. Statoil also introduced a holistic approach to discussing various compliance and sustainability issues, and the links between the two, through workshops for internal and external stakeholders.

Speak Up
Statoil is committed to maintain an open dialog on ethical issues. The Code requires those who have a question or suspect misconduct to raise their concern either through internal channels or through Statoil's external Ethics Helpline. Employees are encouraged to discuss their concerns with their supervisor. Statoil recognises that raising a concern is not always easy so there are several internal channels for taking concerns forward, including through human resources or the ethics and compliance function in the legal department. Concerns can also be expressed through the externally operated Ethics Helpline which is available 24/7, and allows for anonymous reporting and two-way communication through the use of a pin-code. Statoil has a non-retaliation policy for anyone who reports in good faith.

More information about Statoil's policies and requirements related to the Code of Conduct is available on www.statoil.com/ethics.

Deviations from the Code: None

3.11 REMUNERATION TO THE BOARD OF DIRECTORS AND CORPORATE ASSEMBLY

Remuneration to the board of directors

The remuneration of the board and its sub-committees is decided by the corporate assembly, based on a recommendation from the nomination committee. The members have an annual, fixed remuneration, except for deputy members (only elected for employee-elected board members) who receive remuneration per meeting attended. Separate rates are set for the board's chair, deputy chair and other members, respectively. Separate rates are also adopted for the board's sub-committees, with similar differentiation between the chair and the other members of each committee. The employee-elected members of the board receive the same remuneration as the shareholder-elected members.

The board receives its remuneration by cash payment. Board members from outside Scandinavia and outside Europe, respectively, receive separate travel allowances for each meeting attended. The remuneration is not linked to the board members' performance, option programmes or similar. None of the shareholder-elected board members have a pension scheme or agreement concerning pay after termination of their office with the company. If shareholder-elected members of the board and/or companies they are associated with should take on specific assignments for Statoil in addition to their board membership, this will be disclosed to the full board.

In 2016, the total remuneration to the board, including fees for the board's three sub-committees, was NOK 6,524,119 (USD 776,803).

Detailed information about the individual remuneration to the members of the board of directors in 2016 is provided in the table below.

Members of the board (figures in USD thousand except number of shares)	Total remuneration	Share ownership as of 31 December 2016
Øystein Løseth (chair of the board)	104	1,040
Roy Franklin (deputy chair of the board)	114	-
Jakob Stausholm[1)]	52	n.a.
Wenche Agerup	65	2,522
Bjørn Tore Godal	65	-
Rebekka Glasser Herlofsen	61	-
Maria Johanna Oudeman	81	-
Jeroen van der Veer[2)]	61	-
Lill-Heidi Bakkerud	55	342
Stig Lægreid	55	1,881
Ingrid Elisabeth di Valerio	61	3,670
Total	777	9,455

1) Member until 30 September 2016 (resigned).

2) Member from 18 March 2016.

Remuneration to the corporate assembly

The remuneration of the corporate assembly is decided by the general meeting, based on a recommendation from the nomination committee. The members have an annual, fixed remuneration, except for deputy members who receive remuneration per meeting attended. Separate rates are set for the corporate assembly's chair, deputy chair and other members, respectively. The employee-elected members of the corporate assembly receive the same remuneration as the shareholder-elected members. The corporate assembly receives its remuneration by cash payment.

In 2016, the total remuneration to the corporate assembly was NOK 1,065,682 (USD 126,875).
Deviations from the Code: None

PUBLIC COPY - CONFIDENTIAL INFORMATION REMOVED

3.12 REMUNERATION TO THE CORPORATE EXECUTIVE COMMITTEE

In 2016, the aggregate remuneration to the corporate executive committee was NOK 71,414,699 (USD 8,503,083) (rounded figure). The board of directors' complete declaration on remuneration of executive personnel follows below.

Only the following portions of this Section 3.12 Remuneration to the corporate executive committee form part of Statoil's annual report on Form 20-F as filed with the SEC: the table summarizing the main elements of Statoil executive remuneration; the discussion regarding pension and insurance schemes, severance pay arrangements and other benefits; the discussion regarding Performance management and results essential for variable pay and the table summarising the main objectives and KPIs for each perspective; the table summarising remuneration paid to each member of the corporate executive committee; the discussion of the Company performance modifier; and the discussion regarding share ownership, including the summary table.

MESSAGE FROM CHAIR OF THE BOARD

Declaration on remuneration and other employment terms for Statoil's corporate executive committee

Statoil's remuneration policy and terms are aligned with the company's overall values, people policy and performance-oriented framework. Our rewards and recognition for executives are designed to attract and retain the right people; people who are committed to deliver on our business strategy and able to adapt to changing business environment. It remains a key role for the board to ensure that executive compensation is competitive, but not market leading, in the markets in which we operate. Executive compensation should also be seen as fair and aligned with overall compensation levels in the company, and with shareholders' interests. The board must strike this balance. It is our responsibility.

It is the board's belief that the remuneration systems and practices are good and transparent and in accordance with prevailing guidelines and good corporate governance.

Oslo 9 March 2017
Øystein Løseth

Pursuant to the Norwegian Public Limited Liability Companies Act, section 6-16 a, the board will present the following declaration regarding remuneration of Statoil's corporate executive committee to the 2017 annual general meeting.

Remuneration policy and concept for the accounting year 2017

Policy and principles

The company's established remuneration principles and concepts as described in previous year's declaration on remuneration and other employment terms for Statoil's corporate executive committee will be continued in the accounting year 2017.

The remuneration concept is an integrated part of our values based and commercial performance framework. It has been designed to:

- reflect our global competitive market strategy and local market conditions
- encourage a strong and sustainable performance culture
- equally reward and recognise "what" we deliver and "how" we deliver
- differentiate on the basis of responsibilities and performance
- be fair, transparent and non-discriminatory
- promote collaboration and teamwork
- reward both short- and long-term contributions and results
- reflect the company's performance and financial result
- strengthen the common interests of employees in the Statoil group and its shareholders

The remuneration concept for the corporate executive committee

Statoil's remuneration policy and guidelines for the corporate executive committee are translated into the following main elements;

- Fixed remuneration: base salary and as applicable cash compensation
- Variable pay: annual variable pay (AVP) and long-term incentive (LTI)
- Benefits: primarily pension, insurance and share savings plan
- Company performance modifier and threshold for variable pay

The table below illustrate how our reward policy and framework is translated into key remuneration elements.

PUBLIC COPY - CONFIDENTIAL INFORMATION REMOVED

Main elements - Statoil executive remuneration

Remuneration element	Objective	Award level	Performance criteria
Base salary	Attract and retain the right individuals providing competitive but not market-leading terms.	We offer base salary levels which are aligned with and differentiated according to the individual's responsibility and performance. The level is competitive in the markets in which we operate.	The base salary is normally subject to annual review based on an evaluation of the individual's performance.; see "Annual Variable Pay" below
Cash compensation	The cash compensation is applied as a supplementing fixed remuneration element to be competitive in the market.	Reference is made to the remuneration table. Four of the executive vice presidents receive a cash compensation in lieu of pension accrual with reference to the section on pension and insurance scheme.	No performance criteria are linked to the cash compensation. The cash compensation is not included in the pensionable income.
Annual variable pay	Encourage a strong performance culture. Reward individuals for annual achievement of business objectives and goals relating to 'how' results are delivered.	Members of the corporate executive committee are entitled to annual variable pay ranging from 0 - 50% of their fixed remuneration. Target2 value is 25%. The threshold principles and the company modifier are applied.	Achievement of annual performance goals (how and what to deliver), in order to create long-term and sustainable shareholder value. Assessment of goals defined on the individual's performance contract including objectives related to selected KPI's on the balanced scorecard constitute the basis for annual variable pay.
Long-term incentive (LTI)	Strengthen the alignment of top management and shareholder's long term interests. Retention of key executives.	The LTI system is a monetary compensation calculated as a portion of the participant's base salary. On behalf of the participant, the company acquires shares equivalent to the net annual grant amount. The shares are subject to a three-year lock-in period and then released for the participant's disposal. The level of the annual LTI reward is in the range of 25-30%. The threshold principles are applied for the annual grant The company performance modifier is not applied for the LTI.in Statoil ASA	In Statoil ASA, LTI participation and grant level are reflective of the level and impact of the position and not directly linked to the incumbent's performance.
Threshold	Financial threshold for payment of variable remuneration and award of LTI grant.	The threshold is based on Statoil group's full-year adjusted earnings after tax [2], requiring that a minimum level of earnings must be achieved for any payments to be made. This minimum level is USD 2 billion. Earnings between USD 2 and 3.3 will result in bonus payments reduced by 50%. Above USD 3.3 billion the threshold is fully achieved and variable pay payments are not affected.	Adjusted earnings after tax. Application of the threshold is subject to a discretionary assessment of the company's overall performance.
Company performance modifier	Strengthen the alignment between variable remuneration and the company's performance.	The company performance modifier determines the proportion of the bonus that will be paid, ranging from 50% to 150% The company performance modifier is subject to approval by the annual general meeting.	Company performance is assessed against two equally weighted measures: relative total shareholder return (TSR) and relative return on average capital employed (RoACE). Application of the modifier is subject to discretionary assessment based on the company's overall performance.
Pension & insurance schemes	Provide competitive postemployment and other benefits.	The company offers a general occupational pension plan and insurance scheme aligned with local markets c.f. section on pension and insurance scheme	N/A
Employee share savings plan	Align and strengthen employee and shareholder's interests and remunerate for long term commitment and value creation.	The share savings plan is offered to all employees in the group, provided no restrictions due to local legislation or business requirements. Participants are offered to purchase Statoil shares in the market limited to 5% of annual base salary.	If shares are kept for two calendar years of continued employment, the participants will be allocated bonus shares proportionate to their purchase.

2 Target value reflects fully satisfactory goal achievement
[2] See calculation of Adjusted earnings after tax in section 5.2 Accounting standards and non-GAAP measures

Pension and insurance schemes
Members of the corporate executive committee in Statoil ASA are covered by the company's general occupational pension scheme which is a defined contribution scheme with a contribution level of 7% below 7,1 G and 22% above 7,1 G[3]. A defined benefit scheme is retained by a grandfathered group of employees. For new members of the corporate executive committee appointed after 13 February 2015, a cap on pension contribution at 12 G is applied. In lieu of pension accrual above 12 G a cash compensation is provided.

Members of the corporate executive committee appointed before 13 February 2015, will maintain their pension contribution above 12 G based on obligations in previously established agreements.

The chief executive officer and three executive vice presidents have individual early retirement pension agreement with the company.

The chief executive officer and one of the executive vice presidents have individual pension terms according to a previous standard arrangement implemented in October 2006. Subject to specific terms those executives are entitled to a pension amounting to 66 per cent of pensionable salary and a retirement age of 62. When calculating the number of years of membership in Statoil's general pension plan, these agreements grant the right to an extra contribution time corresponding to half a year of extra membership for each year the individual has served as executive vice president.

In addition, two members of the corporate executive committee have individually agreed retirement age of 65 and an early retirement pension level amounting to 66% of pensionable salary.

The individual pension terms for executive vice presidents outlined above are results of commitments according to previous established agreements.

Statoil has implemented a general cap on pensionable income at 12 G for all new hires into the company employed as of 1 September 2017.

In addition to the pension benefits outlined above, the executive vice presidents in the parent company are offered disability and dependents' benefits in accordance with Statoil's general pension plan/defined benefit plan. Members of the corporate executive committee are covered by the general insurance schemes applicable within Statoil.

Severance pay arrangements
The chief executive officer and the executive vice presidents are entitled to a severance payment equivalent to six months' salary, commencing at the time of expiry of a six months' notice period, when the resignation is at the request from the company. The same amount of severance payment is also payable if the parties agree that the employment should be discontinued and the executive vice president gives notice pursuant to a written agreement with the company. Any other payment earned by the executive vice president during the period of severance payment will be fully deducted. This relates to earnings from any employment or business activity where the executive vice president has active ownership.

The entitlement to severance payment is conditional on the chief executive officer or the executive vice president not being guilty of gross misconduct, gross negligence, disloyalty or other material breach of his/her duties.

As a general rule, the chief executive officer's/executive vice president's own notice will not instigate any severance payment.

Other benefits
The members of the corporate executive committee have benefits in kind such as company car and electronic communication. They are also eligible for participation in the share saving scheme as described above.

Performance management, assessment and results essential for variable pay

Individual salary and annual variable pay reviews are based on the performance evaluation in our performance management system.

Performance is evaluated in two dimensions; "What" we deliver and "How" we deliver. "What" we deliver (business delivery) is defined through the company's performance framework "Ambition to Action", which addresses strategic objectives, key performance Indicators (KPIs) and actions across the five perspectives; Safety, Security and Sustainability, People and Leadership, Operations, Market and Results. Generally, Statoil believes in setting ambitious targets to inspire and drive strong performance.

Goals on "How" we deliver are based on our core values and leadership principles and address the behaviour required and expected in order to achieve our delivery goals.

Performance evaluation is holistic, involving both measurement and assessment. Since KPIs are indicators only, sound judgement and hindsight insights are applied. Significant changes in assumptions are taken into account, as well as target ambition levels, sustainability of delivered results and strategic contribution.

This balanced approach, which involves a broad set of goals defined in relation to both "What" and "How" dimensions and an overall performance evaluation, is viewed to significantly reduce the likelihood that remuneration policies may stimulate excessive risk-taking or have other material adverse effects.

In the performance contracts of the chief executive officer and chief financial officer, one of several targets is related to the company's relative total shareholder return (TSR). The amount of the annual variable pay is decided based on an overall assessment of the performance of various targets including but not limited to the company's relative TSR.

[3] G = The basic amount of the Norwegian Social security system

In 2016, the main objectives and KPIs for each perspective were as outlined below. Each perspective was in addition supported by comprehensive plans and actions.

Strategic objectives		2016 assessment
Safety, security and sustainability	The strategic objectives and actions address safety, security and sustainability	Serious Incident Frequency (actual) of 0.29 was above target. Target on the number of oil and gas leakages was not met. CO_2 intensity for the upstream portfolio was in line with target.
People and organisation	The strategic objectives and actions address high performing leaders and teams, and global and cost-effective capabilities	Employee engagement was above target, increasing from 2015 during a period of extensive organizational efficiency programmes. People development was in line with 2015, with strong focus on building competence and upholding learning activity throughout 2016 yielding positive results.
Operations	The strategic objectives and actions address reliable and cost-efficient operations, and value-driven technology development	Production exceeded target, despite an extensive maintenance programme. Relative unit production cost remained the lowest among industry peers. Production efficiency was slightly below target.
Market	The strategic objectives and actions address stakeholder trust, value chain optimisation and portfolio and project management	Capex was below target and external guiding level, due to increased efficiency and stricter prioritization. Cost efficiency for projects under development was above target, exceeding the industry average. Reserve replacement ratio was below the target of >1. Value creation from exploration was below target, mainly due to lower-than-expected discovered volumes.
Results	The strategic objectives and actions address shareholder return, financial robustness, value creation from exploration and cost & capital discipline	Relative Shareholder Return (TSR) improved and ended 3rd in an industry peer group of 12. Relative ROACE for 2016 ended 9th in an industry peer group of 12, falling as a result of exposure to upstream margins. The cash flow improvement programme delivered above target.

Board assessment of the chief executive officer's performance

In its assessment of the chief executive officer's performance, and consequently his annual pay for 2016, the board has put emphasis on the solid delivery on production, efficiency, and prioritization. CAPEX was below target and guiding, and relative TSR is first quartile. The number of oil and gas leakages was above target, while CO_2 intensity for the upstream portfolio was in line with target. The actual SIF was above target (0.29 versus target of 0.18).

Key performance indicators for the chief executive officer for 2017

The delivery dimension for the CEO's variable remuneration and base salary merit increase as of 1 January 2018 will be based on assessment of results on the following KPIs:

Safety, Security and Sustainability

- Serious Incident Frequency (actual)
- CO_2 intensity for the upstream portfolio

Market

- Capex (capital expenditure)

Results

- Relative Total Shareholder Return
- Relative RoACE
- Cash flow improvement programme

Execution of the remuneration policy and principles in 2016

Introduction

- The remuneration policy and principles executed in 2016 were in accordance with the declaration given to the AGM 11 May 2016
- There was no general salary increase for members of the executive committee in 2016
- Subject to application of the threshold described in section on the remuneration concept for the corporate executive committee the LTI in Statoil ASA was reduced by 50% of the executive maximum levels

Threshold and company modifier for variable pay

The company modifier depends on the outcome of two metrics RoACE and TSR, both parameters measured relatively to a peer group of 11 other companies. The results for Statoil in 2016 were; relative ROACE number 9 and relative TSR number 3 in the peer group. This gives 3rd quartile result for RoACE and first quartile result for TSR, which gives a company modifier of 1,17 for 2016.

The threshold measure is the company's adjusted earnings after tax. In 2016 Statoil's adjusted earnings after tax were negative USD 208 million, strongly impacted by low oil and gas prices throughout the year. At the same time, the company has delivered strong operational results and the improvement programmes have given substantial cost reductions.

Even though the adjusted earnings for 2016 ended below the threshold limit, it has been decided based on a holistic assessment of total results that a threshold of 50% will be applied for the earning year 2016. Thus, the bonus payment and LTI award have been be reduced by 50%.

Executive Terms and conditions

The chief executive officer, Eldar Sætre's annual base salary is NOK 5,700,000. Furthermore, the chief executive officer is entitled to an additional fixed remuneration element of NOK 2,000,000 not included in the pensionable income. The remuneration package of the chief executive officer has been restructured. In order to be consistent with revised governmental guidelines the company's long term incentive scheme has been changed. The LTI grant will no longer be included in the basis for calculating annual variable pay. To mitigate the effect of reduced annual variable, pay for the CEO, his fixed remuneration element will be increased by NOK 373,000 from 1 January 2017

The chief executive officer will participate in an annual variable pay scheme with a target level of 25% (max 50%), and participation to the Company's 2017 LTI scheme with a value of 30% (gross) of base salary. The pension terms remain unchanged according to previously established pension agreement, as described in section on pension and insurance scheme.

Terms and conditions for Executive vice president employed in Statoil ASA, are described in section on the remuneration concept for the corporate executive committee.

Based on a mutual understanding, John Knight, employed by Statoil UK, will end his employment with the company as of 1 January 2019. To provide clarity and predictability of compensation and costs related to Knight's remaining employment it has been decided to adjust his remuneration package with effect from the earning year 2016.

The main changes to John Knights remuneration package are;

- The base salary is increased from GBP 599,908 to GBP 630,000 with effect from 1 January 2017
- The variable pay schemes (AVP and LTI), which provided for a maximum variable pay of 150% of base salary are discontinued
- In lieu of variable pay he will be awarded a cash allowance amounting to GBP 535,000 in 2017 and 2018 and GBP 600,000 in 2019

In lieu of pension contribution Knight receives an annual allowance of 20% of his base salary. His contract also includes a provision for severance payment of 12 months' base salary. John Knights taxable compensation in 2016 is USD 1,810,000, compared to USD 2,089,000 in 2015[4]. The adjusted remuneration package does not include variable pay elements and is thus not considered as a deviation from the governmental guidelines on variable compensation. Furthermore, and in line with the company's guidelines, the adjusted compensation package will remain competitive, but not market leading.

The decision-making process

The decision-making process for implementing or changing remuneration policies and concepts, and the determination of salaries and other remuneration for corporate executive committee, are in accordance with the provisions of the Norwegian public limited liability companies act sections 5-6 and 6-16 a and the board's rules of procedure. The board's rules of procedure are available at www.statoil.com/board.

The board of directors has appointed a designated compensation and executive development committee. The compensation and executive development committee is a preparatory body for the board. The committee's main objective is to assist the board of directors in its work relating to the terms of employment for Statoil's chief

4 Based on average currency rates for 2015: USD/NOK = 8,0739, USD/GBP = 1,5289.

PUBLIC COPY - CONFIDENTIAL INFORMATION REMOVED

executive officer and the main principles and strategy for the remuneration and leadership development of our senior executives. The board of directors determines the chief executive officer's salary and other terms of employment.

The compensation and executive development committee answers to the board of Statoil ASA for the performance of its duties. The work of the committee in no way alters the responsibilities of the board of directors or the individual board members.

For further details about the roles and responsibilities of the compensation and executive development committee, please refer to the committee's instructions available at www.statoil.com/compensationcommittee.

1) All figures in the table are presented in USD based on average currency rates (2016: USD/NOK = 8.3987, USD/GBP = 1.3538. 2015: USD/NOK = 8,0739, USD/GBP = 1,5289). The figures are presented on accrual basis.
2) All CEC members receive their remuneration in Norwegian Kroner except John Knight who receives the remuneration in GBP.
3) Fixed pay consists of base salary, fixed remuneration element, holiday allowance and other administrative benefits.
4) Cash allowance in lieu of pension accrual above 12 G (the base amount in the national insurance scheme).
5) The fixed long-term incentive (LTI) element implies an obligation to invest the net amount in Statoil shares, including a lock-in period. The LTI element is presented the year it is granted for the members of the corporate executive committee employed by Statoil ASA.
6) Annual variable pay includes holiday allowance for corporate executive committee (CEC) members resident in Norway.
7) Estimated pension cost is calculated based on actuarial assumptions and pensionable salary (mainly base salary) at 31 December 2015 and is recognized as pension cost in the statement of income for 2016.
8) Estimated present value of pension obligation related to Eldar Sætre, Arne Sigve Nylund, Margareth Øvrum og Timothy Dodson are based on the estimated value of paid-up policies and rights letters from the Defined Benefit Pension Scheme. Estimated present value of pension obligation for the rest of the members of the corporate executive committee employed by Statoil ASA, is presented with value of paid-up policies and right letters from the Defined Benefit Pension Scheme and accrued pension assets from the Defined Contribution Pension Scheme.
9) Includes 2015 CEC members who are also CEC members in 2016.
10) Jannicke Nilsson was appointed executive vice president and chief operating officer (COO) from 1 December 2016.
11) Anders Opedal left the position as executive vice president and chief operating officer (COO) at 30 November 2016.
12) Compensation and benefit for Torgrim Reitan is according to Statoil's international assignment terms.
13) Fixed pay for Eldar Sætre includes a fixed remuneration element of USD 238 thousand not included in pensionable salary. John Knight's fixed pay includes a fixed remuneration element of USD 143 thousand that replaces his defined contribution pension plan and a fixed remuneration element of USD 724 thousand replacing his variable pay arrangements.

There are no loans from the company to members of the corporate executive committee.

Company performance modifier

Introduction

Based on approval by the annual general meeting in 2016 a company performance modifier has been introduced to be applied in calculation of variable pay. The intention is to continue with the performance modifier in 2017. The relative total shareholder return is recommended as one of the criteria in the modifier. Thus, the case is submitted to the annual general meeting for approval, pursuant to the provisions in the Public Limited Companies Act § 5-6 third paragraph last sentence ref. § 6-16 a, first paragraph third sentence number 3.

Background

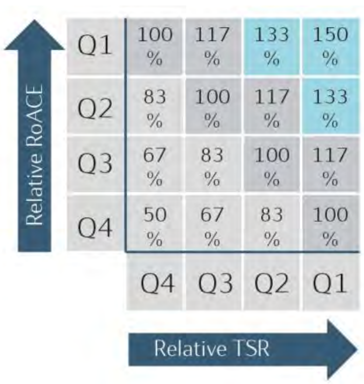
Statoil has implemented annual variable pay schemes (AVP) for members of the corporate executive committee. The schemes are described in section on remuneration concept for the corporate executive committee of this declaration. Other executives, managers and employees in defined professional positions are also eligible for individual variable pay according to the company's guidelines.

The company performance modifier is implemented to strengthen the link between the company's overall financial results and the individual variable pay. The governmental guidelines on executive remuneration also underline that "there shall be a clear connection between the variable salary and the performance of the company."

Proposal

Based on this, the performance modifier will be continued in 2017. The company performance will be assessed against two equally weighted measures: relative total shareholder return (TSR) and relative return on average capital employed (RoACE). TSR and RoACE are currently also applied as performance indicators in the corporate performance management system.

The results of these two performance measures are compared to our peers and our relative position determined. A position of Q1 means that Statoil is amongst the top scoring quartile of peer companies. A position of Q4 means Statoil is in the bottom performing quartile. In years with strong deliveries on relative TSR and RoACE, the matrix will result in the variable pay being modified with a factor higher than one and, correspondingly, lower than one in weak years. The combination of ratings for both measures, will act as a 'multiplier' according to the guideline in the matrix displayed below.



By applying relative numbers, the effect of fluctuating oil price will be reduced. Within the framework of 50 - 150%, the matrix is a guideline and the multiplier (percentages) may be adjusted if oil or gas price effects or other occurrences outside the control of the company are deemed to cause disproportionate results in a given year.

Subject to approval by the 2017 general meeting, the company performance modifier will be continued in calculations of annual variable pay for members of the corporate executive committee in the earning year 2017 with subsequent impact on annual variable pay in 2018. The modifier will also be applied in other variable pay schemes below the corporate executive level. Further application of the company performance modifier will also be assessed and decided if deemed appropriate.

The annual variable pay for members of the corporate executive committee will be within a framework of 50% of the fixed remuneration irrespective of the result of the modifier. Any deviations from this framework for members of the corporate executive committee will be explained in the board's annual declaration on remuneration and other employment terms for Statoil's corporate executive committee.

Share ownership

The number of Statoil shares owned by the members of the board of directors and the executive committee and/or owned by their close associates is shown below. Individually, each member of the board of directors and the corporate executive committee owned less than 1% of the outstanding Statoil shares.

Ownership of Statoil shares (including share ownership of «close associates»)	As of 31 December 2016	As of 8 March 2017
Members of the corporate executive committee		
Eldar Sætre	47,882	48,629
Hans Jakob Hegge	28,190	29,111
Jannicke Nilsson	35,049	35,972
Lars Christian Bacher	24,896	20,895
Torgrim Reitan	32,276	33,133
John Knight	103,808	105,593
Tim Dodson	29,418	30,349
Margareth Øvrum	49,227	50,499
Arne Sigve Nylund	11,312	11,312
Jens Økland	13,937	14,462
Irene Rummelhoff	21,556	22,082
Members of the board of directors		
Øystein Løseth	1,040	1,040
Roy Franklin	0	0
Bjørn Tore Godal	0	0
Jeroen van der Veer	0	0
Maria Johanna Oudeman	0	0
Rebekka Glasser Herlofsen	0	0
Wenche Agerup	2,522	2,522
Lill-Heidi Bakkerud	342	342
Ingrid Elisabeth di Valerio	3,670	3,949
Stig Lægreid	1,881	1,881

Individually, each member of the corporate assembly owned less than 1% of the outstanding Statoil shares as of 31 December 2016 and as of 8 March 2017. In aggregate, members of the corporate assembly owned a total of 24,578 shares as of 31 December 2016 and a total of 25,331 shares as of 8 March 2017. Information about the individual share ownership of the members of the corporate assembly is presented in the section 3.8 Corporate assembly, board of directors and management.

The voting rights of members of the board of directors, the corporate executive committee and the corporate assembly do not differ from those of ordinary shareholders.

Deviations from the Code: None

3.13 INFORMATION AND COMMUNICATIONS

The reporting is based on openness and it takes into account the requirement for equal treatment of all participants in the securities market. Statoil has established guidelines for the company's reporting of financial and other information and the purpose of these guidelines is to ensure that timely and correct information about the company is made available to our shareholders and society in general.

A financial calendar and shareholder information is published at www.statoil.com/calendar.

The investor relations corporate staff function is responsible for coordinating the company's communication with capital markets and for relations between Statoil and existing and potential investors. Investor relations is responsible for distributing and registering information in accordance with the legislation and regulations that apply where Statoil securities are listed. Investor relations reports directly to the chief financial officer.

The company's management holds regular presentations for investors and analysts. The company's quarterly presentations are broadcast live on our website. Investor relations communicate with present and potential shareholders through presentations, one-to-one meetings, conferences, web-site, financial media, telephone, mail and e-mail contact. The pertaining reports from these communication channels are made available together with other relevant information at www.statoil.com/investor.

All information distributed to the company's shareholders is published on the company's website at the same time as it is sent to the shareholders.

Deviations from the Code: None

3.14 TAKE-OVERS

The board of directors endorses the principles concerning equal treatment of all shareholders and Statoil's articles of association do not set limits on share acquisitions. Statoil has no defence mechanisms against take-over bids in its articles of association, nor has it implemented other measures that limit the opportunity to acquire shares in the company. The Norwegian State owns 67% of the shares, and the marketability of these shares is subject to parliamentary decree.

The board is obliged to act professionally and in accordance with the applicable principles for good corporate governance if a situation should arise in which this principle in the Code were put to the test.

Deviations from the Code:
The Code recommends that the board establish guiding principles for how it will act in the event of a take-over bid. The board has not established such guidelines, due to Statoil's ownership structure and for the reasons stated above. In the event of a bid as discussed in section 14 of the Code, the board of directors will, in addition to complying with relevant legislation and regulations, seek to comply with the recommendations in the Code. The board has no other explicit basic principles or written guidelines for procedures to be followed in the event of a take-over bid. The board of directors otherwise concurs with what is stated in the Code regarding this issue.

3.15 EXTERNAL AUDITOR

Our external registered public accounting firm (external auditor) is independent in relation to Statoil and is elected by the general meeting of shareholders. The external auditor's fee must be approved by the general meeting of shareholders.

Pursuant to the instructions for the board's audit committee approved by the board of directors, the audit committee is responsible for ensuring that the company is subject to an independent and effective external and internal audit. Every year, the external auditor presents a plan to the audit committee for the execution of the external auditor's work. The external auditor attends the meeting of the board of directors that deals with the preparation of the annual accounts.

The external auditor also participates in meetings of the audit committee. The audit committee considers all reports from the external auditor before they are considered by the board of directors. The audit committee meets at least five times a year and both the board and the board's audit committee hold meetings with the internal auditor and the external auditor on a regular basis without the company's management being present.

When evaluating the external auditor, emphasis is placed on the firm's qualifications, capacity, local and international availability and the size of the fee.

The audit committee evaluates and makes a recommendation to the board of directors, the corporate assembly and the general meeting of shareholders regarding the choice of external auditor. The committee is responsible for ensuring that the external auditor meets the requirements in Norway and in the countries where Statoil is listed. The external auditor is subject to the provisions of US securities legislation, which stipulates that a responsible partner may not lead the engagement for more than five consecutive years.

The audit committee's policies and procedures for pre-approval
In its instructions for the audit committee, the board of directors has delegated authority to the audit committee to pre-approve assignments to be performed by the external auditor. Within this pre-approval, the audit committee has issued further guidelines. The audit committee has issued guidelines for the management's pre-approval of assignments to be performed by the external auditor.

All audit-related and other services provided by the external auditor must be pre-approved by the audit committee. Provided that the types of services proposed are permissible under SEC guidelines, pre-approval is usually granted at a regular audit committee meeting. The chair of the audit committee has been authorised to pre-approve services that are in accordance with policies established by the audit committee that specify in detail the types of services that qualify. It is a condition that any services pre-approved in this manner are presented to the full audit committee at its next meeting. Some pre-approvals can therefore be granted by the chair of the audit committee if an urgent reply is deemed necessary.

Remuneration of the external auditor in 2014 - 2016
In the annual Consolidated financial statements and in the parent company's financial statements, the independent auditor's remuneration is split between the audit fee and the fee for audit-related and other services. The chair presents the breakdown between the audit fee and the fee for audit-related and other services to the annual general meeting of shareholders.

The following table sets out the aggregate fees related to professional services rendered by Statoil's principal accountant KPMG AS, for the fiscal year 2016, 2015 and 2014.

Auditor's remuneration

(in USD million, excluding VAT)	Full year 2016	2015	2014
Audit fee	6.5	6.1	7.1
Audit related fee	1.0	1.7	1.3
Tax fee	0.1	0.0	0.0
Other service fee	0.0	0.0	0.0
Total	7.5	7.9	8.4

All fees included in the table have been approved by the board's audit committee.

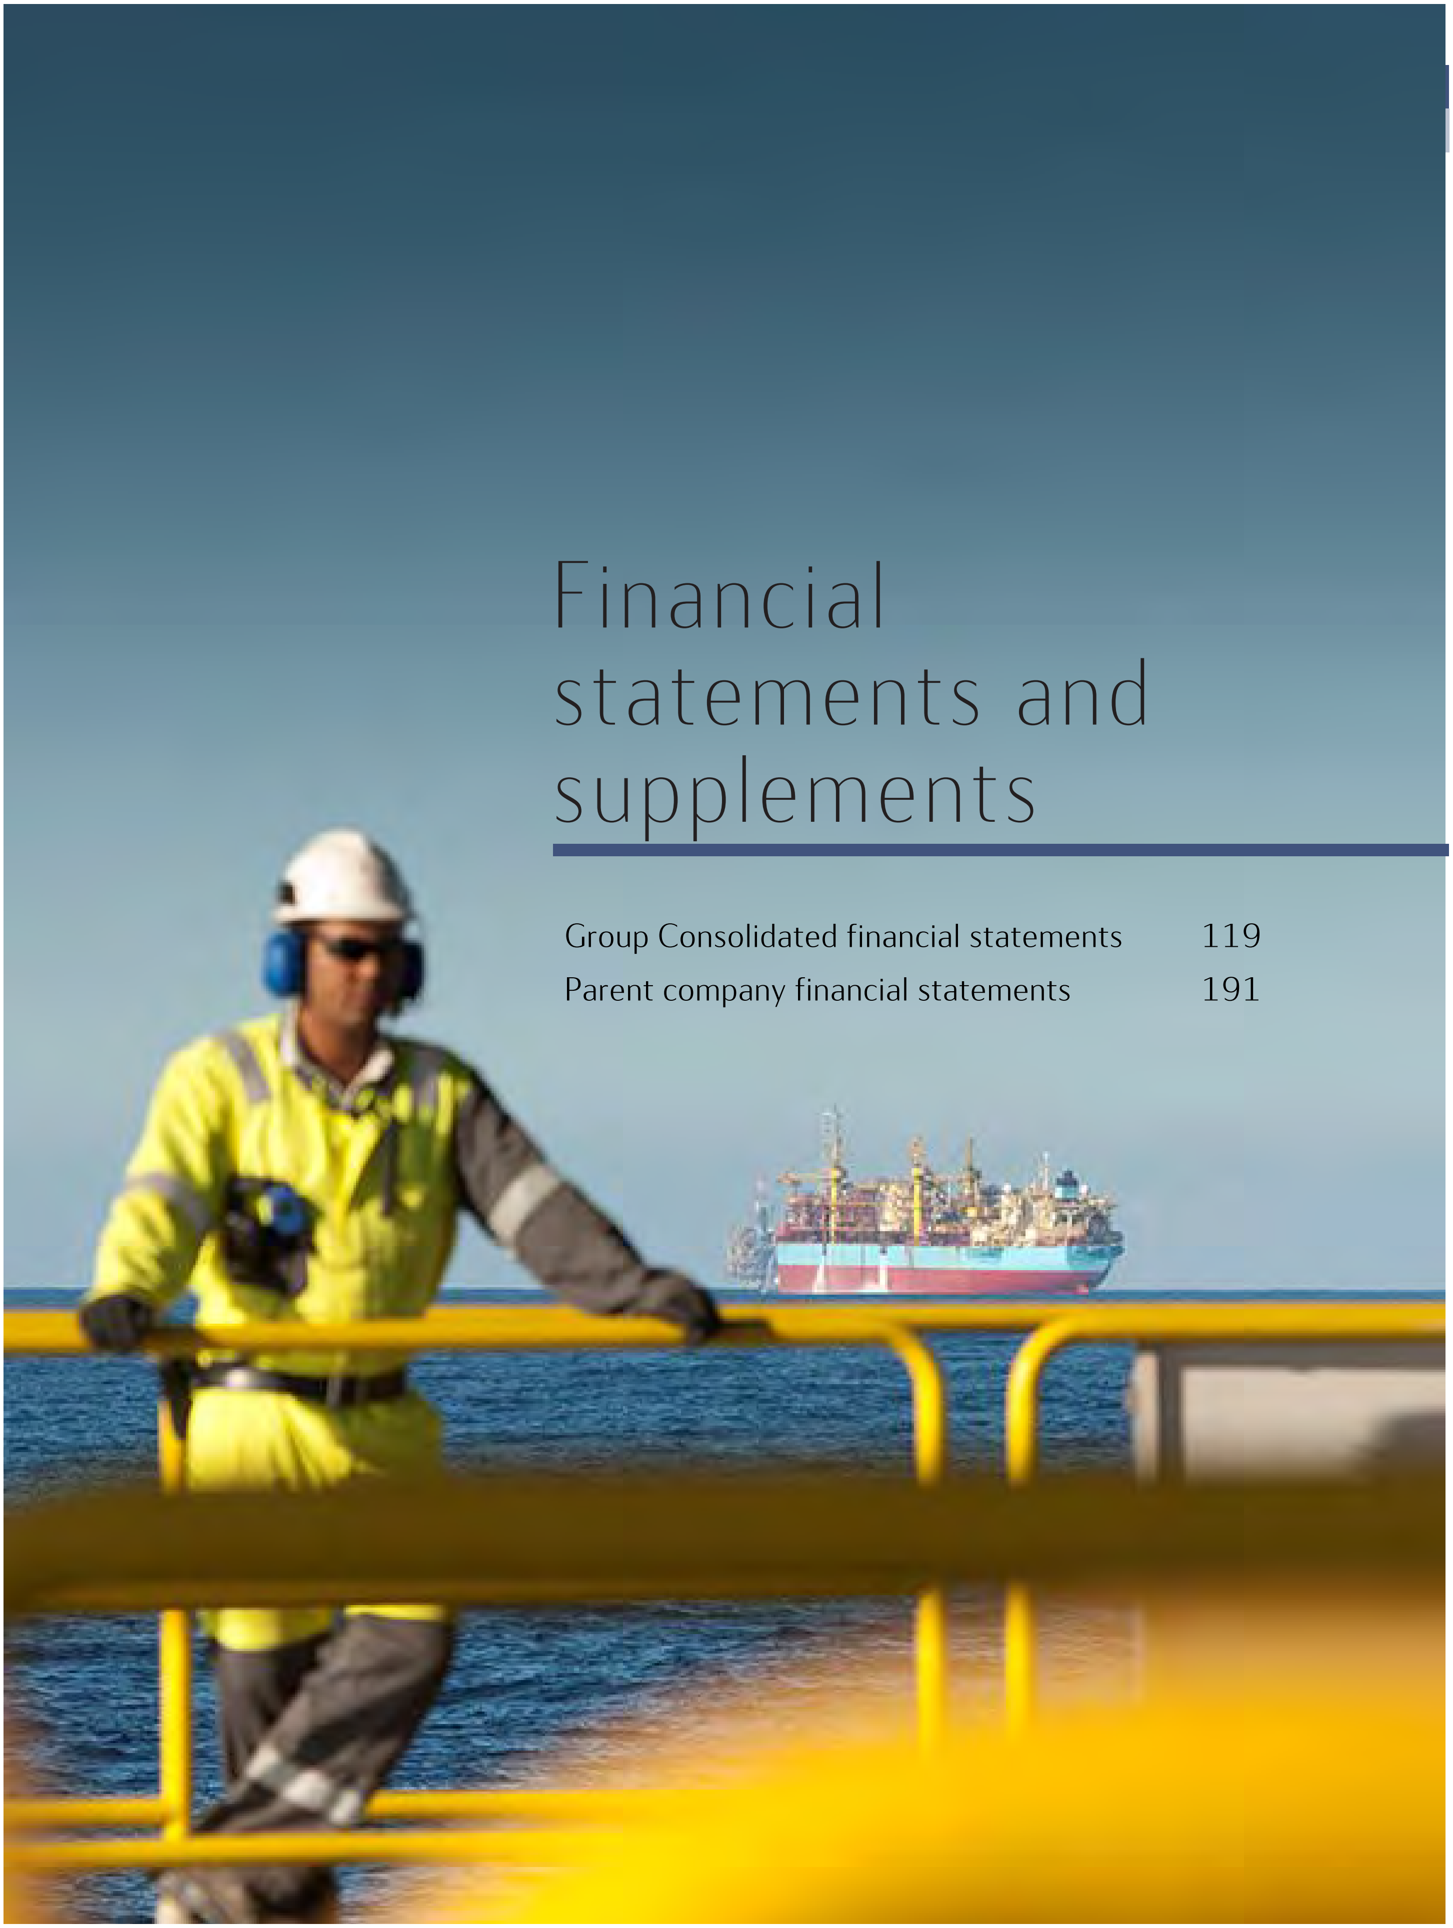
Audit fee is defined as the fee for standard audit work that must be performed every year in order to issue an opinion on Statoil's Consolidated financial statements, on Statoil's internal control over annual reporting and to issue reports on the statutory financial statements. It also includes other audit services, which are services that only the independent auditor can reasonably provide, such as the auditing of non-recurring transactions and the application of new accounting policies, audits of significant and newly implemented system controls and limited reviews of quarterly financial results.

Audit-related fees include other assurance and related services provided by auditors, but not limited to those that can only reasonably be provided by the external auditor who signs the audit report, that are reasonably related to the performance of the audit or review of the company's financial statements, such as acquisition due diligence, audits of pension and benefit plans, consultations concerning financial accounting and reporting standards.

Other services fees include services provided by the auditors within the framework of the Sarbanes-Oxley Act, i.e. certain agreed procedures.

In addition to the figures in the table above, the audit fees and audit-related fees relating to Statoil operated licences paid to KPMG for the years 2016, 2015 and 2014 amounted to USD 0.8 million, USD 0.9 million and USD 1.0 million, respectively.

Deviations from the Code: None



Financial statements and supplements

4.1 Statoil Consolidated financial statements

With effect from 1 January 2016 the financial statements are presented in US dollars (USD). Comparative data has been converted from Norwegian kroner (NOK) to USD accordingly. For more information concerning this see note 26 Change of presentation currency.

CONSOLIDATED STATEMENT OF INCOME

Cash and cash equivalents at the end of the period (net of overdraft)	16	5,090	8,613	11,085

Cash and cash equivalents include bank overdrafts of nil at 31 December 2016 (2015: USD 10 million; 2014: USD 97 million).

Interest paid in cash flows provided by operating activities is excluding capitalised interest of USD 355 million at 31 December 2016, USD 392 million at 31 December 2015 and USD 250 million at 31 December 2014. Capitalised interest is included in Capital expenditures and investments in cash flows used in investing activities.

Notes to the Consolidated financial statements

1 Organisation

Statoil ASA, originally Den Norske Stats Oljeselskap AS, was founded in 1972 and is incorporated and domiciled in Norway. The address of its registered office is Forusbeen 50, N-4035 Stavanger, Norway.

Statoil ASA is listed on the Oslo Børs (Norway) and the New York Stock Exchange (USA).

The Statoil group's business consists principally of the exploration, production, transportation, refining and marketing of petroleum and petroleum-derived products and other forms of energy.

All the Statoil group's oil and gas activities and net assets on the Norwegian continental shelf are owned by Statoil Petroleum AS, a 100% owned operating subsidiary. Statoil Petroleum AS is co-obligor or guarantor of certain debt obligations of Statoil ASA.

The Consolidated financial statements of Statoil for the full year 2016 were authorised for issue in accordance with a resolution of the board of directors on 9 March 2017.

2 Significant accounting policies

Statement of compliance
The Consolidated financial statements of Statoil ASA and its subsidiaries (Statoil) have been prepared in accordance with International Financial Reporting Standards (IFRSs) as adopted by the European Union (EU) and also comply with IFRSs as issued by the International Accounting Standards Board (IASB), effective at 31 December 2016.

Basis of preparation
The financial statements are prepared on the historical cost basis with some exceptions, as detailed in the accounting policies set out below. These policies have been applied consistently to all periods presented in these Consolidated financial statements. Certain amounts in the comparable years have been restated to conform to current year presentation. The subtotals and totals in some of the tables may not equal the sum of the amounts shown due to rounding.

Operating related expenses in the Consolidated statement of income are presented as a combination of function and nature in conformity with industry practice. Purchases [net of inventory variation] and Depreciation, amortisation and net impairment losses are presented in separate lines by their nature, while Operating expenses and Selling, general and administrative expenses as well as Exploration expenses are presented on a functional basis. Significant expenses such as salaries, pensions, etc. are presented by their nature in the notes to the Consolidated financial statements.

Standards and amendments to standards, issued but not yet adopted
At the date of these Consolidated financial statements, the following standards and amendments to standards applicable to Statoil have been issued, but were not yet effective:

IFRS 15 Revenue from Contracts with Customers
IFRS 15, effective from 1 January 2018, covers the recognition of revenue in the financial statements and related disclosure. IFRS 15 will replace IAS 18 Revenue.

IFRS 15 requires identification of the performance obligations for the transfer of goods and services in each contract with customers. Revenue will be recognised upon satisfaction of the performance obligations for the amounts that reflect the consideration to which Statoil expects to be entitled in exchange for those goods and services.

The impact of adopting IFRS 15 will principally impact the Marketing, Midstream and Processing segment (MMP), which accounts for the majority of Statoil's petroleum sales to customers, and which is responsible for the marketing and sale of the State's direct financial interest's (SDFI's) petroleum volumes.

IFRS 15 requires adoption either on a retrospective basis or on the basis of the cumulative effect on retained earnings. Statoil has not yet determined its implementation method for the standard, but at this stage in the evaluations, does not expect either implementation method to affect the Consolidated statement of income, balance sheet or statement of cash flows materially.

Statoil will adopt IFRS 15 on 1 January 2018.

The most significant accounting matters with regards to the implementation of IFRS 15 in Statoil, as well as their expected impact, can be summarised as follows.

Marketing and sale of the Norwegian State's share of crude oil and natural gas production from the Norwegian continental shelf (NCS) and related agent/principal evaluations; in evaluating these sales, Statoil has considered whether it acts as the principal in the transactions under IFRS 15, i.e. whether it controls the State's volumes prior to onwards sales to third party customers. Statoil's sales of the State's natural gas volumes are performed for the Norwegian State's account and risk, and although Statoil has been granted the ability to direct the use of the volumes, all the benefits from the sales of these volumes flow to the State. On that basis, Statoil is not considered the principal in the sale of the SDFI's natural gas volumes. In the sales of the State-originated crude oil, Statoil also directs the use of the volumes. However, although certain benefits from these sales subsequently flow to the State, Statoil purchases the crude oil volumes from the State and obtains substantially all the remaining benefits. Statoil therefore is considered the principal in the crude oil sales. The accounting for Statoil's sale of the SDFI's natural gas and crude oil under IFRS 15 will consequently not lead to material changes compared to the current practice under IAS 18, as separately described in this note disclosure.

Transport of goods sold; in certain sales of goods such as crude oil or natural gas, Statoil provides transport services after control of the good has been transferred to the customer. Following implementation of IFRS 15, in most such instances this transport will be considered a service that is completed over time and is distinct from the good sold, and therefore will be recognised separately. The impact on the Consolidated financial statements from the resulting timing differences in the reflection of revenues from contracts with customers is currently not expected to be material.

Accounting for taxes paid in kind under the terms of profit sharing agreements (PSAs); in certain countries, taxes are paid in kind and the volumes are subsequently sold according to the terms of the PSA and applicable tax regulations. As the sale of the volumes is not performed directly by Statoil, evaluation is still ongoing as to whether the sales proceeds qualify as revenue from contracts with customers under IFRS 15. Irrespective of the conclusion reached, the in-kind tax payments and related sales of volumes will continue to be accounted for gross in the Statement of income, classified as tax expense in accordance with IAS 12 Income taxes and as a form of revenue, respectively.

IFRS 9 Financial Instruments

IFRS 9, effective from 1 January 2018, will replace IAS 39 Financial Instruments: Recognition and Measurement. IFRS 9 introduces a new model for classification and measurement of financial assets and financial liabilities, a reformed approach to hedge accounting, and a more forward-looking impairment model.

IFRS 9 will principally impact Statoil's financing and liquidity management activities, as well as the MMP segment, which reflects the majority of Statoil's trade receivables and commodity-based financial instruments.

Portions of Statoil's cash equivalents and current financial investments tied to liquidity management, which under IAS 39 are classified as held for trading and reflected at fair value through profit and loss, will under IFRS 9 be classified and measured at amortised cost, based on an evaluation of the contractual terms and the business model applied. The investment portfolio of Statoil's captive insurance company will continue to be classified and measured at fair value through profit and loss under IFRS 9.

The impact on the Consolidated statement of income of commodity-based derivative financial instruments, which due to their connection with sales and revenue risk management currently are classified under revenues, is expected to be reflected in an appropriate section within total revenues and other income upon the implementation of IFRS 9. No decisions have yet been made related to whether, and if so, on which elements, hedge accounting will be applied.

IFRS 9's transition provisions partially require retrospective adoption, and partially prospective adoption. IFRS 9 implementation issues are currently not expected to have a material impact on the Consolidated balance sheet, statement of income and statement of cash flows.

Statoil will adopt IFRS 9 on 1 January, 2018.

IFRS 16 Leases

IFRS 16, effective from 1 January 2019, covers the recognition of leases and related disclosure in the financial statements, and will replace IAS 17 Leases. In the financial statement of lessees, the new standard requires recognition of all contracts that qualify under its definition of a lease as right-of-use assets and lease liabilities in the balance sheet, while lease payments are to be reflected as interest expense and reduction of lease liabilities. The right-of-use assets are to be depreciated in accordance with IAS 16 Property, Plant and Equipment over the shorter of each contract's term and the assets' useful life.

The standard consequently implies a significant change in lessees' accounting for leases currently defined as operating leases under IAS 17, both with regard to impact on the balance sheet and the statement of income. IFRS 16 defines a lease as a contract that conveys the right to control the use of an identified asset for a period of time in exchange for consideration. While this definition is not dissimilar to that of IAS 17, it would have required further evaluation of each contract to determine whether all leases included in Note 22 Leases of these financial statements, or contracts currently not defined as leases, would qualify as leases under the new standard.

The standard introduces new requirements both as regards establishing the term of a lease and the related discounted cash flows that determine the amount of a lease liability to be recognised. The standard requires adoption either on a full retrospective basis, or retrospectively with the cumulative effect of initially recognising the standard as an adjustment to retained earnings at the date of initial application, and if so with a number of practical expedients in transitioning existing leases at the time of initial application. Statoil is in the process of evaluating the impact of IFRS 16, and has not yet determined the expected impact of the standard on the Consolidated financial statements.

Implementation of IFRS 16 will affect all Statoil's segments.

Statoil will adopt IFRS 16 on 1 January 2019 and currently expects to apply the modified retrospective method in implementing the standard.

Other amendments to standards
The amendments to IFRS 10 Consolidated Financial Statements and IAS 28 Investments in Associates and Joint Ventures, effective from a future date to be determined by the IASB, establish requirements for the accounting for sales or contributions of assets between an investor and its associate or joint venture. Whether or not the assets are housed in a subsidiary, a full gain or loss will be recognised in the statement of income when the transaction involves assets that constitute a business, whereas a partial gain or loss will be recognised when the transaction involves assets that do not constitute a business. The amendments are to be applied prospectively. Statoil has not determined an adoption date for the amendments.

The disclosure initiative amendments to IAS 7 Statement of Cash Flows, effective from 1 January 2017, establish certain additional requirements for disclosure of changes in financing liabilities. Statoil has implemented the amendments on the effective date.

Other standards and amendments to standards, issued but not yet effective, are either not expected to impact Statoil's Consolidated financial statements materially, or are not expected to be relevant to Statoil's Consolidated financial statements upon adoption.

Change in the Statoil group's presentation currency
On 1 January 2016 Statoil changed its presentation currency from Norwegian kroner (NOK) to US dollars (USD), mainly in order to better reflect the underlying USD exposure of Statoil's business activities and to align with industry practice. As the change in presentation currency represents a policy change, comparative figures have been re-presented in USD to reflect the change. All currency translation adjustments have been set to zero as of 1 January 2006, which was the date of Statoil's transition to IFRS. Translation adjustments and cumulative translation adjustments have been presented as if Statoil had used USD as the presentation currency from that date. For further details and re-presented consolidated financial information for prior periods, reference is made to Note 26 Change of presentation currency in these Consolidated financial statements.

Basis of consolidation
The Consolidated financial statements include the accounts of Statoil ASA and its subsidiaries and include Statoil's interest in jointly controlled and equity accounted investments.

Subsidiaries
Entities are determined to be controlled by Statoil, and consolidated in Statoil's financial statements, when Statoil has power over the entity, ability to use that power to affect the entity's returns, and exposure to, or rights to, variable returns from its involvement with the entity.

All intercompany balances and transactions, including unrealised profits and losses arising from Statoil's internal transactions, have been eliminated in full.

Non-controlling interests are presented separately within equity in the balance sheet.

Joint operations and similar arrangements, joint ventures and associates
A joint arrangement is present where Statoil holds a long-term interest which is jointly controlled by Statoil and one or more other venturers under a contractual arrangement in which decisions about the relevant activities require the unanimous consent of the parties sharing control. Such joint arrangements are classified as either joint operations or joint ventures.

The parties to a joint operation have rights to the assets and obligations for the liabilities, relating to their respective share of the joint arrangement. In determining whether the terms of contractual arrangements and other facts and circumstances lead to a classification as joint operations, Statoil in particular considers the nature of products and markets of the arrangement and whether the substance of their agreements is that the parties involved have rights to substantially all the arrangement's assets. Statoil accounts for the assets, liabilities, revenues and expenses relating to its interests in joint operations in accordance with the principles applicable to those particular assets, liabilities, revenues and expenses. Normally this leads to accounting for the joint operation in a manner similar to the previous proportionate consolidation method.

Those of Statoil's exploration and production licence activities that are within the scope of IFRS 11 Joint Arrangements have been classified as joint operations. A considerable number of Statoil's unincorporated joint exploration and production activities are conducted through arrangements that are not jointly controlled, either because unanimous consent is not required among all parties involved, or no single group of parties has joint control over the activity. Licence activities where control can be achieved through agreement between more than one combination of involved parties are considered to be outside the scope of IFRS 11, and these activities are accounted for on a pro-rata basis using Statoil's ownership share. In determining whether each separate arrangement related to Statoil's unincorporated joint exploration and production licence activities is within or outside the scope of IFRS 11, Statoil considers the terms of relevant licence agreements, governmental concessions and other legal arrangements impacting how and by whom each arrangement is controlled. Subsequent changes in the ownership shares and number of licence participants, transactions involving licence shares, or changes in the terms of relevant agreements may lead to changes in Statoil's evaluation of control and impact a licence arrangement's classification in relation to IFRS 11 in Statoil's Consolidated financial statements. Currently there are no significant differences in Statoil's accounting for unincorporated licence arrangements whether in scope of IFRS 11 or not.

Joint ventures, in which Statoil has rights to the net assets, are accounted for using the equity method.

Investments in companies in which Statoil has neither control nor joint control, but has the ability to exercise significant influence over operating and financial policies, are classified as associates and are also accounted for using the equity method.

Under the equity method, the investment is carried on the balance sheet at cost plus post-acquisition changes in Statoil's share of net assets of the entity, less distribution received and less any impairment in value of the investment. Goodwill may arise as the surplus of the cost of investment over Statoil's share of the net fair value of the identifiable assets and liabilities of the joint venture or associate. Such goodwill is recorded within the corresponding investment. The Consolidated statement of income reflects Statoil's share of the results after tax of an equity-accounted entity, adjusted to account for depreciation, amortization and any impairment of the equity-accounted entity's assets based on their fair values at the date of acquisition. Where material differences in accounting policies arise, adjustments are made to the financial statements of equity-accounted entities in order to bring the accounting policies used into line with Statoil's. Material unrealised gains on transactions between Statoil and its equity-accounted entities are eliminated to the extent of Statoil's interest in each equity-accounted entity. Unrealised losses are also eliminated unless the transaction provides evidence of an impairment of the asset transferred. Statoil assesses investments in equity-accounted entities for impairment whenever events or changes in circumstances indicate that the carrying value may not be recoverable.

Statoil as operator of joint operations and similar arrangements
Indirect operating expenses such as personnel expenses are accumulated in cost pools. These costs are allocated on an hours incurred basis to operating segments and Statoil operated joint operations under IFRS 11 and to similar arrangements (licences) outside the scope of IFRS 11. Costs allocated to the other partners' share of operated joint operations and similar arrangements reduce the costs in the Consolidated statement of income. Only Statoil's share of the statement of income and balance sheet items related to Statoil operated joint operations and similar arrangements are reflected in the Consolidated statement of income and the Consolidated balance sheet.

Reportable segments
Statoil identifies its operating segments on the basis of those components of Statoil that are regularly reviewed by the chief operating decision maker, Statoil's corporate executive committee (CEC). Statoil combines operating segments when these satisfy relevant aggregation criteria.

Statoil's accounting policies as described in this note also apply to the specific financial information included in reportable segments related disclosure in these Consolidated financial statements.

Foreign currency translation
In preparing the financial statements of the individual entities, transactions in foreign currencies (those other than functional currency) are translated at the foreign exchange rate at the dates of the transactions. Monetary assets and liabilities denominated in foreign currencies are translated to the functional currency at the foreign exchange rate at the balance sheet date. Foreign exchange differences arising on translation are recognised in the Consolidated statement of income as foreign exchange gains or losses within net financial items. Foreign exchange differences arising from the translation of estimate-based provisions, however, generally are accounted for as part of the change in the underlying estimate and as such may be included within the relevant operating expense or income tax sections of the Consolidated statement of income depending on the nature of the provision. Non-monetary assets that are measured at historical cost in a foreign currency are translated using the exchange rate at the date of the transactions.

Presentation currency
For the purpose of the Consolidated financial statements, the statement of income, the balance sheet and the cash flows of each entity are translated from the functional currency into the presentation currency, USD. The assets and liabilities of entities whose functional currencies are other than USD, are translated into USD at the foreign exchange rate at the balance sheet date. The revenues and expenses of such entities are translated using the foreign exchange rates on the dates of the transactions. Foreign exchange differences arising on translation from functional currency to presentation currency are recognised separately in Other comprehensive income (OCI). The cumulative amount of such translation differences relating to an entity and previously recognised in OCI, is reclassified to the Consolidated statement of income and reflected as a part of the gain or loss on disposal of that entity.

Business combinations
Determining whether an acquisition meets the definition of a business combination requires judgement to be applied on a case by case basis. Acquisitions are assessed under the relevant IFRS criteria to establish whether the transaction represents a business combination or an asset purchase. Depending on the specific facts, acquisitions of exploration and evaluation licences for which a development decision has not yet been made, have largely been concluded to represent asset purchases.

Business combinations, except for transactions between entities under common control, are accounted for using the acquisition method of accounting. The acquired identifiable tangible and intangible assets, liabilities and contingent liabilities are measured at their fair values at the date of the acquisition. Acquisition costs incurred are expensed under Selling, general and administrative expenses.

Revenue recognition
Revenues associated with sale and transportation of crude oil, natural gas, petroleum products and other merchandise are recognised when risk passes to the customer, which is normally when title passes at the point of delivery of the goods, based on the contractual terms of the agreements.

Revenues from the production of oil and gas properties in which Statoil shares an interest with other companies are recognised on the basis of volumes lifted and sold to customers during the period (the sales method). Where Statoil has lifted and sold more than the ownership interest, an accrual is recognised for the cost of the overlift. Where Statoil has lifted and sold less than the ownership interest, costs are deferred for the underlift.

Revenue is presented net of customs, excise taxes and royalties paid in-kind on petroleum products. Revenue is presented gross of in-kind payments of amounts representing income tax.

Sales and purchases of physical commodities, which are not settled net, are presented on a gross basis as revenues and purchases [net of inventory variation] in the statement of income. Activities related to trading and commodity-based derivative instruments are reported on a net basis, with the margin included in revenues.

Transactions with the Norwegian State

Statoil markets and sells the Norwegian State's share of oil and gas production from the Norwegian continental shelf (NCS). The Norwegian State's participation in petroleum activities is organised through the SDFI. All purchases and sales of the SDFI's oil production are classified as purchases [net of inventory variation] and revenues, respectively. Statoil sells, in its own name, but for the Norwegian State's account and risk, the State's production of natural gas. These sales and related expenditures refunded by the Norwegian State are presented net in the Consolidated financial statements.

Employee benefits

Wages, salaries, bonuses, social security contributions, paid annual leave and sick leave are accrued in the period in which the associated services are rendered by employees of Statoil.

Research and development

Statoil undertakes research and development both on a funded basis for licence holders and on an unfunded basis for projects at its own risk. Statoil's own share of the licence holders' funding and the total costs of the unfunded projects are considered for capitalisation under the applicable IFRS requirements. Subsequent to initial recognition, any capitalised development costs are reported at cost less accumulated amortisation and accumulated impairment losses.

Income tax

Income tax in the Consolidated statement of income comprises current and deferred tax expense. Income tax is recognised in the Consolidated statement of income except when it relates to items recognised in OCI.

Current tax consists of the expected tax payable on the taxable income for the year and any adjustment to tax payable for previous years. Uncertain tax positions and potential tax exposures are analysed individually, and the best estimate of the probable amount for liabilities to be paid (unpaid potential tax exposure amounts, including penalties) and for assets to be received (disputed tax positions for which payment has already been made) in each case is recognised within current tax or deferred tax as appropriate. Interest income and interest expenses relating to tax issues are estimated and recognised in the period in which they are earned or incurred, and are presented within net financial items in the Consolidated statement of income. Uplift benefit on the NCS is recognised when the deduction is included in the current year tax return and impacts taxes payable.

Deferred tax assets and liabilities are recognised for the future tax consequences attributable to differences between the carrying amounts of existing assets and liabilities and their respective tax bases, subject to the initial recognition exemption. The amount of deferred tax is based on the expected manner of realisation or settlement of the carrying amount of assets and liabilities, using tax rates enacted or substantively enacted at the balance sheet date. A deferred tax asset is recognised only to the extent that it is probable that future taxable income will be available against which the asset can be utilised. In order for a deferred tax asset to be recognised based on future taxable income, convincing evidence is required, taking into account the existence of contracts, production of oil or gas in the near future based on volumes of proved reserves, observable prices in active markets, expected volatility of trading profits, expected currency rate movements and similar facts and circumstances.

Oil and gas exploration, evaluation and development expenditures

Statoil uses the successful efforts method of accounting for oil and gas exploration costs. Expenditures to acquire mineral interests in oil and gas properties and to drill and equip exploratory wells are capitalised as exploration and evaluation expenditures within intangible assets until the well is complete and the results have been evaluated, or there is any other indicator of a potential impairment. Exploration wells that discover potentially economic quantities of oil and natural gas remain capitalised as intangible assets during the evaluation phase of the find. This evaluation is normally finalised within one year after well completion. If, following the evaluation, the exploratory well has not found potentially commercial quantities of hydrocarbons, the previously capitalised costs are evaluated for derecognition or tested for impairment. Geological and geophysical costs and other exploration and evaluation expenditures are expensed as incurred.

Capitalised exploration and evaluation expenditures, including expenditures to acquire mineral interests in oil and gas properties, related to offshore wells that find proved reserves are transferred from exploration expenditures and acquisition costs - oil and gas prospects (intangible assets) to property, plant and equipment at the time of sanctioning of the development project. For onshore wells where no sanction is required, the transfer of acquisition cost - oil and gas prospects (intangible assets) to property, plant and equipment occurs at the time when a well is ready for production.

For exploration and evaluation asset acquisitions (farm-in arrangements) in which Statoil has made arrangements to fund a portion of the selling partner's (farmor's) exploration and/or future development expenditures (carried interests), these expenditures are reflected in the Consolidated financial statements as and when the exploration and development work progresses. Statoil reflects exploration and evaluation asset dispositions (farm-out arrangements) on a historical cost basis with no gain or loss recognition.

A gain or loss related to a post-tax based disposition of assets on the NCS includes the release of tax liabilities previously computed and recognised related to the assets in question. The resulting gross gain or loss is recognised in full in other income in the Consolidated statement of income.

Consideration from the sale of an undeveloped part of an onshore asset reduces the carrying amount of the asset. The part of the consideration that exceeds the carrying amount of the asset, if any, is reflected in the Consolidated statement of income under other income.

Exchanges (swaps) of exploration and evaluation assets are accounted for at the carrying amounts of the assets given up with no gain or loss recognition.

Property, plant and equipment
Property, plant and equipment is reflected at cost, less accumulated depreciation and accumulated impairment losses. The initial cost of an asset comprises its purchase price or construction cost, any costs directly attributable to bringing the asset into operation, the initial estimate of an asset retirement obligation, if any, exploration costs transferred from intangible assets and, for qualifying assets, borrowing costs. Property, plant and equipment include costs relating to expenditures incurred under the terms of PSAs in certain countries, and which qualify for recognition as assets of Statoil. State-owned entities in the respective countries, however, normally hold the legal title to such PSA-based property, plant and equipment.

Exchanges of assets are measured at the fair value of the asset given up, unless the fair value of neither the asset received nor the asset given up is measurable with sufficient reliability.

Expenditure on major maintenance refits or repairs comprises the cost of replacement assets or parts of assets, inspection costs and overhaul costs. Where an asset or part of an asset is replaced and it is probable that future economic benefits associated with the item will flow to Statoil, the expenditure is capitalised. Inspection and overhaul costs, associated with regularly scheduled major maintenance programs planned and carried out at recurring intervals exceeding one year, are capitalised and amortised over the period to the next scheduled inspection and overhaul. All other maintenance costs are expensed as incurred.

Capitalised exploration and evaluation expenditures, development expenditure on the construction, installation or completion of infrastructure facilities such as platforms, pipelines and the drilling of production wells, and field-dedicated transport systems for oil and gas are capitalised as producing oil and gas properties within property, plant and equipment. Such capitalised costs, when designed for significantly larger volumes than the reserves from already developed and producing wells, are depreciated using the unit of production method based on proved reserves expected to be recovered from the area during the concession or contract period. Depreciation of production wells uses the unit of production method based on proved developed reserves, and capitalised acquisition costs of proved properties are depreciated using the unit of production method based on total proved reserves. In the rare circumstances where the use of proved reserves fails to provide an appropriate basis reflecting the pattern in which the asset's future economic benefits are expected to be consumed, a more appropriate reserve estimate is used. Depreciation of other assets and transport systems used by several fields is calculated on the basis of their estimated useful lives, normally using the straight-line method. Each part of an item of property, plant and equipment with a cost that is significant in relation to the total cost of the item is depreciated separately. For exploration and production assets, Statoil has established separate depreciation categories which as a minimum distinguish between platforms, pipelines and wells.

The estimated useful lives of property, plant and equipment are reviewed on an annual basis, and changes in useful lives are accounted for prospectively. An item of property, plant and equipment is derecognised upon disposal or when no future economic benefits are expected to arise from the continued use of the asset. Any gain or loss arising on derecognition of the asset (calculated as the difference between the net disposal proceeds and the carrying amount of the item) is included in other income or operating expenses, respectively, in the period the item is derecognised.

Assets classified as held for sale
Non-current assets are classified separately as held for sale in the balance sheet when their carrying amount will be recovered through a sale transaction rather than through continuing use. This condition is met only when the sale is highly probable, the asset is available for immediate sale in its present condition, and management is committed to the sale, which should be expected to qualify for recognition as a completed sale within one year from the date of classification. Liabilities directly associated with the assets classified as held for sale, and expected to be included as part of the sale transaction, are correspondingly also classified separately. Once classified as held for sale, property, plant and equipment and intangible assets are not subject to depreciation or amortisation. The net assets and liabilities of a disposal group classified as held for sale are measured at the lower of their carrying amount and fair value less costs to sell.

Leases
Leases for which Statoil assumes substantially all the risks and rewards of ownership are reflected as finance leases. When an asset leased by a joint operation or similar arrangement to which Statoil is a party qualifies as a finance lease, Statoil reflects its proportionate share of the leased asset and related obligations. Finance leases are classified in the Consolidated balance sheet within property, plant and equipment and finance debt. All other leases are classified as operating leases, and the costs are charged to the relevant operating expense related caption on a straight line basis over the lease term, unless another basis is more representative of the benefits of the lease to Statoil.

Statoil distinguishes between lease and capacity contracts. Lease contracts provide the right to use a specific asset for a period of time, while capacity contracts confer on Statoil the right to and the obligation to pay for certain volume capacity availability related to transport, terminal use, storage, etc. Such capacity contracts that do not involve specified assets or that do not involve substantially all the capacity of an undivided interest in a specific asset are not considered by Statoil to qualify as leases for accounting purposes. Capacity payments are reflected as operating expenses in the Consolidated statement of income in the period for which the capacity contractually is available to Statoil.

Intangible assets including goodwill
Intangible assets are stated at cost, less accumulated amortisation and accumulated impairment losses. Intangible assets include acquisition cost for oil and gas prospects, expenditures on the exploration for and evaluation of oil and natural gas resources, goodwill and other intangible assets.

Intangible assets relating to expenditures on the exploration for and evaluation of oil and natural gas resources are not amortised. When the decision to develop a particular area is made, its intangible exploration and evaluation assets are reclassified to property, plant and equipment.

Goodwill is initially measured at the excess of the aggregate of the consideration transferred and the amount recognised for any non-controlling interest over the fair value of the identifiable assets acquired and liabilities assumed in a business combination at the acquisition date. Goodwill acquired is allocated to each cash generating unit, or group of units, expected to benefit from the combination's synergies. Following initial recognition, goodwill is measured at cost less any accumulated impairment losses.

Financial assets

Financial assets are initially recognised at fair value when Statoil becomes a party to the contractual provisions of the asset. For additional information on fair value methods, refer to the Measurement of fair values section below. The subsequent measurement of the financial assets depends on which category they have been classified into at inception.

At initial recognition, Statoil classifies its financial assets into the following three main categories: Financial investments at fair value through profit or loss, loans and receivables, and available-for-sale (AFS) financial assets. The first main category, financial investments at fair value through profit or loss, further consists of two sub-categories: Financial assets held for trading and financial assets that on initial recognition are designated as fair value through profit and loss. The latter approach may also be referred to as the fair value option.

Cash and cash equivalents include cash in hand, current balances with banks and similar institutions, and short-term highly liquid investments that are readily convertible to known amounts of cash, are subject to an insignificant risk of changes in fair value and have a maturity of three months or less from the acquisition date.

Trade receivables are carried at the original invoice amount less a provision for doubtful receivables which is made when there is objective evidence that Statoil will be unable to recover the balances in full.

A significant part of Statoil's investments in treasury bills, commercial papers, bonds and listed equity securities is managed together as an investment portfolio of Statoil's captive insurance company and is held in order to comply with specific regulations for capital retention. The investment portfolio is managed and evaluated on a fair value basis in accordance with an investment strategy and is accounted for using the fair value option with changes in fair value recognised through profit or loss.

Financial assets are presented as current if they contractually will expire or otherwise are expected to be recovered within 12 months after the balance sheet date, or if they are held for the purpose of being traded. Financial assets and financial liabilities are shown separately in the Consolidated balance sheet, unless Statoil has both a legal right and a demonstrable intention to net settle certain balances payable to and receivable from the same counterparty, in which case they are shown net in the balance sheet.

Inventories

Inventories are stated at the lower of cost and net realisable value. Cost is determined by the first-in first-out method and comprises direct purchase costs, cost of production, transportation and manufacturing expenses.

Impairment

Impairment of property, plant and equipment and intangible assets other than goodwill

Statoil assesses individual assets or groups of assets for impairment whenever events or changes in circumstances indicate that the carrying value of an asset may not be recoverable. Assets are grouped into cash generating units (CGUs) which are the smallest identifiable groups of assets that generate cash inflows that are largely independent of the cash inflows from other groups of assets. Normally, separate CGUs are individual oil and gas fields or plants. Each unconventional asset play is considered a single CGU when no cash inflows from parts of the play can be reliably identified as being largely independent of the cash inflows from other parts of the play. In impairment evaluations, the carrying amounts of CGUs are determined on a basis consistent with that of the recoverable amount. In Statoil's line of business, judgement is involved in determining what constitutes a CGU. Development in production, infrastructure solutions, markets, product pricing, management actions and other factors may over time lead to changes in CGUs such as the division of one original CGU into several.

In assessing whether a write-down of the carrying amount of a potentially impaired asset is required, the asset's carrying amount is compared to the recoverable amount. The recoverable amount of an asset is the higher of its fair value less cost of disposal and its value in use. Fair value less cost of disposal is determined based on comparable recent arm's length market transactions, or based on Statoil's estimate of the price that would be received for the asset in an orderly transaction between market participants. Value in use is determined using a discounted cash flow model. The estimated future cash flows applied are based on reasonable and supportable assumptions and represent management's best estimates of the range of economic conditions that will exist over the remaining useful life of the assets, as set down in Statoil's most recently approved long-term forecasts. Statoil uses an approach of regular updates of assumptions and economic conditions in establishing the long-term forecasts which are reviewed by corporate management and updated at least annually. For assets and CGUs with an expected useful life or timeline for production of expected reserves extending beyond 5 years, the forecasts reflect expected production volumes for oil and natural gas, and the related cash flows include project or asset specific estimates reflecting the relevant period. Such estimates are established on the basis of Statoil's principles and assumptions consistently applied.

In performing a value-in-use-based impairment test, the estimated future cash flows are adjusted for risks specific to the asset and discounted using a real post-tax discount rate which is based on Statoil's post-tax weighted average cost of capital (WACC). The use of post-tax discount rates in determining value in use does not result in a materially different determination of the need for, or the amount of, impairment that would be required if pre-tax discount rates had been used.

Unproved oil and gas properties are assessed for impairment when facts and circumstances suggest that the carrying amount of the asset may exceed its recoverable amount, and at least once a year. Exploratory wells that have found reserves, but where classification of those reserves as proved depends on whether major capital expenditure can be justified or where the economic viability of that major capital expenditure depends on the successful completion of further exploration work, will remain capitalised during the evaluation phase for the exploratory finds. Thereafter it will be considered a trigger for impairment evaluation of the well if no development decision is planned for the near future and there are no firm plans for future drilling in the licence.

An assessment is made at each reporting date as to whether there is any indication that previously recognised impairment losses may no longer be relevant or may have decreased. If such an indication exists, the recoverable amount is estimated. A previously recognised impairment loss is reversed only if there has been a change in the estimates used to determine the asset's recoverable amount since the last impairment loss was recognised. If that is the case, the carrying amount of the asset is increased to its recoverable amount. That increased amount cannot exceed the carrying amount that would have been determined, net of depreciation, had no impairment loss been recognised for the asset in prior years.

Impairment losses and reversals of impairment losses are presented in the Consolidated statement of income as Exploration expenses or Depreciation, amortisation and net impairment losses, on the basis of their nature as either exploration assets (intangible exploration assets) or development and producing assets (property, plant and equipment and other intangible assets), respectively.

Impairment of goodwill
Goodwill is reviewed for impairment annually or more frequently if events or changes in circumstances indicate that the carrying value may be impaired. Impairment is determined by assessing the recoverable amount of the CGU, or group of units, to which the goodwill relates. Where the recoverable amount of the CGU, or group of units, is less than the carrying amount, an impairment loss is recognised. Once recognised, impairments of goodwill are not reversed in future periods.

Financial liabilities
Financial liabilities are initially recognised at fair value when Statoil becomes a party to the contractual provisions of the liability. The subsequent measurement of financial liabilities depends on which category they have been classified into. The categories applicable for Statoil are either financial liabilities at fair value through profit or loss or financial liabilities measured at amortised cost using the effective interest method. The latter applies to Statoil's non-current bank loans and bonds.

Financial liabilities are presented as current if the liability is due to be settled within 12 months after the balance sheet date, or if they are held for the purpose of being traded. Financial liabilities are derecognised when the contractual obligations expire, are discharged or cancelled. Gains and losses arising on the repurchase, settlement or cancellation of liabilities are recognised either in interest income and other financial items or in interest and other finance expenses within net financial items.

Derivative financial instruments
Statoil uses derivative financial instruments to manage certain exposures to fluctuations in foreign currency exchange rates, interest rates and commodity prices. Such derivative financial instruments are initially recognised at fair value on the date on which a derivative contract is entered into and are subsequently re-measured at fair value through profit and loss. The impact of commodity-based derivative financial instruments is recognised in the Consolidated statement of income under revenues, as such derivative instruments are related to sales contracts or revenue-related risk management for all significant purposes. The impact of other financial instruments is reflected under net financial items.

Derivatives are carried as assets when the fair value is positive and as liabilities when the fair value is negative. Derivative assets or liabilities expected to be recovered, or with the legal right to be settled more than 12 months after the balance sheet date are classified as non-current, with the exception of derivative financial instruments held for the purpose of being traded.

Contracts to buy or sell a non-financial item that can be settled net in cash or another financial instrument, or by exchanging financial instruments, as if the contracts were financial instruments, are accounted for as financial instruments. However, contracts that are entered into and continue to be held for the purpose of the receipt or delivery of a non-financial item in accordance with Statoil's expected purchase, sale or usage requirements, also referred to as own-use, are not accounted for as financial instruments. This is applicable to a significant number of contracts for the purchase or sale of crude oil and natural gas, which are recognised upon delivery.

Derivatives embedded in other financial instruments or in non-financial host contracts are recognised as separate derivatives and are reflected at fair value with subsequent changes through profit and loss, when their risks and economic characteristics are not closely related to those of the host contracts, and the host contracts are not carried at fair value. Where there is an active market for a commodity or other non-financial item referenced in a purchase or sale contract, a pricing formula will, for instance, be considered to be closely related to the host purchase or sales contract if the price formula is based on the active market in question. A price formula with indexation to other markets or products will however result in the recognition of a separate derivative. Where there is no active market for the commodity or other non-financial item in question, Statoil assesses the characteristics of such a price related embedded derivative to be closely related to the host contract if the price formula is based on relevant indexations commonly used by other market participants. This applies to certain long-term natural gas sales agreements.

Pension liabilities

Statoil has pension plans for employees that either provide a defined pension benefit upon retirement or a pension dependent on defined contributions and related returns. A portion of the contributions are provided for as notional contributions, for which the liability increases with a promised notional return, set equal to the actual return of assets invested through the ordinary defined contribution plan. For defined benefit plans, the benefit to be received by employees generally depends on many factors including length of service, retirement date and future salary levels.

Statoil's proportionate share of multi-employer defined benefit plans are recognised as liabilities in the balance sheet to the extent that sufficient information is available and a reliable estimate of the obligation can be made.

Statoil's net obligation in respect of defined benefit pension plans is calculated separately for each plan by estimating the amount of future benefit that employees have earned in return for their services in the current and prior periods. That benefit is discounted to determine its present value, and the fair value of any plan assets is deducted. The discount rate is the yield at the balance sheet date, reflecting the maturity dates approximating the terms of Statoil's obligations. The discount rate for the main part of the pension obligations has been established on the basis of Norwegian mortgage covered bonds, which are considered high quality corporate bonds. The cost of pension benefit plans is expensed over the period that the employees render services and become eligible to receive benefits. The calculation is performed by an external actuary.

The net interest related to defined benefit plans is calculated by applying the discount rate to the opening present value of the benefit obligation and opening present value of the plan assets, adjusted for material changes during the year. The resulting net interest element is presented in the statement of income as part of net pension cost within net operating income. The difference between estimated interest income and actual return is recognised in the Consolidated statement of comprehensive income.

Past service cost is recognised when a plan amendment (the introduction or withdrawal of, or changes to, a defined benefit plan) or curtailment (a significant reduction by the entity in the number of employees covered by a plan) occurs, or when recognising related restructuring costs or termination benefits. The obligation and related plan assets are re-measured using current actuarial assumptions, and the gain or loss is recognised in the statement of income.

Actuarial gains and losses are recognised in full in the Consolidated statement of comprehensive income in the period in which they occur, while actuarial gains and losses related to provision for termination benefits are recognised in the Consolidated statement of income in the period in which they occur. Due to the parent company Statoil ASA's functional currency being USD, the significant part of Statoil's pension obligations will be payable in a foreign currency (i.e. NOK). As a consequence, actuarial gains and losses related to the parent company's pension obligation include the impact of exchange rate fluctuations.

Contributions to defined contribution schemes are recognised in the statement of income in the period in which the contribution amounts are earned by the employees.

Notional contribution plans, reported in the parent company Statoil ASA, are recognised as pension liabilities with the actual value of the notional contributions and promised return at reporting date. Notional contributions and changes in fair value of notional assets are recognised in the statement of income as periodic pension cost.

Periodic pension cost is accumulated in cost pools and allocated to operating segments and Statoil operated joint operations (licences) on an hours incurred basis and recognised in the statement of income based on the function of the cost.

Onerous contracts

Statoil recognises as provisions the net obligation under contracts defined as onerous. Contracts are deemed to be onerous if the unavoidable cost of meeting the obligations under the contract exceeds the economic benefits expected to be received in relation to the contract. A contract which forms an integral part of the operations of a CGU whose assets are dedicated to that contract, and for which the economic benefits cannot be reliably separated from those of the CGU, is included in impairment considerations for the applicable CGU.

Asset retirement obligations (ARO)

Provisions for ARO costs are recognised when Statoil has an obligation (legal or constructive) to dismantle and remove a facility or an item of property, plant and equipment and to restore the site on which it is located, and when a reliable estimate of that liability can be made. The amount recognised is the present value of the estimated future expenditures determined in accordance with local conditions and requirements. Cost is estimated based on current regulations and technology, considering relevant risks and uncertainties. The discount rate used in the calculation of the ARO is a risk-free rate based on the applicable currency and time horizon of the underlying cash flows, adjusted for a credit premium which reflects Statoil's own credit risk. Normally an obligation arises for a new facility, such as an oil and natural gas production or transportation facility, upon construction or installation. An obligation may also crystallise during the period of operation of a facility through a change in legislation or through a decision to terminate operations, or be based on commitments associated with Statoil's ongoing use of pipeline transport systems where removal obligations rest with the volume shippers. The provisions are classified under provisions in the Consolidated balance sheet. Some of the refining and process operations are deemed to have indefinite lives, and in consequence, no ARO has been recognised for their plants.

When a provision for ARO cost is recognised, a corresponding amount is recognised to increase the related property, plant and equipment and is subsequently depreciated as part of the costs of the facility or item of property, plant and equipment. Any change in the present value of the estimated expenditure is reflected as an adjustment to the provision and the corresponding property, plant and equipment. When a decrease in the ARO provision related to a producing asset exceeds the carrying amount of the asset, the excess is recognised as a reduction of depreciation, amortisation and net impairment losses in the Consolidated statement of income. When an asset has reached the end of its useful life, all subsequent changes to the ARO provision are recognised as they occur in operating expenses in the Consolidated statement of income. Removal provisions associated with Statoil's role as shipper of volumes through third party transport systems are expensed as incurred.

Measurement of fair values

Quoted prices in active markets represent the best evidence of fair value and are used by Statoil in determining the fair values of assets and liabilities to the extent possible. Financial instruments quoted in active markets will typically include commercial papers, bonds and equity instruments with quoted market prices obtained from the relevant exchanges or clearing houses. The fair values of quoted financial assets, financial liabilities and derivative instruments are determined by reference to mid-market prices, at the close of business on the balance sheet date.

Where there is no active market, fair value is determined using valuation techniques. These include using recent arm's-length market transactions, reference to other instruments that are substantially the same, discounted cash flow analysis, and pricing models and related internal assumptions. In the valuation techniques, Statoil also takes into consideration the counterparty and its own credit risk. This is either reflected in the discount rate used or through direct adjustments to the calculated cash flows. Consequently, where Statoil reflects elements of long-term physical delivery commodity contracts at fair value, such fair value estimates to the extent possible are based on quoted forward prices in the market and underlying indexes in the contracts, as well as assumptions of forward prices and margins where observable market prices are not available. Similarly, the fair values of interest and currency swaps are estimated based on relevant quotes from active markets, quotes of comparable instruments, and other appropriate valuation techniques.

Critical accounting judgements and key sources of estimation uncertainty

Critical judgements in applying accounting policies

The following are the critical judgements, apart from those involving estimations (see below), that Statoil has made in the process of applying the accounting policies and that have the most significant effect on the amounts recognised in the financial statements:

Revenue recognition - gross versus net presentation of traded SDFI volumes of oil and gas production

As described under Transactions with the Norwegian State above, Statoil markets and sells the Norwegian State's share of oil and gas production from the NCS. Statoil includes the costs of purchase and proceeds from the sale of the SDFI oil production in purchases [net of inventory variation] and revenues, respectively. In making the judgement, Statoil considered the detailed criteria for the recognition of revenue from the sale of goods and, in particular, concluded that the risk and reward of the ownership of the oil had been transferred from the SDFI to Statoil.

Statoil sells, in its own name, but for the Norwegian State's account and risk, the State's production of natural gas. These gas sales, and related expenditures refunded by the State, are shown net in Statoil's Consolidated financial statements. In making the judgement, Statoil considered the same criteria as for the oil production and concluded that the risk and reward of the ownership of the gas had not been transferred from the SDFI to Statoil.

Key sources of estimation uncertainty

The preparation of the Consolidated financial statements requires that management make estimates and assumptions that affect reported amounts of assets, liabilities, income and expenses. The estimates and associated assumptions are based on historical experience and various other factors that are believed to be reasonable under the circumstances, the result of which form the basis of making the judgements about carrying values of assets and liabilities that are not readily apparent from other sources. Actual results may differ from these estimates. The estimates and underlying assumptions are reviewed on an on-going basis considering the current and expected future market conditions.

Statoil is exposed to a number of underlying economic factors which affect the overall results, such as liquids prices, natural gas prices, refining margins, foreign exchange rates and interest rates as well as financial instruments with fair values derived from changes in these factors. In addition, Statoil's results are influenced by the level of production, which in the short term may be influenced by, for instance, maintenance programmes. In the long term, the results are impacted by the success of exploration and field development activities.

The matters described below are considered to be the most important in understanding the key sources of estimation uncertainty that are involved in preparing these Consolidated financial statements and the uncertainties that could most significantly impact the amounts reported on the results of operations, financial position and cash flows.

Proved oil and gas reserves

Proved oil and gas reserves may materially impact the Consolidated financial statements, as changes in the proved reserves, for instance as a result of changes in prices, will impact the unit of production rates used for depreciation and amortisation. Proved oil and gas reserves have been estimated by internal qualified professionals on the basis of industry standards and governed by criteria established by regulations of the U.S. Securities Exchange Commission (SEC), which require the use of a price based on a 12-month average for reserve estimation, and which are to be based on existing economic conditions and operating methods and with a high degree of confidence (at least 90% probability) that the quantities will be recovered. The Financial Accounting Standards Board (FASB) requirements for supplemental oil and gas disclosures align with the SEC regulations. Reserves estimates are based on subjective judgements involving geological and engineering assessments of in-place hydrocarbon volumes, the production, historical recovery and processing yield factors and installed plant operating capacity. For future development projects, proved reserves estimates are included only where there is a significant commitment to project funding and execution and when relevant governmental and regulatory approvals have been secured or are reasonably certain to be secured. The reliability of these estimates at any point in time depends on both the quality and quantity of the technical and economic data and the efficiency of extracting and processing the hydrocarbons. An independent third party has evaluated Statoil's proved reserves estimates, and the results of this evaluation do not differ materially from Statoil's estimates. Proved oil and gas reserves are those quantities of oil and gas, which, by analysis of geoscience and engineering data, can be estimated with reasonable certainty to be economically producible from a given date forward, from known reservoirs, and under existing economic conditions, operating methods and government regulations. Unless evidence indicates that renewal is reasonably certain, estimates of economically producible reserves only reflect the period before the contracts providing the right to operate expire. The project to extract the hydrocarbons must have commenced, or the operator must be reasonably certain that it will commence within a reasonable time.

Expected oil and gas reserves
Expected oil and gas reserves may materially impact the Consolidated financial statements, as changes in the expected reserves, for instance as a result of changes in prices, will impact asset retirement obligations and impairment testing of upstream assets, which in turn may lead to changes in impairment charges affecting operating income. Expected oil and gas reserves are the estimated remaining, commercially recoverable quantities, based on Statoil's judgement of future economic conditions, from projects in operation or justified for development. Recoverable oil and gas quantities are always uncertain, and the expected value is the weighted average, or statistical mean, of the possible outcomes. Expected reserves are therefore typically larger than proved reserves as defined by the SEC rules. Expected oil and gas reserves have been estimated by internal qualified professionals on the basis of industry standards and are used for impairment testing purposes and for calculation of asset retirement obligations. Reserves estimates are based on subjective judgements involving geological and engineering assessments of in-place hydrocarbon volumes, the production, historical recovery and processing yield factors, installed plant operating capacity and operating approval limits. The reliability of these estimates at any point in time depends on both the quality and quantity of the technical and economic data and the efficiency of extracting and processing the hydrocarbons.

Exploration and leasehold acquisition costs
Statoil capitalises the costs of drilling exploratory wells pending determination of whether the wells have found proved oil and gas reserves. Statoil also capitalises leasehold acquisition costs and signature bonuses paid to obtain access to undeveloped oil and gas acreage. Judgements as to whether these expenditures should remain capitalised or written down due to impairment losses in the period may materially affect the operating income for the period.

Impairment/reversal of impairment
Statoil has significant investments in property, plant and equipment and intangible assets. Changes in the circumstances or expectations of future performance of an individual asset may be an indicator that the asset is impaired, requiring the carrying amount to be written down to its recoverable amount. Impairments are reversed if conditions for impairment are no longer present. Evaluating whether an asset is impaired or if an impairment should be reversed requires a high degree of judgement and may to a large extent depend upon the selection of key assumptions about the future.

The key assumptions used will bear the risk of change based on the inherent volatile nature of macro-economic factors such as future commodity prices or discount rate and uncertainty in asset specific factors such as reserve estimates and operational decisions impacting the production profile or activity levels for our oil and natural gas properties. When estimating the recoverable amount, the single most likely future cash flows, the point estimate, is the primary method applied to reflect uncertainties in timing and amount inherent in the assumptions used in the estimated future cash flows. For assumptions in which the expected probability distributions or outcome are expected to be significantly skewed the use of decision trees or simulation is applied.

Unproved oil and gas properties are assessed for impairment when facts and circumstances suggest that the carrying amount of the asset may exceed its recoverable amount, and at least annually. If, following evaluation, an exploratory well has not found proved reserves, the previously capitalised costs are tested for impairment. Subsequent to the initial evaluation phase for a well, it will be considered a trigger for impairment testing of a well if no development decision is planned for the near future and there is no firm plan for future drilling in the licence. Impairment of unsuccessful wells is reversed, as applicable, to the extent that conditions for impairment are no longer present.

Estimating recoverable amounts involves complexity in estimating relevant future cash flows, based on assumptions about the future, discounted to their present value. Impairment testing requires long-term assumptions to be made concerning a number of economic factors such as future market prices, refinery margins, currency exchange rates and future output, discount rates and political and country risk among others, in order to establish relevant future cash flows. Long-term assumptions for major economic factors are made at a group level, and there is a high degree of reasoned judgement involved in establishing these assumptions, in determining other relevant factors such as forward price curves, in estimating production outputs and in determining the ultimate terminal value of an asset.

Employee retirement plans
When estimating the present value of defined benefit pension obligations that represent a long-term liability in the Consolidated balance sheet, and indirectly, the period's net pension expense in the Consolidated statement of income, management make a number of critical assumptions affecting these estimates. Most notably, assumptions made about the discount rate to be applied to future benefit payments and plan assets, the expected rate of pension increase and the annual rate of compensation increase, have a direct and potentially material impact on the amounts presented. Significant changes in these assumptions between periods can have a material effect on the Consolidated financial statements.

Asset retirement obligations
Statoil has significant obligations to decommission and remove offshore installations at the end of the production period. The costs of these decommissioning and removal activities require revisions due to changes in current regulations and technology while considering relevant risks and uncertainties. Most of the removal activities are many years into the future, and the removal technology and costs are constantly changing. The estimates include assumptions of the time required and the day rates for rigs, marine operations and heavy lift vessels that can vary considerably depending on the assumed removal complexity. As a result, the initial recognition of the liability and the capitalised cost associated with decommissioning and removal obligations, and the subsequent adjustment of these balance sheet items, involve the application of significant judgement.

Derivative financial instruments
When not directly observable in active markets, the fair value of derivative contracts must be computed internally based on internal assumptions as well as directly observable market information, including forward and yield curves for commodities, currencies and interest rates. Changes in internal assumptions, forward and yield curves could materially impact the internally computed fair value of derivative contracts, particularly long-term contracts, resulting in a corresponding impact on income or loss in the Consolidated statement of income.

Income tax
Every year Statoil incurs significant amounts of income taxes payable to various jurisdictions around the world and recognises significant changes to deferred tax assets and deferred tax liabilities, all of which are based on management's interpretations of applicable laws, regulations and relevant court decisions. The quality of these estimates is highly dependent upon proper application of at times very complex sets of rules, the recognition of changes in applicable rules and, in the case of deferred tax assets, management's ability to project future earnings from activities that may apply loss carry forward positions against future income taxes.

3 Segments

Statoil's operations are managed through the following operating segments: Development and Production Norway (DPN), Development and Production USA (DPUSA), Development and Production International (DPI), Marketing, Midstream and Processing (MMP), **New Energy Solutions (NES)** and Other.

The development and production operating segments are responsible for the commercial development of the oil and gas portfolios within their respective geographical areas: DPN on the Norwegian continental shelf, DPUSA including offshore and onshore activities in the USA and Mexico, and DPI worldwide outside of DPN and DPUSA.

Exploration activities are managed by a separate business unit, which has the global responsibility across the group for discovery and appraisal of new resources. Exploration activities are allocated to and presented in the respective development and production operating segments.

The MMP segment is responsible for marketing and trading of oil and gas commodities (crude, condensate, gas liquids, products, natural gas and liquefied natural gas), electricity and emission rights, as well as transportation, processing and manufacturing of the above mentioned commodities, operations of refineries, terminals, processing and power plants.

The NES segment is responsible for wind parks, carbon capture and storage as well as other renewable energy and low-carbon energy solutions.

Statoil reports its business through reporting segments which correspond to the operating segments, except for the operating segments DPI and DPUSA which have been aggregated into one reporting segment, Development and Production International. This aggregation has its basis in similar economic characteristics, the nature of products, services and production processes, the type and class of customers, the methods of distribution and regulatory environment. The operating segment NES is reported in the segment Other due to its immateriality.

The Other reporting segment includes activities within New Energy Solutions, Global Strategy and Business Development, Technology, Projects and Drilling and Corporate Staffs and Services.

The eliminations section includes the elimination of inter-segment sales and related unrealised profits, mainly from the sale of crude oil and products. Inter-segment revenues are based upon estimated market prices.

Segment data for the years ended 31 December 2016, 2015 and 2014 is presented below. The measurement basis of segment profit is *Net operating income*. In the tables below, deferred tax assets, pension assets and non-current financial assets are not allocated to the segments. Also, the line additions to PP&E, intangibles and equity accounted investments are excluding movements due to changes in asset retirement obligations.

(in USD million)	Development and Production Norway	Development and Production International	Marketing, Midstream and Processing	Other	Eliminations	Total

See note 4 Acquisitions and dispositions for information on transactions that affect the different segments.

See note 10 Property, plant and equipment for information on impairment losses that affected the different segments.

See note 11 Intangible assets for information on impairment losses that affected the different segments.

See note 23 Other commitments, contingent liabilities and contingent assets for information on contingencies that have influenced the segments.

Revenues by geographical areas
Statoil has business operations in more than 30 countries. When attributing revenues third party and other income to the country of the legal entity executing the sale, Norway constitutes 78% and the USA constitutes 14%.

Non-current assets by country

(in USD million)	At 31 December 2016	2015	2014

4 Acquisitions and disposals

2016

Acquisition of shares in Lundin Petroleum AB (Lundin) and sale of interests in the Edvard Grieg field

In January 2016 Statoil acquired 11.93% of the issued share capital and votes in Lundin Petroleum AB for a total purchase price of SEK 4.6 billion (USD 541 million). The shares were accounted for as a non-current financial investment at fair value with changes in fair value presented in the line item net gains (losses) from available for sale financial assets in the Consolidated statement of comprehensive income up until the transaction in June 2016.

In June 2016 Statoil closed an agreement with Lundin to divest its entire 15% interest in the Edvard Grieg field, a 9% interest in the Edvard Grieg Oil pipeline and a 6% interest in the Utsira High Gas pipeline for an increased ownership share in Lundin. In addition to the divested interests, a cash consideration of SEK 544 million (USD 64 million) was paid to Lundin. Following the completion of the transaction Statoil owns 68.4 million shares of Lundin, corresponding to 20.1% of the outstanding shares and votes. Statoil recognised a total net gain of USD 120 million related to the divestment presented in the line item other income in the Consolidated statement of income. In the segment reporting, the gain was recognised in the Development and Production Norway (DPN) segment (USD 114 million) and in the Marketing, Midstream and Processing (MMP) segment (USD 5 million). The transaction was tax exempt under the Norwegian petroleum tax legislation.

Following the increase in ownership interest on 30 June 2016, Statoil obtained significant influence over Lundin, and accounted for the investment as an associate under the equity method. Statoil performed a purchase price allocation to determine the net identifiable assets and liabilities of Lundin. Excess values were allocated mainly to Lundin`s exploration and production licences on the Norwegian continental shelf. The investment in Lundin was included in the Consolidated balance sheet within line item equity accounted investments with a book value of USD 1,199 million as per 30 June 2016. The Lundin investment is reported as part of the DPN segment. For summarized financial information relating investment in Lundin Petroleum AB, see note 12 Associated Companies.

Following the change in accounting classification, Statoil recognised a gain of USD 127 million representing the cumulative gain on its initial 11.93% shareholding being reclassified from the line item net gains (losses) from available for sale financial assets in the Consolidated statement of comprehensive income, to the net financial items line item in the Consolidated statement of income.

Sale of interest in Marcellus operated onshore play
In July 2016 Statoil closed an agreement to divest its operated properties in the US state of West Virginia to EQT Corporation for USD 407 million in cash. The transaction was reported as part of Development and Production International (DPI) segment and had an immaterial effect on the Consolidated statement of income recognized in the third quarter of 2016.

Acquisition of operated interest in Brazil
In November 2016 Statoil closed an agreement with Petróleo Brasileiro S.A. ("Petrobras") to acquire a 66% operated interest in the Brazilian offshore licence BM-S-8 in the Santos basin for the maximum cash consideration of USD 2,500 million. A cash consideration of USD 1,250 million was paid on the closing date. The payment of the remaining consideration is subject to certain conditions being met, and was reflected at fair value at the transaction date. The value of the acquired exploration assets has been recognised in the DPI segment, resulting in an increase in intangible assets of USD 2,271 million.

Sale of interest Kai Kos Dehseh
In December 2016 Statoil signed an agreement with Athabasca Oil Corporation to divest the 100% owned Kai Kos Dehseh (KKD) oil sands projects covering the producing Leismer plant and the undeveloped Corner project, along with a number of midstream contracts associated with Leismer's production. The total consideration consists of a cash consideration of CAD 435 million (USD 323 million), 100 million common shares in Athabasca Oil Corporation (slightly under 20% ownership share) and a series of contingent payments, capped at CAD 250 million (USD 186 million), based on development of oil price and production over the next four years. Both the shares and the contingent consideration will be measured at fair value on the closing date. As of 31 December 2016 the KKD related assets and associated liabilities were presented as held for sale in the Consolidated balance sheet. Upon entering into the agreement, Statoil impaired the assets by USD 412 million. This impairment is partly reflected as depreciation, amortisation and net impairment losses and partly as exploration expense in the Consolidated statement of income. In addition, as a consequence of the transaction, a separate onerous contract provision of USD 50 million, mainly related to vacant office spaces, has been recognised as selling, general and administration expenses. Accumulated foreign exchange losses, currently recognised in other comprehensive income, will be reflected in the Consolidated Statement of Income at the closing date. The transaction was closed 31 January 2017, and will be reflected in the DPI segment in the first quarter 2017.

2015

Sale of interests in the Marcellus onshore play
In January 2015 Statoil reduced its average working interest in the non-operated southern Marcellus onshore play from 29% to 23% through a divestment to Southwestern Energy. Proceeds from the sale were USD 365 million, recognized in the DPI segment with no gain.

Sale of interests in the Shah Deniz project and the South Caucasus Pipeline
In April 2015 Statoil sold its remaining 15.5% interest in the Shah Deniz project and the South Caucasus Pipeline to Petronas with a total gain of USD 1,182 million, recognised in the DPI and the MMP segments. Total proceeds from the sale were USD 2,688 million.

Sale of buildings
In 2015 Statoil sold the shares in Forusbeen 50 AS, Strandveien 4 AS and Arkitekt Ebbelsvei 10 AS with a gain of USD 211 million, recognised in the Other segment. Proceeds from the sale were USD 486 million. At the same time Statoil entered into 15 year operating lease agreements for the buildings.

Sale of interests in the Trans Adriatic Pipeline AG
In December 2015 Statoil sold its 20% interest in Trans Adriatic Pipeline AG to Snam SpA, with a gain of USD 139 million, recognised in the MMP segment. Total proceeds from the sale were USD 227 million.

Sale of interests in the Gudrun field and acquisition of interests in Eagle Ford
In December 2015 Statoil sold a 15% interest in the Gudrun field on the Norwegian continental shelf (NCS) to Repsol, recognizing a total gain of USD 142 million in the DPN segment. Proceeds from the sale were USD 216 million. Simultaneously Statoil acquired an additional 13% interest in the Eagle Ford formation with the same party. The acquisition was accounted for as a business combination using the acquisition method in the DPI and MMP segments with the fair value of net identifiable assets of USD 277 million and USD 121 million, respectively as of 30 December 2015. No goodwill was recognised.

2014

Sale of interests in the Shah Deniz project and the South Caucasus Pipeline
In March 2014 and May 2014 Statoil sold a 3.33% and a 6.67% working interests, in the Shah Deniz project and the South Caucasus Pipeline, to BP and SOCAR respectively, with a total gain of USD 942 million, presented in the DPI and the MMP segments. Proceeds from the sale were USD 1,383 million.

Kai Kos Dehseh oil sands swap agreement
In May 2014 Statoil and its partner PTTEP swapped the two parties' respective interests in the Kai Kos Dehseh oil sands project in Alberta, Canada. Subsequent to the closing, Statoil continues as 100% owner of the Leismer and Corner projects. The transaction has been recognised in the DPI segment resulting in an increase in property, plant and equipment of USD 769 million, including a transfer from intangible assets of USD 301 million, and with no impact on the Consolidated statement of income.

Sale of interests in licences on the Norwegian continental shelf
In December 2014 Statoil sold certain ownership interests in licences on the NCS to Wintershall with a gain of USD 861 million, recognised in the DPN segment. Proceeds from the sale were USD 1,250 million.

5 Financial risk management

General information relevant to financial risks
Statoil's business activities naturally expose Statoil to financial risk. Statoil's approach to risk management includes assessing and managing risk in all activities using a holistic risk approach. Statoil utilises correlations between the most important market risks, such as oil and natural gas prices, refined oil product prices, currencies, and interest rates, to calculate the overall market risk and thereby take into account the natural hedges inherent in Statoil's portfolio. Adding the different market risks without considering these correlations would overestimate Statoil's total market risk. This approach allows Statoil to reduce the number of risk management transactions and thereby reduce transaction costs and avoid sub-optimisation.

An important element in risk management is the use of centralised trading mandates. All major strategic transactions are required to be coordinated through Statoil's corporate risk committee. Mandates delegated to the trading organisations within crude oil, refined products, natural gas and electricity are relatively small compared to the total market risk of Statoil.

The corporate risk committee, which is headed by the chief financial officer and includes representatives from the principal business segments, is responsible for defining, developing and reviewing Statoil's risk policies. The chief financial officer, assisted by the committee, is also responsible for overseeing and developing Statoil's Enterprise Risk Management and proposing appropriate measures to adjust risk at the corporate level.

Financial risks
Statoil's activities expose Statoil to the following financial risks:
- Market risk (including commodity price risk, currency risk and interest rate risk)
- Liquidity risk
- Credit risk

Market risk
Statoil operates in the worldwide crude oil, refined products, natural gas, and electricity markets and is exposed to market risks including fluctuations in hydrocarbon prices, foreign currency rates, interest rates, and electricity prices that can affect the revenues and costs of operating, investing and financing. These risks are managed primarily on a short-term basis with a focus on achieving the highest risk-adjusted returns for Statoil within the given mandate. Long-term exposures are managed at the corporate level, while short-term exposures are managed according to trading strategies and mandates approved by Statoil's corporate risk committee.

For more information on sensitivity analysis of market risk see note 25 Financial instruments: fair value measurement and sensitivity analysis of market risk.

Commodity price risk
Statoil's most important long term commodity risk (oil and natural gas) is related to future market prices as Statoil's risk policy is to be exposed to both upside and downside price movements. To manage short-term commodity risk, Statoil enters into commodity- based derivative contracts, including futures, options, over-the-counter (OTC) forward contracts, market swaps and contracts for differences related to crude oil, petroleum products, natural gas and electricity. Statoil's bilateral gas sales portfolio is exposed to various price indices and uses derivatives to manage the net gas sales exposure towards a diversified combination of long and short dated gas price markers.

The term of crude oil and refined oil products derivatives are usually less than one year, and they are traded mainly on the Inter Continental Exchange (ICE) in London, the New York Mercantile Exchange (NYMEX), the OTC Brent market, and crude and refined products swap markets. The term of natural gas and electricity derivatives is usually three years or less, and they are mainly OTC physical forwards and options, NASDAQ OMX Oslo forwards and futures traded on the NYMEX and ICE.

Currency risk
Statoil's cash flows from operating activities deriving from oil and gas sales, operating expenses and capital expenditures are mainly in USD, but taxes, dividends to shareholders on the Oslo Børs, a share of our operating expenses and capital expenditures are in NOK. Accordingly, Statoil's currency management is primarily linked to mitigate currency risk related to payments in NOK. This means that Statoil regularly purchases NOK, primarily spot, but also on a forward basis using conventional derivative instruments.

Interest rate risk
Bonds are normally issued at fixed rates in a variety of local currencies (among others USD, EUR and GBP). Bonds are normally converted to floating USD bonds by using interest rate and currency swaps. Statoil manages its interest rates exposure on its bond debt based on risk and reward considerations from an enterprise risk management perspective. This means that the fixed/floating mix on interest rate exposure may vary from time to time. For more detailed information about Statoil's long-term debt portfolio see note 18 Finance debt.

Liquidity risk
Liquidity risk is the risk that Statoil will not be able to meet obligations of financial liabilities when they become due. The purpose of liquidity management is to ensure that Statoil has sufficient funds available at all times to cover its financial obligations.

The main cash outflows are the quarterly dividend payments and Norwegian petroleum tax payments paid six times per year. If the cash flow forecasts indicate that the liquid assets will fall below target levels, new long-term funding will be considered.

Short-term funding needs will normally be covered by the USD 5.0 billion US Commercial Papers Programme (CP) which is backed by a revolving credit facility of USD 5.0 billion, supported by 21 core banks, maturing in 2021. The facility supports secure access to funding, supported by the best available short-term rating. As at 31 December 2016 it has not been drawn.

Statoil raises debt in all major capital markets (USA, Europe and Asia) for long-term funding purposes. The policy is to have a smooth maturity profile with repayments not exceeding five percent of capital employed in any year for the nearest five years. Statoil's non-current financial liabilities have a weighted average maturity of approximately nine years.

For more information about Statoil's non-current financial liabilities see note 18 Finance debt.

The table below shows a maturity profile, based on undiscounted contractual cash flows, for Statoil's financial liabilities.

(in USD million)	At 31 December 2016	2015
Due within 1 year	12,766	11,909
Due between 1 and 2 years	4,913	8,361
Due between 3 and 4 years	9,891	9,861
Due between 5 and 10 years	10,884	10,645
Due after 10 years	13,278	13,113
Total specified	51,732	53,889

Credit risk

Credit risk is the risk that Statoil's customers or counterparties will cause Statoil financial loss by failing to honour their obligations. Credit risk arises from credit exposures with customer accounts receivables as well as from financial investments, derivative financial instruments and deposits with financial institutions.

Prior to entering into transactions with new counterparties, Statoil's credit policy requires all counterparties to be formally identified and assigned internal credit ratings as well as exposure limits. The internal credit ratings reflect Statoil's assessment of the counterparties' credit risk and are based on a quantitative and qualitative analysis of recent financial statements and other relevant business information including general market and industry information. All counterparties are re-assessed regularly.

Statoil uses risk mitigation tools to reduce or control credit risk both on a counterparty and portfolio level. The main tools include bank and parental guarantees, prepayments and cash collateral.

Statoil has pre-defined limits for the absolute credit risk level allowed at any given time on Statoil's portfolio as well as maximum credit exposures for individual counterparties. Statoil monitors the portfolio on a regular basis and individual exposures against limits on a daily basis. The total credit exposure portfolio of Statoil is geographically diversified among a number of counterparties within the oil and energy sector, as well as larger oil and gas consumers and financial counterparties. The majority of Statoil's credit exposure is with investment grade counterparties.

The following table contains the carrying amount of Statoil's financial receivables and derivative financial instruments split by Statoil's assessment of the counterparty's credit risk. Trade and other receivables include 4% overdue receivables for 30 days and more. The overdue receivables are mainly joint venture receivables pending the settlement of disputed working interest items payable from Statoil's working interest partners within its US unconventional activities. Provisions have been made for expected losses. Only non-exchange traded instruments are included in derivative financial instruments.

(in USD million)	Non-current financial receivables	Trade and other receivables	Non-current derivative financial instruments	Current derivative financial instruments
At 31 December 2016				
Investment grade, rated A or above	234	1,682	754	412
Other investment grade	264	4,090	1,064	75
Non-investment grade or not rated	210	1,302	0	4
Total financial asset	707	7,074	1,819	491
At 31 December 2015				
Investment grade, rated A or above	0	1,653	1,346	230
Other investment grade	377	3,126	1,350	278
Non-investment grade or not rated	277	1,055	0	34
Total financial asset	655	5,834	2,697	542

At 31 December 2016, USD 571 million of cash was held as collateral to mitigate a portion of Statoil's credit exposure. At 31 December 2015, USD 1,161 million was held as collateral. The collateral cash is received as a security to mitigate credit exposure related to positive fair values on interest rate swaps, cross currency swaps and foreign exchange swaps. Cash is called as collateral in accordance with the master agreements with the different counterparties when the positive fair values for the different swap agreements are above an agreed threshold.

Under the terms of various master netting agreements for derivative financial instruments as of 31 December 2016, USD 817 million presented as liabilities do not meet the criteria for offsetting. At 31 December 2015, USD 794 million was not offset. The collateral received and the amounts not offset from derivative financial instrument liabilities, reduce the credit exposure in the derivative financial instruments presented in the table above as they will offset each other in a potential default situation for the counterparty. Trade and other receivables subject to similar master netting agreements USD 364 million have been offset as of 31 December 2016, and respectively USD 341 million as of 31 December 2015.

6 Remuneration

(in USD million, except average number of employees)	2016	Full year 2015	2014
Salaries[1)]	2,576	2,791	3,698
Pension costs	650	846	544
Payroll tax	394	419	548
Other compensations and social costs	276	312	376
Total payroll costs	3,895	4,369	5,166
Average number of employees[2)]	21,300	22,300	23,300

1) Salaries include bonuses, severance packages and expatriate costs in addition to base pay.
2) Part time employees amount to 3%, 3% and 2% for the years 2016, 2015 and 2014 respectively.

Total payroll expenses are accumulated in cost-pools and partly charged to partners of Statoil operated licences on an hours incurred basis.

Compensation to the board of directors (BoD) and the corporate executive committee (CEC)
Remuneration to members of the BoD and the CEC during the year was as follows:

(in USD thousand)[1]	2016	Full year 2015	2014
Current employee benefits	9,270	11,436	11,624
Post-employment benefits	574	799	2,064
Other non-current benefits	19	15	0
Share-based payment benefits	102	167	175
Total	9,966	12,418	13,863

1) All figures in the table are presented on accrual basis.

At 31 December 2016, 2015 and 2014 there are no loans to the members of the BoD or the CEC.

Share-based compensation
Statoil's share saving plan provides employees with the opportunity to purchase Statoil shares through monthly salary deductions and a contribution by Statoil. If the shares are kept for two full calendar years of continued employment following the year of purchase, the employees will be allocated one bonus share for each one they have purchased.

Estimated compensation expense including the contribution by Statoil for purchased shares, amounts vested for bonus shares granted and related social security tax was USD 61 million, USD 77 million and USD 94 million related to the 2016, 2015 and 2014 programs, respectively. For the 2017 program (granted in 2016) the estimated compensation expense is USD 62 million. At 31 December 2016 the amount of compensation cost yet to be expensed throughout the vesting period is USD 138 million.

7 Other expenses

Auditor's remuneration

(in USD million, excluding VAT)	2016	Full year 2015	2014
Audit fee	6.5	6.1	7.1
Audit related fee	1.0	1.7	1.3
Tax fee	0.1	0.0	0.0
Other service fee	0.0	0.0	0.0
Total	7.5	7.9	8.4

In addition to the figures in the table above, the audit fees and audit related fees related to Statoil operated licences amount to USD 0.8 million, USD 0.9 million and USD 1.0 million for 2016, 2015 and 2014, respectively.

Research and development expenditures
Research and development (R&D) expenditures were USD 298 million, USD 344 million and USD 476 million in 2016, 2015 and 2014, respectively. R&D expenditures are partly financed by partners of Statoil operated licenses. Statoil's share of the expenditures has been recognised as expense in the Consolidated statement of income.

8 Financial items

(in USD million)	Full year 2016	2015	2014
Foreign exchange gains (losses) derivative financial instruments	353	548	(198)
Other foreign exchange gains (losses)	(473)	(793)	(109)
Net foreign exchange gains (losses)	(120)	(245)	(307)
Dividends received	46	42	42
Gains (losses) financial investments	(0)	47	176
Interest income financial investments	63	76	111
Interest income non-current financial receivables	22	23	19
Interest income current financial assets and other financial items	305	208	281
Interest income and other financial items	436	396	628
Gains (losses) derivative financial instruments	470	(491)	904
Interest expense bonds and bank loans and net interest on related derivatives	(830)	(707)	(684)
Interest expense finance lease liabilities	(26)	(27)	(47)
Capitalised borrowing costs	355	392	250
Accretion expense asset retirement obligations	(420)	(481)	(597)
Interest expense current financial liabilities and other finance expense	(122)	(147)	(127)
Interest and other finance expenses	(1,043)	(971)	(1,205)
Net financial items	(258)	(1,311)	20

Statoil's main financial items relate to assets and liabilities categorised in the held for trading category and the amortised cost category. For more information about financial instruments by category see note 25 Financial instruments: fair value measurement and sensitivity analysis of market risk.

The line item interest expense bonds and bank loans and net interest on related derivatives primarily includes interest expenses of USD 1,018 million, USD 1,041 million and USD 1,079 million from the financial liabilities at amortised cost category. This was partly offset by net interest on related derivatives from the held for trading category, USD 188 million, USD 334 million and USD 395 million for 2016, 2015 and 2014, respectively.

The line item gains (losses) derivative financial instruments primarily includes fair value gain from the held for trading category of USD 454 million, a loss of USD 492 million and a gain of USD 897 million for 2016, 2015 and 2014, respectively.

Foreign exchange gains (losses) derivative financial instruments include fair value changes of currency derivatives related to liquidity and currency risk. The line item foreign exchange gains (losses) includes a net foreign exchange loss of USD 205 million, a loss of USD 1,208 million and a loss of USD 2,120 million from the held for trading category for 2016, 2015 and 2014, respectively.

9 Income taxes

Significant components of income tax expense

(in USD million)	Full year 2016	2015	2014
Current income tax expense in respect of current year	(3,869)	(6,488)	(14,299)
Prior period adjustments	(158)	(91)	307
Current income tax expense	(4,027)	(6,579)	(13,993)
Origination and reversal of temporary differences	1,372	1,519	29
Change in tax regulations	(50)	(90)	(19)
Prior period adjustments	(20)	(74)	(29)
Deferred tax expense	1,302	1,355	(19)
Income tax expense	(2,724)	(5,225)	(14,011)

During the normal course of its business, Statoil files tax returns in many different tax regimes. There may be differing interpretation of applicable tax laws and regulations regarding some of the matters in the tax returns. In certain cases it may take several years to complete the discussions with the relevant tax authorities or to reach a resolution of the tax positions through litigations. Statoil has provided for probable income tax related assets and liabilities based on best estimates reflecting consistent interpretations of the applicable laws and regulations.

Reconciliation of statutory tax rate to effective tax rate

(in USD million)	Full year 2016	2015	2014
Income before tax	(178)	55	17,898
Calculated income tax at statutory rate[1)]	676	1,078	(5,139)
Calculated Norwegian Petroleum tax[2)]	(2,250)	(4,145)	(9,960)
Tax effect uplift[2)]	812	847	980
Tax effect of permanent differences regarding divestments	153	468	911
Tax effect of permanent differences caused by functional currency different from tax currency	(356)	719	762
Tax effect of other permanent differences	(48)	(2)	(298)
Change in unrecognised deferred tax assets	(1,625)	(3,557)	(1,299)
Change in tax regulations	(50)	(90)	(19)
Prior period adjustments	(177)	(165)	278
Other items including currency effects	141	(376)	(228)
Income tax expense	(2,724)	(5,225)	(14,011)
Effective tax rate	>(100%)	>100%	78.3%

1) The weighted average of statutory tax rates was positive 379.8% in 2016, negative 1,950.2% in 2015 and positive 28.7% in 2014. The high tax rate in 2016, the negative rate in 2015 and the change in average statutory tax rates from 2015 to 2016 is mainly caused by earnings composition between tax regimes with lower statutory tax rates and tax regimes with higher statutory tax rates. In both years there are positive income in tax regimes with relatively lower tax rates and losses, including impairments and provisions, in tax regimes with relatively higher tax rates. The decrease from 2014 to 2015 was mainly caused by losses, impairments and provisions in entities with higher than average statutory tax rates.

2) When computing the petroleum tax of 53% (54% from 2017) on income from the Norwegian continental shelf, an additional tax-free allowance, or uplift, is granted at a rate of 5.5% per year (5.4% per year from 2017 for new investments) on the basis of the original capitalised cost of offshore production installations. For investments made prior to 5 May 2013, the rate is 7.5% per year. Transitional rules apply to investments from 5 May 2013 covered by among others Plans for development and operation (PDOs) or Plans for installation and operation (PIOs) submitted to the Ministry of Oil and Energy prior to 5 May 2013. The uplift may be deducted from taxable income for a period of four years, starting in the year in which the capital expenditure is incurred. Unused uplift may be carried forward indefinitely. At year end 2016 and 2015, unrecognised uplift credits amounted to USD 2,121 million and USD 2,333 million, respectively.

Deferred tax assets and liabilities comprise

(in USD million)	Tax losses carried forward	Property, plant and equipment and Intangible assets	Asset removal obligation	Pensions	Derivatives	Other	Total
Deferred tax at 31 December 2016							
Deferred tax assets	4,283	233	7,078	743	138	849	13,323
Deferred tax liabilities	0	(16,797)	0	0	(270)	(488)	(17,555)
Net asset (liability) at 31 December 2016	4,283	(16,564)	7,078	743	(132)	361	(4,231)
Deferred tax at 31 December 2015							
Deferred tax assets	4,743	185	6,980	578	7	797	13,291
Deferred tax liabilities	(0)	(16,731)	0	(0)	(928)	(1,032)	(18,691)
Net asset (liability) at 31 December 2015	4,743	(16,545)	6,980	578	(920)	(235)	(5,399)

Changes in net deferred tax liability during the year were as follows:

(in USD million)	2016	2015	2014
Net deferred tax liability at 1 January	5,399	7,881	10,317
Charged (credited) to the Consolidated statement of income	(1,302)	(1,355)	19
Other comprehensive income	(129)	461	56
Translation differences and other	264	(1,588)	(2,510)
Net deferred tax liability at 31 December	4,231	5,399	7,881

Deferred tax assets and liabilities are offset to the extent that the deferred taxes relate to the same fiscal authority, and there is a legally enforceable right to offset current tax assets against current tax liabilities. After netting deferred tax assets and liabilities by fiscal entity, deferred taxes are presented on the balance sheet as follows:

(in USD million)	At 31 December 2016	2015
Deferred tax assets	2,195	2,022
Deferred tax liabilities	6,427	7,421

Deferred tax assets are recognised based on the expectation that sufficient taxable income will be available through reversal of taxable temporary differences or future taxable income. At year end 2016 and 2015 the deferred tax assets of USD 2,195 million and USD 2,022 million, respectively, were primarily recognised in Norway, Angola, Brasil and the UK.

Unrecognised deferred tax assets

	At 31 December			
	2016		2015	
(in USD million)	Basis	Tax	Basis	Tax
Deductible temporary differences	3,431	1,360	2,448	1,010
Tax losses carried forward	17,440	6,557	14,329	5,297
Total	20,871	7,917	16,776	6,307

Approximately 9% of the unrecognised carry forward tax losses can be carried forward indefinitely. The majority of the remaining part of the unrecognised tax losses expire after 2027. The unrecognised deductible temporary differences do not expire under the current tax legislation. Deferred tax assets have not been recognised in respect of these items because currently there is insufficient evidence to support that future taxable profits will be available to secure utilisation of the benefits.

At year end 2016 unrecognised deferred tax assets in the US and Angola represents USD 5,655 million and USD 800 million of the total unrecognised deferred tax assets of USD 7,917 million. Similar amounts for 2015 were USD 4,461 million in the US and USD 643 million in Angola of a total of USD 6,307 million.

10 Property, plant and equipment

(in USD million)	Machinery, equipment and transportation equipment, including vessels	Production plants and oil and gas assets	Refining and manufacturing plants	Buildings and land	Assets under development	Total
Cost at 31 December 2015	3,466	133,269	7,459	928	20,284	165,406
Additions and transfers	62	11,960	776	70	(2,148)	10,720

Estimated useful lives (years)	3-20	UoP [2]	15 - 20	20 - 33		

1) Includes USD 445 million related to change in the classification of Statoil's investment in joint operation (pro-rata line by line consolidation)/full consolidation to joint venture (equity method), mainly related to Dudgeon Offshore Wind Ltd (USD 341 million).
2) Depreciation according to unit of production method (UoP), see note 2 Significant accounting policies.

The carrying amount of assets transferred to Property, plant and equipment from Intangible assets in 2016 and 2015 amounted to USD 692 million and USD 332 million, respectively.

Impairments

(in USD million)	Property, plant and equipment	Intangible assets[3]	Total
At 31 December 2016			
Producing and development assets[1]	1,301	590	1,890
Acquisition costs related to oil and gas prospects[2]	0	403	403
Total net impairment losses recognised	1,301	992	2,293
At 31 December 2015			
Producing and development assets[1]	5,526	1,263	6,788
Goodwill[1]	0	539	539
Acquisition costs related to oil and gas prospects[2]	0	688	688
Total net impairment losses recognised	5,526	2,490	8,015

1) Producing and development assets and goodwill are subject to impairment assessment under IAS 36. The total net impairment losses recognised under IAS 36 in 2016 and 2015 amount to USD 1,890 million and USD 7,327 million, respectively, including impairment of acquisition costs - oil and gas prospects (intangible assets).
2) Acquisition costs related to exploration activities, subject to impairment assessment under the successful efforts method (IFRS 6).
3) See note 11 Intangible assets.

In assessing the need for impairment of the carrying amount of a potentially impaired asset, the asset's carrying amount is compared to its recoverable amount. The recoverable amount is the higher of fair value less cost of disposal (FVLCOD) and estimated value in use (VIU).

The base discount rate for VIU calculations is 6.0% real after tax (2015: 6.5%). The discount rate is derived from Statoil's weighted average cost of capital. A derived pre-tax discount rate would generally be in the range of 8-12%, depending on asset specific characteristics, such as specific tax treatments, cash flow profiles and economic life. For certain assets a pre-tax discount rate could be outside this range, mainly due to special tax elements (for example permanent differences) affecting the pre-tax equivalent. See note 2 Significant accounting policies for further information regarding impairment on property, plant and equipment.

		2016		2015	
(in USD million)	Impairment method	Carrying amount after impairment 1)	Net impairment loss	Carrying amount after impairment 1)	Net impairment loss

	FVLCOD	0	0	0	0
Total		16,286	1,890	17,525	7,327

1) Carrying amount relates to assets impaired/reversed.

During 2016 net impairment losses of USD 1,890 million were recognised on producing and development assets mainly due to downward revision of long-term commodity price assumptions. For 2015 the net impairment losses recognised were USD 7,327 million primarily due to declining commodity prices.

Development and Production Norway (DPN)
In the DPN segment net impairment losses of USD 829 million were recognised in 2016, which were mainly related to conventional offshore assets in the development phase. The net impairment losses were triggered by reduction in commodity price assumptions. In 2015 impairment losses of USD 1,074 million were recognised.

Development and Production International (DPI)
In the DPI segment net impairment losses of USD 1,130 million were recognised in 2016 of which USD 1,357 million, including a reversal of USD 571 million, related to unconventional onshore assets in North America. The loss includes impairment of Kai Kos Dehseh, classified as held for sale as of 31 December 2016. In addition, impairment reversals of USD 780 million and impairment losses of USD 553 million were recognised in relation to conventional assets. Net impairment losses of USD 541 million were recognised as Depreciation, amortisation and net impairment losses and net impairment losses of USD 590 million related to signature bonuses and acquisition costs recognised as Exploration expenses. In 2015 impairment losses of USD 6,678 million were recognised.

The net impairment losses were mainly a result from reduced long term commodity price assumptions partly offset by increased short term prices, operational performance improvements and cost reductions.

Marketing, Midstream and Processing (MMP)
The MMP segment recognised a net impairment reversal of USD 74 million mainly related to a refinery. The reversal of impairment was triggered by increased refinery margins and operational and commercial improvements. In 2015 net reversal of USD 425 million were recognised.

The recoverable amount of assets tested for impairment was mainly based on Value in Use (VIU) estimates on the basis of internal forecasts on costs, production profiles and commodity prices. In fourth quarter, the downward revision of the long term price forecast constituted the most important impairment indicator. Business plan updates including improved production profiles, more efficient operations and lower costs in addition to increased short term commodity prices partially offsets the effect of lower long term prices. Short term commodity prices (2017 - 2019) are forecasted by using observable forward prices for 2017 and a linear projection towards the 2020 internal forecast. In 2015 the observable forward prices were used for the first three years.

Recoverable amount for assets measured at Fair Value Less Cost of Disposal (FVLCOD) have partially been established through comparisons with observed market transactions and bids, and partially through internally prepared net present value estimates using assumed market participant assumptions.

The price assumptions used for impairment calculations were as follows (prices used in 2015 impairment calculations for the respective years are indicated in brackets):

Year (Prices in real terms)	2017		2020		2025		2030	
Brent Blend - USD/bbl	55	(45)	75	(83)	78	(92)	80	(100)
NBP - USD/mmbtu	6.0	(4.9)	6.0	(8.0)	8.0	(9.0)	8.0	(9.2)
Henry Hub - USD/mmbtu	3.4	(2.7)	4.0	(4.2)	4.0	(4.4)	4.0	(4.6)

Sensitivities
Commodity prices have historically been volatile. Significant further downward adjustments of Statoil's commodity price assumptions would result in impairment losses on certain producing and development assets in Statoil's portfolio. If a further decline in commodity price forecasts over the lifetime of the assets were 20%, considered to represent a reasonably likely change, the impairment amount to be recognised could illustratively be in the region of USD 8 billion before tax effects. This illustrative impairment sensitivity assumes no changes to input factors other than prices; however, a price reduction of 20% is likely to result in changes in business plans as well as other factors used when estimating an asset's recoverable amount. Changes in such input factors would likely significantly reduce the actual impairment amount compared to the illustrative sensitivity above. Changes that could be expected would include a reduction in the cost level in the oil and gas industry as well as offsetting currency effects, both of which have historically occurred following significant changes in commodity prices. The illustrative sensitivity is therefore not considered to represent a best estimate of an expected impairment impact, nor an estimated impact on revenues or operating income in such a scenario. A significant and prolonged reduction in oil and gas prices would also result in mitigating actions by Statoil and its license partners, as a reduction of oil and gas prices would impact drilling plans and production profiles for new and existing assets. Quantifying such impacts is considered impracticable, as it requires detailed technical, geological and economical evaluations based on hypothetical scenarios and not based on existing business or development plans.

11 Intangible assets

(in USD million)	Exploration expenses	Acquisition costs - oil and gas prospects	Goodwill	Other	Total
Cost at 31 December 2015	3,701	5,207	1,565	402	10,875

Carrying amount at 31 December 2015	3,701	5,207	323	220	9,452

The useful lives of intangible assets are assessed to be either finite or indefinite. Intangible assets with finite useful lives are amortised systematically over their estimated economic lives, ranging between 10-20 years.

During 2016, intangible assets were impacted by impairments of acquisition costs related to exploration activities of USD 403 million primarily as a result from dry wells and uncommercial discoveries in Gulf of Mexico, South America and Angola. Additionally, Statoil recognised impairments of signature bonuses and acquisition costs totalling USD 590 million.

Impairment losses and reversals of impairment losses are presented as Exploration expenses and Depreciation, amortisation and net impairment losses on the basis of their nature as exploration assets (intangible assets) and other intangible assets, respectively. The impairment losses and reversal of impairment losses are based on recoverable amount estimates triggered by changes in reserve estimates, cost estimates and market conditions. See note 10 Property, plant and equipment for more information on the basis for impairment assessments.

The table below shows the aging of capitalised exploration expenditures.

(in USD million)	2016	2015
Less than one year	311	1,448
Between one and five years	2,216	1,923
More than five years	329	331
Total	2,856	3,701

The table below shows the components of the exploration expenses.

(in USD million)	2016	Full year 2015	2014
Exploration expenditures	1,437	2,860	3,730
Expensed exploration expenditures previously capitalised	1,800	2,164	2,097
Capitalised exploration	(285)	(1,151)	(1,161)
Exploration expenses	2,952	3,872	4,666

Summary financial information of equity accounted investments

The following table provides summarised financial information relating to Lundin Petroleum AB. This information is presented on a 20.1% basis and also reflects adjustments made by Statoil to Lundin Petroleum AB's own results in applying the equity method of accounting. Statoil adjusts Lundin Petroleum AB's results for depreciation of excess values determined in the purchase price allocation at the date of acquisition. Where there are significant differences in accounting policies, adjustments are made to bring the accounting policies applied in line with Statoil's. These adjustments have decreased the reported net income for 2016, as shown in the table below, compared with the equivalent amount reported by Lundin Petroleum AB.

	Lundin Petroleum AB
(in USD million)	2016
At 31 December	
Current assets	69
Non-Current assets	3,069
Current liabilities	(70)
Non-Current liabilities	(1,947)
Net assets	1,121
Year ended 31 December	
Gross revenues[1)]	135
Income before tax[1)]	(83)
Net income[1)]	(78)
Capital expenditures[1)]	589

1) For the period 30 June to 31 December 2016.

Statoil has not received dividends from Lundin Petroleum AB for 2016.

Statoil's quoted market value as per 31.12.2016 was USD 1.496 billion.

13 Financial investments and non-current prepayments

Non-current financial investments

(in USD million)	At 31 December 2016	2015
Bonds	1,362	1,412
Listed equity securities	731	715
Non-listed equity securities	251	209
Financial investments	2,344	2,336

Bonds and listed equity securities relate to investment portfolios which are held by Statoil's captive insurance company and accounted for using the fair value option.

Non-current prepayments and financial receivables

(in USD million)	At 31 December 2016	2015
Financial receivables interest bearing	707	764
Prepayments and other non-interest bearing receivables	185	203
Prepayments and financial receivables	893	967

Financial receivables interest bearing primarily relate to project financing of equity accounted companies and loans to employees.

Current financial investments

(in USD million)	At 31 December 2016	2015
Time deposits	3,242	2,166
Interest bearing securities	4,995	7,650
Financial investments	8,211	9,817

At 31 December 2016 current financial investments include USD 818.3 million investment portfolios which are held by Statoil's captive insurance company and accounted for using the fair value option. The corresponding balance at 31 December 2015 was USD 677.2 million.

For information about financial instruments by category, see note 25 Financial instruments: fair value measurement and sensitivity analysis of market risk.

14 Inventories

(in USD million)	At 31 December 2016	2015
Crude oil	1,966	1,210
Petroleum products	744	580
Natural gas	160	294
Other	358	419
Inventories	3,227	2,502

Higher inventory level of crude oil at 31 December is mainly related to higher prices and in-transit volumes. Other inventory consists of spare parts and operational materials, including drilling and well equipment.

The write-down of inventories from cost to net realisable value amounted to an expense of USD 74 million and USD 439 million in 2016 and 2015, respectively.

15 Trade and other receivables

(in USD million)	At 31 December 2016	2015
Trade receivables	5,504	4,464
Current financial receivables	862	736
Joint venture receivables	592	574
Equity accounted investments and other related party receivables	116	60
Total financial trade and other receivables	7,074	5,834
Non-financial trade and other receivables	765	837
Trade and other receivables	7,839	6,671

For more information about the credit quality of Statoil's counterparties, see note 5 Financial risk management. For currency sensitivities, see note 25 Financial instruments: fair value measurement and sensitivity analysis of market risk.

16 Cash and cash equivalents

(in USD million)	At 31 December 2016	2015
Cash at bank available	596	1,047
Time deposits	1,660	1,494
Money market funds	65	450
Interest bearing securities	2,234	5,091
Restricted cash, including margin deposits	535	540
Cash and cash equivalents	5,090	8,623

Restricted cash at 31 December 2016 and 2015 includes collateral deposits related to trading activities of USD 398 million and USD 411 million, respectively. Collateral deposits are related to certain requirements set out by exchanges where Statoil is participating. The terms and conditions related to these requirements are determined by the respective exchanges.

17 Shareholders' equity and dividends

At 31 December 2016, Statoil's share capital of NOK 8,112,623,527.50 (USD 1,155,993,270) comprised 3,245,049,411 shares at a nominal value of NOK 2.50. Share capital at 31 December 2015 was NOK 7,971,617,757.50 (USD 1,138,981,520) comprised 3,188,647,103 shares at a nominal value of NOK 2.50.

Statoil ASA has only one class of shares and all shares have voting rights. The holders of shares are entitled to receive dividends as and when declared and are entitled to one vote per share at general meetings of the company.

Dividends declared per share were USD 0.2201 for the first three quarters of 2016. The board of directors will propose to the annual general meeting to maintain a dividend of USD 0.2201 per ordinary share for the fourth quarter, and continue the scrip programme giving shareholders the option to receive the dividend for the fourth quarter in cash or newly issued shares in Statoil at 5% discount.

As part of Statoil's scrip dividend program, approved by Statoil's general assembly in May 2016, eligible shareholders can elect to receive their dividend in the form of new ordinary Statoil shares or in cash. For ADR (American Depository Receipts) holders, dividend can be received in the form of ADSs (American Depository Shares) or in cash. The subscription price for the dividend shares will have a discount compared to the volume-weighted average price on OSE of the last two trading days of the subscription period for each quarter. For the fourth quarter of 2015 and for the first, second and third quarter of 2016 the discount has been set at 5%.

During 2016 dividend for the third and for the fourth quarter of 2015 and dividend for the first and second quarter of 2016 were settled. Dividend declared but not yet settled, is presented as dividends payable in the Consolidated balance sheet, regardless of whether the dividend is expected to be paid in cash or by issuance of new shares. The Consolidated statement of changes in equity shows declared dividend in the period (retained earnings), offset by scrip dividend settled during the period (share capital and additional paid-in-capital). Dividend declared in 2016 relate to the fourth quarter of 2015 and to the first three quarters of 2016.

(in USD million)	At 31 December 2016	2015
Dividends declared	2,824	2,930
US dollar per share or ADS	0.8804	0.9173 1)
Dividends paid in cash	1,876	2,836
US dollar per share or ADS	0.8804	0.9034
Norwegian kroner per share	7.3364	7.2000
Scrip dividends	904	-
Number of shares issued (millions)	56.4	-
Sum dividends settled	2,780	2,836

1) Dividend for the fourth quarter 2014 and for the first quarter 2015 declared in NOK and translated to USD at currency rate on declaration date.

During 2016 a total of 4,011,860 treasury shares were purchased for USD 62 million and 3,882,153 treasury shares were allocated to employees participating in the share saving plan. In 2015 a total of 4,057,902 treasury shares were purchased for USD 69 million and 3,203,968 treasury shares were allocated to employees participating in the share saving plan. At 31 December 2016 Statoil had 11,138,890 treasury shares and at 31 December 2015 11,009,183 treasury shares, all of which are related to Statoil's share saving plan. For further information, see note 6 Remuneration.

18 Finance debt

Capital management

The main objectives of Statoil's capital management policy are to maintain a strong financial position and to ensure sufficient financial flexibility. One of the key ratios in the assessment of Statoil's financial robustness is net interest-bearing debt adjusted (ND) to capital employed adjusted (CE).

(in USD million)	At 31 December 2016	2015
Net interest-bearing debt adjusted (ND)	19,389	14,748
Capital employed adjusted (CE)	54,490	55,055
Net debt to capital employed adjusted (ND/CE)	35.6%	26.8%

ND is defined as Statoil's interest bearing financial liabilities less cash and cash equivalents and current financial investments, adjusted for collateral deposits and balances held by Statoil's captive insurance company (amounting to USD 1,216 million and USD 1,111 million for 2016 and 2015, respectively) and balances related to the SDFI (amounting to USD 199 million and USD 214 million for 2016 and 2015, respectively) CE is defined as Statoil's total equity (including non-controlling interests) and ND.

Non-current finance debt

Finance debt measured at amortised cost

	Weighted average interest rates in %[1]		Carrying amount in USD millions at 31 December		Fair value in USD millions at 31 December[2]	
	2016	2015	2016	2015	2016	2015
Unsecured bonds						
United States Dollar (USD)	3.54	3.51	19,712	20,768	20,681	21,630
Euro (EUR)	2.10	2.28	8,211	7,201	8,884	7,495
Great Britain Pound (GBP)	6.08	6.08	1,693	2,040	2,475	2,698
Norwegian kroner (NOK)	4.18	4.18	348	341	386	378
Total			29,964	30,350	32,427	32,201
Unsecured loans						
Japanese yen (JPY)	4.30	4.30	85	83	88	89
Secured bank loans						
Norwegian kroner (NOK)	-	3.11	-	52	-	52
Finance lease liabilities			507	580	526	575
Total			592	715	614	716
Total finance debt			30,556	31,065	33,041	32,918
Less current portion			2,557	1,100	2,584	1,100
Non-current finance debt			27,999	29,965	30,457	31,818

1) Weighted average interest rates are calculated based on the contractual rates on the loans per currency at 31 December and do not include the effect of swap agreements.
2) The fair value of the non-current financial liabilities is determined using a discounted cash flow model and is classified at level 2 in the fair value hierarchy. Interest rates used in the model are derived from the LIBOR and EURIBOR forward curves and will vary based on the time to maturity for the non-current financial liabilities. The credit premium used is based on indicative pricing from external financial institutions.

Unsecured bonds amounting to USD 19,712 million are denominated in USD and unsecured bonds amounting to USD 7,420 million are swapped into USD. Four bonds denominated in EUR amounting to USD 2,832 million are not swapped. The table does not include the effects of agreements entered into to swap the various currencies into USD. For further information see note 25 Financial instruments: fair value measurement and sensitivity analysis of market risk.

Substantially all unsecured bond and unsecured bank loan agreements contain provisions restricting future pledging of assets to secure borrowings without granting a similar secured status to the existing bondholders and lenders.

In 2016 Statoil issued the following bonds:

Issuance date	Amount in EUR billion	Interest rate in %	Maturity date
9 November 2016	0.60	0.750	November 2026
9 November 2016	0.60	1.625	November 2036

Out of Statoil's total outstanding unsecured bond portfolio, 47 bond agreements contain provisions allowing Statoil to call the debt prior to its final redemption at par or at certain specified premiums if there are changes to the Norwegian tax laws. The carrying amount of these agreements is USD 29,616 million at the 31 December 2016 closing exchange rate.

For more information about the revolving credit facility, maturity profile for undiscounted cash flows and interest rate risk management, see note 5 Financial risk management.

Non-current finance debt maturity profile

(in USD million)	At 31 December 2016	2015
Year 2 and 3	6,478	6,234
Year 4 and 5	3,798	4,881
After 5 years	17,723	18,850
Total repayment of non-current finance debt	27,999	29,965
Weighted average maturity (years)	9	9
Weighted average annual interest rate (%)	3.41	3.39

More information regarding finance lease liabilities is provided in note 22 Leases.

Current finance debt

(in USD million)	At 31 December 2016	2015
Collateral liabilities	571	1,161
Non-current finance debt due within one year	2,557	1,100
Other including bank overdraft	545	66
Total current finance debt	3,674	2,326
Weighted average interest rate (%)	1.61	1.90

Collateral liabilities and other current liabilities relate mainly to cash received as security for a portion of Statoil's credit exposure and outstanding amounts on US Commercial paper (CP) programme. At 31 December USD 500 million were issued on the CP programme. Corresponding at 31 December 2015 there were no outstanding amounts.

19 Pensions

The main pension plans for Statoil ASA and its most significant subsidiaries are defined contribution plans, in which the pension costs are recognised in the Consolidated statement of income in line with payments of annual pension premiums. The pension contribution plans in Statoil ASA also includes certain unfunded elements (notional contribution plans), for which the annual notional contributions are recognised as pension liabilities. These notional pension liabilities are regulated equal to the return on asset within the main contribution plan. See note 2 Significant accounting policies for more information about the accounting treatment of the notional contribution plans reported in Statoil ASA.

In addition, Statoil ASA has a closed defined benefit plan for employees which in 2015 had less than 15 years of future service before their regular retirement age, and for employees in certain subsidiaries. Statoil's defined benefit plans are generally based on a minimum of 30 years of service and 66% of the final salary level, including an assumed benefit from the Norwegian National Insurance Scheme. The Norwegian companies in the group are subject to, and complies with, the requirements of the Norwegian Mandatory Company Pensions Act.

The defined benefit plans in Norway are managed and financed through Statoil Pensjon (Statoil's pension fund - hereafter "Statoil Pension"). Statoil Pension is an independent pension fund that covers the employees in Statoil's Norwegian companies. The pension fund's assets are kept separate from the company's and group companies' assets. Statoil Pension is supervised by the Financial Supervisory Authority of Norway ("Finanstilsynet") and is licensed to operate as a pension fund.

Statoil is a member of a Norwegian national agreement-based early retirement plan ("AFP"), and the premium is calculated on the basis of the employees' income between 1 and 7.1 G. The premium is payable for all employees until age 62. Pension from the AFP scheme will be paid from the AFP plan administrator to employees for their full lifetime. Statoil has determined that its obligations under this multi-employer defined benefit plan can be estimated with sufficient reliability for recognition purposes. Accordingly, the estimated proportionate share of the AFP plan is recognised as a defined benefit obligation.

The present values of the defined benefit obligation, except for the notional contribution plan, and the related current service cost and past service cost are measured using the projected unit credit method. The assumptions for salary increases, increases in pension payments and social security base amount are based on agreed regulation in the plans, historical observations, future expectations of the assumptions and the relationship between these assumptions. At 31 December 2016 the discount rate for the defined benefit plans in Norway was established on the basis of seven years' mortgage covered bonds interest rate extrapolated on a yield curve which matches the duration of Statoil's payment portfolio for earned benefits, which was calculated to be 17.4 years at the end of 2016. Social security tax is calculated based on a pension plan's net funded status and is included in the defined benefit obligation.

Statoil has more than one defined benefit plan, but the disclosure is made in total since the plans are not subject to materially different risks. Pension plans outside Norway are not material and as such not disclosed separately. The pension costs in Statoil ASA are partly re-charged to license partners.

Net pension cost

(in USD million)	2016	2015	2014
Current service cost	238	378	751
Interest cost	192	191	496
Interest (income) on plan asset	(148)	(145)	(409)
Past service cost	2	-	(1)
Losses (gains) from curtailment, settlement or plan amendment	109	250	(298)
Actuarial (gains) losses related to termination benefits	59	(1)	(27)
Notional contributions	50	36	-
Defined benefit plans	503	709	512
Defined contribution plans	148	135	32
Total net pension cost	650	844	544

New entrants for the early retirement plans have been included as a settlement cost. The total impact in 2016 was USD 123 million and USD 173 million in 2015.

(in USD million)	2016	2015
Defined benefit obligations (DBO)		
Defined benefit obligations at 1 January	6,822	8,745
Current service cost	239	378
Interest cost	192	191
Actuarial (gains) losses - Financial assumptions	879	(703)
Actuarial (gains) losses - Experience	(282)	(369)
Benefits paid	(235)	(233)
Losses (gains) from curtailment, settlement or plan amendment[1)]	171	253
Paid-up policies	(131)	(143)
Foreign currency translation	87	(1,332)
Changes in notional contribution liability	50	34
Defined benefit obligations at 31 December	7,791	6,822
Fair value of plan assets		
Fair value of plan assets at 1 January	5,127	6,066
Interest income	148	145
Return on plan assets (excluding interest income)	76	69
Company contributions	22	35
Benefits paid	(80)	(70)
Paid-up policies and personal insurance	(92)	(208)
Foreign currency translation	50	(911)
Fair value of plan assets at 31 December	5,250	5,127
Net pension liability at 31 December	(2,541)	(1,695)
Represented by:		
Asset recognised as non-current pension assets (funded plan)	839	1,284
Liability recognised as non-current pension liabilities (unfunded plans)	(3,380)	(2,979)
DBO specified by funded and unfunded pension plans	7,791	6,822
Funded	4,423	3,849
Unfunded	3,368	2,974
Actual return on assets	131	207

The actuarial losses from changes in financial assumptions mainly relate to increased pension liabilities due to reduced interest rates and a higher expected rate of pension increase. For 2015 Statoil recognised a gain from an opposite movement of these assumptions.

Actuarial losses and gains recognised directly in Other comprehensive income (OCI)

(in USD million)	2016	2015	2014
Net actuarial (losses) gains recognised in OCI during the year	(482)	1,139	24
Actuarial (losses) gains related to currency effects on net obligation and foreign exchange translation	(21)	460	611
Tax effects of actuarial (losses) gains recognised in OCI	129	(461)	(56)
Recognised directly in OCI during the year net of tax	(374)	1,138	580
Cumulative actuarial (losses) gains recognised directly in OCI net of tax	(1,188)	(814)	(1,952)

Actuarial assumptions

	Assumptions used to determine benefit costs in %		Assumptions used to determine benefit obligations in %	
	2016	2015	2016	2015
Discount rate	2.75	2.50	2.50	2.75
Rate of compensation increase	2.25	2.25	2.25	2.25
Expected rate of pension increase	1.00	1.50	1.75	1.00
Expected increase of social security base amount (G-amount)	2.25	2.25	2.25	2.25
Weighted-average duration of the defined benefit obligation			17.4	17.1

The assumptions presented are for the Norwegian companies in Statoil which are members of Statoil's pension fund. The defined benefit plans of other subsidiaries are immaterial to the consolidated pension assets and liabilities.

Expected attrition at 31 December 2016 and 2015 was 0.4% and 0.1% for employees between 50-59 years and 60-67 years, respectively.

For population in Norway, the mortality table K2013, issued by The Financial Supervisory Authority of Norway, is used as the best mortality estimate.

Disability tables for plans in Norway developed by the actuary were implemented in 2013 and represent the best estimate to use for plans in Norway.

Sensitivity analysis

The table below presents an estimate of the potential effects of changes in the key assumptions for the defined benefit plans. The following estimates are based on facts and circumstances as of 31 December 2016.

	Discount rate		Expected rate of compensation increase		Expected rate of pension increase		Mortality assumption	
(in USD million)	0.50%	-0.50%	0.50%	-0.50%	0.50%	-0.50%	+ 1 year	- 1 year
Changes in:								
Defined benefit obligation at 31 December 2016	(605)	689	129	(121)	599	(542)	371	(384)
Service cost 2017	(24)	28	6	(6)	24	(22)	9	(10)

The sensitivity of the financial results to each of the key assumptions has been estimated based on the assumption that all other factors would remain unchanged. The estimated effects on the financial result would differ from those that would actually appear in the Consolidated financial statements because the Consolidated financial statements would also reflect the relationship between these assumptions.

Pension assets
The plan assets related to the defined benefit plans were measured at fair value. Statoil Pension invests in both financial assets and real estate.

Real estate properties owned by Statoil Pension amounted to USD 402 million and USD 386 million of total pension assets at 31 December 2016 and 2015, respectively, and are rented to Statoil companies.

The table below presents the portfolio weighting as approved by the board of Statoil Pension for 2016. The portfolio weight during a year will depend on the risk capacity.

(in %)	Pension assets on investments classes 2016	2015	Target portfolio weight
Equity securities	39.0	38.3	31 - 43
Bonds	41.1	40.3	36 - 48
Money market instruments	13.9	14.9	0 - 29
Real estate	5.4	5.0	5 - 10
Other assets	0.6	1.5	
Total	100.0	100.0	

In 2016 98% of the equity securities, 30% of bonds and 71% of money market instruments had quoted market prices in an active market (level 1). In 2015 100% of the equity securities, 38% of bonds and 100% of money market instruments had quoted market prices in an active market. For definition of the various levels, see note 25 *Financial instruments: fair value measurement and sensitivity analysis of market risk*.

No company contribution is expected to be paid to Statoil Pension in 2017.

20 Provisions

(in USD million)	Asset retirement obligations	Claims and litigations	Other provisions	Total
Non-current portion at 31 December 2015	10,632	1,116	675	12,422
Long term interest bearing provisions at 31 December 2015 reported as finance debt	-	-	27	27
Current portion at 31 December 2015 reported as trade and other payables	150	1,009	388	1,547
Provisions at 31 December 2015	10,782	2,124	1,090	13,997
New or increased provisions	660	256	2,046	2,962
Decrease in the estimates	(1,168)	(21)	(583)	(1,772)
Amounts charged against provisions	(221)	(3)	(195)	(420)
Effects of change in the discount rate	426	-	28	455
Reduction due to divestments	(41)	-	(0)	(41)
Accretion expenses	398	-	-	398
Reclassification and transfer	(44)	-	(0)	(45)
Currency translation	107	(0)	24	131
Provisions at 31 December 2016	10,899	2,356	2,409	15,664
Current portion at 31 December 2016 reported as trade and other payables	188	1,147	922	2,258
Non-current portion at 31 December 2016	10,711	1,209	1,487	13,406

Expected timing of cash outflows

(in USD million)	Asset retirement obligations	Other provisions, including claims and litigations	Total
2017 - 2021	1,233	4,340	5,574
2022 - 2026	1,849	78	1,927
2027 - 2031	1,760	27	1,788
2032 - 2036	3,306	21	3,328
Thereafter	2,751	298	3,048
At 31 December 2016	10,899	4,765	15,664

The claims and litigations category mainly relates to expected payments on unresolved claims. The timing and amounts of potential settlements in respect of these are uncertain and dependent on various factors that are outside management's control.

See also comments on provisions in note 23 Other commitments, contingent liabilities and contingent assets.

The other provisions category relates to expected payments on onerous contracts, cancellation fees and other. In 2016 Statoil recognised a provision amounting to USD 1 billion of which USD 0.3 billion is current portion for a contingent consideration related to the BM-S-8 acquisition in Brazil. For further information, see note 4 Acquisitions and dispositions.

For further information of methods applied and estimates required, see note 2 Significant accounting policies.

21 Trade, other payables and provisions

(in USD million)	At 31 December 2016	2015
Trade payables	2,358	2,052
Non-trade payables and accrued expenses	1,623	2,323
Joint venture payables	2,632	2,590
Equity accounted investments and other related party payables	620	622
Total financial trade and other payables	7,233	7,587
Current portion of provisions and other non-financial payables	2,433	1,746
Trade, other payables and provisions	9,666	9,333

Included in current portion of provisions and other non-financial payables are certain provisions that are further described in note 20 Provisions and in note 23 Other commitments, contingent liabilities and contingent assets. For information regarding currency sensitivities, see note 25 Financial instruments: fair value measurement and sensitivity analysis of market risk. For further information on payables to equity accounted investments and other related parties, see note 24 Related parties.

22 Leases

Statoil leases certain assets, notably drilling rigs, vessels and office buildings.

In 2016, net rental expenditures were USD 2,569 million (USD 3,439 million in 2015 and USD 3,637 million in 2014) consisting of minimum lease payments of USD 3,113 million (USD 4,046 million in 2015 and USD 4,505 million in 2014) reduced with sublease payments received of USD 558 million (USD 608 million in 2015 and USD 870 million in 2014). Net rental expenditures in 2016 include rig cancellation payments of USD 115 million. No material contingent rent payments have been expensed in 2016, 2015 or 2014.

The information in the table below shows future minimum lease payments due and receivable under non-cancellable operating leases at 31 December 2016:

	Operating leases						
(in USD million)	Rigs	Vessels	Land and buildings	Other	Total	Sublease	Net total
2017	1,099	592	143	158	1,993	(135)	1,857
2018	807	462	132	114	1,514	(100)	1,414
2019	624	336	126	94	1,179	(99)	1,080
2020	459	281	124	70	934	(97)	837
2021	324	223	123	52	723	(66)	657
2022-2026	572	396	591	91	1,650	(76)	1,574
2027-2031	-	105	408	29	542	-	542
Thereafter	-	-	100	15	114	-	114
Total future minimum lease payments	3,885	2,395	1,746	624	8,649	(573)	8,076

Statoil had certain operating lease contracts for drilling rigs at 31 December 2016. The remaining significant contracts' terms range from one month to eight years. Rig lease agreements are for the most part based on fixed day rates. Certain rigs have been subleased in whole or for part of the lease term mainly to Statoil operated licenses on the Norwegian continental shelf. These leases are shown gross as operating leases in the table above.

Statoil has a long-term time charter agreement with Teekay for offshore loading and transportation in the North Sea. The contract covers the lifetime of applicable producing fields and at year end 2016 includes three crude tankers. The contract's estimated nominal amount was approximately USD 650 million at year end 2016, and it is included in the category vessels in the table above.

The category land and buildings includes future minimum lease payments to related parties of USD 474 million regarding the lease of one office building located in Bergen and owned by Statoil`s pension fund ("Statoil Pension"). These operating lease commitments extend to the year 2034. USD 367 million of the total is payable after 2020.

Statoil had finance lease liabilities of USD 507 million at 31 December 2016. The nominal minimum lease payments related to these finance leases amount to USD 667 million. Property, plant and equipment includes USD 484 million for finance leases that have been capitalised at year end (USD 768 million in 2015), mainly presented in the category machinery, equipment and transportation equipment, including vessels in note 11 Property, plant and equipment.

Certain contracts contain renewal options. The execution of such options will depend on future market development and business needs at the time when such options are to be exercised.

23 Other commitments, contingent liabilities and contingent assets

Contractual commitments
Statoil had contractual commitments of USD 6,889 million at 31 December 2016. The contractual commitments reflect Statoil's share and mainly comprise construction and acquisition of property, plant and equipment as well as committed investments in equity accounted entities.

As a condition for being awarded oil and gas exploration and production licenses, participants may be committed to drill a certain number of wells. At the end of 2016, Statoil was committed to participate in 42 wells, with an average ownership interest of approximately 39%. Statoil's share of estimated expenditures to drill these wells amounts to USD 777 million. Additional wells that Statoil may become committed to participating in depending on future discoveries in certain licenses are not included in these numbers.

Other long-term commitments

Statoil has entered into various long-term agreements for pipeline transportation as well as terminal use, processing, storage and entry/exit capacity commitments and commitments related to specific purchase agreements. The agreements ensure the rights to the capacity or volumes in question, but also impose on Statoil the obligation to pay for the agreed-upon service or commodity, irrespective of actual use. The contracts' terms vary, with durations of up to 30 years.

Take-or-pay contracts for the purchase of commodity quantities are only included in the table below if their contractually agreed pricing is of a nature that will or may deviate from the obtainable market prices for the commodity at the time of delivery.

Obligations payable by Statoil to entities accounted for using the equity method are included gross in the table below. For assets (for example pipelines) that Statoil accounts for by recognising its share of assets, liabilities, income and expenses (capacity costs) on a line-by-line basis in the Consolidated financial statements, the amounts in the table include the net commitment payable by Statoil (i.e. gross commitment less Statoil's ownership share).

Nominal minimum other long-term commitments at 31 December 2016:

(in USD million)	
2017	1,483
2018	1,395
2019	1,262
2020	1,179
2021	1,021
Thereafter	5,513
Total	11,853

Long term commitments related to contracts in the process of being terminated, and for which the termination fee has been provided for in the accounts, are not included in the above table.

Guarantees

Statoil has guaranteed for its proportionate portion of an associate's long term bank debt, amounting to USD 160 million. The book value of the guarantee is immaterial.

Contingent liabilities and contingent assets

During the annual audits of Statoil's participation in Block 4, Block 15, Block 17 and Block 31 offshore Angola, the Angolan Ministry of Finance has assessed additional profit oil and taxes due on the basis of activities that currently include the years 2002 up to and including 2014. Statoil disputes the assessments and is pursuing these matters in accordance with relevant Angolan legal and administrative procedures. On the basis of the assessments and continued activity on the four blocks up to and including 2016, the exposure for Statoil at year end 2016 is estimated to USD 1,808 million, the most significant part of which relates to profit oil elements. Statoil has provided in the Consolidated financial statements for its best estimate related to the assessments, reflected in the Consolidated statement of income mainly as a revenue reduction, with additional amounts reflected as interest expenses and tax expenses, respectively.

Through its ownership in OML 128 in Nigeria, Statoil is party to an ownership interest redetermination process for the Agbami field. In October 2015, Statoil received the Expert's final ruling which implies a reduction of 5.17 percentage points in Statoil's equity interest in the field. Statoil had previously initiated arbitration proceedings to set aside interim decisions made by the Expert, but this was declined by the arbitration tribunal in its November 2015 judgment. Statoil has initiated proceedings before the Federal High Court in Lagos to set aside the arbitration award. In October 2016 Statoil also initiated a new arbitration to set aside the Expert's final ruling. Currently Statoil has two distinct, but connected, legal processes ongoing related to the Agbami redetermination. As of 31 December 2016, Statoil has recognised a provision of USD 1,104 million net of tax, which reflects a reduction of 5.17 percentage points in Statoil's equity interest in the Agbami field. The provision is reflected within Provisions in the Consolidated balance sheet.

Some long term gas sales agreements contain price review clauses. Certain counterparties have requested arbitration in connection with price review claims. The related exposure for Statoil has been estimated to an amount equivalent to approximately USD 374 million for gas delivered prior to year end 2016. Statoil has provided for its best estimate related to these contractual gas price disputes in the Consolidated financial statements, with the impact to the Consolidated statement of income reflected as revenue adjustments.

There is a dispute between the Nigerian National Petroleum Corporation (NNPC) and the partners (Contractor) in Oil Mining Lease (OML) 128 of the unitised Agbami field concerning interpretation of the terms of the OML 128 Production Sharing Contract (PSC). The dispute relates to the allocation between NNPC and Contractor of cost oil, tax oil and profit oil volumes. The Contractor initiated arbitration in the matter in accordance with the terms of the PSC. In 2015 the Arbitral Tribunal ruled in favour of Contractor's interpretation of the PSC on the main points. The Contractor is currently proceeding to enforce the favourable decision by the means available in the Nigerian legal system, while NNPC on its hand has initiated litigation concerning certain objections to the arbitration award. The Nigerian Federal Inland Revenue Service is also contesting the legality of the arbitration process as far as resolving tax related disputes goes, and in March 2017 the arbitration award was set aside by the Nigerian Federal High Court (FHC) based on the dispute having a tax nature and therefore being non-arbitrable. The Contractor will challenge this ruling in the Court of Appeal. The FHC's ruling will not impact Statoil's

2016 financial statements, as Statoil's stake in the dispute at year end mainly relates to oil volumes previously lifted by NNPC contrary to the PSC terms. NNPC has continued overlifting contrary to the arbitration award.

Brazilian tax authorities have issued an updated tax assessment for 2011 for Statoil's Brazilian subsidiary which was party to Statoil's divestment of 40% of the Peregrino field to Sinochem at that time. The assessment disputes Statoil's allocation of the sale proceeds between entities and assets involved, resulting in a significantly higher assessed taxable gain and related taxes payable in Brazil. Statoil disagrees with the assessment, and has provided an initial response to this effect. The process of formal communication with the Brazilian tax authorities, as well as any subsequent litigation that may become necessary, may take several years. No taxes will become payable until the matter has been finally settled. Statoil is of the view that all applicable tax regulations have been applied in the case and that the group has a strong position. No amounts have consequently been provided for in the accounts.

On 26 September 2016, the Norwegian Ministry of Finance (MoF) denied Statoil's appeal related to a 2014 order from the Financial Supervisory Authority of Norway to change the timing of a Cove Point related onerous contract provision to a financial period prior to the first quarter of 2013, in which Statoil originally reflected the provision. Statoil has decided not to pursue the matter further, as it does not impact any comparative financial periods presented in the annual Consolidated financial statements of 2016. Further reference is made to Note 23 Other commitments, contingent liabilities and contingent assets of Statoil's 2015 Financial Statements.

On 6 July 2016, the Norwegian tax authorities issued a deviation notice for the years 2012 to 2014 related to the internal pricing on certain transactions between Statoil Coordination Centre (SCC) in Belgium and Norwegian entities in the Statoil group. The main issue relates to SCC`s capital structure and its compliance with the arm's length principle. Statoil is of the view that arm's length pricing has been applied in these cases and that the group has a strong position, and no amounts have consequently been provided for in the accounts.

During the normal course of its business, Statoil is involved in legal proceedings, and several other unresolved claims are currently outstanding. The ultimate liability or asset, in respect of such litigation and claims cannot be determined at this time. Statoil has provided in its Consolidated financial statements for probable liabilities related to litigation and claims based on its best estimate. Statoil does not expect that its financial position, results of operations or cash flows will be materially affected by the resolution of these legal proceedings. Statoil is actively pursuing the above disputes through the contractual and legal means available in each case, but the timing of the ultimate resolutions and related cash flows, if any, cannot at present be determined with sufficient reliability.

Provisions related to claims are reflected within note 20 Provisions.

24 Related parties

Transactions with the Norwegian State
The Norwegian State is the majority shareholder of Statoil and also holds major investments in other Norwegian companies. As of 31 December 2016 the Norwegian State had an ownership interest in Statoil of 67.0% (excluding Folketrygdfondet, the Norwegian national insurance fund, of 3.2%). This ownership structure means that Statoil participates in transactions with many parties that are under a common ownership structure and therefore meet the definition of a related party. All transactions are considered to be on an arm's length basis.

Total purchases of oil and natural gas liquids from the Norwegian State amounted to USD 5,848 million, USD 7,431 million and USD 13,718 million in 2016, 2015 and 2014, respectively. Total purchases of natural gas regarding the Tjeldbergodden methanol plant from the Norwegian State amounted to USD 44 million, USD 68 million and USD 73 million in 2016, 2015 and 2014, respectively. These purchases of oil and natural gas are recorded in Statoil ASA. In addition, Statoil ASA sells in its own name, but for the Norwegian State's account and risk, the Norwegian State's gas production. These transactions are presented net. For further information please see note 2 Significant accounting policies. The most significant items included in the line item equity accounted investments and other related party payables in note 21 Trade and other payables, are amounts payable to the Norwegian State for these purchases.

Other transactions
In relation to its ordinary business operations Statoil enters into contracts such as pipeline transport, gas storage and processing of petroleum products, with companies in which Statoil has ownership interests. Such transactions are carried out on an arm's length basis and are included within the applicable captions in the Consolidated statement of income. Gassled and certain other infrastructure assets are operated by Gassco AS, which is an entity under common control by the Norwegian Ministry of Petroleum and Energy. Gassco's activities are performed on behalf of and for the risk and reward of pipeline and terminal owners, and capacity payments flow through Gassco to the respective owners. Statoil payments that flowed through Gassco in this respect amounted to USD 1,167 million, USD 1,105 million and USD 1,476 million in 2016, 2015 and 2014, respectively. These payments are recorded in Statoil ASA. In addition, Statoil ASA process in its own name, but for the Norwegian State's account and risk, the Norwegian State's share of the Gassco costs. These transactions are presented net.

On 30 June 2016, Statoil increased its ownership interest in Lundin Petroleum AB (Lundin) to 20.1% of the outstanding shares and votes. Since 30 June, total purchase of oil and related products from Lundin amounted to USD 155 million. The purchase of oil and related products is recorded in Statoil ASA. For more information concerning the Lundin acquisition, see note 4 Acquisitions and disposals.

For information concerning certain lease arrangements with Statoil Pension, see note 22 Leases.

Related party transactions with management are presented in note 6 Remuneration. Management remuneration for 2016 is presented in note 4 Remuneration in the financial statements of the parent company, Statoil ASA.

25 Financial instruments: fair value measurement and sensitivity analysis of market risk

Financial instruments by category

The following tables present Statoil's classes of financial instruments and their carrying amounts by the categories as they are defined in IAS 39 Financial Instruments: Recognition and Measurement. All financial instruments' carrying amounts are measured at fair value or their carrying amounts reasonably approximate fair value except non-current financial liabilities. See note 18 Finance debt for fair value information of non-current bonds, bank loans and finance lease liabilities.

See note 2 Significant accounting policies for further information regarding measurement of fair values.

Fair value hierarchy

The following table summarises each class of financial instruments which are recognised in the Consolidated balance sheet at fair value, split by Statoil's basis for fair value measurement.

(in USD million)	Non-current financial investments	Non-current derivative financial instruments - assets	Current financial investments	Current derivative financial instruments - assets	Cash equivalents	Non-current derivative financial instruments - liabilities	Current derivative financial instruments - liabilities	Net fair value
At 31 December 2016								
Level 1	1,095	-	516	-	-	-	-	1,611
Level 2	1,042	970	4,479	426	2,299	(1,414)	(503)	7,299
Level 3	207	848	-	66	-	(6)	(4)	1,110
Total fair value	2,344	1,819	4,994	492	2,299	(1,420)	(508)	10,019
At 31 December 2015								
Level 1	1,194	-	542	-	-	-	-	1,737
Level 2	932	1,756	7,109	491	5,541	(1,226)	(264)	14,340
Level 3	209	941	-	50	-	(59)	-	1,141
Total fair value	2,336	2,697	7,651	542	5,541	(1,285)	(264)	17,218

Level 1, fair value based on prices quoted in an active market for identical assets or liabilities, includes financial instruments actively traded and for which the values recognised in the Consolidated balance sheet are determined based on observable prices on identical instruments. For Statoil this category will, in most cases, only be relevant for investments in listed equity securities and government bonds.

Level 2, fair value based on inputs other than quoted prices included within level 1, which are derived from observable market transactions, includes Statoil's non-standardised contracts for which fair values are determined on the basis of price inputs from observable market transactions. This will typically be when Statoil uses forward prices on crude oil, natural gas, interest rates and foreign exchange rates as inputs to the valuation models to determining the fair value of its derivative financial instruments.

Level 3, fair value based on unobservable inputs, includes financial instruments for which fair values are determined on the basis of input and assumptions that are not from observable market transactions. The fair values presented in this category are mainly based on internal assumptions. The internal assumptions are only used in the absence of quoted prices from an active market or other observable price inputs for the financial instruments subject to the valuation.

The fair value of certain earn-out agreements and embedded derivative contracts are determined by the use of valuation techniques with price inputs from observable market transactions as well as internally generated price assumptions and volume profiles. The discount rate used in the valuation is a risk-free rate based on the applicable currency and time horizon of the underlying cash flows adjusted for a credit premium to reflect either Statoil's credit premium, if the value is a liability, or an estimated counterparty credit premium if the value is an asset. In addition a risk premium for risk elements not adjusted for in the cash flow may be included when applicable. The fair values of these derivative financial instruments have been classified in their entirety in the third category within current derivative financial instruments and non-current derivative financial instruments. Another reasonable assumption, that could have been applied when determining the fair value of these contracts, would be to extrapolate the last observed forward prices with inflation. If Statoil had applied this assumption, the fair value of the contracts included would have decreased by approximately USD 97 million at end of 2016 and decreased by USD 526 million at end of 2015 and impacted the Consolidated statement of income with corresponding amounts.

The reconciliation of the changes in fair value during 2016 and 2015 for financial instruments classified in the third level in the hierarchy are presented in the following table.

(in USD million)	Non-current financial investments	Non-current derivative financial instruments - assets	Current derivative financial instruments - assets	Non-current derivative financial instruments liabilities	Current derivative financial instruments - liabilities	Total amount
Full year 2016						
Opening balance	209	941	50	(59)	-	1,141
Total gains and losses recognised in statement of income	-	(98)	66	49	-	17
Purchases	2	-	-	-	-	2
Settlement	(5)	(17)	(53)	-	-	(75)
Transfer to current portion	-	(1)	1	4	(4)	-
Foreign currency translation differences	1	23	1	-	-	25
Closing balance	207	848	66	(6)	(4)	1,110
Full year 2015						
Opening balance	189	1,707	87	-	-	1,983
Total gains and losses recognised in statement of income	(2)	(442)	54	(59)	-	(449)
Purchases	28	-	-	-	-	28
Settlement	-	(110)	(79)	-	-	(190)
Foreign currency translation differences	(5)	(214)	(11)	-	-	(231)
Closing balance	209	941	50	(59)	-	1,141

During 2016 the financial instruments within level 3 have had a net decrease in the fair value of USD 31 million. The USD 44 million recognised in the Consolidated statement of income during 2016 are impacted by a reduction of USD 13 million related to changes in fair value of certain earn-out agreements. Related to the same earn-out agreements, USD 69 million included in the opening balance for 2016 has been fully realised as the underlying volumes have been delivered during 2016 and the amount is presented as settled in the above table.

Substantially all gains and losses recognised in the Consolidated statement of income during 2016 are related to assets held at the end of 2016.

Sensitivity analysis of market risk

Commodity price risk

The table below contains the commodity price risk sensitivities of Statoil's commodity based derivatives contracts. For further information related to the type of commodity risks and how Statoil manages these risks, see note 5 Financial risk management.

Statoil's assets and liabilities resulting from commodity based derivatives contracts consist of both exchange traded and non-exchange traded instruments, including embedded derivatives that have been bifurcated and recognised at fair value in the Consolidated balance sheet.

Price risk sensitivities at the end of 2016 and 2015 at 30% are assumed to represent a reasonably likely change based on the duration of the derivatives.

Since none of the derivative financial instruments included in the table below are part of hedging relationships, any changes in the fair value would be recognised in the Consolidated statement of income.

Commodity price sensitivity (in USD million)	2016 - 30%	2016 + 30%	2015 - 30%	2015 + 30%
At 31 December				
Crude oil and refined products net gains (losses)	395	(390)	110	(66)
Natural gas and electricity net gains (losses)	810	(809)	249	(248)

Currency risk

The following currency risk sensitivity has been calculated by assuming an 12% reasonably possible change in the main foreign exchange rates that Statoil is exposed to. At the end of 2015 a change of 11% in the foreign exchange rates were viewed as reasonably possible changes. An increase in the foreign exchange rates means that the transaction currency has strengthened in value. The estimated gains and the estimated losses following from a change in the foreign exchange rates would impact the Consolidated statement of income. For further information related to the currency risk and how Statoil manages these risks, see note 5 Financial risk management.

Currency risk sensitivity (in million)	2016 - 12%	2016 + 12%	2015 - 11%	2015 + 11%
At 31 December				
USD net gains (losses)	79	(79)	247	(247)
NOK net gains (losses)	31	(31)	(185)	185

Interest rate risk

The following interest rate risk sensitivity has been calculated by assuming a change of 0.8 percentage points as reasonably possible changes in the interest rates at the end of 2016. At the end of 2015 a change of 0.9 percentage points in the interest rates was viewed as reasonably possible changes. The estimated gains following from a decrease in the interest rates and the estimated losses following from an interest rate increase would impact the Consolidated statement of income. For further information related to the interest risks and how Statoil manages these risks, see note 5 Financial risk management.

Interest risk sensitivity (in USD million)	2016 - 0.8 percentage points	2016 + 0.8 percentage points	2015 - 0.9 percentage points	2015 + 0.9 percentage points
At 31 December				
Interest rate net gains (losses)	897	(897)	1,217	(1,217)

26 Change of presentation currency

On 1 January 2016 Statoil changed its presentation currency from Norwegian kroner (NOK) to US dollars (USD). The change was made mainly in order to better reflect the underlying USD exposure of Statoil's business activities and to align with industry practice.

The change in presentation currency has been accounted for as a policy change, and comparative figures have been re-presented to USD, to reflect the change in presentation currency. There are no policy changes other than the change in presentation currency.

The different components of assets and liabilities in USD correspond to the amount published in NOK translated at the USD/NOK closing rate applicable at the end of each reporting period. The same relates to the equity as a whole. As such, the change in presentation currency will not impact the valuation of assets, liabilities, equity or any ratios between these components, such as debt to equity ratios. Income statements are translated at quarterly average rate.

All currency translation adjustments have been set to zero as of 1 January 2006, which was the date of Statoil's transition to IFRS. Translation adjustments and cumulative translation adjustments have been presented as if Statoil had used USD as the presentation currency from that date.

The recalculation of currency translation adjustments in USD has an impact on the distribution of shareholders' equity for comparable periods, between currency translation adjustments and other components of equity. Together with changes in net income arising from the change in presentation currency, these effects are presented as re-presentations in the table below.

EFFECT OF CHANGES IN REPORTED EQUITY

31 December 2015	Historical Consolidated financial statements in NOK billion	Historical Consolidated financial statements in USD million[1]	Re-presentation in USD million	Consolidated financial statements in USD million
Share capital	8.0	905	234	1,139
Additional paid-in capital	40.1	4,552	1,168	5,720
Retained earnings	215.1	24,417	14,276	38,693
Currency translation adjustments	91.6	10,398	(15,679)	(5,281)
Non-controlling interests	0.3	34	2	36
Total equity	355.1	40,307	0	40,307

1) Translated at exchange rate USD/NOK 8,8090 as of 31 December 2015.

31 December 2014	Historical Consolidated financial statements in NOK billion	Historical Consolidated financial statements in USD million[1]	Re-presentation in USD million	Consolidated financial statements in USD million
Share capital	8.0	1,072	67	1,139
Additional paid-in capital	40.2	5,408	306	5,714
Retained earnings	268.4	36,097	9,580	45,677
Currency translation adjustments	64.3	8,650	(9,955)	(1,305)
Non-controlling interests	0.4	54	3	57
Total equity	381.2	51,282	0	51,282

1) Translated at exchange rate USD/NOK 7,4332 as of 31 December 2014.

The Consolidated statement of income, Consolidated statement of other comprehensive income, Consolidated statement of changes in equity and Consolidated statement of cash flows have been re-presented to reflect the currency rates of transactions in foreign currencies at the date of the transactions.

Upon disposal of a foreign operation accumulated currency translation adjustments arising from currency movements between the Group's presentation currency and the functional currency of the foreign operation are reclassified from equity to profit or loss and included as part of the gain or loss from the disposal, presented as other income. When changing the Group's presentation currency from NOK to USD, the gains or losses from such disposals have been changed to reflect accumulated currency gains or losses being calculated based on USD being the presentation currency rather than NOK. These effects are presented as re-presentations in the table below, and represent the only re-measurements following the change in presentation currency to USD.

EFFECT OF CHANGES IN REPORTED NET INCOME

Net income	Historical Consolidated financial statements in NOK billion	Historical Consolidated financial statements in USD million[1)]	Re-presentation in USD million	Consolidated financial statements in USD million
Full year 2015	(37)	(4,684)	(485)	(5,169)
Full year 2014	22	3,831	56	3,887

1) Translated at average exchange rates for the quarters.

The disposal with most significant effect on the net income of the Group is the disposal of Statoil's interests in Shah Deniz, presented within the DPI segment in the second quarter 2015, for which the gain presented in NOK included NOK 3.2 billion arising from reclassification of accumulated translation differences. As the disposed foreign operation had USD as functional currency, there are no accumulated translation differences when presented in USD for this transaction.

The Statement of cash flow has been re-presented to reflect the changes described above and based on the currency rates applicable at the transaction dates of relevant transactions. The re-presentation impacts the classification between the different lines in the statement of cash flow, between currency translation adjustments and other components of cash flow.

27 Supplementary oil and gas information (unaudited)

In accordance with Financial Accounting Standards Board Accounting Standards Codification "Extractive Activities - Oil and Gas" (Topic 932), Statoil is reporting certain supplemental disclosures about oil and gas exploration and production operations. While this information is developed with reasonable care and disclosed in good faith, it is emphasised that some of the data is necessarily imprecise and represents only approximate amounts because of the subjective judgement involved in developing such information. Accordingly, this information may not necessarily represent the present financial condition of Statoil or its expected future results.

For further information regarding the reserves estimation requirement, see note 2 Significant accounting policies - Critical accounting judgements and key sources of estimation uncertainty - Proved oil and gas reserves.

No new events have occurred since 31 December 2016 that would result in a significant change in the estimated proved reserves or other figures reported as of that date.

The disputed equity determination at Agbami will potentially alter Statoil's equity share in this field. The effect on the proved reserves will be included once the redetermination is finalised and the effect is known.The effect of the farm out of the oil sands projects will be included in 2017, after the closing date of the transaction, and will reduce the proved reserves at year end 2017 by an immaterial volume related to the Leismer field.

Oil and gas reserve quantities
Statoil's oil and gas reserves have been estimated by its qualified professionals in accordance with industry standards under the requirements of the U.S. Securities and Exchange Commission (SEC), Rule 4-10 of Regulation S-X. Statements of reserves are forward-looking statements.

The determination of these reserves is part of an ongoing process subject to continual revision as additional information becomes available. Estimates of proved reserve quantities are imprecise and change over time as new information becomes available. Moreover, identified reserves and contingent resources that may become proved in the future are excluded from the calculations.

Statoil's proved reserves are recognised under various forms of contractual agreements, including production sharing agreements (PSAs) where Statoil's share of reserves can vary due to commodity prices or other factors. Reserves from agreements such as PSAs and buy back agreements are based on the volumes to which Statoil has access (cost oil and profit oil), limited to available market access. At 31 December 2016, 7% of total proved reserves were related to such agreements (13% of total oil, condensate and natural gas liquids (NGL) reserves and 2% of total gas reserves). This compares with 9% and 12% of total proved reserves for 2015 and 2014, respectively. Net entitlement oil and gas production from fields with such agreements was 96 million boe during 2016 (104 million boe for 2015 and 95 million boe for 2014). Statoil participates in such agreements in Algeria, Angola, Azerbaijan, Libya, Nigeria and Russia.

Statoil is recording, as proved reserves, volumes equivalent to our tax liabilities under negotiated fiscal arrangements (PSAs) where the tax is paid on behalf of Statoil. Reserves are net of royalty oil paid in kind and quantities consumed during production.

Rule 4-10 of Regulation S-X requires that the appraisal of reserves is based on existing economic conditions, including a 12-month average price prior to the end of the reporting period, unless prices are defined by contractual arrangements. The proved reserves at year end 2016 have been determined based on a Brent blend price equivalent of USD 42.82/bbl, compared to USD 54.17/bbl and USD 101.27/bbl for 2015 and 2014 respectively. The volume weighted average gas price for proved reserves at year end 2016 was USD 4.50MMBtu. The comparable gas price used to determine gas reserves at year end 2015 and 2014 was USD 5.76MMBtu and USD 8.01MMBtu. The volume weighted average NGL price for proved reserves at year end 2016 was USD 24.85/boe. The corresponding NGL price used to determine NGL reserves at year end 2015 and 2014 was USD 30.56/boe and USD 57.03/boe. The decrease in commodity prices affects the profitable reserves to be recovered from accumulations resulting in reduced reserves marginally. The negative revisions due to price are in general a result of earlier economic cut-off. For fields with a production-sharing type of agreement this is to some degree offset by higher entitlement to the reserves. These changes are all included in the revision category in the tables below, giving a net reduction of Statoil's proved reserves at year end.

From the Norwegian continental shelf (NCS), Statoil is responsible for managing, transporting and selling the Norwegian State's oil and gas on behalf of the Norwegian State's direct financial interest (SDFI). These reserves are sold in conjunction with the Statoil reserves. As part of this arrangement, Statoil delivers and sells gas to customers in accordance with various types of sales contracts on behalf of the SDFI. In order to fulfil the commitments, Statoil utilizes a field supply schedule which provides the highest possible total value for the joint portfolio of oil and gas between Statoil and the SDFI.

Statoil and the SDFI receive income from the joint natural gas sales portfolio based upon their respective share in the supplied volumes. For sales of the SDFI natural gas, to Statoil and to third parties, the payment to the Norwegian State is based on achieved prices, a net back formula calculated price or market value. All of the Norwegian State's oil and NGL is acquired by Statoil. The price Statoil pays to the SDFI for the crude oil is based on market reflective prices. The prices for NGL are either based on achieved prices, market value or market reflective prices.

The regulations of the owner's instruction, as described above, may be changed or withdrawn by the Statoil ASA's general meeting. Due to this uncertainty and the Norwegian State's estimate of proved reserves not being available to Statoil, it is not possible to determine the total quantities to be purchased by Statoil under the owner's instruction.

Topic 932 requires the presentation of reserves and certain other supplemental oil and gas disclosures by geographical area, defined as country or continent containing 15% or more of total proved reserves. Norway contains 76% of total proved reserves at 31 December 2016 and no other country contains reserves approaching 15% of total proved reserves. Accordingly, management has determined that the most meaningful presentation of geographical areas would be Norway and the continents of Eurasia (excluding Norway), Africa and Americas.

The following tables reflect the estimated proved reserves of oil and gas at 31 December 2013 through 2016, and the changes therein.

The reason for the most significant changes to our proved reserves at year end 2016 were:

- Positive revisions due to better performance of producing fields, maturing of improved recovery projects, and reduced uncertainty due to further drilling and production experience. This added a total of 409 million boe in 2016. A significant part of these positive revisions are related to large, producing fields offshore Norway where production is declining less than previously assumed for the proved reserves due to continuous improvement activities.
- Proved reserves from new discoveries have also been added through the sanctioning of new field development projects in 2016, Svale Nord Trestakk and Utgard in Norway and Julia in US. The new projects added a total of 66 million boe. New discoveries with proved reserves booked in 2016 are all expected to start production within a period of five years.
- Further drilling in the Bakken, Marcellus and Eagle Ford onshore plays in the US increased the proved reserves in 2016, and some of these additions are presented as extensions. Extension of proved area on existing field added a total of 112 million boe of new proved reserves in 2016. Together with proved reserves from new fields this adds a total of 179 million boe of proved reserves from Extensions and discoveries.
- The net effect of purchase and sale increased the reserves by 39 million boe in 2016.
- Production during 2016 reduced proved reserves by 673 million boe.

Changes to the proved reserves in 2016 are also described in some detail in section 2.8 Operating and financial performance by each geographical area. Development of the proved reserves are described in section 2.8 Operating and financial performance, Development of reserve*s.*

The conversion rates used are 1 standard cubic meter = 35.3 standard cubic feet, 1 standard cubic meter oil equivalent = 6.29 barrels of oil equivalent (boe) and 1,000 standard cubic meter gas = 1 standard cubic meter oil equivalent.

Capitalised cost related to oil and gas producing activities

Consolidated companies

(in USD million)	2016	2015	At 31 December 2014
Unproved properties	13,563	13,341	13,121
Proved properties, wells, plants and other equipment	159,284	150,653	158,586
Total capitalised cost	172,847	163,994	171,707
Accumulated depreciation, impairment and amortisation	(109,160)	(99,118)	(92,451)
Net capitalised cost	63,687	64,876	79,256

Net capitalised cost related to equity accounted investments as of 31 December 2016 was USD 2,000 million, USD 1,000 million in 2015 and USD 1,147 million in 2014. The increase is mainly related to the investment in Lundin Petroleum AB as described in note 12. The reported figures are based on capitalised costs within the upstream segments in Statoil, in line with the description below for result of operations for oil and gas producing activities.

Expenditures incurred in oil and gas property acquisition, exploration and development activities

These expenditures include both amounts capitalised and expensed.

Consolidated companies

(in USD million)	Norway	Eurasia excluding Norway	Africa	Americas	Total
Full year 2016					
Exploration expenditures	495	155	197	590	1,437

Acquired unproved properties	0	3	(3)	355	355
Total	9,471	2,434	3,348	5,596	20,849

Expenditures incurred in development activities related to equity accounted investments was USD 1,370 million in 2016, USD 46 million in 2015 and USD 255 million in 2014. The increase is mainly related to the investment in Lundin Petroleum AB, USD 1,199 million, as described in note 12.

Results of operation for oil and gas producing activities
As required by Topic 932, the revenues and expenses included in the following table reflect only those relating to the oil and gas producing operations of Statoil.

The result of operations for oil and gas producing activities contains the two upstream reporting segments Development and Production Norway (DPN) and Development and Production International (DPI) as presented in note 3 *Segments*. Production cost is based on operating expenses related to production of oil and gas. From the operating expenses certain expenses such as; transportation costs, accruals for over/underlift position, royalty payments and diluent costs are excluded. These expenses and mainly upstream business administration are included as other expenses in the tables below. Other revenues mainly consist of gains and losses from sales of oil and gas interests and gains and losses from commodity based derivatives within the upstream segments.

Income tax expense is calculated on the basis of statutory tax rates adjusted for uplift and tax credits. No deductions are made for interest or other elements not included in the table below.

Average production cost in USD per boe based on entitlement volumes (consolidated)	Norway	Eurasia excluding Norway	Africa	Americas	Total
2016	5	8	7	6	5
2015	6	10	8	8	6
2014	8	10	10	8	8

Production cost per boe is calculated as the production costs in the result of operations table, divided by the produced entitlement volumes (mboe) for the corresponding period.

Standardised measure of discounted future net cash flows relating to proved oil and gas reserves

The table below shows the standardised measure of future net cash flows relating to proved reserves. The analysis is computed in accordance with Topic 932, by applying average market prices as defined by the SEC, year end costs, year end statutory tax rates and a discount factor of 10% to year end quantities of net proved reserves. The standardised measure of discounted future net cash flows is a forward-looking statement.

Future price changes are limited to those provided by existing contractual arrangements at the end of each reporting year. Future development and production costs are those estimated future expenditures necessary to develop and produce year-end estimated proved reserves based on year-end cost indices, assuming continuation of year-end economic conditions. Pre-tax future net cash flow is net of decommissioning and removal costs. Estimated future income taxes are calculated by applying the appropriate year-end statutory tax rates. These rates reflect allowable deductions and tax credits and are applied to estimated future pretax net cash flows, less the tax basis of related assets. Discounted future net cash flows are calculated using a discount rate of 10% per year. Discounting requires a year-by-year estimate of when future expenditures will be incurred and when reserves will be produced. The standardised measure of discounted future net cash flows prescribed under Topic 932 requires assumptions as to the timing and amount of future development and production costs and income from the production of proved reserves. The information does not represent management's estimate or Statoil's expected future cash flows or the value of its proved reserves and therefore should not be relied upon as an indication of Statoil's future cash flow or value of its proved reserves.

Net change in sales and transfer prices and in production (lifting) costs related to future production	(21,148)	(71,817)	(20,157)
Changes in estimated future development costs	(16)	6,739	(3,838)
Sales and transfers of oil and gas produced during the period, net of production cost	(16,824)	(20,803)	(36,904)
Net change due to extensions, discoveries, and improved recovery	1,099	3,745	3,685
Net change due to purchases and sales of minerals in place	(566)	(1,026)	(4,181)
Net change due to revisions in quantity estimates	8,163	7,491	19,340
Previously estimated development costs incurred during the period	7,998	10,474	15,811
Accretion of discount	5,949	11,335	12,691
Net change in income taxes	11,070	32,958	12,374
Total change in the standardised measure during the year	(4,274)	(20,904)	(1,178)
Standardised measure at end of year	21,092	25,366	46,270
Equity accounted investments			
Standardised measure at end of year	406	140	806
Standardised measure at end of year including equity accounted investments	21,498	25,506	47,076

In the table above, each line item presents the sources of changes in the standardised measure value on a discounted basis, with the accretion of discount line item reflecting the increase in the net discounted value of the proved oil and gas reserves due to the fact that the future cash flows are now one year closer in time.

The standardized measure at the beginning of the year represents the discounted net present value after deductions of both future development costs, production costs and taxes. The 'Net change in sales and transfer prices and in production (lifting) costs related to future production' is, on the other hand, related to the future net cash flows at 31 December 2015. The proved reserves at 31 December 2015 were multiplied by the actual change in price, and change in unit of production costs, to arrive at the net effect of changes in price and production costs. Development costs and taxes are reflected in the line items 'Change in estimated future development costs' and 'Net change in income taxes' and are not included in the 'Net change in sales and transfer prices and in production (lifting) costs related to future production'.

28 Subsequent events

See note 17 Equity and dividend for proposed dividend for the fourth quarter 2016.

29 Condensed consolidated financial information related to guaranteed debt securities

Statoil Petroleum AS, a 100% owned subsidiary of Statoil ASA, is the co-obligor of certain existing debt securities of Statoil ASA that are registered under the US Securities Act of 1933 ("US registered debt securities"). As co-obligor, Statoil Petroleum AS fully, unconditionally and irrevocably assumes and agrees to perform, jointly and severally with Statoil ASA, the payment and covenant obligations for these US registered debt securities. In addition, Statoil ASA is also the co-obligor of a US registered debt security of Statoil Petroleum AS. As co-obligor, Statoil ASA fully, unconditionally and irrevocably assumes and agrees to perform, jointly and severally with Statoil Petroleum AS, the payment and covenant obligations of that security. In the future, Statoil ASA may from time to time issue future US registered debt securities for which Statoil Petroleum AS will be the co-obligor or guarantor.

The following financial information on a condensed consolidated basis provides financial information about Statoil ASA, as issuer and co-obligor, Statoil Petroleum AS, as co-obligor and guarantor, and all other subsidiaries as required by SEC Rule 3-10 of Regulation S-X. The condensed consolidated information is prepared in accordance with Statoil's IFRS accounting policies as described in note 2 *Significant accounting policies*, except that investments in subsidiaries and jointly controlled entities are accounted for using the equity method as required by Rule 3-10.

The following is condensed consolidated financial information for the full year 2016, 2015 and 2014, and as of 31 December 2016 and 2015.

The reports set out below are provided in accordance with standards of the Public Company Accounting Oversight Board (United States). KPMG AS has also issued a report in accordance with law, regulations, and auditing standards and practices generally accepted in Norway, including International Standards on Auditing (ISAs), which includes opinions on the consolidated financial statements and the parent company financial statements of Statoil ASA, and on other required matters. That report is set out on pages 226 to 230.

Report of Independent Registered Public Accounting Firm

To the board of directors and shareholders of Statoil ASA

We have audited the accompanying Consolidated balance sheets of Statoil ASA and subsidiaries as of 31 December 2016 and 2015, and the related Consolidated statements of income, comprehensive income, changes in equity, and cash flows for each of the years in the three-year period ended 31 December 2016. These Consolidated financial statements are the responsibility of the Statoil ASA's management. Our responsibility is to express an opinion on these Consolidated financial statements based on our audits.

We conducted our audits in accordance with the standards of the Public Company Accounting Oversight Board (United States). Those standards require that we plan and perform the audit to obtain reasonable assurance about whether the financial statements are free of material misstatement. An audit includes examining, on a test basis, evidence supporting the amounts and disclosures in the financial statements. An audit also includes assessing the accounting principles used and significant estimates made by management, as well as evaluating the overall financial statement presentation. We believe that our audits provide a reasonable basis for our opinion.

In our opinion, the Consolidated financial statements referred to above present fairly, in all material respects, the financial position of Statoil ASA and subsidiaries as of 31 December 2016 and 2015, and the results of their operations and their cash flows for each of the years in the three-year period ended 31 December 2016, in conformity with International Financial Reporting Standards as issued by the International Accounting Standards Board and International Financial Reporting Standards as adopted by the European Union.

As discussed in Note 26 to the Consolidated financial statements, Statoil ASA has elected to change its presentation currency from Norwegian Kroner to US Dollar. In addition to the information included in Note 26, Statoil ASA has also included a US Dollar Consolidated balance sheet as of 31 December 2014.

We also have audited, in accordance with the standards of the Public Company Accounting Oversight Board (United States), Statoil ASA's internal control over financial reporting as of 31 December 2016, based on criteria established in Internal Control - Integrated Framework (2013) issued by the Committee of Sponsoring Organizations of the Treadway Commission (COSO), and our report dated 9 March 2017 expressed an unqualified opinion on the effectiveness of the Statoil ASA's internal control over financial reporting.

Oslo, Norway
9 March 2017

Report of KPMG on Statoil's internal control over financial reporting

Report of Independent Registered Public Accounting Firm

To the board of directors and shareholders of Statoil ASA

We have audited Statoil ASA's internal control over financial reporting as of 31 December 2016, based on criteria established in *Internal Control – Integrated Framework (2013)* issued by the Committee of Sponsoring Organizations of the Treadway Commission (COSO). Statoil ASA's management is responsible for maintaining effective internal control over financial reporting and for its assessment of the effectiveness of internal control over financial reporting, included in the accompanying *The management's report on internal control over financial reporting*. Our responsibility is to express an opinion on Statoil ASA's internal control over financial reporting based on our audit.

We conducted our audit in accordance with the standards of the Public Company Accounting Oversight Board (United States). Those standards require that we plan and perform the audit to obtain reasonable assurance about whether effective internal control over financial reporting was maintained in all material respects. Our audit included obtaining an understanding of internal control over financial reporting, assessing the risk that a material weakness exists, and testing and evaluating the design and operating effectiveness of internal control based on the assessed risk. Our audit also included performing such other procedures as we considered necessary in the circumstances. We believe that our audit provides a reasonable basis for our opinion.

A company's internal control over financial reporting is a process designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with generally accepted accounting principles. A company's internal control over financial reporting includes those policies and procedures that (1) pertain to the maintenance of records that, in reasonable detail, accurately and fairly reflect the transactions and dispositions of the assets of the company; (2) provide reasonable assurance that transactions are recorded as necessary to permit preparation of financial statements in accordance with generally accepted accounting principles, and that receipts and expenditures of the company are being made only in accordance with authorizations of management and directors of the company; and (3) provide reasonable assurance regarding prevention or timely detection of unauthorized acquisition, use, or disposition of the company's assets that could have a material effect on the financial statements.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements. Also, projections of any evaluation of effectiveness to future periods are subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

In our opinion, Statoil ASA maintained, in all material respects, effective internal control over financial reporting as of 31 December 2016, based on criteria established in Internal Control – Integrated Framework (2013) issued by the Committee of Sponsoring Organizations of the Treadway Commission (COSO).

We also have audited, in accordance with the standards of the Public Company Accounting Oversight Board (United States), the Consolidated balance sheets of Statoil ASA and subsidiaries as of 31 December 2016 and 2015, and the related Consolidated statements of income, comprehensive income, changes in equity, and cash flows for each of the years in the three-year period ended 31 December 2016, and our report dated 9 March 2017 expressed an unqualified opinion on those Consolidated financial statements.

/s/ KPMG AS

Oslo, Norway
9 March 2017

4.2 Parent company financial statements

With effect from 1 January 2016 Statoil ASA changed the accounting principles from NGAAP to simplified IFRS and changed the presentation currency from Norwegian Kroner (NOK) to US dollars (USD). Comparative data has been converted from NGAAP to simplified IFRS and from NOK to USD accordingly. For more information concerning this, see note 24 Transition to Simplified IFRS and USD presentation currency.

Cash and cash equivalents at the end of the period	14	4,274	7,471

Notes to the Financial statements Statoil ASA

1 Significant accounting policies and basis of presentation

Statoil ASA is the parent company of the Statoil Group (Statoil), consisting of Statoil ASA and its subsidiaries. Statoil ASA's main activities includes shareholding in group companies, group management, corporate functions and group financing. Statoil ASA also carries out activities related to external sales of oil and gas products, purchased externally or from group companies, including related refinery and transportation activities. Reference is made to disclosure note 1 Organisation and basis of presentation in Statoil's Consolidated financial statements.

The financial statements of Statoil ASA ("the company") are prepared in accordance with simplified IFRS pursuant to the Norwegian Accounting Act §3-9 and regulations regarding simplified application of IFRS issued by the Norwegian Ministry of Finance on 3 November 2014. The use of simplified IFRS represents a change from previous years' financial statements, in which Statoil ASA used Norwegian Generally Accepted Accounting Principles (NGAAP). At the same time Statoil has changed the presentation currency for the parent company's accounts from Norwegian kroner (NOK) to United States dollars (USD). The basis for the changes in accounting framework and presentation currency is to seek consistency with the group financial statements and with the company's functional currency, which is USD. For a description of the transition effects when changing from NGAAP to simplified IFRS and from NOK to USD, see note 24 Transition to simplified IFRS and USD presentation currency.

These parent company financial statements should be read in connection with the Consolidated financial statements of Statoil, published together with these financial statements. With the exceptions described below, Statoil ASA applies the accounting policies of the group, as described in Statoil's disclosure note 2 Significant Accounting Policies, and reference is made to the Statoil note for further details. Insofar that the company applies policies that are not described in the Statoil note due to group level materiality considerations, such policies are included below if necessary for a sufficient understanding of Statoil ASA's accounts.

Subsidiaries, associated companies and joint ventures

Shareholdings and interests in subsidiaries, associated companies (companies in which the company does not have control, or joint control, but has the ability to exercise significant influence over operating and financial policies, generally when the ownership share is between 20% and 50%) and joint ventures are accounted for using the equity method. The company applies the equity method on the basis of the respective entities' financial reporting prepared in compliance with the Statoil group's IFRS accounting principles. Reserves for valuation variances included within the company's equity are established based on the sum of contributions from each individual equity accounted investment, with the limitation that the net amount cannot be negative. Goodwill included in the balance sheets of subsidiaries and associated companies is tested for impairment as part of the related investment in the subsidiary or associated company. Any related impairment expense is included in the company's statement of income under Net income from subsidiaries and other equity accounted companies.

Expenses related to the Statoil group as operator of joint operations and similar arrangements (licences)

Indirect operating expenses incurred by the company, such as personnel expenses, are accumulated in cost pools. Such expenses are allocated in part on an hours incurred cost basis to Statoil Petroleum AS, to other group companies, and to licences where Statoil Petroleum AS or other group companies are operators. Costs allocated in this manner reduce the expenses in the company's statement of income.

Asset transfers between the company and its subsidiaries

Transfers of assets and liabilities between the company and the entities that it directly or indirectly controls are accounted for at the carrying amounts (continuity) of the assets and liabilities transferred, when the transfer is part of a reorganisation within the Statoil group.

Dividends payable and group contributions

Dividends are reflected as Dividends payable within current liabilities. Group contributions for the year to other entities within Statoil's Norwegian tax group are reflected in the balance sheet as current liabilities within Liabilities to group companies. Under simplified IFRS the presentation of dividends payable and payable group contributions differs from the presentation under IFRS, as it also includes dividends and group contributions payable which at the date of the balance sheet is subject to a future general assembly approval before distribution.

Reserves for unrealised gains

Reserves for unrealised gains included within the Company's equity consists of accumulated unrealised gains on non-exchange traded financial instruments and the fair value of embedded derivatives, with the limitation that the net amount cannot be negative.

2 Financial risk management and measurement of financial instruments

General information relevant to financial risks

Statoil ASA's activities expose the company to market risk, liquidity risk and credit risk, and the management of such risks do not substantially differ from the Group's. See note 5 Financial risk management in the Consolidated financial statements.

Measurement of financial instruments by categories

The following tables present Statoil ASA's classes of financial instruments and their carrying amounts by the categories as they are defined in IAS 39 Financial Instruments: Recognition and Measurement. All financial instruments' carrying amounts are measured at fair value or their carrying amounts reasonably approximate fair value except non-current financial liabilities. See note 18 Finance debt for fair value information of non-current bonds, bank loans and finance lease liabilities and note 25 Financial instruments fair value measurement and sensitivity analysis of market risk in the Consolidated financial statements where fair value measurement is explained in detail.

See note 2 Significant accounting policies in the Consolidated financial statements for further information regarding measurement of fair values.

Total	2,261	(1,513)	748

Sensitivity analysis of market risk

Commodity price risk
Statoil ASA's assets and liabilities resulting from commodity based derivatives contracts consist of both exchange traded and non-exchange traded instruments mainly in crude oil and refined products.

Price risk sensitivities at the end of 2016 and 2015 at 30% are assumed to represent a reasonably likely change based on the duration of the derivatives.

	2016		2015	
(in USD million)	- 30% sensitivity	30% sensitivity	- 30% sensitivity	30% sensitivity
At 31 December				
Crude oil and refined products net gains (losses)	650	(644)	336	(335)

Currency risk
The estimated gains and the estimated losses following from a change in the foreign exchange rates would impact the company's statement of income.

Currency risk sensitivity for Statoil ASA mainly differ from currency risk sensitivity in Group due to interesting bearing receivables from subsidiaries. For more detailed information about these receivables see note 11 Financial assets and liabilities.

+	2016		2015	
(in USD million)	- 12% sensitivity	12% sensitivity	- 11% sensitivity	11% sensitivity
At 31 December				
NOK net gains (losses)	(1,691)	1,691	(1,774)	1,774

Interest rate risk
The estimated gains following from a decrease in the interest rates and the estimated losses following from an interest rate increase would impact the company's statement of income.

	2016		2015	
(in USD million)	- 0.8 percentage points sensitivity	0.8 percentage points sensitivity	- 0.9 percentage points sensitivity	0.9 percentage points sensitivity
At 31 December				
Interest rate net gains (losses)	817	(817)	1,176	(1,176)

3 Revenues

	Full year	
(in USD million)	2016	2015

4 Remuneration

Statoil ASA remuneration in 2016

(in USD million, except average number of employees)	Full year 2016	2015
Salaries[1)]	2,163	2,270
Pension cost	631	806
Social security tax	336	354
Other compensations	240	268
Total	3,370	3,698
Average number of employees[2)]	18,800	19,600

1) Salaries include bonuses, severance packages and expatriate costs in addition to base pay.
2) Part time employees amount to 3% for 2016 and 3% for 2015.

Total payroll expenses are accumulated in cost-pools and charged to partners of Statoil operated licences and group companies on an hours incurred basis. For further information see note 22 Related parties.

Compensation to and share ownership of the corporate assembly, the board of directors (BoD) and the corporate executive committee (CEC)
Compensation to the corporate assembly was USD 126,875 and the total share ownership of the members of the corporate assembly was 24,578 shares. Remuneration to members of the BoD and the CEC during the year and share ownership at the end of the year were as follows:

Members of the board (figures in USD thousand except number of shares)	Total remuneration	Share ownership as of 31 December 2016
Øystein Løseth (chair of the board)	104	1,040
Roy Franklin (deputy chair of the board)	114	-

John Knight13)	1,679	0	0	0	131	1,810	0	0	0	2,089	103,808

1) All figures in the table are presented in USD based on average currency rates (2016: USD/NOK = 8.3987, USD/GBP = 1.3538. 2015: USD/NOK = 8,0739, USD/GBP = 1,5289). The figures are presented on accrual basis.
2) All CEC members receive their remuneration in Norwegian Kroner except John Knight who receives the remuneration in GBP.
3) Fixed pay consists of base salary, fixed remuneration element, holiday allowance and other administrative benefits.
4) Cash allowance in lieu of pension accrual above 12 G (the base amount in the national insurance scheme).
5) The fixed long-term incentive (LTI) element implies an obligation to invest the net amount in Statoil shares, including a lock-in period. The LTI element is presented the year it is granted for the members of the corporate executive committee employed by Statoil ASA.
6) Annual variable pay includes holiday allowance for corporate executive committee (CEC) members resident in Norway.
7) Estimated pension cost is calculated based on actuarial assumptions and pensionable salary (mainly base salary) at 31 December 2015 and is recognized as pension cost in the statement of income for 2016.
8) Estimated present value of pension obligation related to Eldar Sætre, Arne Sigve Nylund, Margareth Øvrum og Timothy Dodson are based on the estimated value of paid-up policies and rights letters from the Defined Benefit Pension Scheme. Estimated present value of pension obligation for the rest of the members of the corporate executive committee employed by Statoil ASA, is presented with value of paid-up policies and right letters from the Defined Benefit Pension Scheme and accrued pension assets from the Defined Contribution Pension Scheme.
9) Includes 2015 CEC members who are also CEC members in 2016.
10) Jannicke Nilsson was appointed executive vice president and chief operating officer (COO) from 1 December 2016.
11) Anders Opedal left the position as executive vice president and chief operating officer (COO) at 30 November 2016.
12) Compensation and benefit for Torgrim Reitan is according to Statoil's international assignment terms.
13) Fixed pay for Eldar Sætre includes a fixed remuneration element of USD 238 thousand not included in pensionable salary. John Knight's fixed pay includes a fixed remuneration element of USD 143 thousand that replaces his defined contribution pension plan and a fixed remuneration element of USD 724 thousand replacing his variable pay arrangements.

There are no loans from the company to members of the corporate executive committee.

Remuneration policy and concept

Reference is made to the section on «Declaration on remuneration and other employment terms for Statoil's Corporate Executive committee" for a detailed description of the remuneration and remuneration policy for executive management applicable for the years 2016 and 2017. The main elements of Statoil's executive remuneration are described in chapter 3 Governance, section 3.12 Remuneration to the corporate executive committee in this report.

5 Share-based compensation

Statoil's share saving plan provides employees with the opportunity to purchase Statoil shares through monthly salary deductions. If the shares are kept for two full calendar years of continued employment, following the year of purchase, the employees will be allocated one bonus share for each one they have purchased.

Estimated compensation expense including the contribution by Statoil ASA for purchased shares, amounts vested for bonus shares granted and related social security tax was USD 54 million in 2016 and USD 70 million in 2015. For the 2017 program (granted in 2016) the estimated compensation expense is USD 55 million. At 31 December 2016 the amount of compensation cost yet to be expensed throughout the vesting period is USD 122 million.

6 Auditor's remuneration

	Full year	
(in USD million, excluding VAT)	2016	2015
Audit fee	1.3	1.1
Audit related fee	0.3	1.1
Other service fee	0.0	0.0
Total	1.7	2.1

There are no fees incurred related to tax services.

7 Financial items

	Full year	
(in USD million)	2016	2015
Foreign exchange gains (losses) derivative financial instruments	353	548
Other foreign exchange gains (losses)	(59)	(2,367)
Net foreign exchange gains (losses)	294	(1,819)
Interest income from group companies	682	273
Interest income current financial assets and other financial items	298	140
Interest income and other financial items	981	413
Gains (losses) derivative financial instruments	470	(491)
Interest expense to group companies	(163)	(126)
Interest expense non-current finance debt	(850)	(725)
Interest expense current financial liabilities and other finance expense	(3)	(23)
Interest and other finance expenses	(1,016)	(874)
Net financial items	728	(2,771)

Statoil's main financial items relate to assets and liabilities categorised in the held for trading category and the amortised cost category. For more information about financial instruments by category see note 25 Financial instruments: fair value measurement and sensitivity analysis of market risk in the Consolidated financial statements.

The line item interest expense non-current finance debt primarily includes interest expenses of USD 1,039 million and USD 1,059 million from the financial liabilities at amortised cost category. This was partly offset by net interest on related derivatives from the held for trading category, USD 188 million and USD 334 million for 2016 and 2015, respectively.

The line item gains (losses) derivative financial instruments primarily includes fair value gain from the held for trading category of USD 454 million and a loss of USD 507 million for 2016 and 2015, respectively.

Foreign exchange gains (losses) derivative financial instruments include fair value changes of currency derivatives related to liquidity and currency risk. The line item foreign exchange gains (losses) includes a net foreign exchange loss of USD 289 million and a loss of USD 1,089 million from the held for trading category for 2016 and 2015, respectively.

8 Income taxes

Income tax

(in USD million)	Full year 2016	2015
Current taxes	92	75
Change in deferred tax	(499)	850
Income tax	(407)	925

Reconciliation of Norwegian statutory tax rate to effective tax rate

(in USD million)	Full year 2016	2015
Income(loss) before tax	(2,202)	(7,541)
Nominal tax rate in 2016 (25%) and in 2015 (27%)	550	2,036
Tax effect of:		
Permanent differences caused by NOK being the tax currency	(198)	(491)
Permanent differences caused by loans in USD	(0)	1,172
Tax effect of permanent differences related to equity accounted companies	(671)	(1,464)
Other permanent differences	(81)	57
Income tax prior years	(21)	(69)
Change in tax regulations	10	(132)
Other	4	(183)
Total	(407)	925
Effective tax rate	(18.5%)	12.3%

Change in tax regulations refers to change in deferred taxes caused by a reduction in Norwegian statutory tax rate from 25% to 24% effective from 2017.

Significant components of deferred tax assets and liabilities were as follows:

(in USD million)	At 31 December 2016	2015
Deferred tax - assets		
Inventory	0	52
Tax losses carry forward	22	422
Pensions	627	438
Long term provisions	105	64
Derivatives and long term debt	160	0
Other non-current items	2	280
Total deferred tax assets	917	1,256
Deferred tax - liabilities		
Inventory	6	0
Property, plant and equipment	65	54
Derivatives and long term debt	0	19
Total deferred tax liabilities	71	73
Net deferred tax assets	846	1,183

At 31 December 2016, Statoil ASA had recognised net deferred tax assets of USD 846 million, as it is considered probable that taxable profit will be available to utilise the deferred tax assets.

The movement in deferred tax

(in USD million)	2016	2015
Deferred tax assets at 1 January	1,183	1,676
Charged to the income statement	(499)	850
Actuarial losses pension	126	(435)
Group Contribution	32	(909)
Other	4	1
Deferred tax assets at 31 December	846	1,183

10 Investments in subsidiaries and other equity accounted companies

(in USD million)	2016	2015
Investments at 1 January	51,330	64,270
Net income from subsidiaries and other equity accounted companies	(2,726)	(4,686)
Increase (decrease) in paid-in capital	(8,462)	(2,794)
Acquisitions	1,199	0
Distributions	(1,194)	(2,984)
Translation adjustments	(260)	(2,498)
Other	(1)	22
Investments at 31 December	39,886	51,330

The closing balance of investments at 31 December of USD 39,886 million consists of investments in subsidiaries amounting to USD 38,660 million and investments in other equity accounted companies amounting to USD 1,226 million. In 2015, the amounts were USD 51,229 million and USD 101 million respectively.

The foreign currency translation adjustments relate to currency translation effects from subsidiaries with functional currencies other than USD.

In 2016 net income from subsidiaries and other equity accounted companies was impacted by net impairment losses related to property, plant and equipment and exploration assets of USD 1,678 million after tax, primarily resulting from reduced long term commodity price assumptions. For more information see the Consolidated financial statements of Statoil note 10 Property, plant and equipment. In 2015 net income from subsidiaries and other equity accounted companies was impacted by net impairment losses related to property, plant and equipment and exploration assets of USD 6,655 million after tax, primarily resulting from reduced short term commodity price assumptions.

No impairment of goodwill has been recognised in 2016 (2015: USD 539 million).

Increase (decrease) in paid-in capital in 2016 mainly consist of repayment of capital from Statoil Coordination Centre of USD 8,500 million.

Distributions during 2016 mainly consist of dividends and group contributions related to 2015 from group companies of USD 1,194 million. In 2015 distributions mainly consisted of dividends and group contributions related to 2014 from group companies of USD 1,312 million and group contribution from Statoil Petroleum AS of USD 358 million after tax and from other group companies of USD 1,094 million after tax.

In January 2016 Statoil ASA acquired 11.93% of the issued share capital and votes in Lundin Petroleum AB for a total purchase price of SEK 4.6 billion (USD 541 million). In June 2016 Statoil ASA increased ownership share in Lundin Petroleum AB till 68.4 million shares of Lundin, corresponding to 20.1% of the outstanding shares and votes. The consideration for these additional shares consisted of SEK 544 million (USD 64 million) in cash and the conversion of a previous receivable for the amount of USD 496 million.

Up until the transaction on 30 June 2016, the shares were accounted for as a non-current financial investment at fair value with changes in fair value presented in the line item net gains (losses) from available for sale financial assets in the Statoil ASA statement of comprehensive income. Statoil recognised gain of USD 153 million in the line net financial items in the Statoil ASA statement of income.

In 2015 Statoil sold the shares in Forusbeen 50 AS, Strandveien 4 AS and Arkitekt Ebbelsvei 10 AS with a gain of USD 211 million. Proceeds from the sale were USD 486 million. At the same time Statoil entered into a 15 year operating lease agreement for the buildings.

For further information, see in the Consolidated Financial Statements of Statoil Group note disclosure 4 Acquisitions and Dispositions.

The acquisition cost for investments in subsidiaries and other equity accounted companies are USD 39,254 million in 2016 and USD 46,717 million in 2015.

For a list of ownership in certain subsidiaries and other equity accounted companies, please see Significant and properties in section 2.7 Corporate.

11 Financial assets and liabilities

Non-current receivables from subsidiaries and other equity accounted companies

(in USD million)	At 31 December 2016	2015
Interest bearing receivables from subsidiaries and other equity accounted companies	23,520	13,879
Non-interest bearing receivables from subsidiaries	124	96
Receivables from subsidiaries and other equity accounted companies	23,644	13,976

Interest bearing receivables from subsidiaries and other equity accounted companies are mainly related to Statoil Petroleum AS. The total amount of credit facility given to Statoil Petroleum AS is NOK 135 billion at 31 December 2016 and NOK 135 billion at 31 December 2015, under which USD 14,501 million (NOK 125 billion) and USD 13,622 million (NOK 120 billion) is drawn in 2016 and 2015, respectively. Of the total USD amount drawn at 31 December 2016, USD 1,740 million (NOK 15 billion) is due within the next twelve months, and reclassified to current. The remaining amount on financial receivables interest bearing primarily relate to long term funding of other subsidiaries.

Of the total interest bearing non-current receivables at 31 December 2016, USD 580 million (NOK 5 billion) is due within the next five years. Remaining amounts fall due beyond five years.

Of the non-interest bearing receivables from subsidiaries at 31 December 2016, USD 79 million relates to pension, see also note 19 Pensions in the Consolidated financial statements. Correspondingly, USD 96 million related to pension at 31 December 2015.

Current receivables from subsidiaries and other equity accounted companies include current portion of credit facility given to Statoil Petroleum AS of USD 1,740 million and positive internal bank balances of USD 787 million at 31 December 2016.

Current receivables at 31 December 2015 include group contribution of USD 0.5 billion from Statoil Petroleum AS.

Current financial investments

(in USD million)	At 31 December 2016	2015
Time deposits	3,217	2,166
Interest bearing securities	4,176	6,973
Financial investments	7,393	9,139

Current Financial investments
The cost price for current financial investments was USD 6.0 billion at 31 December 2016 and USD 9.2 billion at 31 December 2015.

For more information about financial instruments by category, see note 25 Financial instruments: fair value measurement and sensitivity analysis of market risk in the Consolidated financial statements.

Current liabilities to subsidiaries and other equity accounted companies
Liabilities to subsidiaries and other equity accounted companies include current liabilities to Statoil Petroleum AS of USD 2.3 billion and liabilities related to Statoil groups' internal bank arrangements of USD 8.5 billion at 31 December 2016. The corresponding amounts were USD 2.2 billion and USD 7.0 billion at 31 December 2015.

12 Inventories

(in USD million)	At 31 December 2016	2015
Crude oil	1,504	749
Petroleum products	478	355
Natural gas	133	266
Other	36	24
Inventories	2,150	1,394

Higher inventory level of crude oil at 31 December is mainly related to higher prices and in-transit volumes. The write-down of inventories from cost to net realisable value amounts to an expense of USD 11 million and USD 277 million in 2016 and 2015, respectively.

13 Trade and other receivables

(in USD million)	At 31 December 2016	2015
Trade receivables	3,755	3,077
Other receivables	1,004	751
Trade and other receivables	4,760	3,828

14 Cash and cash equivalents

(in USD million)	At 31 December 2016	2015
Cash at bank available	128	243
Time deposits	1,658	1,494
Money market funds	65	450
Interest bearing securities	2,220	5,077
Margin deposits	203	206
Cash and cash equivalents	4,274	7,471

Restricted cash at 31 December 2016 and 2015 consists of margin deposits including both cash and exchange traded derivative products with daily settlement of USD 203 million and USD 206 million, respectively.

15 Equity and shareholders

Change in equity

(in USD million)	At 31 December 2016	2015
Shareholders' equity at 1 January	39,277	50,108
Net income	(2,608)	(6,616)
Actuarial gain (loss) defined benefit pension plans	(374)	1,138
Foreign currency translation adjustments	(304)	(2,498)
Ordinary dividend	(2,838)	(2,860)
Scrip dividend	904	0
Value of stock compensation plan	(26)	(4)
Treasury shares purchased	27	10
Total equity at 31 December	34,059	39,277

The accumulated foreign currency translation effect as of 31 December 2016 decreased total equity by USD 1,338 million. At 31 December 2015 the corresponding effect was a decrease in total equity of USD 1,034 million. The foreign currency translation adjustments relate to currency translation effects from the subsidiaries.

Common stock

	Number of shares	NOK per value	At 31 December Common stock
Authorised and issued	3,245,049,411	2.50	8,112,623,527.50
Treasury shares	11,138,890	2.50	27,847,225.00
Total outstanding shares	3,233,910,521	2.50	8,084,776,302.50

There is only one class of shares and all the shares have the same voting rights.

During 2016 a total of 4,011,860 treasury shares were purchased for USD 62 million and 3,882,153 treasury shares were allocated to employees participating in the share saving plan. In 2015 a total of 4,057,902 treasury shares were purchased for USD 69 million and 3,203,968 treasury shares were allocated to employees participating in the share saving plan. At 31 December 2016 Statoil had 11,138,890 treasury shares and at 31 December 2015 11,009,183 treasury shares, all of which are related to Statoil's share saving plan. For further information, see note 5 Share-based compensation.

Statoil's general assembly has authorised the company to acquire Statoil shares in the market. The authorisation may be used to acquire Statoil shares with an overall nominal value of up to NOK 42.0 million. Such shares acquired in accordance with the authorisation may only be used for sale and transfer to employees of the Statoil group as part of the group's share saving plan approved by the board. The minimum and maximum amount that may be paid per share will be NOK 50 and NOK 500, respectively. The authorisation is valid until the next ordinary general meeting. For further details, please see note 17 Shareholder's equity of the Consolidated financial statements.

For information regarding the 20 largest shareholders in Statoil ASA, please see Major Shareholders in section 5.1 Shareholder information.

16 Finance debt

Non-current finance debt

	At 31 December	
(in USD million)	2016	2015
Unsecured bonds	29,964	30,350
Unsecured loans	85	83
Finance lease liabilities	382	416
Total finance debt	30,432	30,849
Less current portion	2,549	1,084
Non-current finance debt	27,883	29,764
Weighted average interest rate (%)	3.30	3.33

Statoil ASA uses currency swaps to manage foreign exchange risk on its non-current financial liabilities. For information about the Statoil Group and Statoil ASA´s interest rate risk management, see note 5 Financial risk management in the Consolidated financial statement and note 2 Financial risk management and measurement of financial instruments in the Statoil ASA financial statement.

In 2016 Statoil ASA issued the following bonds:

Issuance date	Amount in EUR billion	Interest rate in %	Maturity date
9 November 2016	0.60	0.75	November 2026
9 November 2016	0.60	1.625	November 2036

Substantially all unsecured bond and unsecured bank loan agreements contain provisions restricting future pledging of assets to secure borrowings without granting a similar secured status to the existing bond holders and lenders.

Out of Statoil ASA total outstanding unsecured bond portfolio, 47 bond agreements contain provisions allowing Statoil to call the debt prior to its final redemption at par or at certain specified premiums if there are changes to the Norwegian tax laws. The carrying amount of these agreements is USD 29.6 billion at the 31 December 2016 closing exchange rate.

Statoil ASA has a revolving credit facility of USD 5.0 billion, supported by 21 core banks, maturing in 2021. The facility supports secure access to funding, supported by the best available short-term rating. As at 31 December 2016 and 2015 it has not been drawn.

Non-current finance debt repayment profile

(in USD million)	
2018	3,645
2019	2,822
2020	1,986
2021	1,803
Thereafter	17,627
Total	27,883

More information regarding finance lease liabilities is provided in note 20 Leases.

Current finance debt

(in USD million)	At 31 December 2016	2015
Collateral liabilities and other current financial liabilities	1,112	1,158
Non-current finance debt due within one year	2,549	1,084
Current finance debt	3,661	2,243
Weighted average interest rate (%)	1.62	1.93

Collateral liabilities and other current financial liabilities relate mainly to cash received as security for a portion of Statoil ASA's credit exposure and outstanding amounts on US Commercial paper (CP) programme. At 31 December USD 500 million were issued on the CP programme. Corresponding at 31 December 2015 there were no outstanding amounts.

17 Pensions

Statoil ASA is subject to the Mandatory Company Pensions Act, and the company's pension scheme follows the requirements of the Act. Reference is made to the Annual notes in the Financial statement for Statoil Group, for a description of the pension scheme in Statoil ASA.

Net pension cost

(in USD million)	2016	2015
Current service cost	234	368
Interest cost	182	180
Interest (income) on plan asset	(137)	(134)
Losses (gains) from curtailment, settlement or plan amendment	123	251

Actuarial (losses) gains related to currency effects on net obligation and foreign exchange translation	(30)	415
Tax effects of actuarial (losses) gains recognised in retained earnings	129	(461)
Recognised directly in retained earnings during the year net of tax	(374)	1,138
Cumulative actuarial (losses) gains recognised directly in retained earnings net of tax	(1,188)	(814)

Actuarial assumptions and sensitivity analysis

Actuarial assumptions, sensitivity analysis, portfolio weighting and information about pension assets in Statoil Pension are presented in the Pension note in the Financial statement for Statoil Group. The number of employees, including pensioners related to the main benefit plan in Statoil ASA are 9,410. In addition, all employees are members of the AFP plan and different groups of employees are members of other unfunded plans.

18 Provisions

(in USD million)	Provisions
Non-current portion at 31 December 2015	294

Non-current portion at 31 December 2016	289

See also comments on provisions in note 21 Other commitments, contingent liabilities and contingent assets.

19 Trade, other payables and provisions

	At 31 December	
(in USD million)	2016	2015
Trade payables	1,388	977
Non-trade payables, accrued expenses and provisions	890	1,137
Equity accounted investments and other related party payables	615	599
Trade, other payables and provisions	2,893	2,713

20 Leases

Statoil ASA leases certain assets, notably vessels and office buildings.

In 2016, net rental expenditures were USD 464 million (USD 427 million in 2015) consisting of minimum lease payments of USD 533 million (USD 501 million in 2015) reduced with sublease payments received of USD 70 million in 2016 (USD 75 million in 2015). Contingent rents expensed were immaterial both years.

The information in the table below shows future minimum lease payments under non-cancellable leases at 31 December 2016. Amounts related to finance leases include future minimum lease payments for assets recognised in the financial statements at year end 2016.

			Finance leases		
(in USD million)	Operating leases	Operating sublease	Minimum lease payments	Discount element	Net present value minimum lease payments
2017	441	(25)	53	(2)	50
2018	335	(24)	53	(4)	48
2019	287	(23)	53	(7)	46
2020	251	(22)	53	(8)	44
2021	227	(21)	53	(10)	42
2022-2026	686	(76)	210	(59)	151
2027-2031	372	0	0	0	0
Thereafter	73	0	0	0	0
Total future minimum lease payments	2,671	(191)	473	(91)	382

More information related to the operating leases of vessels and office buildings is found in the Statoil group financial statements.

Statoil ASA leases three LNG vessels on behalf of Statoil and the State's direct financial interest (SDFI). Statoil ASA accounts for the combined Statoil and SDFI share of these agreements as finance leases in the balance sheet, and further accounts for the SDFI related portion as operating sublease. The finance leases included in the balance sheet reflect the original lease term of 20 years from 2006.

Property, plant and equipment includes USD 312 million for leases that have been capitalised at year end 2016 (USD 345 million in 2015), also presented in the category vessels in note 9 Property, plant and equipment.

21 Other commitments, contingent liabilities and contingent assets

Contractual commitments
Statoil ASA had contractual commitments of USD 960 million at 31 December 2016. The contractual commitments reflect the Statoil ASA share and comprise financing commitments related to exploration activities.

Other long-term commitments
Statoil ASA has entered into various long-term agreements for pipeline transportation as well as terminal use, processing, storage and entry/exit capacity commitments and commitments related to specific purchase agreements. The agreements ensure the rights to the capacity or volumes in question, but also impose on the company the obligation to pay for the agreed-upon service or commodity, irrespective of actual use. The contracts' terms vary, with duration of up to 30 years.

Take-or-pay contracts for the purchase of commodity quantities are only included in the table below if their contractually agreed pricing is of a nature that will or may deviate from the obtainable market prices for the commodity at the time of delivery.

Obligations payable by Statoil ASA to entities accounted for as associates and joint ventures are included gross in the table below. Obligations payable by Statoil ASA to entities accounted for as joint operations (for example pipelines) are included net (i.e. gross commitment less Statoil ASA's ownership share).

Nominal minimum commitments at 31 December 2016:

(in USD million)	
2017	1,106
2018	1,047
2019	1,031
2020	975
2021	822
Thereafter	4,084
Total	9,065

Guarantees
Statoil ASA has provided parent company guarantees covering liabilities of subsidiaries with operations in Algeria, Angola, Australia, Azerbaijan, Brazil, Colombia, Denmark, Germany, Greenland, India, Ireland, Libya, New Zealand, Nicaragua, Nigeria, Norway, Russia, Sweden, United Kingdom, the United States of America, Uruguay and Venezuela. The company has also counter-guaranteed certain bank guarantees covering liabilities of subsidiaries in Algeria, Angola, Australia, Brazil, Canada, Colombia, Denmark, the Faroes, Indonesia, Mexico, Myanmar, the Netherlands, Nicaragua, Norway, South Africa, Sweden, United Kingdom, the United States of America and Uruguay.

Statoil ASA has guaranteed for its proportionate portion of an associate's long term bank debt, amounting to USD 160 million. The book value of the guarantee is immaterial.

Contingencies
Statoil ASA is the participant in certain entities ("DAs") in which the company has unlimited responsibility for its proportionate share of such entities' liabilities, if any, and also participates in certain companies ("ANSs") in which the participants in addition have joint and several liability. For further details, refer to note 10 Investments in subsidiaries and other equity accounted investments.

A number of Statoil ASA's long-term gas sales agreements contain price review clauses. Certain counterparties have requested arbitration in connection with price review claims. The related exposure for Statoil ASA has been estimated to an amount equivalent to approximately USD 374 million for gas delivered prior to year end 2016. Statoil ASA has provided for its best estimate related to these contractual gas price disputes in the financial statements, with the impact to the statement of income reflected as revenue adjustments.

On 26 September 2016, the Norwegian Ministry of Finance (MoF) denied Statoil's appeal related to a 2014 order from the Financial Supervisory Authority of Norway to change the timing of a Cove Point related onerous contract provision to a financial period prior to the first quarter of 2013, in which Statoil originally reflected the provision. Statoil has decided not to pursue the matter further, as it does not impact any comparative financial periods presented in the annual Consolidated financial statements of 2016. Further reference is made to Note 23 Other commitments, contingent liabilities and contingent assets of Statoil's 2015 Consolidated financial statements.

On 6 July 2016, the Norwegian tax authorities issued a deviation notice for the years 2012 to 2014 related to the internal pricing on certain transactions between Statoil Coordination Centre (SCC) in Belgium and Statoil ASA. The main issue relates to SCC's capital structure and its compliance with the arm's length principle. Statoil ASA is of the view that arm's length pricing has been applied in these cases and that the group has a strong position, and no amounts have consequently been provided for in the accounts.

During the normal course of its business Statoil ASA is involved in legal proceedings, and several other unresolved claims are currently outstanding. The ultimate liability or asset in respect of such litigation and claims cannot be determined at this time. Statoil ASA has provided in its financial statements for probable liabilities related to litigation and claims based on the company's best judgment. Statoil ASA does not expect that its financial position, results of operations or cash flows will be materially affected by the resolution of these legal proceedings.

Provisions related to claims and disputes are reflected within note 18 Provisions.

22 Related parties

Reference is made to note 24 Related parties in Statoil's Consolidated financial statement for information regarding Statoil ASAs related parties. This include information regarding related parties as a result of Statoil ASA's ownership structure and also information regarding transactions with the Norwegian State.

Transactions with internally owned companies
Revenue transactions with related parties are presented in note 3 Revenues. Total intercompany revenues amounted to USD 3,221 million and USD 4,283 million in 2016 and 2015, respectively. The major part of intercompany revenues is attributed to sales of crude oil and sales of refined products to Statoil Refining Denmark AS and Statoil Marketing.

Statoil ASA sells natural gas and pipeline transport on a back-to-back basis to Statoil Petroleum AS. Similarly, Statoil ASA enters into certain financial contracts, also on a back-to-back basis with Statoil Petroleum AS. All of the risks related to these transactions are carried by Statoil Petroleum AS and the transactions are therefore not reflected in Statoil ASA's financial statements.

Statoil ASA buys volumes from its subsidiaries and sells them into the market. Total purchases of goods from subsidiaries amounted to USD 12,511 million and USD 15,296 million in 2016 and 2015, respectively. The major part of intercompany purchases of goods is attributed to Statoil Petroleum AS, USD 8,163 million and USD 10,282 million in 2016 and 2015, respectively.

In relation to its ordinary business operations, Statoil ASA has regular transactions with group companies in which Statoil has ownership interests. Statoil ASA makes purchases from group companies amounting to USD 490 million and USD 999 million in 2016 and 2015, respectively.

Expenses incurred by the company, such as personnel expenses, are accumulated in cost pools. Such expenses are allocated in part on an hours incurred cost basis to Statoil Petroleum AS, to other group companies, and to licences where Statoil Petroleum AS or other group companies are operators. Cost allocated in this manner is not reflected in Statoil ASA's financial statements. Expenses allocated to group companies amounted to USD 4,214 million and USD 4,758 million in 2016 and 2015, respectively. The major part of the allocation is related to Statoil Petroleum AS, USD 3,302 million and USD 3,980 million in 2016 and 2015, respectively.

Other transactions
Reference is made to note 24 Related parties in Statoil's Consolidated financial statement for information regarding Statoil ASAs transactions with related parties based on ordinary business operations.

Current receivables and current liabilities from subsidiaries and other equity accounted companies are included in note 11 Financial assets and liabilities.

Related party transactions with management and management remunerations for 2016 are presented in note 4 Remuneration.

23 Subsequent events

See note 17 Equity and dividend in Statoil's consolidated financial statements for proposed dividend for the fourth quarter 2016.

24 Transition to simplified IFRS and USD presentation currency

Change to simplified IFRS and change of presentation currency – re-presentation of comparative

With effect from 1 January 2016 Statoil ASA changed the accounting principles from NGAAP to simplified IFRS pursuant to the Norwegian Accounting Act § 3-9 and regulations regarding simplified application of IFRS issued by the Ministry of Finance on 3 November 2014. With effect from 1 January 2016 Statoil ASA also changed its presentation currency from Norwegian kroner (NOK) to US dollars (USD). The effects of the changes are described in this disclosure. The effects on the comparative figures for 2014 and 2015 are presented in the tables below.

Simplified IFRS Transition

The accounting policies set out in note 2 have been applied in preparing the financial statements for the year ended 31 December 2016, the comparative information presented in these financial statements for the year ended 31 December 2014 and 31 December 2015, and the preparation of an opening balance sheet in accordance with simplified IFRS at 1 January 2015.

Opening balance sheet

The financial statements have been retrospectively re-stated with effect from 1 January 2015. In preparing its opening simplified IFRS balance sheet as at 1 January 2015, Statoil ASA has adjusted amounts reported previously in financial statements prepared in accordance with its old basis of accounting, NGAAP. An explanation of how the transition from NGAAP to simplified IFRS has affected Statoil ASAs statement of income, balance sheet and statement of cash flows is set out below.

IFRS 1 Exemptions and elections applied, IAS 1 presentation and simplified IFRS exemptions

In making the transition to simplified IFRS Statoil ASA has applied IFRS 1, First-time Adoption of International Financial Reporting Standards and the simplified IFRS pursuant to the Norwegian Accounting Act § 3-9 and regulations regarding simplified application of IFRS issued by the Ministry of Finance on 3 November 2014. IFRS 1 requires that all IFRS standards and interpretations are applied consistently and retrospectively for all fiscal years presented. However, this standard provides exemptions and exceptions to this general requirement in specific cases. Simplified IFRS provides some exemptions from IFRS 1 and IAS 1. Statoil ASA has chosen to apply the following exemptions under IFRS 1 and the simplified IFRS regulation:

Business Combinations

IFRS 1 allows for Business combinations occurred before transition to IFRS not to be restated according to IFRS 3. Statoil has applied this exemption. Business combinations that occurred before 1 January 2015, has not been restated retrospectively. Within the limits imposed by IFRS 1, the carrying amounts of assets acquired and liabilities assumed as part of past business combinations that arose from such transactions as they were determined under NGAAP, are considered their deemed cost under simplified IFRS at the date of transition. The carrying amount of goodwill in the opening simplified IFRS statement of financial position is its carrying amount in accordance with NGAAP at the date of transition.

Cumulative currency translation differences

According to IFRS 1 the cumulative foreign translations for all foreign operations could be set to zero at the date of transition to IFRS. When IFRS was implemented in the Statoil group 1 January 2006, the currency translation adjustments were set to zero. The currency translation adjustments calculated from 1 January 2006 is regarded as the best approximation of the historical translation adjustment and is the starting point of the translation adjustments in the statutory accounts of Statoil ASA.

GAAP differences between IFRS and simplified IFRS

The IFRS principles applied by the Statoil Group have been applied in Statoil ASA with the following exemptions in accordance with the simplified IFRS regulations:

Dividends and group contributions

Statoil ASA has applied the exemptions from IAS 10, no 12 and 13, IAS 18 no. 30 and IFRIC 17 no 10 and recognize proposed dividend and group contributions at the end of the year.

Statement of changes in equity

Statoil ASA has applied the exemption from providing a statement of changes in equity. The specification of changes in equity is presented in disclosure 15.

Primary changes in accounting policies

The changes in accounting policies are primarily related to derivatives and goodwill.
See note 2 Significant accounting policies in the Consolidated financial statements for further information.

Change in presentation currency

The change in presentation currency effective from 1 January 2016 was made mainly in order to better reflect the underlying USD exposure of Statoil's business activities and to align with industry practice. The change in presentation currency has been accounted for as a policy change, and comparative figures have been re-presented to USD retrospectively from 1 January 2015 to reflect the change in presentation currency.

The different components of assets and liabilities in USD correspond to the amount published in NOK translated at the USD/NOK closing rate applicable at 31. December 2014. The same relates to the equity as a whole. As such, the change in presentation currency will not impact the valuation of assets, liabilities, equity or any ratios between these components, such as debt to equity ratios.

All currency translation adjustments have been calculated from 1 January 2006, which was the date of Statoil group's transition to IFRS. Cumulative translation adjustments have been presented as if Statoil ASA had used USD as the presentation currency from that date.

The recalculation of currency translation adjustments in USD has an impact on the distribution of shareholders' equity for comparable periods, between currency translation adjustments and other components of equity. Together with changes in net income arising from the change in presentation currency, these effects have been presented as re-presentations in the table below.

EFFECT OF CHANGES IN REPORTED EQUITY

	NGAAP NOK as reported (billion)	Simplified IFRS adjustments NOK (billion)	Simplified IFRS in NOK (billion)	Simplified IFRS in USD (million)[1)]	USD reclassifications (million)	Simplified IFRS in USD (million)
Share capital	8.0		8.0	1,073	66	1,139

1) Translated at exchange rate USD/NOK 8.809 as of 31 December 2015.

IFRS adjustments relates to fair value adjustments on commodity and financial derivatives. In 2015 the adjustment also included depreciation of goodwill. Paid in capital have been recognized at the USD/NOK exchange rate of 6.998 at the time of the conversion of Statoil ASA from NOK to USD, 31 December 2008.

The Statement of income, Statement of financial position and Statement of cash flows have been re-presented to reflect the currency rates of transactions in foreign currencies at the date of the transactions.

Upon disposal of a foreign operation accumulated currency translation adjustments arising from currency movements between the Statoil ASA's presentation currency and the operational currency of the foreign operation are reclassified from equity to profit or loss and included as part of the gain or loss from the disposal, presented as other income. When changing Statoil ASA's presentation currency from NOK to USD, the gains or losses from such disposals have been changed to reflect accumulated currency gains or losses being calculated based on USD being the presentation currency rather than NOK. These effects are presented as re-presentations in the table below, and represent the only re-measurements following the change in presentation currency to USD.

EFFECT OF CHANGES IN REPORTED NET INCOME

	Full year ended 31 December 2015
Net income under NGAAP NOK as reported (billion)	(46.8)
Simplified IFRS adjustments	
Goodwill[1)]	0.3
Merger timing effects [2)]	0.7
Commodity derivatives[3)]	(0.9)
Financial derivatives[3)]	(2.3)
Total simplified IFRS translation adjustments NOK (billion)	(2.3)
Simplified IFRS in NOK (billion)	(49.1)
Simplified IFRS in USD (million) - Translated at average exchange rates for the quarters	(6,131)
Translation to USD re-presentation effects[4)]	(485)
Net income under simplified IFRS in USD (million)	(6,616)

Impacts in reported net income

1) Goodwill
According to NGAAP goodwill has been depreciated linear over 10 years. Goodwill depreciation according to NGAAP in 2015 has been reversed. The goodwill is recognized at amortized cost at 1 January 2015.

2) Merger effects
The entities within the Statholding group merged with Statholding AS in 2015. The transaction date for the merger was 1 January 2015 under NGAAP. Under simplified IFRS the transaction date was 15 December 2015. The Statholding AS has USD functional currency. Entities with NOK functional currency included in the merger changed the function currency from NOK to USD effective from 1 January 2015 under NGAAP and at 15 December 2015 under simplified IFRS.

3) Commodity and financial derivatives
Under simplified IFRS all non-exchange traded commodity derivatives and embedded derivatives have been booked at fair value. Under NGAAP all non-exchange traded commodity derivatives have been booked at the lowest of cost and fair value. Embedded derivatives have not been recognized under NGAAP. All interest derivatives (OTC) are booked at fair value under simplified IFRS while under NGAAP all interest derivatives were booked at the lowest of cost and fair value

4) Change in presentation currency
The disposal with most significant effect on the net income in Statoil ASA in 2015 is the disposal of Statoil's interests in the subsidiary Shah Deniz, for which the gain presented in NOK included NOK 3.2 billion arising from reclassification of accumulated translation differences. As the disposed foreign operation had USD as functional currency, there are no accumulated translation differences when presented in USD for this transaction.

Impact on cash flow

Simplified IFRS adjustments
There are no changes between cash flows from operating activities, investing activities, and financing activities. The transition to simplified IFRS has only effect between line items within cash flow provided by operating activity. The effect on net income related to the merger effect and commodity derivatives is offset in the line item (increase) decrease in other items related to operating activities. The effect on net income related to the financial derivatives is offset in the line item derivatives. No adjustments have been made to cash and cash equivalents, and no other adjustments have been made to the statements of cash flows on conversion.

Change in presentation currency
The Statement of cash flow has been re-presented to reflect the changes described above and based on the currency rates applicable at the transaction dates of relevant transactions. The re-presentation impacts the classification between the different lines in the statement of cash flow, between currency translation adjustments and other components of cash flow.

The report set out below is provided in accordance with law, regulations, and auditing standards and practices generally accepted in Norway, including International Standards on Auditing (ISAs). KPMG AS has also issued reports in accordance with standards of the Public Company Accounting Oversight Board in the US, which include opinions on the consolidated financial statements of Statoil ASA and on the effectiveness of internal control over financial reporting as at 31 December 2016. Those reports are set out on pages 189 and 190.

Independent auditor's report

To the annual shareholders' meeting of Statoil ASA

Report on the audit of the financial statements

Opinion

We have audited the financial statements of Statoil ASA (the Company) for the year ended 31 December 2016.

The financial statements comprise:
- the Consolidated financial statements of Statoil ASA and its subsidiaries (the Group), which comprise the Consolidated balance sheet as at 31 December 2016, the Consolidated statements of income, comprehensive income, changes in equity and cash flows for the year then ended, and a summary of significant accounting policies and other explanatory information
- the parent company financial statements of Statoil ASA, which comprise the company balance sheet as at 31 December 2016, and the company's statements of income, comprehensive income and cash flows for the year then ended, and a summary of significant accounting policies and other explanatory information

In our opinion:
- the financial statements are prepared in accordance with relevant Norwegian law and regulations
- the Consolidated financial statements give a true and fair view of the financial position of Statoil ASA and its subsidiaries as at 31 December 2016, of its financial performance and its cash flows for the year then ended in accordance with International Financial Reporting Standards as adopted by the EU
- the parent company financial statements give a true and fair view of the financial position of Statoil ASA as at 31 December 2016, of its financial performance and its cash flows for the year then ended in accordance with simplified application of international accounting standards according to section 3-9 of the Norwegian Accounting Act

Basis for opinion

We conducted our audit in accordance with law, regulations, and auditing standards and practices generally accepted in Norway, including International Standards on Auditing (ISAs). Our responsibilities under those standards are further described in the 'Auditor's Responsibilities for the Audit of the Financial Statements' section of our report. We are independent of the Company and the Group as required by law and regulations, and we have fulfilled our ethical responsibilities in accordance with these requirements.

We believe that the audit evidence we have obtained is sufficient and appropriate to provide a basis for our opinion.

Key audit matters

Key audit matters are those matters that, in our professional judgment, were of most significance in our audit of the financial statements for the year ended 31 December 2016. These matters were addressed in the context of our audit of the financial statements as a whole, and in forming our opinion thereon, and we do not express any discrete opinion on these matters.

PUBLIC COPY - CONFIDENTIAL INFORMATION REMOVED

Key audit matter	*Our response*
Valuation of upstream assets including assets under development, capitalised exploration expenses and acquisition costs for oil and gas prospects The Group owns significant upstream assets including assets under development, capitalised exploration expenses and acquisition costs for oil and gas prospects. The recoverability of these assets is dependent on management's estimates of the future cash flows that these assets are expected to produce. The carrying value of these assets are therefore particularly sensitive to changes in management's long term commodity price forecasts. Changes in short term commodity price forecasts, which management derives from observed forward oil and gas price curves over a one year period, can also have a significant impact for shorter-lived assets. In the fourth quarter of 2016, management reduced the Company's long term commodity price forecasts. Further, management reduced the discount rate used to calculate the value in use of these assets from 6.5% to 6.0%. The reduction in commodity price assumptions resulted in a large number of assets being triggered for impairment. Management also included business plan updates and capital expenditure forecasts and reserves updates that, in combination with the reduction of the discount rate and improved short term commodity price outlook, partially offset the effect of the reduction in the long term commodity price forecasts. Capitalised exploration expenses and the capitalised acquisition cost of oil and gas prospects are assessed for impairment when facts and circumstances suggest that the carrying amount of the asset may exceed its recoverable amount. Strategic decisions made by management, notably in the Gulf of Mexico and Brazil led to impairment of capitalized exploration expenses in 2016. Refer to note 10 *Property, plant and equipment* and note 11 *Intangible assets* to the Consolidated financial statements.	We evaluated and tested management's controls over the process it uses to identify triggers that would require impairment testing of specific assets. We also assessed the appropriateness of management's identification of cash generating units in light of our knowledge of the business. In addition, we undertook our own analysis to assess whether all material assets requiring impairment testing had been identified by management. We did not identify any assets where impairment testing was required that had not been identified by management. For those assets where management identified an impairment trigger, we evaluated and tested management's controls over the impairment calculations performed, including the assumptions applied. We assessed management's macroeconomic assumptions including short and long term commodity price, foreign currency rate and inflation rate forecasts and discount rates. We compared the short term price forecasts to observable market forward curves that we sourced independently. We compared management's long term assumptions to views published by brokers, economists, consultancies and respected industry bodies that we sourced independently, which provided a range of relevant third-party data points, and to our own views. We also assessed by reference to market data the inputs to and calculation of the discount rate used by management to assess whether the discount rate being applied was too low. The key inputs included the risk-free rate, market risk premium and industry financing structures (gearing and cost of debt and equity). In testing these assumptions we made use of KPMG valuation experts. For those assets where management identified an impairment trigger, we assessed the valuation method, estimates of future cash flows and challenged whether these were appropriate in light of: • management's commodity price, foreign currency rate and inflation rate forecasts • production and reserve estimates • capital and operating budgets and historical performance; and • previous estimates We assessed the mathematical accuracy of the valuation models and the accuracy of the impairment (reversal) recognised in the financial statements. Based on our procedures we consider the impairment charges/reversals to be appropriate. We considered whether the sensitivity analysis included in note 10 *Property, plant and equipment* appropriately described the Group's exposure to further impairments should future commodity prices deviate from management's forecasts. We evaluated and tested management's controls over the process it uses to evaluate whether the carrying value of capitalised exploration expenses and acquisition cost for oil and gas prospects is no longer sustainable. Based on our procedures on the exploration portfolio we consider the write-offs and the remaining carrying value to be appropriate.

Taxation The Group has operations in multiple countries, each with its own taxation regime. Management makes judgements and estimates in relation to uncertain tax positions. The Group has significant deferred tax assets and unrecognised tax losses, most notably in the US. The period over which such assets are expected to be recovered can be extensive and management applies significant judgement in assessing whether deferred tax assets should be recognised and to determine the recoverability of those balances. In addition, management applies significant judgement in estimating the provision relating to uncertain tax positions and/or related disclosure. These usually arise in countries where the fiscal contribution of the oil and gas industry to the country's budget is very significant and where the tax regime and administration are immature and/or developing. The most notable significant uncertain tax positions are the dispute with the Angolan Ministry of Finance regarding the Group's participation in Block 4, Block 15, Block 17 and Block 31 offshore Angola with regards to profit oil and taxes on activities between 2002 and 2012. Further, the Norwegian tax authorities have issued a deviation notice regarding transactions between Statoil Coordination Centre (SSC) in Belgium and Norwegian entities within the Group. The issue relates to SCC's capital structure and compliance with the arm's length principle. In addition, the Brazilian tax authorities have issued a tax assessment for 2011 disputing the allocation of sale proceeds between entities and assets involved, with regard to a divestment of 40% interest in the Peregrino field to Sinochem at the time. Refer to note 9 *Income taxes* and note 23 *Other commitments, contingent liabilities and contingent assets* to the Consolidated financial statements.	We evaluated and tested management's controls over the process it uses to recognise deferred tax assets, to determine unrecognised tax losses and to determine provisions for uncertain tax positions and/or related disclosure. In determining the extent to which deferred tax assets should be recognised, management applied long term commodity price forecasts and foreign currency assumptions as described in the key audit matter relating to valuation of upstream assets including assets under development, capitalised exploration expenses and acquisition costs for oil and gas prospects. We challenged the key assumptions made by management and confirmed that these were consistent with the long term business plans used by management to manage and monitor the development of the business. We performed detailed testing over the tax position in each significant jurisdiction in which the Group operates using our global and local tax experts as appropriate. We examined and assessed correspondence with tax authorities and the Group's tax advisers and papers relating to tax investigations/cases as appropriate. The calculations used by management to determine the provisions for uncertain tax positions were assessed, based on our understanding of the position of the Group and the position of the tax authorities. We consider that the provisions for uncertain tax positions and related disclosure are appropriate. We highlighted the high level of inherent uncertainty in some of the positions.
Estimate of asset retirement obligation Given the nature of its operations, the Group incurs obligations to dismantle and remove facilities and to restore the site on which it is located. Management applies significant judgement to estimate the asset retirement obligation due to inherent complexity in estimating future costs and the limited historical experience against which to benchmark estimates of future costs. Key assumptions include future abandonment costs, foreign currency assumptions and inflation rates. Refer to note 20 *Provisions* to the Consolidated financial statements.	We challenged the key assumptions in management's annual review process for determining the asset retirement obligation. Our testing was focused on those assumptions having the most significant impact on the asset retirement obligation selected based on our sensitivity analysis. To validate the appropriateness of the expected future abandonment costs we tested whether technical inputs including the number of wells, weight of the structure and length of pipelines applied in the calculation are consistent with technical assessments of the relevant fields. Further, we assessed the reasonableness of rig rates using external market data and historic rig contracts. Our procedures over foreign currency assumptions and inflation rates were an integral part of our assessment of assumptions as applied in impairment testing. We refer to our response as described in the key audit matter over the valuation of upstream including assets under development, capitalised exploration expenses and acquisition costs for oil and gas prospects. Based on our procedures, we consider management's estimate of the asset retirement obligation as at 31 December 2016 to be appropriate.

Other information

Management is responsible for the other information. The other information comprises the chapters introduction, strategic report, governance and additional information included in the annual report, but does not include the financial statements and our auditor's report thereon.

Our opinion on the financial statements does not cover the other information and note 27 Supplementary oil and gas information to the Consolidated financial statements, and we do not express any form of assurance conclusion thereon.

In connection with our audit of the financial statements, our responsibility is to read the other information and, in doing so, consider whether the other information is materially inconsistent with the financial statements or our knowledge obtained in the audit or otherwise appears to be materially misstated.

If, based on the work we have performed, we conclude that there is a material misstatement of this other information, we are required to report that fact. We have nothing to report in this regard.

Responsibilities of management and board of directors for the financial statements

Management is responsible for the preparation and fair presentation of the financial statements of the parent company in accordance with simplified application of international accounting standards according to the Norwegian Accounting Act section 3-9, and for the preparation and fair presentation of the Consolidated financial statements of the Group in accordance with International Financial Reporting Standards as adopted by the EU, and for such internal control as management determines is necessary to enable the preparation of financial statements that are free from material misstatement, whether due to fraud or error.

In preparing the financial statements, management is responsible for assessing the Company's ability to continue as a going concern, disclosing, as applicable, matters related to going concern and using the going concern basis of accounting unless management either intends to liquidate the Group or to cease operations, or has no realistic alternative but to do so.

Auditor's responsibilities for the audit of the financial statements

Our objectives are to obtain reasonable assurance about whether the financial statements as a whole are free from material misstatement, whether due to fraud or error, and to issue an auditor's report that includes our opinion. Reasonable assurance is a high level of assurance, but is not a guarantee that an audit conducted in accordance with law, regulations, and auditing standards and practices generally accepted in Norway, including ISAs will always detect a material misstatement when it exists. Misstatements can arise from fraud or error and are considered material if, individually or in the aggregate, they could reasonably be expected to influence the economic decisions of users taken on the basis of these financial statements (see further explanation below).

As part of an audit in accordance with law, regulations, and auditing standards and practices generally accepted in Norway, including ISAs, we exercise professional judgment and maintain professional scepticism throughout the audit. We also:

- identify and assess the risks of material misstatement of the financial statements, whether due to fraud or error, design and perform audit procedures responsive to those risks, and obtain audit evidence that is sufficient and appropriate to provide a basis for our opinion. The risk of not detecting a material misstatement resulting from fraud is higher than for one resulting from error, as fraud may involve collusion, forgery, intentional omissions, misrepresentations, or the override of internal control
- obtain an understanding of internal control relevant to the audit in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the Company's or the Group's internal control
- evaluate the appropriateness of accounting policies used and the reasonableness of accounting estimates and related disclosures made by management
- conclude on the appropriateness of management's use of the going concern basis of accounting and, based on the audit evidence obtained, whether a material uncertainty exists related to events or conditions that may cast significant doubt on the Company's and the Group's ability to continue as a going concern. If we conclude that a material uncertainty exists, we are required to draw attention in our auditor's report to the related disclosures in the financial statements or, if such disclosures are inadequate, to modify our opinion. Our conclusions are based on the audit evidence obtained up to the date of our auditor's report. However, future events or conditions may cause the Company to cease to continue as a going concern
- evaluate the overall presentation, structure and content of the financial statements, including the disclosures, and whether the financial statements represent the underlying transactions and events in a manner that achieves fair presentation
- obtain sufficient appropriate audit evidence regarding the financial information of the entities or business activities within the Group to express an opinion on the Consolidated financial statements. We are responsible for the direction, supervision and performance of the Group audit. We remain solely responsible for our audit opinion

We communicate with the board of directors regarding, among other matters, the planned scope and timing of the audit and significant audit findings, including any significant deficiencies in internal control that we identify during our audit.

We also provide the board of directors with a statement that we have complied with relevant ethical requirements regarding independence, and to communicate with them all relationships and other matters that may reasonably be thought to bear on our independence, and where applicable, related safeguards.

From the matters communicated with the board of directors, we determine those matters that were of most significance in the audit of the financial statements of the current period and are therefore the key audit matters. We describe these matters in our auditor's report unless law or regulation precludes public disclosure about the matter or when, in extremely rare circumstances, we determine that a matter should not be communicated in our report because the adverse consequences of doing so would reasonably be expected to outweigh the public interest benefits of such communication.

Report on other legal and regulatory requirements

Opinion on the board of directors' report and the statements on corporate governance and corporate social responsibility

Based on our audit of the financial statements as described above, it is our opinion that the information presented in the board of directors' report and in the statements on corporate governance and corporate social responsibility concerning the financial statements and the going concern assumption, and the proposal for the coverage of the loss is consistent with the financial statements and complies with relevant law and regulations.

Opinion on registration and documentation

Based on our audit of the financial statements as described above, and procedures we considered necessary in accordance with the International Standard on Assurance Engagements (ISAE) 3000, «Assurance Engagements Other than Audits or Reviews of Historical Financial Information», it is our opinion that management has fulfilled its duty to produce a proper and clearly set out registration and documentation of the Company's accounting information in accordance with relevant law and bookkeeping standards and practices generally accepted in Norway.

Additional information

5.1 SHAREHOLDER INFORMATION

Statoil is the largest company listed on the Oslo Børs where it trades under the ticker code STL. Statoil is also listed on the New York Stock Exchange under the ticker code STO, trading in the form of American Depositary Shares (ADS).

Statoil's shares have been listed on the Oslo Børs since our initial public offering on 18 June 2001. The ADSs traded on the New York Stock Exchange are evidenced by American Depositary Receipts (ADR), and each ADS represents one ordinary share.

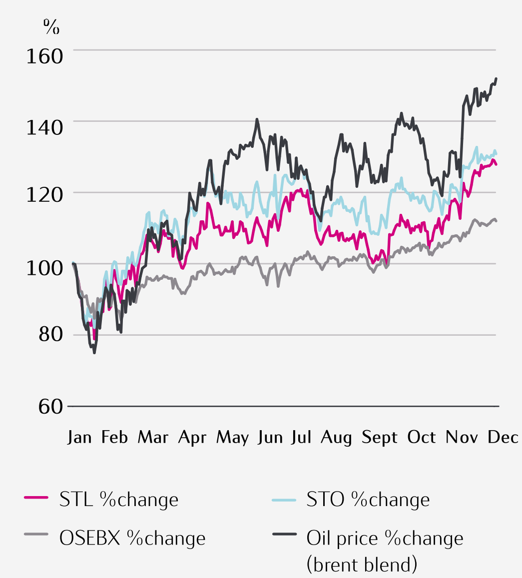
Statoil share price 2016



As of 31 December 2016, Statoil represented 23.24% of the total value of all companies registered on the Oslo Børs, with a market value of NOK 514 billion. Total shareholder return (dividend reinvested) for 2016 is 35.4%.

The graph shows the development of the Statoil share price compared to the oil price and the Oslo Børs Benchmark Index (OSEBX). The turnover of shares is a measure of traded volumes. On average, 4.62 million Statoil shares were traded on the Oslo Børs every day in 2016 compared to 5.1 million shares in 2015. In 2016, Statoil shares accounted for 15% of the total market value traded throughout the year which is equal to 2015.

Statoil ASA has one class of shares, and each share confers one vote at the general meeting. Statoil ASA had 3,245,049,411 ordinary shares outstanding at year end. As of 31 December 2016, Statoil had 91,128 shareholders registered in the Norwegian Central Securities Depository (VPS), down from 91,774 shareholders at 31 December 2015.

Share prices

These are the reported high and low quotations at market closing for the ordinary shares on the Oslo Børs and New York Stock Exchange for the periods indicated. They are derived from the Oslo Børs Daily Official List, and the highest and lowest sales prices of the ADSs as reported on the New York Stock Exchange composite tape.

Dividend policy and dividends

It is Statoil's ambition to grow the annual cash dividend measured in USD per share in line with long-term underlying earnings.

Statoil's board approves first, second and third quarter interim dividends, based on an authorisation from the annual general meeting (AGM), while the AGM approves the fourth quarter dividend and implicitly the total annual dividend based on a proposal from the board. It is Statoil's intention to pay quarterly dividends, although when deciding the interim dividends and recommending the total annual dividend level, the board will take into consideration expected cash flow, capital expenditure plans, financing requirements and appropriate financial flexibility.

In addition to cash dividend, Statoil might buy back shares as part of total distribution of capital to the shareholders. The shareholders at the AGM may vote to reduce, but may not increase, the fourth quarter dividend proposed by the board of directors. Statoil announces dividend payments in connection with quarterly results.

Payment of quarterly dividends is expected to take place within six months after the announcement of each quarterly dividend.

The board of directors proposes to the AGM a dividend of USD 0.2201 per share for the fourth quarter 2016 and to continue with the two-year scrip dividend programme which started from fourth quarter 2015. The scrip programme will give shareholders the option to receive quarterly dividends in cash or in newly issued shares in Statoil at a 5% discount for the fourth quarter 2016. On 11 May 2016, Statoil and the Norwegian state entered into a two-year agreement whereby the Norwegian state shall use the part of its quarterly dividend to subscribe for the number of shares that is required to maintain its ownership of 67%. Any part of the Dividend not used as settlement for dividend shares by the Norwegian state shall be paid in cash. For further information about dividends and our scrip dividend programme see Statoil.com.

The following table shows the cash dividend amounts to all shareholders since 2011 on a per share basis and in aggregate.

ADDITIONAL INFORMATION

	Ordinary dividend per share									Ordinary dividend per share
Fiscal year	Curr.	Q1	Curr.	Q2	Curr.	Q3	Curr.	Q4	Curr.	
2012									NOK	6.7500
2013									NOK	7.0000
2014	NOK	1.8000	NOK	1.8000	NOK	1.8000	NOK	1.8000	NOK	7.2000
2015	NOK	1.8000	NOK	0.0000	NOK	0.0000	NOK	0.0000	NOK	1.8000
2015	USD	0.0000	USD	0.2201	USD	0.2201	USD	0.2201	USD	0.6603
2016	USD	0.2201	USD	0.2201	USD	0.2201	USD	0.2201	USD	0.8804

The proposed fourth quarter 2016 dividend will be considered at the annual general meeting 11 May 2017. The Statoil share will be traded ex dividend 12 May 2017 and the dividend will be disbursed around late June 2017. For US ADR holders, the ex-dividend date will be 11 May 2017 and expected payment and allocation of new dividend shares for ADR holders will be in June 2017.

Dividends in NOK per share will be calculated and communicated four business days after record date for shareholders at Oslo Børs. The NOK dividend will be based on average USD/NOK fixing rates from Norges Bank in the period plus/minus three business days from record date, in total seven business dates.

Share repurchase
For the period 2013-2016, the board of directors was authorised by the annual general meeting of Statoil to repurchase Statoil shares in the market for subsequent annulment. Statoil has not undertaken any share repurchase based on this authorisation.

It is Statoil's intention to renew this authorisation at the annual general meeting in May 2017.

SHARES PURCHASED BY ISSUER

Shares are acquired in the market for transfer to employees under the share savings scheme in accordance with the limits set by the board of directors. No shares were repurchased in the market for the purpose of subsequent annulment in 2016.

Statoil's share savings plan

Since 2004, Statoil has had a share savings plan for employees of the company. The purpose of this plan is to strengthen the business culture and encourage loyalty through employees becoming part-owners of the company.

Through regular salary deductions, employees can invest up to 5% of their base salary in Statoil shares. In addition, the company contributes 20% of the total share investment made by employees in Norway, up to a maximum of NOK 1,500 per year (approximately USD 170). This company contribution is a tax-free employee benefit under current Norwegian tax legislation. After a lock-in period of two calendar years, one extra share will be awarded for each share purchased. Under current Norwegian tax legislation, the share award is a taxable employee benefit, with a value equal to the value of the shares and taxed at the time of the award.

The board of directors is authorized to acquire Statoil shares in the market on behalf of the company. The authorization is valid until the next annual general meeting, but not beyond 30 June 2017. This authorisation replaces the previous authorisation to acquire Statoil's own shares for implementation of the share savings plan granted by the annual general meeting 19 May 2015. It is Statoil's intention to renew this authorisation at the annual general meeting. Statoil intends to use share buybacks more actively going forward, based on balance sheet strength considerations.

Period in which shares were repurchased	Number of shares repurchased	Average price per share in NOK	Total number of shares purchased as part of programme	Maximum number of shares that may yet be purchased under the programme authorisation

Statoil ADR programme fees

Fees and charges payable by a holder of ADSs.
As depositary from 31 January 2013, Deutsche Bank Trust Company Americas collects its fees for the delivery and surrender of ADSs directly from investors depositing shares or surrendering ADSs for the purpose of withdrawal, or from intermediaries acting for them.

The depositary collects fees from investors by deducting the fees from the amounts distributed or by selling a portion of distributable property to pay the fees. The depositary may refuse to provide fee-attracting services until its fees for those services are paid.

The charges of the depositary payable by investors are as follows:

Persons depositing or withdrawing shares must pay:	For:
USD 5.00 (or less) per 100 ADSs (or portion of 100 ADSs)	· Issuance of ADSs, including issuances resulting from a distribution of shares or rights or other property · Cancellation of ADSs for the purpose of withdrawal, including if the deposit agreement terminates
USD 0.02(or less) per ADS, subject to the company's consent	· Any cash distribution to ADS registered holders
USD 0.05 (or less) per ADS, subject to the company's consent	· For the operation and maintenance costs in administering the ADR programme
A fee equivalent to the fee that would be payable if securities distributed to you had been shares and the shares had been deposited for issuance of ADSs	· Distribution of securities distributed to holders of deposited securities which are distributed by the Depositary to ADS registered holders
Registration or transfer fees	· Transfer and registration of shares on our share register to or from the name of the Depositary or its agent when you deposit or withdraw shares
Expenses of the Depositary	· Cable, telex and facsimile transmissions (as provided in the deposit agreement) · Converting foreign currency to USD
Taxes and other governmental charges the Depositary or the custodian have to pay on any ADS or share underlying an ADS, for example, stock transfer taxes, stamp duty or withholding taxes	· As necessary
Any charges incurred by the Depositary or its agents for servicing the deposited securities	· As necessary

Reimbursements and payments made and fee waivers granted by the depositary
The depositary has agreed to reimburse certain company expenses related to the company's ADR programme and incurred by the company in connection with the programme. In the year ended 31 December 2016, the depositary reimbursed approximately USD 1.29 million to the company in relation to certain expenses including investor relations expenses, expenses related to the maintenance of the ADR programme, legal counsel fees, printing and ADR certificates.

The depositary has also agreed to waive fees for costs associated with the administration of the ADR programme, and it has paid certain expenses directly to third parties on behalf of the company. The expenses paid to third parties include expenses relating to reporting services, access charges to its online platform, re-registration costs borne by the custodian and costs in relation to printing and mailing AGM materials. For the year ended 31 December 2016, the depositary paid expenses of approximately USD 214,814 directly to third parties.

TAXATION

This section describes the material Norwegian tax consequences that apply to shareholders resident in Norway and to non-resident shareholders in connection with the acquisition, ownership and disposal of shares and American Depositary Shares (ADS). The term "shareholder" refers to both holders of shares and holders of ADSs, unless otherwise explicitly stated.

Norwegian tax matters

The outline does not provide a complete description of all tax regulations that might be relevant (i.e. for investors to whom special regulations may be applicable), and is based on current law and practice. Shareholders should consult their professional tax adviser for advice about individual tax consequences.

Taxation of dividends

Corporate shareholders (i.e. limited liability companies and similar entities) residing in Norway for tax purposes are generally subject to tax in Norway on dividends received from Norwegian companies. The basis for taxation is 3% of the dividends received, which is subject to the standard income tax rate. The standard income tax rate has been reduced from 25% in 2016 to 24% in 2017.

Individual shareholders resident in Norway for tax purposes are subject to the standard income tax rate (reduced from 25% in 2016 to 24% in 2017) in Norway for dividend income exceeding a basic tax free allowance. However, in 2017 dividend income exceeding the basic tax free allowance is grossed up with a factor of 1.24 before included in the ordinary taxable income, resulting in an effective tax rate of 29.76% (24% x 1.24). The tax free allowance is computed for each individual share or ADS and corresponds as a rule to the cost price of that share or ADS multiplied by an annual risk-free interest rate. Any part of the calculated allowance for one year that exceeds the dividend distributed for the share or ADS ("unused allowance") may be carried forward and set off against future dividends received for (or gains upon the realisation of, see below) the same share or ADS. Any unused allowance will also be added to the basis for computation of the allowance for the same share or ADS the following year.

Non-resident shareholders are as a rule subject to withholding tax at a rate of 25% on dividends distributed by Norwegian companies. It is the responsibility of the distributing company to deduct the withholding tax when dividends are paid to non-resident shareholders. This withholding tax does not apply to corporate shareholders in the EEA area that document that they are genuinely established and carry on genuine economic business activity within the EEA area, provided that Norway is entitled to receive information from the state of residence pursuant to a tax treaty or other international treaty. If no such treaty exists with the state of residence, the shareholder may instead present confirmation issued by the tax authorities of the state of residence verifying the documentation. Individual shareholders resident for tax purposes in the EEA area may apply to the Norwegian tax authorities for a refund if the tax withheld by the distributing company exceeds the tax that would have been levied on individual shareholders resident in Norway.

The withholding rate of 25% is often reduced in tax treaties between Norway and other countries. The reduced withholding rate will generally only apply to dividends paid on shares held by shareholders who are able to properly demonstrate that they are the beneficial owner and entitled to the benefits of the tax treaty.

For holders of shares and ADSs deposited with Deutsche Bank Trust Company Americas (Deutsche Bank), documentation establishing that the holder is eligible for the benefits under the tax treaty with Norway, may be provided to Deutsche Bank. Deutsche Bank has been granted permission by the Norwegian tax authorities to receive dividends from us for redistribution to a beneficial owner of shares and ADSs at the applicable treaty withholding rate.

Dividends paid to shareholders (either directly or through a depositary) who have not provided the relevant documentation to the relevant party that they are eligible for the reduced rate, will be subject to withholding tax of 25%. The beneficial owners will in this case have to apply to the Central Office - Foreign Tax Affairs for a refund of the excess amount of tax withheld.

Corporate shareholders that carry on business activities in Norway, and whose shares or ADSs are effectively connected with such activities are not subject to withholding tax. For such shareholders, 3% of the received dividends are subject to the standard income tax rate (reduced from 25% in 2016 to 24% in 2017).

Taxation on the realisation of shares and ADSs

Corporate shareholders resident in Norway for tax purposes are not subject to tax in Norway on gains derived from the sale, redemption or other disposal of shares or ADSs in Norwegian companies. Capital losses are not deductible.

Individual shareholders residing in Norway for tax purposes are subject to tax in Norway on the sale, redemption or other disposal of shares or ADSs. Gains or losses in connection with such realisation are included in the individual's ordinary taxable income in the year of disposal, which is subject to the standard income tax rate, being reduced from 25% in 2016 to 24% in 2017. However, in 2017 the taxable gain or deductible loss is grossed up with a factor of 1.24 before included in the ordinary taxable income, resulting in an effective tax rate of 29.76% (24% x 1.24).

The taxable gain or deductible loss (before gross up) is calculated as the sales price adjusted for transaction expenses minus the taxable basis. A shareholder's tax basis is normally equal to the acquisition cost of the shares or ADSs. Any unused allowance pertaining to a share may be deducted from a taxable gain on the same share or ADS, but may not lead to or increase a deductible loss. Furthermore, any unused allowance may not be set off against gains from the realisation of the other shares or ADSs.

If the shareholder disposes of shares or ADSs acquired at different times, the shares or ADSs that were first acquired will be deemed to be first sold (the "FIFO" principle) when calculating gain or loss for tax purposes.

From 2017, individual shareholders may hold listed shares in companies resident within EEA through a stock savings account. If the conditions for the stock savings account are met, taxable gain or loss on shares owned through the stock savings account will be payable when deposits are withdrawn from the account whereas loss on shares will be deductible when the account is terminated. Dividends are not comprised by the stock savings account scheme and will thus be taxed pursuant to the ordinary rules described above.

A corporate shareholder or an individual shareholder who ceases to be tax resident in Norway due to domestic law or tax treaty provisions may, in certain circumstances, become subject to Norwegian exit taxation on capital gains related to shares or ADSs.

Shareholders not residing in Norway are generally not subject to tax in Norway on capital gains, and losses are not deductible on the sale, redemption or other disposal of shares or ADSs in Norwegian companies, unless the shareholder carries on business activities in Norway and such shares or ADSs are or have been effectively connected with such activities.

Wealth tax
The shares or ADSs are included in the basis for the computation of wealth tax imposed on individuals resident in Norway for tax purposes. Norwegian limited companies and certain similar entities are not subject to wealth tax. The current marginal wealth tax rate is 0.85% of the value assessed. The assessment value of listed shares (including ADSs) is 90% of the listed value of such shares or ADSs on 1 January in the assessment year.

Non-resident shareholders are not subject to wealth tax in Norway for shares and ADSs in Norwegian limited companies unless the shareholder is an individual and the shareholding is effectively connected with the individual's business activities in Norway.

Inheritance tax and gift tax
No inheritance or gift tax is imposed in Norway.

Transfer tax
No transfer tax is imposed in Norway in connection with the sale or purchase of shares or ADSs.

United States tax matters
This section describes the material United States federal income tax consequences for US holders (as defined below) of owning shares or ADSs. It only applies to you if you hold your shares or ADSs as capital assets for tax purposes and are not a member of a special class of holders subject to special rules, including dealers in securities, insurance companies, partnerships, persons liable for the alternative minimum tax, persons that actually or constructively own 10% of the voting stock of Statoil, persons that hold shares or ADSs as part of a straddle or a hedging or conversion transaction, or persons whose functional currency is not USD.

This section is based on the Internal Revenue Code of 1986, as amended, its legislative history, existing and proposed regulations, published rulings and court decisions, and the Convention between the United States of America and the Kingdom of Norway for the Avoidance of Double Taxation and the Prevention of Fiscal Evasion with Respect to Taxes on Income and Property (the "Treaty"). These laws are subject to change, possibly on a retroactive basis. In addition, this section is based in part upon the representations of the depositary and the assumption that each obligation in the deposit agreement and any related agreement will be performed in accordance with its terms. For United States federal income tax purposes, if you hold ADRs evidencing ADSs, you will generally be treated as the owner of the ordinary shares represented by those ADRs. Exchanges of shares for ADRs and ADRs for shares will not generally be subject to United States federal income tax.

A "US holder" is a beneficial owner of shares or ADSs that is: (i) a citizen or resident of the United States; (ii) a United States domestic corporation; (iii) an estate whose income is subject to United States federal income tax regardless of its source; or (iv) a trust if a United States court can exercise primary supervision over the trust's administration and one or more United States persons are authorised to control all substantial decisions of the trust.

You should consult your own tax adviser regarding the United States federal, state and local and Norwegian and other tax consequences of owning and disposing of shares and ADSs in your particular circumstances.

Taxation of dividends
The gross amount of any dividend (including any Norwegian tax withheld from the dividend payment) paid by Statoil out of its current or accumulated earnings and profits (as determined for United States federal income tax purposes) is taxable for you when you, in the case of shares, or the depositary, in the case of ADSs, receive the dividend, actually or constructively. If you are a non-corporate US holder, dividends paid to you will be eligible to be taxed at the preferential rates applicable to long-term capital gains as long as, in the year that you receive the dividend, the shares or ADSs are readily tradable on an established securities market in the United States or Statoil is eligible for benefits under the Treaty. To qualify for the preferential rates, you must hold the shares or ADSs for more than 60 days during the 121-day period beginning 60 days before the ex-dividend date and meet certain other requirements. The dividend will not be eligible for the dividends-received deduction generally allowed to United States corporations in respect of dividends received from other United States corporations.

The amount of the dividend distribution that you must include in your income as a US holder will be the value in USD of the payments made in NOK determined at the spot NOK/USD rate on the date the dividend distribution is includible in your income, regardless of whether or not the payment is in fact converted into USD. Distributions in excess of current and accumulated earnings and profits, as determined for United States federal income tax purposes, will be treated as a non-taxable return of capital to the extent of your tax basis in the shares or ADSs and, to the extent in excess of your tax basis, will be treated as capital gain.

Subject to certain limitations, the 15% Norwegian tax withheld in accordance with the Treaty and paid to Norway will be creditable or deductible against your United States federal income tax liability, unless a refund of the tax withheld is available to you under Norwegian law. Special rules apply when determining the foreign tax credit limitation with respect to dividends that are subject to the preferential rates. Dividends will be income from sources outside the United States and will generally, depending on your circumstances, be either "passive" or "general" income for purposes of computing the foreign tax credit allowable to you. Any gain or loss resulting from currency exchange rate fluctuations during the period from the date you include the dividend payment in income until the date you convert the payment into USD will generally be treated as US-source ordinary income or loss and will not be eligible for the special tax rate.

Taxation of capital gains
If you sell or otherwise dispose of your shares or ADSs, you will generally recognise a capital gain or loss for United States federal income tax purposes equal to the difference between the value in USD of the amount that you realise and your tax basis, determined in USD, in your shares or ADSs. A capital gain of a non-corporate US

holder is generally taxed at preferential rates if the property is held for more than one year. The gain or loss will generally be income or loss from sources within the United States for foreign tax credit limitation purposes. If you receive any foreign currency on the sale of shares or ADSs, you may recognise ordinary income or loss from sources within the United States as a result of currency fluctuations between the date of the sale of the shares or ADSs and the date the sales proceeds are converted into USD. You should consult your own tax adviser regarding how to account for payments made or received in a currency other than USD.

PFIC rules

We believe that the shares and ADSs should not be treated as stock of a PFIC for United States federal income tax purposes, but this conclusion is a factual determination that is made annually and thus may be subject to change. If we were to be treated as a PFIC, a gain realised on the sale or other disposition of the shares or ADSs would in general not be treated as a capital gain. Instead, unless you elect to be taxed annually on a mark-to-market basis with respect to the shares or ADSs, you would be treated as if you had realised such gain and certain "excess distributions" ratably over your holding period for the shares or ADSs. Amounts allocated to the year in which the gain is realised or the “excess distribution” is received or to a taxable year before we were classified as a PFIC would be subject to tax at ordinary income tax rates, and amounts allocated to all other years would be taxed at the highest tax rate in effect for each such year to which the gain or distribution was allocated, together with an interest charge in respect of the tax attributable to each such year. With certain exceptions, your shares or ADSs will be treated as stock in a PFIC if we were a PFIC at any time during the period you held the shares or ADSs. Dividends that you receive from us will not be eligible for the preferential tax rates if we are treated as a PFIC with respect to you, either in the taxable year of the distribution or the preceding taxable year, but will instead be taxable at rates applicable to ordinary income.

Foreign Account Tax Compliance Withholding

A 30% withholding tax will be imposed on certain payments to certain non-US financial institutions that fail to comply with information reporting requirements or certification requirements in respect of their direct and indirect United States shareholders and/or United States accountholders. To avoid becoming subject to the 30% withholding tax on payments to them, we and other non-US financial institutions may be required to report information to the IRS regarding the holders of shares or ADSs and to withhold on a portion of payments under the shares or ADSs to certain holders that fail to comply with the relevant information reporting requirements (or hold shares or ADSs directly or indirectly through certain non-compliant intermediaries). However, such withholding will not apply to payments made before January 1, 2019. The rules for the implementation of this legislation have not yet been fully finalised, so it is impossible to determine at this time what impact, if any, this legislation will have on holders of the shares and ADSs.

EXCHANGE RATES

The table below shows the high, low, average and end-of-period exchange rates for the Norwegian krone for USD 1.00 as announced by Norges Bank (Norway's central bank).

The average is computed using the quarterly average exchange rates announced by Norges Bank during the period indicated.

For the year ended 31 December	Low	High	Average	End of Period
2012	5.5349	6.1471	5.8172	5.5664
2013	5.4438	6.2154	5.8753	6.0837
2014	5.8611	7.6111	6.3011	7.4332
2015	7.3593	8.8090	8.0637	8.8090
2016	7.9766	8.9578	8.4014	8.6200

	Low	High
2016		
September	8.0517	8.3483
October	7.9766	8.2810
November	8.1780	8.6138
December	8.3662	8.7277
2017		
January	8.2641	8.6676
February	8.1953	8.3868
March (up to and including 8 March 2017)	8.4134	8.4798

On 8 March 2017, the exchange rate announced by the Norges Bank for the Norwegian krone was USD 1.00 = NOK 8.4798

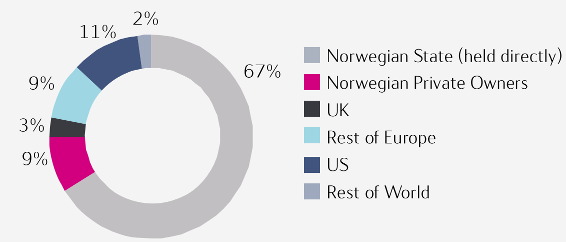
Fluctuations in the exchange rate between the NOK and USD will affect the amounts in USD received by holders of American Depositary Shares (ADSs) on the conversion of dividends, if any, paid in Norwegian kroner on the ordinary shares, and they may affect the USD price of the ADSs on the New York Stock Exchange.

ADDITIONAL INFORMATION

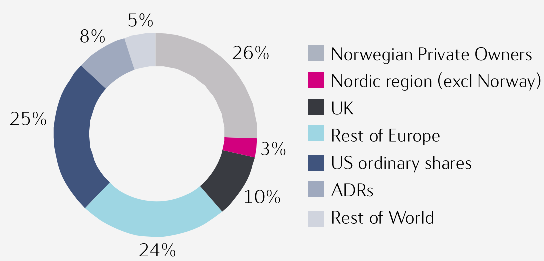
MAJOR SHAREHOLDERS

The Norwegian State is the largest shareholder in Statoil, with a direct ownership interest of 67%. Its ownership interest is managed by the Norwegian Ministry of Petroleum and Energy.

Distribution of shareholders at year end 2016



Free float breakdown



Pursuant to the exchange ratio agreed in connection with the merger with Hydro's oil and gas activities, the State's ownership interest in the merged company was 62.5%, or 1,992,959,739 shares, on 1 October 2007. In accordance with the Norwegian parliament's decision of 2001 concerning a minimum state shareholding in Statoil of two-thirds, the Government built up the State's ownership interest in Statoil by buying shares in the market during the period from June 2008 to March 2009. In March 2009, the Government announced that the State's direct ownership interest had reached 67% and the Government's direct purchase of Statoil shares was completed.

As of 31 December 2016, the Norwegian State had a 67% direct ownership interest in Statoil and a 3.22% indirect interest through the National Insurance Fund (Folketrygdfondet), totaling 70.22%. Also, the Norwegian State has entered into an agreement where it commits for each quarterly dividend where a scrip option is offered to receive newly issued shares for a fraction of its shareholdings equal to the average participation among the other shareholders. This to ensure that the States ownership share is not impacted by the scrip programme.

Statoil has one class of shares, and each share confers one vote at the general meeting. The Norwegian State does not have any voting rights that differ from the rights of other ordinary shareholders. Pursuant to the Norwegian Public Limited Liability Companies Act, a majority of at least two-thirds of the votes cast as well as of the votes represented at a general meeting is required to amend our articles of association. As long as the Norwegian State owns more than one-third of our shares, it will be able to prevent any amendments to our articles of association. Since the Norwegian State, acting through the Norwegian Minister of Petroleum and Energy, has in excess of two-thirds of the shares in the company, it has sole power to amend our articles of association. In addition, as majority shareholder, the Norwegian State has the power to control any decision at general meetings of our shareholders that requires a majority vote, including the election of the majority of the corporate assembly, which has the power to elect our board of directors and approve the dividend proposed by the board of directors.

The Norwegian State endorses the principles set out in "The Norwegian Code of Practice for Corporate Governance", and it has stated that it expects companies in which the State has ownership interests to adhere to the code. The principle of ensuring equal treatment of different groups of shareholders is a key element in the State's own guidelines. In companies in which the State is a shareholder together with others, the State wishes to exercise the same rights and obligations as any other shareholder and not act in a manner that has a detrimental effect on the rights or financial interests of other shareholders. In addition to the principle of equal treatment of shareholders, emphasis is also placed on transparency in relation to the State's ownership and on the general meeting being the correct arena for owner decisions and formal resolutions.

	Shareholders at December 2016	Number of Shares	Ownership in %
1	Government of Norway	2,174,183,105	67.00%
2	Folketrygdfondet	104,403,441	3.22%
3	BlackRock Institutional Trust Company, N.A.	29,242,733	0.90%
4	Lazard Asset Management, L.L.C.	28,711,525	0.88%

EXCHANGE CONTROLS AND LIMITATIONS

Under Norwegian foreign exchange controls currently in effect, transfers of capital to and from Norway are not subject to prior government approval. An exception applies to the physical transfer of payments in currency exceeding certain thresholds, which must be declared to the Norwegian custom authorities. This means that non-Norwegian resident shareholders may receive dividend payments without Norwegian exchange control consent as long as the payment is made through a licensed bank or other licensed payment institution.

There are no restrictions affecting the rights of non-Norwegian residents or foreign owners to hold or vote for our shares.

5.2 ACCOUNTING STANDARDS (IFRS) AND non-GAAP MEASURES

Since 2007, Statoil has been preparing the Consolidated financial statements in accordance with International Financial Reporting Standards (IFRS) as adopted by the EU and as issued by the International Accounting Standards Board. The IFRS standards have been applied consistently to all periods presented in the Consolidated financial statements. See note 2 Significant accounting policies to the Consolidated financial statements for a discussion of key accounting estimates and judgements.

Non-GAAP MEASURES

Statoil is subject to SEC regulations regarding the use of "non-GAAP financial measures" in public disclosures. Non-GAAP financial measures are defined as numerical measures that either exclude or include amounts that are not excluded or included in the comparable measures calculated and presented in accordance with generally accepted accounting principles, which in Statoil's case refers to IFRS. The following financial measures may be considered non-GAAP financial measures:

- Return on average capital employed (ROACE)
- Net debt to capital employed ratio before adjustments
- Net debt to capital employed ratio adjusted
- Adjusted earnings after tax
- Organic capital expenditures

For information regarding Organic capital expenditures, see Investments in section 2.9 Liquidity and capital resources.

Return on average capital employed (ROACE)

This measure provides useful information for both the group and investors about performance during the period under evaluation. Statoil uses ROACE to measure the return on capital employed, regardless of whether the financing is through equity or debt. The use of ROACE should not be viewed as an alternative to income before financial items, income taxes and minority interest, or to net income, which are measures calculated in accordance with GAAP or ratios based on these figures. Impacted by impairments, ROACE was negative 4.7% in 2016 compared to negative 8.9% in 2015 and 3.4% in 2014. The change from 2015 is mainly due to an increase in net income adjusted for financial items.

Calculation of numerator and denominator used in ROACE calculation	For the year ended 31 December				
(in USD million, except percentages)	2016	2015	2014	16-15 change	15-14 change
Net income for the year	(2,902)	(5,169)	3,887		
- Net financial items	(258)	(1,311)	20		
- Tax on financial items	(75)	1,259	1,466		
+ Accretion expense net after tax	21	(124)	(175)		
Net income adjusted for financial Items after tax (A1)	(2,548)	(5,241)	2,226	51%	N/A
Capital employed before adjustments to net interest-bearing debt: 1)					
Year End 2016	53,471				
Year End 2015	54,159	54,159			
Year End 2014		63,311	63,311		
Year End 2013			68,092		
Sum of capital employed for two years (B1)	107,630	117,470	131,403		
Calculated average capital employed:					
Average capital employed before adjustments to net interest-bearing debt (B1/2)	53,815	58,735	65,702	(8%)	(11%)
Calculated ROACE:					
Return on average capital employed (A1/(B1/2))	(4.7%)	(8.9%)	3.4%	47%	N/A

1) Capital employed before adjustments for each year is reconciled in the table in section 5.2 Net debt to capital employed ratio.

Net debt to capital employed ratio

In the Company's view, the calculated net debt to capital employed ratio gives a more complete picture of the Group's current debt situation than gross interest-bearing financial liabilities.

The calculation uses balance sheet items relating to gross interest bearing financial liabilities and adjusts for cash, cash equivalents and current financial investments. Certain adjustments are made, such as collateral deposits classified as cash and cash equivalents in the Consolidated balance sheet but considered non cash in the non-GAAP calculations. The financial investments held in Statoil Forsikring AS are excluded in the non-GAAP calculations as they are deemed restricted. These two adjustment are increasing the net debt and give a stricter definition of the net debt to capital employed ratio than the IFRS based definition. Similarly, certain net interest-bearing debts incurred from activities pursuant to the Owners Instruction from the Norwegian State are set off against receivables on the Norwegian State's direct financial interest (SDFI).

The net interest-bearing debt adjusted for these items is included in the average capital employed. The table below reconciles the net interest-bearing liabilities adjusted, capital employed and net debt to capital employed adjusted ratio with the most directly comparable financial measure or measures calculated in accordance with IFRS.

Calculation of capital employed and net debt to capital employed ratio (in USD million, except percentages)	For the year ended 31 December 2016	2015	2014
Shareholders' equity	35,072	40,271	51,225
Non-controlling interests (Minority interest)	27	36	57
Total equity (A)	35,099	40,307	51,282
Current bonds, bank loans, commercial papers and collateral liabilities	3,674	2,326	3,561
Bonds, bank loans and finance lease liabilities	27,999	29,965	27,593
Gross interest-bearing financial liabilities (B)	31,673	32,291	31,154
Cash and cash equivalents	5,090	8,623	11,182
Current financial investments	8,211	9,817	7,968
Cash and cash equivalents and current financial investments (C)	13,301	18,440	19,150
Net interest-bearing liabilities before adjustments (B1) (B-C)	18,372	13,852	12,004
Other interest-bearing elements [1)]	1,216	1,111	1,081
Marketing instruction adjustment [2)]	(199)	(214)	(212)
Adjustment for project loan [3)]	0	0	(18)
Net interest-bearing liabilities adjusted (B2)	19,389	14,748	12,855
Calculation of capital employed:			
Capital employed before adjustments to net interest-bearing liabilities (A+B1)	53,471	54,159	63,286
Capital employed adjusted (A+B2)	54,488	55,055	64,137
Calculated net debt to capital employed:			
Net debt to capital employed before adjustments (B1/(A+B1)	34.4%	25.6%	19.0%
Net debt to capital employed adjusted (B2/(A+B2)	35.6%	26.8%	20.0%

1) Other interest-bearing elements are cash and cash equivalents adjustments regarding collateral deposits classified as cash and cash equivalents in the Consolidated balance sheet but considered as non-cash in the non-GAAP calculations as well as financial investments in Statoil Forsikring AS classified as current financial investments.

2) Marketing instruction adjustment is an adjustment to gross interest-bearing financial debt due to the SDFI part of the financial lease in the Snøhvit vessels that are included in Statoil's Consolidated balance sheet.

3) Adjustment for project loan is adjustment to gross interest-bearing debt due to the BTC project loan structure.

Adjusted earnings after tax

Adjusted earnings are based on net operating income and adjusts for certain items affecting the income for the period in order to separate out effects that management considers may not be well correlated to Statoil's underlying operational performance in the individual reporting period. Management considers adjusted earnings to be a supplemental measure to Statoil's IFRS measures that provides an indication of Statoil's underlying operational performance in the period and facilitates a better understanding of operational trends between the periods, and uses this metric in determining variable remuneration and awards of LTI grants to members of the corporate executive committee. Adjusted earnings adjusts for the following items:

- Certain gas contracts are, due to pricing or delivery conditions, deemed to contain embedded derivatives, required to be carried at fair value. Certain transactions related to historical divestments include contingent consideration, carried at fair value. The accounting impacts of changes in fair value of the aforementioned are excluded from adjusted earnings. In addition, adjustments are also made for changes in the unrealised **fair value of derivatives** related to some natural gas trading contracts. Due to the nature of these gas sales contracts, these are classified as financial derivatives to be measured at fair value at the balance sheet date. Unrealised gains and losses on these contracts reflect the value of the difference between current market gas prices and the actual prices to be realised under the gas sales contracts. Only realised gains and losses on these contracts are reflected in adjusted earnings. This presentation best reflects the underlying performance of the business as it replaces the effect of temporary timing differences associated with the re-measurements of the derivatives to fair value at the balance sheet date with actual realised gains and losses for the period
- **Periodisation of inventory hedging effect**: Commercial storage is hedged in the paper market. Commercial storage is accounted for by using the lower of cost and market price. If market prices increase above cost price, there will be a loss in the IFRS income statement since the derivatives always reflect changes in the market price. An adjustment is made to reflect the unrealised market value of the commercial storage. As a result, loss on derivatives is matched by a similar adjustment for the exposure being managed. If market prices decrease below cost price, the write-down and the derivative effect in the IFRS income statement will offset each other and no adjustment is made
- **Over/underlift** is accounted for using the sales method and therefore revenues are reflected in the period the product is sold rather than in the period it is produced. The over/underlift position depends on a number of factors related to our lifting programme and the way it corresponds to our entitlement share of production. The effect on income for the period is therefore adjusted, to show estimated revenues and associated costs based upon the production for the period which management believes reflects operational performance and increase comparability with peers
- Statoil holds **operational storage** which is not hedged in the paper market due to inventory strategies. Cost of goods sold is measured based on the FIFO (first-in, first-out) method, and includes realised gains or losses that arise due to changes in market prices. These gains or losses will fluctuate from one period to another and are not considered part of the underlying operations for the period
- **Impairment** and **reversal of impairment** are excluded from adjusted earnings since they affect the economics of an asset for the lifetime of that asset; not only the period in which it is impaired or the impairment is reversed. Impairment and reversal of impairment can impact both the exploration expenses and the depreciation, amortisation and impairment line items
- **Gain or loss from sales** is eliminated from the measure since the gain or loss does not give an indication of future performance or periodic performance; such a gain or loss is related to the cumulative value creation from the time the asset is acquired until it is sold
- **Internal unrealised profit on inventories**: Volumes derived from equity oil inventory will vary depending on several factors and inventory strategies, i.e. level of crude oil in inventory, equity oil used in the refining process and level of in-transit cargoes. Internal profit related to volumes sold between entities in the group, and still in inventory at period end, is eliminated according to IFRS (write down to production cost). The proportion of realised versus unrealised gain will fluctuate from one period to another due to inventory strategies and accordingly impact net operating income. This impact is not assessed to be a part of the underlying operational performance, and elimination of internal profit related to equity volumes is excluded in adjusted earnings
- **Other items of income and expense** are adjusted when the impacts on income in the period are not reflective of Statoil's underlying operational performance in the reporting period. Such items may be unusual or infrequent transactions but they may also include transactions that are significant which would not necessarily qualify as either unusual or infrequent. Other items can include transactions such as provisions related to reorganisation, early retirement, etc

The measure **adjusted earnings after tax** excludes net financial items and the associated tax effects on net financial items. It is based on adjusted earnings less the tax effects on all elements included in adjusted earnings (or calculated tax on operating income and on each of the adjusting items using an estimated marginal tax rate). In addition, tax effect related to tax exposure items not related to the individual reporting period is excluded from adjusted earnings after tax. Management considers adjusted earnings after tax, which reflects a normalised tax charge associated with its operational performance excluding the impact of financing, to be a supplemental measure to Statoil's net income. Certain net USD denominated financial positions are held by group companies that have a USD functional currency that is different from the currency in which the taxable income is measured. As currency exchange rates change between periods, the basis for measuring net financial items for IFRS will change disproportionally with taxable income which includes exchange gains and losses from translating the net USD denominated financial positions into the currency of the applicable tax return. Therefore, the effective tax rate may be significantly higher or lower than the statutory tax rate for any given period.

Management considers that adjusted earnings after tax provides a better indication of the taxes associated with underlying operational performance in the period (excluding financing), and therefore better facilitates a comparison between periods. However, the adjusted taxes included in adjusted earnings after tax should not be considered indicative of the amount of current or total tax expense (or taxes payable) for the period.

Adjusted earnings and adjusted earnings after tax should be considered additional measures rather than substitutes for net operating income and net income, which are the most directly comparable IFRS measures. There are material limitations associated with the use of adjusted earnings and adjusted earnings after tax compared with the IFRS measures since they do not include all the items of revenues/gains or expenses/losses of Statoil which are needed to evaluate its profitability on an overall basis. Adjusted earnings and adjusted earnings after tax are only intended to be indicative of the underlying developments in trends of our on-going operations for the production, manufacturing and marketing of our products and exclude pre and post-tax impacts of net financial items. We reflect such underlying development in our operations by eliminating the effects of certain items that may not be directly associated with the period's operations or financing. However, for that reason, adjusted earnings and adjusted earnings after tax are not complete measures of profitability. The measures should therefore not be used in isolation.

Adjusted earnings equal the sum of net operating income less all applicable adjustments. Adjusted earnings after tax equals the sum of net operating income less income tax in business areas and adjustments to operating income taking the applicable marginal tax into consideration. See the table below for details.

Calculation of adjusted earnings after tax	For the year ended 31 December	
(in USD million)	2016	2015
Net operating income	**80**	**1,366**
Total revenues and other income	**1,020**	**(924)**
Changes in fair value of derivatives	738	356

Adjusted earnings	**4,070**	**9,633**
Tax on adjusted earnings	**(4,277)**	**(7,168)**
Adjusted earnings after tax	**(208)**	**2,465**

5.3 LEGAL PROCEEDINGS

Statoil is involved in a number of proceedings globally concerning matters arising in connection with the conduct of its business. No further update is provided on previously reported legal or arbitration proceedings which Statoil does not believe will, individually or in the aggregate, have a significant effect on Statoil's financial position, profitability, results of operations or liquidity. See also note 9 Income taxes and note 23 Other commitments, contingent liabilities and contingent assets in Consolidated financial statements.

5.4 PAYMENTS TO GOVERNMENTS

Reporting in accordance with the Norwegian transparency rule

The Norwegian regulation regarding reporting on payments to governments ("Forskrift om land-for-land rapportering") was approved by the Norwegian parliament in December 2013 and came into effect 1 January 2014. It requires companies involved in extractive and logging activities to disclose payments they make to governments at project and country level. Additional contextual information must be disclosed, consisting of certain legal, monetary, numerical and production volume information, related to the extractive part of the operations or to the entire group.

Statoil has prepared this report in accordance with this Norwegian regulation. The reporting under the Norwegian regulation goes beyond the requirements of the EU directive for member states and EEA countries that was approved in June 2013 ("Directive on the annual financial statements, consolidated financial statements and related reports of certain types of undertakings"). Statoil is committed to and engaged in revenue transparency for activities in the extractives sector, and has found this practise conducive to establish trust between stakeholder groups. Statoil supports consistency in regulation on revenue transparency between jurisdictions. More information can be found on Statoil.com.

Basis for preparation

The regulation requires Statoil to prepare a consolidated report for the previous financial year on direct payments to governments, including payments made by subsidiaries, joint operations and joint ventures, or on behalf such entities involved in extractive activities. Statoil has assessed the reporting obligations to be as described below.

Scope and validity

Statoil activities covering the exploration, prospecting, discovery, development and extraction of oil and natural gas ('extractive activities') are included in this report. Additional contextual information is disclosed for legal entities engaged in extractive activities or for the entire group, on a country or legal entity basis, as applicable.

Reporting principles

Within the scope of this report are payment types made directly by Statoil to governments, such as taxes and royalties. Payments made by the operator of an oil and/or gas licence on behalf of the licensed partners, such as area fees, are also included in this report. For assets where Statoil is the operator, the full payment made on behalf of the whole partnership (100%) is included. No payment will be disclosed in cases where Statoil is not the operator, unless the operator is a state-owned entity and it is possible to distinguish the payment from other cost recovery items.

Host government entitlements paid by the licence operator are also included in the report. The size of such entitlements can in some cases constitute the most significant payments to governments.

For some of our projects, we have established a subsidiary to hold the ownership in a joint venture. For these projects, payments may be made to governments in the country of operation as well as to governments in the country where the subsidiary resides.

Payments to governments are reported in the year that the actual cash payment was made (cash principle). Amounts included as contextual information are reported in the year the transaction relates to, regardless of when the cash transaction occurred (accrual principle). Amounts are subject to rounding. Rounding differences may occur in summary tables.

Changes from last year

In 2016 Statoil's reporting currency was changed from Norwegian kroner (NOK) to US Dollars (USD). For 2015 the listing of subsidiaries included all companies with minority ownership interest. In the 2016 report this has been changed to include only subsidiaries, i.e. companies in which Statoil has more than 50% ownership interest.

Government

In the context of this report, a government is defined as any national, regional or local authority of a country. It includes any department, agency or undertaking (i.e. corporation) controlled by that government.

Project definition

A project is defined as the operational activity governed by a single contract, licence, lease, concession or similar legal agreement and that forms the basis for payment obligations to a government.

Payments not directly linked to a specific project but levied at the company entity level, are reported at that level.

Materiality

Payments constitute a single payment, or a series of related payments that equal or exceed NOK 800,000 (approximately USD 100,000 at average annual 2016 exchange rates) during the year. Payments below the threshold in a given country will not be included in the overview of projects and payments.

Reporting currency

Payments to governments in foreign currencies (those other than USD) are converted to USD using the average annual 2016 exchange rate.

Payment types disclosed at project or legal entity level that are relevant for Statoil

The following payment types are disclosed for legal entities involved in extractive activities. They are presented on a cash basis (cash principle), net of any interest expenses, whether paid in cash or in-kind. In-kind payments are reported in millions of barrels of oil equivalent and the equivalent cash value They include:

- Tax levied on the income, production or profits of companies. Includes severance tax and taxes paid in-kind. The value of taxes paid in-kind is calculated based on the market price at the time of the in-kind payment. Taxes levied on consumption, such as value added tax, personal income tax, sales tax, withholding tax, property tax and environmental tax, are excluded
- Royalties are usage-based payments for the right to the on-going use of an asset
- Fees are typically levied on the right to use a geographical area for exploration, development and production and include rental fees, area fees, entry fees, concession fees and other considerations for licences and/or concessions. Administrative government fees that are not specifically related to the extractive activities or to access extractive resources, are excluded
- Bonuses are payments made when signing an oil and gas lease, when discovering natural resources and/or when production has commenced. Bonuses often include signature, discovery and production bonuses and are a commonly used payment type, depending on the petroleum fiscal regime. Bonuses can also include elements of social contribution
- Host government entitlements are the host government's share of production after oil production has been allocated to cover costs and expenses under a production sharing agreement (PSA). Host government entitlements are most often paid in-kind. The value of these payments is calculated based on the market price at the time of the in-kind payment. For some PSAs, the host government entitlements are sold by the operator, and the cost split between the partners. For these contracts, Statoil does not make payments directly to governments, but to the operator. See basis for preparation for more information

Contextual information at country level

The report discloses contextual information for legal entities engaged in extractive activities in Statoil, as listed below. All information is disclosed in accordance with the accrual principle.

- Investments are defined as additions to property, plant and equipment (including capitalised finance leases), capitalised exploration expenditures, intangible assets, long-term share investments and investments in associated companies
- Revenues associated with the production of crude oil and natural gas related to our extractive activities. Revenues include third party revenues and other income, inter-segment revenues and net income from equity accounted investments
- Cost shows the sum of operating expenses, SG&A (sales, general and administrative expenses) and exploration expenses, adjusted for net impairments
- Production volumes are the volumes that correspond to Statoil's ownership interest in a particular field and do not include production of the Norwegian State's share of oil and natural gas

Contextual information at entity level

The following contextual information is disclosed for all of Statoil's subsidiaries as of 31 December 2016:

- Country of incorporation is the jurisdiction in which the company is registered
- Country of operation is the country where the company performs its main activities
- Number of employees (per subsidiary) is based on the registered company location. The actual number of employees present in a country can deviate from the reported figures due to expatriation. In some subsidiaries there are no employees. These may purchase man-hours from other companies in the Statoil group, as applicable
- Net intercompany interest is the company's net intercompany interest expense (interest expense minus interest income) to subsidiaries in another jurisdiction. Interest between companies within the same jurisdiction is eliminated. Intercompany interest is the interest levied on long-term and short-term borrowings within the Statoil group

PUBLIC COPY - CONFIDENTIAL INFORMATION REMOVED

ADDITIONAL INFORMATION

Consolidated overview

The consolidated overview below discloses the sum of Statoil's payments to governments in each country, according to the payment type. The overview is based on the location of the receiving government. The total payments to each country may be different from the total payments disclosed in the overview of payments for each project in the report. This is because payments disclosed for each project relate to the country of operation, irrespective of the location of the receiving government.

In 2016, the downward trend in overall payments from previous years continued, a result of continued low oil and gas prices. In 2016 Statoil had no new major exploration awards that triggered signatory bonuses.

- Algeria – In-kind payments to Sonatrach, 0.9 mmboe valued at USD 5.9 million. These are in addition to the Host government entitlements.
- Angola - Signature bonus to Sonangol USD 10.8 million. This is the last instalment of Statoil's commitment towards social projects under the Kwanza concession.
- Nigeria - In-kind payments to Nigerian National Petroleum Corporation (NNPC), 3.6 mmboe valued at USD 194.0 million. There is an ongoing dispute regarding the allocation of oil volumes between NNPC and the partners in the Agbami field. In addition to the in-kind payments there are Host government entitlements.
- USA - Bakken is owned by Statoil Oil & Gas LP. Eagle Ford is owned by Statoil Texas Onshore Properties LLC. Marcellus is owned by Statoil USA Onshore Properties Inc.
- USA - In North Dakota Statoil pays oil severance tax on the taxable oil value produced from Bakken. In 2016 the payment was USD 60 million. Equivalent payments for 2015 and 2014 were USD 94 million and USD 178 million, respectively. These amounts were not reported in previous years' reports as they were paid by a Statoil midstream company, a company outside the scope of the payments to governments reporting.
- USA - Statoil paid USD 4.8 million in signature bonuses related to the award of three offshore blocks in the Gulf of Mexico.

ADDITIONAL INFORMATION

Contextual information at country level

The contextual information provides a broader picture of our overall economic impact in the countries where we have business activities and adds context to the reported payments to governments. The information is disclosed for each country and relates to the entities engaged in extractive activities. It consists of: investments; revenues; cost; and production volumes.

The contextual information reported is based on data collected mainly for the purpose of financial reporting.

(in USD million)	Investments	Revenues	Cost	Production volume(mmboe)

Contextual information at Statoil group level: Subsidiaries, number of employees and intercompany interest

The table below provides an overview as of 31 December 2016 of all subsidiaries in the Statoil group, their country of incorporation and operation, number of employees and each company's net intercompany interest to companies in other jurisdictions. A negative number implies a net intercompany interest income for the company, whereas a positive number implies a net intercompany interest expense.

During 2016, Statoil proceeded with its plan to transfer services related to internal bank operations from Belgium to Norway. Operational cash management tasks continue to be run out of Mechelen in Belgium.

Independent Limited Assurance Report to Statoil ASA on the payments to governments report

We were engaged by management of Statoil ASA to provide assurance on the Payments to governments report for the year ended 31 December 2016 ("the Report").

Statoil ASA's Responsibilities

The board of directors and management are responsible for properly preparing and presenting the Report that is free from material misstatement in accordance with the Norwegian Accounting Act §3-3d and the detailed regulation included in "Forskrift om land-for-land rapportering" and the reporting principles as set out in the Report and for the information contained therein. This responsibility includes: designing, implementing and maintaining internal control relevant to the preparation and presentation of the Report that is free from material misstatement, whether due to fraud or error.

Our Responsibilities

Our responsibility is to examine the Report prepared by Statoil ASA and to report thereon in the form of an independent limited assurance conclusion based on the procedures we have performed and the evidence obtained. We conducted our engagement in accordance with the International Standard for Assurance Engagements (ISAE) 3000: Assurance Engagements other than Audits or Reviews of Historical Financial Information, issued by the International Auditing and Assurance Standards Board. That standard requires that we plan and perform our procedures to obtain a meaningful level of assurance about whether the Report is properly prepared and presented, in all material respects, as the basis for our limited assurance conclusion.

The firm applies International Standard on Quality Control 1 and accordingly maintains a comprehensive system of quality control including documented policies and procedures regarding compliance with ethical requirements, professional standards and applicable legal and regulatory requirements.

We have complied with the Code of Ethics for Professional Accountants (IESBA Code) issued by the International Ethics Standards Board for Accountants, which sets out ethical requirements, including independence and other requirements founded on fundamental principles of integrity, objectivity, professional competence and due care, confidentiality and professional behaviour.

A limited assurance engagement in accordance with ISAE 3000 involves assessing the risks of material misstatement of the Report, whether due to fraud or error, responding to the assessed risks as necessary in the circumstances of the engagement and evaluating the overall presentation of the Report. The nature, timing and extent of procedures selected depend on our understanding of the Report and other engagement circumstances, and our consideration of areas of the Report where material misstatements are likely to arise.

In developing our understanding of the Report, we developed an understanding of internal control over the preparation and presentation of the Report in order to design assurance procedures that are appropriate in the circumstances, but not for the purposes of expressing a conclusion as to the effectiveness of Statoil ASA's internal control over the preparation and presentation of the Report.

Limited assurance is less than absolute assurance and reasonable assurance. A limited assurance engagement is substantially less in scope than a reasonable assurance engagement in relation to both the risk assessment procedures, including an understanding of internal control, and the evidence-gathering procedures performed in response to the assessed risks, which vary in nature and timing from and are substantially less in scope than for a reasonable assurance engagement. As a result, the level of assurance obtained in a limited assurance engagement is substantially lower than the assurance that would have been obtained had we performed a reasonable assurance engagement.

The procedures we performed were based on our professional judgment and included inquiries, observation of processes performed, inspection of documents, analytical procedures, evaluating the appropriateness of quantification methods and reporting policies and agreeing or reconciling the Report with underlying records.

We do not express a reasonable assurance conclusion about whether the Report has been prepared and presented, in all material respects, in accordance with the Norwegian Accounting Act §3-3d and the detailed regulation included in "Forskrift om land-for-land rapportering" and the reporting principles as set out in the Report and for the information contained therein.

Limited Assurance Conclusion
Our conclusion has been formed on the basis of, and is subject to, the matters outlined in this report. We believe that the evidence we have obtained is sufficient and appropriate to provide a basis for our conclusion.

Based on the procedures we have performed and the evidence we have obtained, described in this limited assurance report, nothing has come to our attention that causes us to believe that the Report for the year ended 31 December 2016 is not prepared and presented, in all material respects, in accordance with the Norwegian Accounting Act §3-3d and the detailed regulation included in "Forskrift om land-for-land rapportering" and the reporting principles as set out in the Report.

Oslo, 9 March 2017

5.5 STATEMENTS ON THIS REPORT

Board statement on Reporting of payments to governments

Today, the board of directors and the chief executive officer have reviewed and approved the board of director's report prepared in accordance with the Norwegian Securities Trading Act section 5-5a regarding Reporting on payments to governments as of 31 December 2016.

To the best of our knowledge, we confirm that:

- The information presented in the report has been prepared in accordance with the requirements of the Norwegian Securities Trading Act section 5-5a and associated regulations

Oslo, 9 March 2017

Statement on compliance

Today, the board of directors, the chief executive officer and the chief financial officer reviewed and approved the 2016 Annual report and Form 20-F, which includes the board of directors' report and the Statoil ASA Consolidated and parent company annual financial statements as of 31 December 2016.

To the best of our knowledge, we confirm that:

- the Statoil Consolidated annual financial statements for 2016 have been prepared in accordance with IFRS and IFRIC as adopted by the European Union (EU), IFRS as issued by the International Accounting Standards Board (IASB) and additional Norwegian disclosure requirements in the Norwegian Accounting Act, and that
- the parent company financial statements for Statoil ASA for 2016 have been prepared in accordance with simplified IFRS pursuant to the Norwegian Accounting Act §3-9 and regulations regarding simplified application of IFRS issued by the Norwegian Ministry of Finance, and that
- the board of directors' report for the group and the parent company is in accordance with the requirements in the Norwegian Accounting Act and Norwegian Accounting Standard no 16, and that
- the information presented in the financial statements gives a true and fair view of the company's and the group's assets, liabilities, financial position and results for the period viewed in their entirety, and that
- the board of directors' report gives a true and fair view of the development, performance, financial position, principle risks and uncertainties of the company and the group

Recommendation of the corporate assembly

Resolution:
At its meeting of 17 March 2017 the corporate assembly discussed the 2016 annual accounts of Statoil ASA and the Statoil group, and the board of directors' proposal for the allocation of net income.

The corporate assembly recommends that the annual accounts and the allocation of net income proposed by the board of directors are approved.

Oslo, 17 March 2017

Tone Cathrine Lunde Bakker
Chair of the corporate assembly

5.6 TERMS AND ABBREVIATIONS

Organisational abbreviations

- ADS – American Depositary Share
- ADR – American Depositary Receipt
- ACG - Azeri-Chirag-GunashliX
- ACQ - Annual contract quantity
- AFP - Agreement-based early retirement plan
- AGM - Annual general meeting
- ÅTS - Åsgard transport system
- APA - Awards in pre-defined areas
- ARO - Asset retirement obligation
- BTC - Baku-Tbilisi-Ceyhan pipeline
- CCS - Carbon capture and storage
- CH4 - Methane
- CO2 - Carbon dioxide
- DKK - Danish Krone
- DPI - Development and Production International
- DPN - Development and Production Norway
- DPUSA - Development and Production USA
- DST - Drill Stem Test
- D&W - Drilling and Well
- EEA - European Economic Area
- EFTA - European Free Trade Association
- EMTN - Euro medium-term note
- EU - European Union
- EU ETS - EU Emissions Trading System
- EUR - Euro
- EXP - Exploration
- FPSO - Floating production, storage and offload vessel
- GAAP - Generally Accepted Accounting Principals
- GBP - British Pound
- GBS - Gravity-based structure
- GDP - Gross domestic product
- GHG - Greenhouse gas
- GSB - Global Strategy and Business Development
- HSE - Health, safety and environment
- HTHP - High-temperature/high pressure
- IASB - International Accounting Standards Board
- ICE - Intercontinental Exchange
- IEA - International Energy Agency
- IFRS - International Financial Reporting Standards
- IOR - Improved oil recovery
- LNG - Liquefied natural gas
- LPG - Liquefied petroleum gas
- MMP - Marketing, Midstream and Processing
- MPE - Norwegian Ministry of Petroleum and Energy
- MW - Mega watt
- NCS - Norwegian continental shelf
- NES – New Energy Solutions
- NIOC - National Iranian Oil Company
- NOK - Norwegian kroner
- NOx- Nitrogen oxide
- OECD - Organisation of Economic Co-Operation and Development
- OML - Oil mining lease
- OPEC - Organization of the Petroleum Exporting Countries
- OTC - Over-the-counter
- OTS - Oil trading and supply department
- P5+1 – UN Security Council`s five permanent members
- PDO - Plan for development and operation
- PDQ – Production drilling quarters
- PIO - Plan for installation and operation
- PRD - Project Development organisation
- PSA - Production sharing agreement
- PSC – Production sharing contract
- PSR - Procurement and Supplier Relations
- RDI - Research, Development and Innovation
- R&D - Research and development
- ROACE - Return on average capital employed
- RRR - Reserve replacement ratio
- SAGD - Steam-assisted gravity drainage
- SCP - South Caucasus Pipeline System
- SDFI - Norwegian State's Direct Financial Interest
- SEC - Securities and Exchange Commission
- SEK - Swedish Krona
- SFR - Statoil Fuel & Retail
- SIF - Serious Incident Frequency
- TAP - Trans Adriatic Pipeline AG
- TEX - Technology Excellence
- TLP - Tension leg platform
- TPD - Technology, projects and drilling
- TRIF - Total recordable injuries per million hours worked
- TSP - Technical service provider
- UKCS - UK continental shelf
- USD - United States dollar
- WTG - Wind Turbine Generators

Metric abbreviations etc.

- bbl - barrel
- mbbl - thousand barrels
- mmbbl - million barrels
- boe - barrels of oil equivalent
- mboe - thousand barrels of oil equivalent
- mmboe - million barrels of oil equivalent
- mmcf - million cubic feet
- MMBtu - million british thermal units
- bcf - billion cubic feet
- tcf - trillion cubic feet
- scm - standard cubic metre
- mcm - thousand cubic metres
- mmcm - million cubic metres
- bcm - billion cubic metres
- mmtpa - million tonnes per annum
- km - kilometre
- ppm - part per million
- one billion - one thousand million

Equivalent measurements are based upon

- 1 barrel equals 0.134 tonnes of oil (33 degrees API)
- 1 barrel equals 42 US gallons
- 1 barrel equals 0.159 standard cubic metres
- 1 barrel of oil equivalent equals 1 barrel of crude oil
- 1 barrel of oil equivalent equals 159 standard cubic metres of natural gas
- 1 barrel of oil equivalent equals 5,612 cubic feet of natural gas
- 1 barrel of oil equivalent equals 0.0837 tonnes of NGLs
- 1 billion standard cubic metres of natural gas equals 1 million standard cubic metres of oil equivalent
- 1 cubic metre equals 35.3 cubic feet
- 1 kilometre equals 0.62 miles
- 1 square kilometre equals 0.39 square miles
- 1 square kilometre equals 247.105 acres
- 1 cubic metre of natural gas equals 1 standard cubic metre of natural gas
- 1,000 standard cubic meter gas equals 1 standard cubic meter oil equivalent
- 1,000 standard cubic metres of natural gas equals 6.29 boe
- 1 standard cubic foot equals 0.0283 standard cubic metres
- 1 standard cubic foot equals 1000 British thermal units (btu)

ADDITIONAL INFORMATION

- 1 tonne of NGLs equals 1.9 standard cubic metres of oil equivalent
- 1 degree Celsius equals minus 32 plus five-ninths of the number of degrees Fahrenheit

Miscellaneous terms

- Appraisal well: A well drilled to establish the extent and the size of a discovery
- Backwardation and contango are terms used in the crude oil market. Contango is a condition where forward prices exceed spot prices, so the forward curve is upward sloping. Backwardation is the opposite condition, where spot prices exceed forward prices, and the forward curve slopes downward
- Biofuel: A solid, liquid or gaseous fuel derived from relatively recently dead biological material and is distinguished from fossil fuels, which are derived from long dead biological material
- BOE (barrels of oil equivalent): A measure to quantify crude oil, natural gas liquids and natural gas amounts using the same basis. Natural gas volumes are converted to barrels on the basis of energy content
- Clastic reservoir systems: The integrated static and dynamic characteristics of a hydrocarbon reservoir formed by clastic rocks of a specific depositional sedimentary succession and its seal
- Condensates: The heavier natural gas components, such as pentane, hexane, iceptane and so forth, which are liquid under atmospheric pressure - also called natural gasoline or naphtha
- Crude oil, or oil: Includes condensate and natural gas liquids
- Development: The drilling, construction, and related activities following discovery that are necessary to begin production of crude oil and natural gas fields
- Downstream: The selling and distribution of products derived from upstream activities
- Equity and entitlement volumes of oil and gas: Equity volumes represent volumes produced under a production sharing agreement (PSA) that correspond to Statoil's percentage ownership in a particular field. Entitlement volumes, on the other hand, represent Statoil's share of the volumes distributed to the partners in the field, which are subject to deductions for, among other things, royalties and the host government's share of profit oil. Under the terms of a PSA, the amount of profit oil deducted from equity volumes will normally increase with the cumulative return on investment to the partners and/or production from the licence. The distinction between equity and entitlement is relevant to most PSA regimes, whereas it is not applicable in most concessionary regimes such as those in Norway, the UK, Canada and Brazil. The overview of equity production provides additional information for readers, as certain costs described in the profit and loss analysis were directly associated with equity volumes produced during the reported years
- Heavy oil: Crude oil with high viscosity (typically above 10 cp), and high specific gravity. The API classifies heavy oil as crudes with a gravity below 22.3° API. In addition to high viscosity and high specific gravity, heavy oils typically have low hydrogen-to-carbon ratios, high asphaltene, sulphur, nitrogen, and heavy-metal content, as well as higher acid numbers
- High grade: Relates to selectively harvesting goods, to cut the best and leave the rest. In reference to exploration and production this entails strict prioritisation and sequencing of drilling targets
- Hydro: A reference to the oil and energy activities of Norsk Hydro ASA, which merged with Statoil ASA
- IOR (improved oil recovery): Actual measures resulting in an increased oil recovery factor from a reservoir as compared with the expected value at a certain reference point in time. IOR comprises both of conventional and emerging technologies
- Liquids: Refers to oil, condensates and NGL
- LNG (liquefied natural gas): Lean gas - primarily methane - converted to liquid form through refrigeration to minus 163 degrees Celsius under atmospheric pressures
- LPG (liquefied petroleum gas): Consists primarily of propane and butane, which turn liquid under a pressure of six to seven atmospheres. LPG is shipped in special vessels
- Midstream: Processing, storage, and transport of crude oil, natural gas, natural gas liquids and sulphur
- Naphtha: inflammable oil obtained by the dry distillation of petroleum
- Natural gas: Petroleum that consists principally of light hydrocarbons. It can be divided into 1) lean gas, primarily methane but often containing some ethane and smaller quantities of heavier hydrocarbons (also called sales gas) and 2) wet gas, primarily ethane, propane and butane as well as smaller amounts of heavier hydrocarbons; partially liquid under atmospheric pressure
- NGL (natural gas liquids): Light hydrocarbons mainly consisting of ethane, propane and butane which are liquid under pressure at normal temperature
- Oil sands: A naturally occurring mixture of bitumen, water, sand, and clay. A heavy viscous form of crude oil
- Oil and gas value chains: Describes the value that is being added at each step from 1) exploring; 2) developing; 3) producing; 4) transportation and refining; and 5) marketing and distribution
- Organic capital expenditures: Capital expenditures excluding acquisitions, capital leases and other investments with significant different cash flow pattern
- Oslo Børs : Oslo stock exchange
- Peer group: Statoil's peer group consists of Statoil, Shell, ExxonMobil, OMV, ConocoPhillips, BP, Marathon, Chevron, Total, Repsol, Anadarko and Eni
- Petroleum: A collective term for hydrocarbons, whether solid, liquid or gaseous. Hydrocarbons are compounds formed from the elements hydrogen (H) and carbon (C). The proportion of different compounds, from methane and ethane up to the heaviest components, in a petroleum find varies from discovery to discovery. If a reservoir primarily contains light hydrocarbons, it is described as a gas field. If heavier hydrocarbons predominate, it is described as an oil field. An oil field may feature free gas above the oil and contain a quantity of light hydrocarbons, also called associated gas
- Proved reserves: Reserves claimed to have a reasonable certainty (normally at least 90% confidence) of being recoverable under existing economic and political conditions, and using existing technology. They are the only type the US Securities and Exchange Commission allows oil companies to report
- Refining reference margin: Is a typical average gross margin of our two refineries, Mongstad and Kalundborg. The reference margin will differ from the actual margin, due to variations in type of crude and other feedstock, throughput, product yields, freight cost, inventory etc
- Rig year: A measure of the number of equivalent rigs operating during a given period. It is calculated as the number of days rigs are operating divided by the number of days in the period
- Upstream: Includes the searching for potential underground or underwater oil and gas fields, drilling of exploratory wells, subsequent operating wells which bring the liquids and or natural gas to the surface
- VOC (volatile organic compounds): Organic chemical compounds that have high enough vapour pressures under normal conditions to significantly vaporise and enter the earth's atmosphere (e.g. gasses formed under loading and offloading of crude oil)

5.7 FORWARD-LOOKING STATEMENTS

This Annual Report on Form 20-F contains certain forward-looking statements that involve risks and uncertainties, in particular in the sections "Business overview" and "Strategy and market overview". In some cases, we use words such as "aim", "ambition", "anticipate", "believe", "continue", "could", "estimate", "expect", "intend", "likely", "objective", "outlook", "may", "plan", "schedule", "seek", "should", "strategy", "target", "will", "goal" and similar expressions to identify forward-looking statements. All statements other than statements of historical fact, including, among others, statements regarding future financial position, results of operations and cash flows; future financial ratios and information; future financial or operational portfolio or performance; future market position and conditions; future credit rating; business strategy; growth strategy; sales, trading and market strategies; research and development initiatives and strategy; market outlook and future economic projections and assumptions; competitive position; projected regularity and performance levels; expectations related to our recent transactions and projects, such as the sale of interests in the Shah Deniz project and the South Caucasus Pipeline, interests in the Marcellus onshore play in the US, interests in Trans Adriatic Pipeline, interests in Gudrun and acquisition of interests in Eagle Ford in the US, the UK Mariner project, the Peregrino phase II project in Brazil, in addition to the Johan Sverdrup and Aasta Hansteen projects on the NCS, discoveries on the NCS and internationally; our ownership share in Gassled; completion and results of acquisitions, disposals and other contractual arrangements; reserve information; recovery factors and levels; future margins; projected returns; future levels or development of capacity, reserves or resources; future decline of mature fields; planned turnarounds and other maintenance; plans for cessation and decommissioning; oil and gas production forecasts and reporting; growth, expectations and development of production, projects, pipelines or resources; estimates related to production and development levels and dates; operational expectations, estimates, schedules and costs; exploration and development activities, plans and expectations; projections and expectations for upstream and downstream activities; expectations relating to licences; oil, gas, alternative fuel and energy prices and volatility; oil, gas, alternative fuel and energy supply and demand; renewable energy production, industry outlook and carbon capture and storage; organisational structure and policies; planned responses to climate change; technological innovation, implementation, position and expectations; future energy efficiency; projected operational costs or savings; our ability to create or improve value; future sources of financing; exploration and project development expenditure; our goal of safe and efficient operations; effectiveness of our internal policies and plans; our ability to manage our risk exposure; our liquidity levels and management; estimated or future liabilities, obligations or expenses; expected impact of currency and interest rate fluctuations; expectations related to contractual or financial counterparties; capital expenditure estimates and expectations; projected outcome, impact or timing of HSE regulations; HSE goals and objectives of management for future operations; expectations related to regulatory trends; impact of PSA effects; projected impact or timing of administrative or governmental rules, standards, decisions, standards or laws (including taxation laws); projected impact of legal claims against us; plans for capital distribution and amounts of dividends are forward-looking statements. You should not place undue reliance on these forward-looking statements. Our actual results could differ materially from those anticipated in the forward-looking statements for many reasons, including the risks described above in "Risk review", and in "Operational review", and elsewhere in this Annual Report on Form 20-F.

These forward-looking statements reflect current views about future events and are, by their nature, subject to significant risks and uncertainties because they relate to events and depend on circumstances that will occur in the future. There are a number of factors that could cause actual results and developments to differ materially from those expressed or implied by these forward-looking statements, including levels of industry product supply, demand and pricing; exchange rate and interest rate fluctuations; the political and economic policies of Norway and other oil-producing countries; EU directives; general economic conditions; political and social stability and economic growth in relevant areas of the world; Euro-zone uncertainty; global political events and actions, including war, terrorism and sanctions; security breaches, including breaches of our digital infrastructure (cybersecurity); changes or uncertainty in or non-compliance with laws and governmental regulations; the timing of bringing new fields on stream; an inability to exploit growth opportunities; material differences from reserves estimates; unsuccessful drilling; an inability to find and develop reserves; ineffectiveness of crisis management systems; adverse changes in tax regimes; the development and use of new technology, particularly in the renewable energy sector; geological or technical difficulties; operational problems; operator error; inadequate insurance coverage; the lack of necessary transportation infrastructure when a field is in a remote location and other transportation problems; the actions of competitors; the actions of field partners; the actions of the Norwegian state as majority shareholder; counterparty defaults; natural disasters, adverse weather conditions, climate change, and other changes to business conditions; failure to meet our ethical and social standards; an inability to attract and retain personnel and other factors discussed elsewhere in this report.

Although we believe that the expectations reflected in the forward-looking statements are reasonable, we cannot assure you that our future results, level of activity, performance or achievements will meet these expectations. Moreover, neither we nor any other person assumes responsibility for the accuracy and completeness of the forward-looking statements. Unless we are required by law to update these statements, we will not necessarily update any of these statements after the date of this Annual Report, either to make them conform to actual results or changes in our expectations.

5.8 SIGNATURE PAGE

The registrant hereby certifies that it meets all of the requirements for filing on Form 20-F and that it has duly caused and authorised the undersigned to sign this Annual Report on its behalf.

1 Introduction

1.1 About the report

Statoil's Annual Report on Form 20-F for the year ended 31 December 2015 ("Annual Report on Form 20-F") is available online at www.statoil.com.

Statoil is subject to the information requirements of the US Securities Exchange Act of 1934 applicable to foreign private issuers. In accordance with these requirements, Statoil files its Annual Report on Form 20-F and other related documents with the Securities and Exchange Commission (the SEC). It is also possible to read and copy documents that have been filed with the SEC at the SEC's public reference room located at 100 F Street, N.E., Washington, D.C. 20549, US. You can also call the SEC at 1-800-SEC-0330 for further information about the public reference rooms and their copy charges, or you can log on to www.sec.gov. The report can also be downloaded from the SEC website at www.sec.gov.

Statoil discloses on its website at www.statoil.com/en/about/corporategovernance/statementofcorporategovernance/pages/default.aspx, and in its Annual Report on Form 20-F (Item 16G) significant ways (if any) in which its corporate governance practices differ from those mandated for US companies under the New York Stock Exchange (the "NYSE") listing standards.

PUBLIC COPY - CONFIDENTIAL INFORMATION REMOVED

1.2 Key figures and highlights

Statoil publishes financial data in accordance with International Financial Reporting Standards (IFRS) as issued by the International Accounting Standards Board (IASB) and as adopted by the European Union (EU).

(in NOK billion, unless stated otherwise)	For the year ended 31 December 2015	2014	2013	2012	2011

Weighted average number of ordinary shares outstanding (in thousands)	**3,179,443**	3,179,959	3,180,684	3,181,546	3,182,113

1) See section 6 *Shareholder information* for a description of how dividends are determined and information on share repurchases.
The board of directors will propose the total 2015 dividend for approval at the annual general meeting scheduled for 11 May 2016.

2) Proposed cash dividend for 2015. For 2015, the NOK amount covers first quarter while the USD amount is for second, third and fourth quarter.
Figure presented for 2015 using the Central Bank of Norway 2015 year end rate for Norwegian kroner, which was USD 1.00 = 8.8090 NOK.

3) Figures presented using the Central Bank of Norway year end rate for Norwegian kroner.

4) Total revenues and other income for 2013 and 2012 are restated.

2 Strategy and market overview

The profitability of the oil and gas industry continues to be challenged and Statoil's financial results in 2015 were influenced by the fall in oil prices. Stricter project prioritisation and a comprehensive efficiency programme are showing progress and are expected to continue to improve cash flow and profitability. Statoil proposes to the annual general meeting a scrip dividend from the fourth quarter of 2015. Statoil's strong financial position provides a firm basis on which to balance capital investment and dividends to shareholders, which Statoil expects to grow in line with its long-term earnings.

Last year Statoil outlined plans to further strengthen its competitiveness, and is now reinforcing its effort and commitment to deliver on priorities of high value creation, increased efficiency and competitive shareholder returns. Through Statoil`s flexibility in its investment programme Statoil believes that it is well prepared for potential sustained market volatility and uncertainty.

Statoil's ambition to further reduce costs and improve efficiency was presented at the capital markets update (CMU) on 6 February 2015. Then, the company announced that it was targeting annual savings of USD 1.7 billion from 2016 (pre-tax) as measured against the cost base of 2013. Having already realised $1.9 billion in savings (pre-tax), Statoil announced a new goal at the CMU on 4 February 2016. The company will step up its efficiency programme by 50% with a goal to realise USD 2.5 billion in annual savings from 2016 (pre-tax), again as measured against the cost base of 2013. The step-up of $0.8 billion is expected to be divided by two-thirds capital expenditures (capex) and one-third operational expenditures (opex).

Improvement programmes are Statoil's response to the industrial challenges characterised by high costs and declining returns. More specifically, the ambition is to realise positive production effects and cost savings to improve Statoil's financial results and cash-flows.

These forward-looking statements reflect current views about future events and are, by their nature, subject to significant risks and uncertainties because they relate to events and depend on circumstances that will occur in the future. See section 10 *Forward-Looking Statements* for more information.

2.1 Statoil's business environment

2.1.1 Market overview

Global economic GDP growth eased in 2015, to 2.4% from 2.6% in 2014. This largely reflects weakness in non-OECD economies where activity decelerated over the year. Growth in OECD, on the other hand, held up relatively well at around 2%, supporting overall economic growth and energy demand.

The underlying fundamentals of the United States economy remain sound and GDP growth ticked up slightly to 2.5% in 2015 from 2.4% in 2014. GDP growth also accelerated nominally in the Eurozone to 1.5%, supported by low energy prices, reduced fiscal headwinds, more monetary stimulus and a weak euro. UK GDP growth slowed in 2015, but remains decent at 2.4%, whereas Japan barely avoided its fourth recession in five years. Growth in emerging countries slipped to 3.6% in 2015, reflecting both weakness in commodity prices and domestic challenges. Deep recessions have emerged in Brazil and Russia, whilst China continues on an intended path of gradual deceleration and consequent structural reforms. Net commodity importers such as India are doing much better, and India's GDP growth rate outpaced China's in 2015.

Several major forces are at play in the global economy and will continue to affect demand, including soft commodity prices and persistently low interest rates, increasingly divergent monetary policies across major economies, and weak world trade. In particular, the sharp decline in oil prices since mid-2014 has supported global economic activity and is expected to continue to do so in 2016.

Global oil demand grew by a healthy 1.6 mmbbl per day in 2015, driven by a colder than normal winter in the US and Northern Europe and the lower prices of crude oil. Demand growth in absolute terms was highest in China, despite 2015 being a challenging year for Chinese stock markets and the Chinese economy in general. Non-Opec producers have proven to be resilient to lower prices and grew production by 1.3 mmbbl per day in 2015 while Opec added 1.1 mmbbl per day to their production, mainly from Saudi Arabia and Iraq. This has postponed the rebalancing between supply and demand and has led to a continued drop in oil prices.

2015 saw moderate growth in gas supply and demand of 1.5%, which is below the growth rates of the previous years. The United States is the main driver behind the growth. Europe experienced a weather-driven increase in demand as compared to 2014. Gas consumption declined in Japan and South Korea due to weak power sector gas demand caused by the (re)start of coal and nuclear power plants. Gas demand growth slowed in China and other emerging markets, with more competitively priced oil products being one contributing factor. In the United States, a multi-year wave of gas supply growth came to an end in 2015, but demand could not keep up with supply growth, and prices fell. A strong supply of pipeline gas to Europe and an emerging oversupply of LNG have further depressed gas prices.

The global economic situation continues to be fragile, with development partly driven by uncertain political environments in key countries and regions, in addition to normal supply and demand factors. The situation at the end of 2015, with high storage levels and low prices, will continue to put pressure on international oil companies to increase efficiency and reduce costs. This will contribute to a gradual rebalancing of markets for oil and gas. The impact of this on price levels and price developments is very uncertain.

2.1.2 Oil prices and refining margins

High volatility characterised the oil market in 2015, with the price of Brent in a range between USD 66 per barrel in May to USD 35 per barrel at the end of December. Refinery margins were well above normal levels due to low crude prices throughout the year.

Oil prices

The average price for dated Brent crude in 2015 was USD 53/bbl, down 47% from 2014. The price was at USD 55/bbl in the beginning of 2015, on a downward trajectory. A temporary low was reached at just above USD 45/bbl in the middle of January before the prices started climbing again. A positive market sentiment drove the price of dated Brent up in the second quarter. Signs of a downturn in the Chinese economy and the nuclear deal between P5+1 and Iran contributed to a declining market sentiment and prices fell again to a new low in August. The price of dated Brent recovered somewhat again in the 3rd quarter and in to the 4th quarter, before the 168th Opec meeting on the 4th of December. No action was agreed by the Opec member countries and the price of Brent went below USD 40/bbl for the first time since the spring of 2009. The dated Brent price was USD 36/bbl on 31 December 2015, a year-end level not seen for a decade. The futures market for Brent at the Intercontinental Exchange (ICE) was in contango throughout 2015. See section 9 *Terms and definitions* for further details.

Although the conflict level in Syria increased further and the armed conflict in Yemen added tension in the Middle East, geopolitical events had less effect on the crude oil prices in 2015, compared with the previous year.

Opec's decision, in late 2014, to not balance the market, marked the change of a 30-year old strategy. Subsequent to this the oil market was highly volatile throughout 2015, while the participants endeavoured to find the new price level of crude oil. Although oil demand increased by 1.6 mmbbl per day, much due to a cold winter and low prices, the market remained oversupplied throughout the whole year, with total supply growth of 2.4 mmbbl per day of production. As a consequence, the global oil stocks were at historically high levels by year-end.

2015 was an eventful year for North American (NA) crude. The price of US WTI crude, as quoted at the Cushing tank farm in Oklahoma, averaged USD 49/bbl in 2015, down 47% from 2014. The price of WTI was USD 53/bbl at the beginning of the year. On 31 December 2015 the WTI price was at USD 37/bbl, roughly at par with first month Brent. With low crude prices through 2015, rig counts have dropped and production growth has faltered. At the same time, crude inventories have continued to grow, further weighing on crude prices. New pipeline and crude distillation capacity, coupled with slower production growth, have created a tighter balance for US light crude, easing the large price discounts of inland crudes relative to Brent. The easing of discounts has challenged the economics of more expensive transport solutions such as rail relative to pipeline, such that crude by rail loadings have declined dramatically during 2015. In late 2015, the US government passed legislation allowing unrestricted export of crude oil for the first time since the 1970s. While little impact is expected in the global market short term, given the current oversupplied global crude market, unrestricted US crude exports provides producers with greater access to higher value global crude markets and could impact price differentials.

Refining margins

Refinery margins in Northwest Europe, as calculated against dated Brent crude, were well above normal in 2015. One reason for the strength was the weak crude oil market, with dated Brent priced below the first forward month at the ICE exchange throughout the year. Further, the price differentials vs. Brent for the crude oils actually used were lower than last year. The other main factor was a very strong gasoline market. Low price levels at the pump led to rising demand in the US, and gasoline demand in Europe stopped falling. Changes to the Chinese economy led to more emphasis on the consumer sector. New car sales in China almost matched that of the US, and some 80% were net additions to the fleet. Chinese gasoline demand therefore rose almost as much as in the US, and strong growth was also seen in India and Pakistan. This demand growth led to capacity constraints at refineries, in particular for high-octane components. Europe, being in net surplus on gasoline, was able to export more into these markets, with parts of it going as high-octane components at strong price premiums. For naphtha, which is a feedstock both for the petrochemical industry and for making gasoline, Asian demand for imports from Europe rose through the year and gave very strong margins here. On the other hand, new refineries in Asia and the Middle East were geared towards diesel production. New diesel volumes exported to Europe led to rising inventory levels here, despite a quite strong demand growth. The situation became dramatic in the fourth quarter of 2015, when high refinery throughputs in order to make enough gasoline and naphtha led to excess diesel production. This made diesel tanks go full and the diesel margin decreased. LPG was oversupplied due to high exports from the US. Heavy fuel oil was oversupplied due to declining demand. However, against the low Brent crude oil prices, both products still saw quite normal margins.

2.1.3 Natural gas prices

Natural gas prices fell during 2015 in most markets. European gas prices reached the lowest level since early 2010. Reasons include weak demand, good supplies and low prices for coal, oil and other competing fuels. Henry Hub gas prices in the United States also declined during 2015, and the prices at year-end were at the lowest level since the 1990s.

Gas prices - Europe
European gas market prices averaged USD 6.5/mmBtu in 2015, down 20% from 2014. EU gas consumption for heating purposes recovered in 2015 as temperatures returned to more normal levels after a particularly mild winter in 2014. The use of gas for power generation increased in Southern Europe due to high summer temperatures, but declined in other parts of Europe. High availability of wind in 2015 and a steady growth in renewable generation capacity made inroads in the overall need for gas-fired and other thermal power plants in Europe.

Norwegian exports of pipeline gas reached record-levels of 108 bcm in 2015. EU indigenous gas production fell by 10% to 125 bcm as the Dutch government lowered existing production caps at the large Groningen field as a response to earthquake activity. Russia exported more than 150 bcm of pipeline gas to Europe in 2015, close to recent historical highs. Europe imported around 50 bcm LNG in 2015, more than in 2014, but still 35 bcm below the peak a few years ago.

Gas prices - North America
First quarter prices centered on USD 3/mmBtu, while second and third quarter prices fluctuated around USD 2.75/mmBtu, with weather-related ups and downs. However, in the fourth quarter prices fell and reached USD 1.50/mmBtu at the end of the year, as storage rose to new record highs and an El Niño weather event quashed demand in the winter peak season. As a result, the Henry Hub average of USD 2.6/mmBtu was the lowest annual price in over a decade, down from USD 4.4/mmBtu in 2014.

US gas producers responded to the falling prices by withdrawing rigs. Gas production peaked at the end of the summer and supply has been falling since. Demand for gas was strong in 2015, with natural gas for the first time exceeding coal use in the power sector for most of the year.

Global LNG prices
Global prices for LNG have plummeted. Prices under long-term LNG contracts to buyers in Asia are tracking oil prices with a lag, and contract prices were typically down 40% from 2014. The price assessment for spot LNG cargoes in Asia reached USD 7.5/mmBtu over the year compared to USD 14/mmBtu in 2014. LNG prices are now back to levels prior to the Fukushima nuclear disaster in March 2011. The global LNG market has entered a period where the growth of supplies from Australian, US and other liquefaction projects could exceed demand.

2.2 Statoil's corporate strategy

Statoil creates value by accessing, exploring, developing, and producing energy sources globally, and by enhancing the value of such production through its mid- and downstream positions.

Fundamental changes are happening in the oil and gas industry. The industry faces new challenges, such as increased pressure on margins, changing patterns of energy supply and consumption, geopolitical instability and rising climate change concerns.

Statoil's top priorities remain to conduct safe and reliable operations with zero harm to people and the environment, and to grow value through disciplined investments and prudent financial management with competitive redistribution of capital to shareholders. To succeed going forward in turning Statoil's vision into reality, Statoil pursues a strategy that will:

- Deepen and prolong Statoil's NCS position
- Grow material and profitable international positions
- Pursue focused and value-adding mid- and downstream activities
- Provide energy for a low carbon future

In addition, Statoil will research, develop, and deploy technology to create opportunities and enhance the value of Statoil's current and future assets.

Deepen and prolong Statoil's NCS position

For more than 40 years, Statoil has explored, developed and produced oil and gas from the Norwegian continental shelf (NCS). Statoil aims to deepen and prolong its position by accessing and maturing opportunities into valuable production. At the same time Statoil plans to improve the reliability and lifespan of fields already in production.

- **Exploration:** Statoil has proven to be a committed NCS explorer across mature, growth, and frontier areas. In the last year, Statoil participated in 21 completed exploration wells of which 10 were discoveries. Statoil announced discoveries in the Aasta Hansteen area, the Krafla area, and the King Lear area. Statoil applied for new acreage in the Barents Sea as part of the 23rd licensing round and entered the Barents Sea Exploration Collaboration with four other oil and gas explorers to address common operational challenges. Statoil also applied for additional NCS licenses during the 2015 Awards in Predefined Areas (APA) with the results awarded in 2016
- **Development:** Statoil received approval from the Norwegian Ministry of Petroleum and Energy for the plan for development and operation (PDO) for Johan Sverdrup Phase I and awarded several related key contracts to suppliers. The development plan for Johan Sverdrup Phase II, along with other projects, continues to be matured. In 2015, Statoil delayed the concept selection for Johan Castberg, Snorre 2040 and Trestakk (sanctioned early 2016) to secure robust development solutions. Gina Krog's expected start-up is now 2017 with the steel jacket having been installed and predrilling of the production wells started
- **Production:** Statoil began production from Valemon, Oseberg Delta 2, Gullfaks South Oil, Smørbukk South Extension and the Lundin-operated Edvard Grieg field. Three major projects to increase recovery have been delivered in 2015; at Troll A two new gas compressors were installed, the Åsgard subsea compression, the world's first subsea gas compression plant, came on stream, and the world's first subsea wet gas compressor is nearing completion at Gullfaks

Statoil made further portfolio adjustments to improve its NCS position. Statoil increased its share in the Alfa Sentral project, which straddles the border of the NCS and UK continental shelf (UKCS). Statoil's equity share now stands at 24% in licence P312 on the UKCS and 62% in licence PL046 on the NCS (Statoil-operated); the two licenses together comprise the Alfa Sentral field. Statoil also farmed down in the Gudrun field. Statoil remains the operator of the field.

The target to reduce CO_2 emissions on the NCS was increased to 1.2 million tonnes by 2020, which is up 50% from the initial target of 800,000 tonnes. The initial target was set in 2008 and is expected to be reached in 2016.

Grow material and profitable international positions

International oil and gas production represents approximately 37% of Statoil's equity production and now stands at 739 kboe/d. Statoil will continue to explore, develop, and produce oil and gas opportunities outside Norway to enhance Statoil's upstream portfolio.

- **Exploration:** Statoil is an active international explorer for oil and gas. In the last year, Statoil participated in 18 completed exploration wells of which eight were discoveries. Statoil focused in Canada, Tanzania, Brazil, the UK and the US Gulf of Mexico. Statoil announced a gas discovery in Tanzania (Mdalasini-1). Statoil accessed new acreage in Canada, New Zealand, Indonesia, Mozambique, Russia, and the US Gulf of Mexico, and entered three new countries, Nicaragua, South Africa, and Uruguay. Government approval is pending for the newly acquired acreage in Mozambique, South Africa, and Uruguay. Statoil exited both our operated and non-operated licenses in the Chukchi Sea (Alaska). Statoil also closed its office in the Faroe Islands following the relinquishment of our exploration acreage
- **Development:** In Europe, the partner-operated Corrib gas field in Ireland came on stream at the end of 2015; meanwhile, Statoil postponed the Mariner field's start-up date to 2018. In the US Gulf of Mexico, the partner-operated Heidelberg project entered its final stages in 2015 as it prepared for first oil in early 2016, meanwhile Big Foot was postponed due to technical challenges in the final project stage
- **Production:** Production has steadily increased from fields such as CLOV in Angola and Jack/St. Malo in the US Gulf of Mexico. In the US, further optimisation of the onshore portfolio targeting cost improvements has been on-going, including the reorganisation of some of the activities to extract greater synergies

Statoil made further portfolio adjustments to improve its international exploration portfolio. Statoil sees value in gaining operatorships, and in 2015 Statoil became the operator in BM-C-33 offshore Brazil, which contains the Pão de Açúcar, Seat, and Gávea discoveries. Statoil also completed an agreement to reduce Statoil's average working interest in Statoil's non-operated US southern Marcellus onshore asset from 29% to 23%. In another transaction, Statoil acquired an additional 13% interest in Statoil's Eagle Ford joint venture and became its sole operator.

Pursue focused and value-adding mid- and downstream activities

The prime objective for Statoil's mid- and downstream activities is to process and transport its oil and gas production (including the Norwegian State's petroleum) competitively to premium markets, securing maximum value realisation. The priorities are:

- High regularity in midstream operation and continuous improvement within HSE, efficiency and costs
- Market Statoil's equity production (crude oil, natural gas, related products) and the State's Direct Financial Interest (SDFI) volumes for maximum value creation
- Develop the Asset Backed Trading model across commodities
- Maintain the position as a leading European gas supplier
- A capital lean asset structure

Strategic focus is directed at optimising the value of Statoil's flexible Norwegian gas production assets that supply Europe and Statoil's midstream activities in North America, where Statoil's onshore un-conventionals portfolio is progressing and where margin capture is important. Statoil achieved strong trading results across all commodities and robust refinery results through good margins, cost reductions and high availability.

Strategic progress in Statoil's mid- and downstream portfolio has been made in 2015. Export pipelines for the Utsira High and the Norwegian Sea (Polarled) were installed. Statoil agreed to divest its 20% stake in the Trans Adriatic Pipeline AG in 2015 following earlier divestments in 2014.

Providing energy for a low carbon future

Statoil recognises that opportunities are increasingly available in producing low carbon energy. In 2015, Statoil created a new business area, New Energy Solutions, to further access, develop, and produce low carbon energy when and where it is deemed valuable.

- **Development:** In the 4th quarter 2015, Statoil sanctioned Hywind Scotland Offshore Floating Test Park in Scotland; Statoil's ownership share is 100%. The park will have a total installed capacity of 30 MW and planned production start-up is 2017. The Dudgeon Offshore Wind Park sanctioned in 2014 is progressing as planned towards start-up in 2017; Statoil's ownership share is 35%. The park will have a total installed capacity of 402 MW. The Forewind consortium, comprising Statoil, Statkraft, RWE and SSE, all with a 25% owner stake, continues to mature projects and has received consent for four 1.2 GW projects in the Dogger Bank Area off the UK east coast
- **Production:** Statoil is a non-operating partner in the Scira consortium (40% owner stake) which produces electricity from the Sherringham Shoal wind park in the UK. The park has an installed capacity of 317 MW

Research, development, and deployment of technology to unlock opportunities and enhance value

Statoil believes that technology is a critical success factor in the current business environment. Statoil's technology development activities aim to reduce field development, drilling and operating costs, and CO_2 and other greenhouse gas emissions. Statoil's technology efforts focus on the following priority areas:

- **Business-critical technologies**: Upstream technologies are prioritised, primarily in the areas of Exploration, Reservoir, Drilling and Well and Subsea production systems. Statoil's main focus has been on cost reduction, for example further development of the steerable drilling liner system to reduce well construction costs
- **Strengthening Statoil's licence to operate**: Statoil's commitment to sustainability continues. Statoil's ongoing "Powering collaboration" agreement with GE aims to accelerate the development of more sustainable energy solutions by addressing CO_2 and methane emissions, water usage and energy optimisation of operations. Statoil is also addressing energy efficiency of operating assets by, e.g. implementing on-line water wash systems on gas turbines
- **Expanding Statoil's capabilities**: Statoil's technical capabilities are expanding to meet the challenges of the New Energy Solutions business area for renewable and low carbon energy solutions. Technology development is conducted in-house, in collaboration with suppliers and through venture activities. A key technological focus area is finding more efficient ways of producing clean energy, particularly by reducing costs in the areas of construction and maintenance for both fixed and floating offshore wind applications

2.3 Group outlook

Statoil's plans address the current environment while continuing to invest in high-quality projects. Statoil continues to reiterate its efforts and commitment to deliver on its priorities of high value creation, increased efficiency and competitive shareholder return.

- Organic capital expenditures for 2016 (i.e. excluding acquisitions, capital leases and other investments with significant different cash flow pattern) are estimated at around USD 13 billion
- Statoil intends to continue to mature the large portfolio of exploration assets and estimates a total exploration activity level of around USD 2 billion for 2016, excluding signature bonuses
- Statoil aims to deliver efficiency improvements with pre-tax cash flow effects of around USD 2.5 billion annually from 2016
- Statoil's ambition is to keep the unit of production cost in the top quartile of Statoil's peer group
- For the period 2014 - 2017, organic production growth [7] is expected to come from new projects resulting in around 1% CAGR (Compound Annual Growth Rate) from a 2014 level rebased for divestments
- The equity production for 2016 is estimated to be somewhat lower than the 2015 level [7]
- Scheduled maintenance activity is estimated to reduce quarterly production by approximately 25 mboe per day in the first quarter of 2016 of which the majority is liquids internationally. In total, the maintenance is estimated to reduce equity production by around 60 mboe per day for the full fiscal year 2016, which is higher than the 2015 impact
- Indicative effects from Production Sharing Agreement (PSA-effect) and US royalties are estimated to be around 135 mboe per day in 2016 based on an oil price of USD 40 per barrel and 165 mboe per day based on an oil price of USD 70 per barrel [4]
- Deferral of production to create future value, gas off-take, timing of new capacity coming on stream and operational regularity represent the most significant risks related to the production guidance
- The board of directors proposes to the annual general meeting (AGM) maintaining a dividend of USD 0.2201 per share for the fourth quarter 2015 and to introduce a two-year scrip dividend programme for eligible shareholders starting from the fourth quarter 2015
- With effect from first quarter of 2016, Statoil will change to USD as presentation currency

These forward-looking statements reflect current views about future events and are, by their nature, subject to significant risks and uncertainties because they relate to events and depend on circumstances that will occur in the future. For further information see section 10 *Forward-Looking Statements*.

3 Business overview

3.1 Our history

Statoil was formed in 1972 by a decision of the Norwegian parliament and listed on the stock exchanges in Oslo and New York in 2001.

Statoil was incorporated as a limited liability company under the name Den norske stats oljeselskap AS on 18 September 1972. As a company wholly owned by the Norwegian State, Statoil's role was to be the government's commercial instrument in the development of the oil and gas industry in Norway.

In 2001, the company became a public limited company listed on the Oslo and New York stock exchanges, and it changed its name to Statoil ASA.

Statoil has grown in parallel with the Norwegian oil and gas industry, which dates back to the late 1960s. Initially, Statoil's operations were primarily focused on exploration, development and production of oil and gas on the Norwegian continental shelf (NCS), as a partner.

In the 1970s, Statoil commenced its own operations, made important discoveries and began oil refining operations, which have been of great importance to the further development of the NCS.

Statoil grew substantially in the 1980s through the development of large fields on the NCS (Statfjord, Gullfaks, Oseberg, Troll and others). Statoil also became a major player in the European gas market by securing large sales contracts for the development and operation of gas transport systems and terminals. During the same decade, Statoil was involved in manufacturing and marketing in Scandinavia and established a comprehensive network of service stations.

Since 2000, our business has grown as a result of substantial investments on the NCS and internationally. Our ability to fully realise the potential of the NCS was strengthened through the merger with Hydro's oil and gas division on 1 October 2007.

In recent years, Statoil has utilised their expertise to design and manage operations in various environments in order to grow our upstream activities outside our traditional area of offshore production. This includes the development of heavy oil and shale gas projects.

In 2010, Statoil carried out an initial public offering of Statoil Fuel & Retail ASA on the Oslo Børs, partially divesting and reducing our interest in the business relating to service stations. In 2012, all of the remaining shares in Statoil Fuel & Retail ASA were divested.

Statoil also participates in projects that focus on other forms of energy, such as offshore wind and carbon capture and storage, in anticipation of the need to expand energy production, strengthen energy security and combat adverse climate change.

3.2 Our business

Statoil is a technology-driven energy company primarily engaged in oil and gas exploration and production activities.

Statoil ASA is a public limited liability company organised under the laws of Norway and subject to the provisions of the Norwegian Public Limited Liability Companies Act. The Norwegian State is the largest shareholder in Statoil ASA, with a direct ownership interest of 67%.

Statoil's head office is located in Stavanger, Norway. Statoil has business operations in more than 30 countries and employs about 21,600 employees worldwide.

Statoil is the leading operator on the Norwegian continental shelf (NCS) and also has substantial international activities. Statoil is present in several of the most important oil and gas provinces in the world. In 2015, 37% of Statoil's equity production came from international activities and the company also holds operatorships internationally.

Our access to crude oil in the form of equity, governmental and third party volumes makes Statoil a large net crude oil seller, and Statoil is the second-largest supplier of natural gas to the European market. Processing and refining are also part of our operations. Statoil is also participating in projects that focus on other forms of energy, such as offshore wind and carbon capture and storage, in anticipation of the need to expand energy production, strengthen energy security and combat adverse climate change.

Statoil's business address is Forusbeen 50, N-4035 Stavanger, Norway. Its telephone number is +47 51 99 00 00.

3.3 Our competitive position

There is intense competition in the oil and gas industry for customers, production licences, operatorships, capital and experienced human resources.

Statoil competes with large integrated oil and gas companies, as well as with independent and state-owned companies, for the acquisition of assets and licences for the exploration, development and production of oil and gas, and for the refining, marketing and trading of crude oil, natural gas and related products. Key factors affecting competition in the oil and gas industry are oil and gas supply and demand, exploration and production costs, global production levels, alternative fuels, and environmental and governmental regulations. In addition, Statoil competes to develop wind energy opportunities.

Statoil's ability to remain competitive will depend, among other things, on the company's management continuing to focus on reducing unit costs and improving efficiency, and maintaining long-term growth in reserves and production through continuing technological innovation. It will also depend on our ability to seize international opportunities in areas where our competitors may also be actively pursuing exploration and development opportunities. Statoil believes it is in a position to compete effectively in each of our business segments.

The information about Statoil's competitive position in the business overview and strategy, and operational review sections, is based on a number of sources. They include investment analyst reports, independent market studies, and our internal assessments of our market share based on publicly available information about the financial results and performance of market players.

Statoil has endeavoured to be accurate in our presentation of information based on other sources, but has not independently verified such information.

Improvement programmes

Statoil's ambition to further reduce cost and improve efficiency was presented at the capital markets update (CMU) on 6 February 2015, targeting annual savings of USD 1.7 billion from 2016. At the CMU on 4 February 2016, Statoil announced that it will step up its efficiency programme by 50% with a goal to realise USD 2.5 billion in annual savings from 2016.

Improvement programmes are Statoil's response to the industrial challenge characterised by reducing prices for our products, escalating cost and declining returns. More specifically, the ambition is to realise positive production effects and capex and operating cost savings to improve financial results and cash-flows.

3.4 Corporate structure

Statoil's operations are managed through the following business areas:

Development and Production Norway (DPN)

DPN comprises our upstream activities on the Norwegian continental shelf (NCS). DPN aims to continue its leading role and ensure maximum value creation on the NCS. Through excellent HSE and improved operational performance and cost, DPN strives to maintain and strengthen Statoil's position as a world-leading operator of producing offshore fields. DPN seeks to open new acreage and to mature improved oil recovery and exploration prospects. New and existing fields are primarily developed using an industrial approach, in which speed of delivery and cost improvements through standardisation and repeated use of proved solutions are key elements.

Development and Production International (DPI)

DPI comprises our worldwide upstream activities that are not included in the DPN and Development and Production USA (DPUSA) business areas. DPI's ambition is to build a large and profitable international production portfolio comprising activities ranging from accessing new opportunities to delivering on existing projects and managing a production portfolio. DPI endeavours to ensure the delivery of profitable projects in a range of complex technical and stakeholder environments, and it manages a broad non-operated production portfolio that will be complemented with operated positions.

Development and Production United States (DPUSA)

DPUSA comprises our upstream activities in the USA and Mexico. DPUSA's ambition is to develop a material and profitable position in the US and Mexico, including the deep water regions of the Gulf of Mexico and unconventional oil and gas in the US. In this connection, Statoil aims to further strengthen its capabilities in deep water and unconventional oil and gas operations.

Marketing, Midstream and Processing (MMP)

MMP comprises our marketing and trading of oil products and natural gas, transportation, processing and manufacturing, and the development of oil and gas value chains. MMP's ambition is to maximise value creation in Statoil's midstream, marketing and renewable energy business.

Technology, Projects and Drilling (TPD)

TPD's ambition is to provide safe, efficient and cost-competitive global well and project delivery, technological excellence, and research and development. Cost-competitive procurement is an important contributory factor, although group-wide procurement services are also expected to help to drive costs in the group down.

Exploration (EXP)

EXP's ambition is to position Statoil as one of the leading global exploration companies. This is achieved through accessing high potential new acreage in priority basins, globally prioritising and drilling more significant wells in growth and frontier basins, delivering near-field exploration on the NCS and other select areas, and achieving step-change improvements in performance.

New Energy Solutions (NES)

NES reflects Statoil's aspirations to gradually complement its oil and gas portfolio with profitable renewable energy and other low-carbon energy solutions. NES is responsible for wind parks, carbon capture and storage as well as other renewable energy and low-carbon energy solutions.

Global Strategy and Business Development (GSB)

GSB sets the corporate strategy, business development and merger and acquisition (M&A) activities for Statoil. The ambition of the GSB business area is to closely link corporate strategy, business development and M&A activities to actively drive Statoil's corporate development.

Reporting segments

Statoil reports its business in the following reporting segments: Development and Production Norway (DPN); Development and Production International (DPI), which combines the DPI and DPUSA business areas; Marketing, Midstream and Processing (MMP); and Other.

The Other reporting segment includes activities in New Energy Solutions (NES), Technology, Projects and Drilling (TPD), Global Strategy and Business Development (GSB) and Corporate staffs and support functions. Activities relating to the Exploration (EXP) business area are allocated to, and presented in, the respective development and production segments.

Presentation

In the following sections, the operations of each reporting segment are presented. Underlying activities or business clusters are presented according to how the reporting segment organises its operations. The Exploration business area's activities, which include group discoveries and the appraisal of new exploration resources, are presented as part of the various development and production reporting segments (Development and Production Norway, and Development and Production International).

As required by the SEC, Statoil prepares its disclosures about oil and gas reserves and certain other supplementary oil and gas disclosures based on geographical areas. The geographical areas are defined by country and continent. They consist of Norway, Eurasia excluding Norway, Africa, and the Americas.

See note 3 *Segments* in the Consolidated financial statement for more details.

3.5 Development and Production Norway (DPN)

3.5.1 DPN overview

Development and Production Norway (DPN) is responsible for field development and operational activities on the Norwegian continental shelf (NCS).

Statoil's equity and entitlement production on the NCS was 1,232 mboe per day in 2015. That was about 68% of Statoil's total entitlement production and 62.5% of Statoil's equity production.

DPN has organised the production operations into four business clusters: Operations North (Barents Sea) located in Harstad, Operations Mid-Norway (Norwegian Sea) located in Stjørdal near Trondheim, Operations West (North Sea) located in Bergen and Operation South (North Sea) located in Stavanger. Partner-operated fields cover the entire NCS and are internally included in the Operations South business cluster.

When possible, the fields in each cluster use common infrastructure, such as production installations and oil and gas transport facilities. This reduces the investments required to develop new fields. DPN's efforts in these core areas also focus on finding and developing smaller fields through the use of existing infrastructure and on increasing production by improving the recovery factor.

DPN is also working to extend production from our existing fields through improved reservoir management and the application of new technology.

Key events and portfolio developments in 2015:

- In January 2015, Statoil announced the start-up of production at the Valemon oil and gas field in the North Sea
- Statoil announced production start up on fast track projects at the Oseberg Delta in February, Gullfaks Sør Olje in July and Smørbukk Sør Extension in September
- In November the start up of production at the Edvard Grieg field was announced by Lundin
- The major redevelopment projects Åsgard Subsea compression and two new compressors on the Troll A platform have started up
- A total of seven turnarounds were planned to be performed during 2015. Four turnarounds were carried out, and three turnarounds were deferred from 2015 to 2016 to coordinate with other activities due to reduce production losses and reduce costs
- Plan for Development and Operations (PDO) for the Johan Sverdrup field and Gullfaks Rimfaksdalen Fast track project were approved by the Ministry of Petroleum and Energy (MPE) and the PDO for Oseberg Vestflanken 2 was submitted to the MPE
- An extensive exploration drilling program in 2015 resulted in 21 completed wells, of which 10 were discoveries. A total of 16 wells were Statoil operated
- Statoil has delivered an extensive application for the 23rd concession round and has been awarded interest in 24 licenses on the NCS in the Awards in Predefined Areas (APA) 2015, 13 of those as operator and 11 as partner
- In December Statoil announced that it farmed down to Repsol a 15% interest in the Gudrun field. Statoil remains as operator and largest equity holder with a 36% interest

The profitability of our industry continues to be challenged. Statoil's response to the industrial challenge characterised by high costs and declining returns is addressed in the section 2 *Strategy and market overview*.

3.5.2 Fields in production on the NCS

Statoil's entitlement production at NCS was about 68% of Statoil's total entitlement production in 2015.

The following table shows DPN's average daily entitlement production of oil, including NGL and condensates, and natural gas for the years ending 31 December 2015, 2014 and 2013. Field areas are groups of fields operated as a single entity.

	For the year ended December 31,								
	2015			2014			2013		
	Oil and NGL	Natural gas		Oil and NGL	Natural gas		Oil and NGL	Natural gas	
Area production	mbbl	mmcm	mboe/day	mbbl	mmcm	mboe/day	mbbl	mmcm	mboe/day
Operations North	32	7	78	36	7	80	24	5	56
Operations Mid	113	17	218	126	17	235	126	15	222
Operations West	267	51	591	264	43	535	290	48	589
Operations South	134	13	214	107	11	177	94	12	167
Partner Operated Fields	50	13	132	55	16	157	58	20	182
Total	595	101	1,232	588	95	1,184	591	99	1,217

The following table shows the NCS production by fields and field areas in which Statoil was participating as of 31 December 2015.

Business cluster	Geographical area	Statoil's equity interest in %	Operator	On stream	Licence expiry date	Average daily production in 2015 mboe/day
Operations North						
Snøhvit	The Barents Sea	36.79	Statoil	2007	2035	47.1

The following sections provide information about the main producing assets. See section 4.1.4 *DPN profit and loss analysis* for a discussion of results of operations for 2015, 2014 and 2013.

3.5.2.1 Operations North

The main producing fields in the Operations North area are Snøhvit and Norne.

The Norwegian Sea region is characterised by petroleum reserves located at water depths between 340 and 380 metres. In the Barents Sea the petroleum reserves are located at water depths between 310 and 340 meters. The Gulf Stream keeps the sea free of ice all year round, but winter storms can make surface installations difficult to operate.

Snøhvit was the first field developed in the Barents Sea. It is one of the first major developments using onshore production facilities. All offshore installations are subsea. The natural gas is transported to shore and then processed at our Liquefied Natural Gas (LNG) plant on Melkøya. The LNG are shipped to customers in Europe, Asia, North and South America in tankers. The CO_2 in the feed-gas from Snøhvit and Albatross is removed due to freezing constraints in the process system. To reduce carbon dioxide emissions to the air the removed CO_2 is liquefied, transported through a pipeline, and then injected into a storage reservoir in Snøhvit. The LNG plant has produced according to plan in 2015, with high production efficiency, improved HSE results and enhanced cost efficiency. As of 1 January 2016 responsibility for operation of Snøhvit onshore facilities is transferred from DPN to MMP.

Norne is an oil field in the Norwegian Sea. The field has been developed using a floating production, storage and offloading vessel (FPSO) connected to subsea templates. Alve, Marulk, Urd and Skuld are tie-in fields connected to the Norne FPSO.

3.5.2.2 Operations Mid-Norway

The main producing fields in the Operations Mid-Norway area are Åsgard, Kristin, Tyrihans and Heidrun.

Operation Mid-Norway operates in a mature part of the Norwegian Sea, and is a significant contributor to Statoil's equity production. Main focus is to capitalise existing fields through profitable realisation of increased oil recovery and successful implementation of new developments. There is still exploration potential in the area and a targeted exploration effort is in execution.

The **Åsgard** field includes the Åsgard A production and storage ship for oil, the Åsgard B semi-submersible floating production platform for gas, and the Åsgard C storage vessel for condensate. In September 2015 Statoil started the world first subsea gas compressor on Åsgard. The compressor increases the Åsgard recovery rate from 67% to 87% thereby extending the reservoirs' productive lives. Mikkel and Morvin are tie ins to Åsgard.

Tyrihans is a subsea field with five templates. The well stream of oil and gas is tied back to Kristin for processing. Tyrihans receives seawater injection from Kristin and gas injection from Åsgard B.

Kristin is a gas and condensate field. The Kristin development is the first high-temperature/high-pressure (HTHP) field developed with subsea installations. The pressure and temperature in the reservoir are among the highest of all developed fields on the NCS.

Heidrun is developed with a floating concrete tension leg platform. The oil is transferred to the floating storage unit, Heidrun B, operated from June 2015.

The **Njord** field is located in the Norwegian Sea and the field has been developed with a floating steel platform unit, Njord A, with both drilling and processing facilities. The subsea field Hyme is tied back to Njord A.
As a result of structural integrity issues Njord A was temporarily shut down and extensive reinforcement work was completed through a long turnaround period from Sept 2013 to July 2014. Since July 2014 conditional monitoring and precautionary evacuation in forecasted bad weather conditions have been applied. In addition there is no drilling activity. The Project "Njord Future" is established to secure long term production for both the Njord and Hyme fields and to act as a tie-in host candidate for discoveries in the area.

3.5.2.3 Operations West

The main producing fields in the Operations West area are Troll, Oseberg, Gullfaks, Kvitebjørn, Visund and Grane

Operation West produces approximately half of Statoil's equity production in Norway. Its main focus is prolonging and increasing production through increased oil recovery, exploration and new field developments.

Troll is the largest gas field on the NCS and a major oil field. The Troll field is split into three hydrocarbon-bearing regions connected to three platforms: Troll A, B and C. The Troll gas is mainly exported and produced at the Troll A platform, while oil is mainly produced at Troll B and C. Fram and Fram H Nord are tie-ins to Troll C.

In October 2015 Troll A finalised the third and fourth pre-compressor project as described in the original PDO for the Troll field. The purpose of the project is to increase gas production by installing two extra pre-compressors on the Troll A platform.

The **Oseberg** area includes the Oseberg Field Centre, Oseberg C, Oseberg East and Oseberg South production platforms. Oil and gas from the satellites are transported in pipelines to the Oseberg Field Centre for processing and transportation.

The Delta2 facilities project on Oseberg Field Center was completed in 2015. Drilling operations related to the project have been on-going throughout 2015 and were finalised in January 2016. The Vestflanken2 project at Oseberg Field Center was sanctioned December 2015 with drilling to be performed by the Cat-J rig on the new unmanned wellhead platform, both under construction, with drilling expected to start third quarter in 2017. The Tender Support Vessel (TSV) project at Oseberg Øst is expected to commence drilling support operations in 2016.

Gullfaks has been developed with three large concrete production platforms. Since production started on Gullfaks in 1986, five satellite fields have been developed with subsea wells that are remotely controlled from the Gullfaks A and C platforms.

Drilling of the new Gullfaks South Increased Oil Recovery (GSO IOR) project wells is ongoing. Operations on the satellites will continue with a mobile rig until September 2016 and plan for development and operation for Shetland/Lista was delivered in second quarter of 2015.

The Gullfaks Rimfaksdalen (PDO) was submitted in 2014 and production will start up in the fourth quarter of 2016. Drilling of wells was completed in 2015. The projects Gullfaks B Drilling Upgrade and Gullfaks South IOR both started up in 2015.

Kvitebjørn is a gas and condensate field. The field is developed with an integrated accommodation, drilling and processing facility with a steel jacket.

The **Valemon** field is a gas and condensate field between Kvitebjørn and Gullfaks South. Valemon is built as a normally not manned, fixed steel platform with separation facilities for gas, condensate and water. The condensate is piped to Kvitebjørn for stabilisation and from there to the Mongstad refinery near Bergen. The production started in January 2015.

Visund is an oil and gas field development that includes floating drilling, production and living quarter units and two subsea templates, in the northern and southern parts of the field.

Grane is Statoil's largest producing heavy oil field. The Svalin field is a tie-in to Grane platform.

The Heimdal platforms are a hub for the processing and distribution of gas to the European gas markets. The hub consists of an integrated steel platform and a riser platform. During 2015 Heimdal has plugged and abandoned its production wells in the main reservoir. Heimdal will start production in 2016 from one new well drilled from the modular rig which was temporarily installed for plugging and abandonment activity.

3.5.2.4 Operations South

The main producing fields in Operations South are Sleipner, Gudrun, Statfjord and Snorre.

Operation South represents a mature oil and gas province. However, it still remains a significant contributor to Statoil's equity production and new fields are under development in the area. Main focus in the area is to capitalise on existing fields through profitable realisation of increased oil potential and successful implementation of new developments.

Sleipner consists of the Sleipner East, Gungne and Sleipner West gas and condensate fields. The gas from Sleipner has a high level of CO. This is extracted at the field and re-injected into a sand layer beneath the seabed to reduce carbon dioxide emissions to the air. Sleipner also processes gas, condensate and oil from Gudrun, Volve and Sigyn. The Gina Krog field, currently under development, will also be tied back to Sleipner.

The **Gudrun** field is a separate steel jacket-based process platform for separation of oil and gas, with separate pipelines transporting gas and partly stabilised oil from Gudrun to Sleipner.

Statfjord has been developed using three fully integrated platforms supported by gravity-based structures with concrete storage cells and an offshore loading system. Statfjord North, Statfjord Øst and Sygna are satellite fields have all been developed using subsea templates tied back to Statfjord C.

The **Snorre** field has two floating platforms and one subsea production system connected to the Snorre A platform. In addition, the satellite fields Tordis and Vigdis are part of Snorre business unit and are tied back to Gullfaks C and Snorre A, respectively.

3.5.2.5 Partner-operated fields

Partner-operated fields account for approximately 11% of our total oil and gas production on the NCS. The main producing fields are Ormen Lange, Skarv and Ekofisk.

Statoil's partner operated fields NCS portfolio is organised under Operations South.

Ormen Lange operated by Shell, is a deepwater gas field in the Norwegian Sea. The well stream is transported to an onshore processing and export plant at Nyhamna.

Skarv is an oil and gas field located in the Norwegian Sea, with BP as operator. The field development includes a floating production, storage and offloading vessel (FPSO) and five subsea multi-well installations.

Ekofisk is operated by ConocoPhillips. It consists of the Ekofisk, Eldfisk and Embla fields, and Tor. The Eldfisk II project delivered a new PDQ platform early 2015 that will serve as Eldfisk field center.

Edvard Grieg is an oil field located in the Utsira High Area. The field development includes a fixed steel jacket with processing and export facilities. Edvard Grieg is operated by Lundin. Production started on 28 November 2015 according to plan. Two wells were ready at start-up. Drilling will continue and a total of 10 production wells and four injection wells are planned.

3.5.3 Exploration on the NCS

Continued high exploration activity on the NCS

An extensive drilling program in 2015 resulted in 21 completed wells, of which 10 were discoveries. A total of 16 wells were Statoil operated.

Statoil has delivered an application for the 23rd concession round on the NCS. The round covers 57 blocks and parts of blocks, with three in the Norwegian Sea and 54 in the Barents Sea. South-East Barents Sea is the first new exploration acreage area opened on the NCS since 1994. Statoil and 15 other companies cooperate in the Barents Sea Exploration Collaboration (BaSEC) project to find common solutions for exploration operations in the Barents Sea and to ensure cost-effectiveness and good safety standards.

Statoil has been awarded interest in 24 licences in the Awards in Predefined Areas (APA) round 2015 on the NCS, 13 of those as operator and 11 as partner. Statoil has been awarded new licences in all three NCS provinces - North Sea, Norwegian Sea and the Barents Sea.

In general, Statoil's exploration strategy on the NCS is reflected in its diverse exploration portfolio, which ranges from frontier drilling to infra-structure led exploration close to existing infrastructure.

The table below shows the exploration and development wells drilled on the NCS in the last three years.

	2015	2014	2013
North Sea			
Statoil operated exploratory	11	11	11
Partner operated exploratory	3	7	10
Norwegian Sea			
Statoil operated exploratory	5	0	7
Partner operated exploratory	1	1	1
Barents Sea			
Statoil operated exploratory	0	9	2
Partner operated exploratory	1	1	4
Totals			
Exploratory	21	29	35
Exploration extension wells	3	2	7

Potential producing areas

In addition to producing areas, Statoil operates a significant number of exploration licences. Exploration takes place in undeveloped frontier areas as well as near existing infrastructure and producing fields.

Area	Square km (NCS Total)	Square km (Statoil)	Change vs 2014	Number of licenses (NCS Total)	Number of licenses (Statoil equity)	Number of licenses (Statoil operated)	New licenses (Statoil equity)	New licenses (Statoil operated)
North Sea	43,928	13,884	(1,006)	304	125	95	9	7
Norwegian Sea	37,784	12,581	(1,681)	144	79	55	9	4
Barents Sea	32,998	13,802	(135)	63	31	19	1	-
NCS total	114,710	40,267	(2,822)	511	235	169	19	11

North Sea

In the North Sea, Statoil participated in 14 exploration wells. Statoil operated ten of the exploration wells with seven discoveries.

Norwegian Sea

In the Norwegian Sea, Statoil participated in six exploration wells. Statoil operated five of the exploration wells with three discoveries.

Barents Sea

No Statoil operated wells in 2015. One partner operated well was completed in 2015.

3.5.4 Fields under development on the NCS

The main sanctioned development projects on the NCS.

The table below shows some key figures as of 31 December 2015 for Statoil's major development projects on the NCS.

Sanctioned projects	Operator	Statoil's equity share	Time of sanctioning	Production start
Aasta Hansteen	Statoil	51.00%	2013	2018
Johan Sverdrup	Statoil	40.01%	2015	2019
Gina Krog	Statoil	58.70%	2012	2017
Ivar Aasen	Det Norske	41.47%	2012	2016
Goliat	Eni	35.00%	2009	2016
Martin Linge	Total	19.00%	2011	2016

Johan Sverdrup is an oil discovery in the southern part of the North Sea, approximately 140 km west of Stavanger. A plan for development and operation was submitted in February 2015 and approved by the Norwegian authorities in August 2015. The Phase 1 of the development will consist of 35 production and water injection wells and a field center with four platforms: A living quarter platform, a wellhead platform with permanent drilling facility, a processing platform and a riser and utility platform. The crude oil will be exported to Mongstad through a 274 km long dedicated pipeline, and the gas will be exported to the gas processing facility at Kårstø through a 156 km long pipeline via a subsea connection to the Statpipe pipeline. The expected production start-up is in the fourth quarter of 2019.

Aasta Hansteen is a deep water gas discovery in the Norwegian Sea. The development concept includes three subsea templates tied in to a floating processing unit with gas export through a new pipeline, Polarled, to Nyhamna and further exportation through the Langeled pipeline. The Aasta Hansteen processing unit can also serve as a hub for other potential discoveries in the area. Expected production start-up is in 2018.

Gina Krog is an oil and gas discovery in the North Sea approximately 30 kilometres north of the Sleipner field. The field development concept includes a steel-jacket platform. Oil will be exported via offshore loading from a floating storage unit. Due to the high condensate content, the rich gas will be exported via Sleipner, where it will be further processed. The development concept also includes gas injection in order to maximise the recovery factor for the field. The development concept includes a total of 15 wells. Expected production start-up is in 2017.

Ivar Aasen is an oil and gas field located in the Utsira High Area. The development includes a fixed steel jacket with partial processing and living quarters tied in as a satellite to Edvard Grieg for further processing and export. The Ivar Aasen development is operated by Det norske, The operator expects production start-up in the fourth quarter of 2016.

Goliat is the first oil field to be developed in the Barents Sea. The field is being developed by means of subsea wells tied back to a circular floating production, storage and offloading vessel (FPSO). The oil will be offloaded to shuttle tankers. The Goliat development is operated by Eni who expects production start-up during first quarter of 2016.

Martin Linge is an oil and gas field, operated by Total, near the British sector in the North Sea. The reservoir is complex with gas under high pressure and high temperatures. The development includes a platform as a fixed steel jacket with processing and export facilities. Electrical power will be supplied from Kollsnes. The operator expects production start-up in 2018.

Redevelopment on the NCS - Improved oil recovery (IOR)
In 2015 Statoil started the world's first subsea gas compression plant at the Åsgard field. Processing on the seabed, particularly gas compression, is important for developing seabed solutions for areas of deeper water and in colder and more challenging areas. Åsgard's subsea compression, the world's first subsea gas compression plant, is one of Statoil's most demanding technology projects. The compressors will increase recovery from the Midgard reservoir on Åsgard from 67 percent to 87 percent, and from the Mikkel reservoir from 59 percent to 84 percent, extending the operational life of the fields up to 2032 and contributing to significant reduction in energy consumption and CO_2 emissions over the fields' lifetimes.

The **Gullfaks subsea compression** project the second largest subsea gas compression project being developed by Statoil on the NCS. Subsea gas compression will have a significant impact on the Gullfaks field as this technology, combined with conventional low-pressure production, is expected to lift the recovery rate from the Gullfaks South Brent reservoir from 62% to 74%.

The **Smørbukk South Extension** project, in the Åsgard field, is a world class project production from tight formations previously regarded as infeasible. Production began in September 2015 through the combination of wells with long well sections and "fishbones", a new completion technology implemented for the first time on the NCS, and further utilisation of existing infrastructure at Åsgard.

Troll A field's two new topside compressors started operating in October 2015. Installation of these compressors is an important step to achieve the Troll field's long-term production profile, which now extends to 2063. They are operated with power from shore, which reduces the field's CO_2 emissions significantly.

The **Gullfaks South Oil (GSO)** project started production in July 2015 and will increase recovery from the Gullfaks area. It includes two subsea templates, four production wells, two gas injectors, a gas injection pipeline and umbilicals and power cables for pipeline heating. The project utilise spare processing capacity and will extend the Gullfaks A platform life beyond 2030.

The **Gullfaks B lifetime extension** project aims at extending the drilling program on the Gullfaks B platform until 2032. Operation started on August 2015. Many of the future wells in Gullfaks B are water injection wells that will help maintain production from all three of the platforms in the field through increased pressure support in the reservoir. The drilling upgrade also provides the opportunity to connect to smaller producers from the surrounding area.

The **Ormen Lange** onshore compression project being executed as part of the overall expansion of the Nyhamna facility to handle third-party gas entering the plant through the new Polarled pipeline. The two 37 MW onshore compressors are scheduled for start-up in July 2017.

These projects are all examples of Statoil's efforts to maximise recovery from existing fields. They have also opened opportunities for technology application to realise volumes from other fields with similar conditions.

3.5.5 Decommissioning on the NCS

Under the Petroleum Act, the Norwegian government has imposed strict procedures for removal and disposal of offshore oil and gas installations. The Convention for the Protection of the Marine Environment of the Northeast Atlantic (OSPAR) stipulates similar procedures.

Glitne ceased production in February 2013 and decommissioning of the field has been ongoing 2013 - 2015. Permanent plugging and abandonment of the seven wells completed in October 2014. All facilities/equipment were removed from the field in 2015. Safety zones in the area have been repealed and national maps updated.

Huldra ceased production in September 2014, after 13 years in production. Permanent plugging and abandonment of six wells is planned for 2016 and the plan is that the Huldra topside facilities will be removed in 2019.

Yttergryta is a subsea field with one production well that ceased production in 2013. Permanent plugging of the well was completed early in 2015.

On **Heimdal** a modular drilling rig has been successfully installed in order to plug and abandon all 12 wells at the Heimdal main reservoir. The plug and abandonment project started in the fourth quarter 2014, and is scheduled to be finalised by second quarter 2016.

During 2015 there were permanent plugging and abandonment operations at Statfjord Øst, Statfjord A, Sleipner and Tordis. In addition Åsgard decommissioned part of the Midgard flowline loop in 2015.

For further information about decommissioning see note 2 *Significant accounting policies* to the Consolidated financial statements.

3.6 Development and Production International (DPI)

3.6.1 DPI overview

Statoil is present in several of the most important oil and gas provinces in the world.

Development and Production International (DPI) is responsible for all development and production of oil and gas outside the Norwegian continental shelf (NCS).

In 2015, DPI was engaged in production in 11 countries: Algeria, Angola, Azerbaijan, Brazil, Canada, Ireland, Nigeria, Russia, the UK, the US, and Venezuela. DPI produced 37% of Statoil's total equity production of oil and gas in 2015.

As of 31 December 2015, Statoil has exploration licenses in North America (Canada and US), South America and sub-Saharan Africa (Angola, Brazil, Colombia, Mozambique, Nicaragua, Suriname, South Africa and Tanzania), North Africa (Algeria and Libya), Europe and Asia (Azerbaijan, Greenland, Indonesia, Myanmar, Russia and the UK) as well as Oceania (Australia and New Zealand). The main development projects in which DPI is involved are in Brazil, Canada, the UK, and the US.

Statoil also has representative offices in Kazakhstan, Mexico and United Arab Emirates.

Statoil closed its office in Iran in 2013 but has residual payment obligations for tax and social security under legacy contracts in Iran. These will be dealt with in accordance with all applicable sanctions. See section 5.1.1 *Risks related to our business* for information regarding sanctions towards Iran.

The map shows Statoil's international producing countries and additional countries where Statoil has discoveries and/or exploration acreage.

Key events and portfolio developments in 2015:

- Eight wells (exploration and appraisal) were announced as discoveries in 2015, including the Piri 2, Tangawizi 2 and Mdalasini (Statoil-operated) discoveries in Tanzania
- Statoil accessed new acreage in Lampyrus in Russia, Mozambique, Nicaragua, Flemish Pass basin and Nova Scotia in East Coast Canada and South Africa
- In January, a transaction with Southwestern Energy was closed. The agreement reduced Statoil's working interest in the non-operated US southern **Marcellus** onshore asset from 29% to 23%
- Delay of **Big Foot** development first oil in the US Gulf of Mexico. The operator Chevron expects first oil in 2018. Initial plans called for production to start in late 2015, however, installation was halted and the tension leg plarform (TLP) moved to sheltered waters following damage to subsea installation tendons in late May 2015
- In April, the **Kizomba Satellites Phase 2** project in Block 15 offshore Angola started production
- In April, Statoil completed its sale of its remaining 15.5% interest in **Shah Deniz** and the **South Caucasus Pipeline (SCP)** to the Malaysian oil and gas company PETRONAS. The effective date was 1 January 2014
- In August, the **Peregrino** field offshore Brazil passed a significant milestone with 100 million barrels of oil produced since production started in April 2011
- On 30 December, the Shell operated **Corrib** gas field in Ireland started production
- In December, Statoil completed the sale of its 20% interest in **Trans Adriatic Pipeline AG (TAP)** to the Italian gas infrastructure company Snam. TAP is an 882 km-long section of the Southern Gas Corridor, linking Shah Deniz Stage 2 to gas markets in Europe
- In December, transactions with Repsol were announced. As a result of these transactions, Statoil's working interest in the US **Eagle Ford** increased from 50% to 63% and Statoil took full operatorship. In addition, Statoil will assume operatorship of the **BM-C-33** licence in Brazil's Campos basin and acquire a 31% equity share in the UK licence for **Alfa Sentral**, a field which spans the UK-Norway maritime border. The transactions for BM-C-33 and Alfa Sentral are pending approval from relevant government authorities
- In February 2016, the In Salah Gas joint venture announced the start- up of operations at the **In Salah Southern Fields** project in Algeria
- Significant impairment losses on assets and oil and gas prospects and signature bonuses were recognised in 2015, see section 4.1.5 *DPI profit and loss analysis* for further details

The profitability of our industry continues to be challenged. Statoil's response to the industrial challenge characterised by high costs and declining returns is addressed in the section 2 *Strategy and market overview*.

3.6.2 International production

Statoil's entitlement production outside Norway was about 32% of Statoil's total entitlement production in 2015.

The following table shows DPI's average daily entitlement production of liquids and natural gas for the years ending 31 December 2015, 2014 and 2013. Entitlement production figures are after deductions for production sharing and profit sharing. For US assets entitlement production are expressed net of royalty interests. For all other countries royalties paid in-cash are included in entitlement production and royalties payable in-kind are excluded.

	For the year ended 31 December		
Entitlement production	2015	2014	2013
Oil and NGL (mboe per day)	436	383	354
Natural gas (mmcm per day)	23	26	23
Total (mboe per day)	580	546	502

The table below provides information about the fields that contributed to production in 2015

Producing fields during calendar year 2015

Field	Statoil's equity interest in %	Operator	On stream	Licence expiry date	Average daily equity production mboe/day	Average daily entitlement production mboe/day
North America					282.3	239.7
US: Marcellus [1]	Varies	Statoil/others	2008	HBP[2]	115.7	96.9
US: Bakken [1]	Varies	Statoil/others	2011	HBP[2]	61.6	49.3
US: Eagle Ford [1]	Varies	Statoil	2010	HBP[2]	34.7	26.6
US: Tahiti	25.00	Chevron	2009	HBP[2]	16.9	13.9
US: Caesar Tonga	23.55	Anadarko	2012	HBP[2]	9.1	8.7
US: St. Malo	21.50	Chevron	2014	HBP[2]	7.6	7.6
US: Jack	25.00	Chevron	2014	HBP[2]	6.6	6.6
Canada: Leismer Demo	100.00	Statoil	2010	HBP[2]	19.9	19.9
Canada: Terra Nova	15.00	Suncor	2002	2022	5.4	5.4
Canada: Hibernia/Hibernia southern extension[3]	Varies	HMDC	1997	2027	4.8	4.8
South America					43.5	43.5
Brazil: Peregrino	60.00	Statoil	2011	2034	43.5	43.5
Sub-Saharan Africa					273.3	197.8
Angola, Block 17	23.33	Total	2001	2022-34[4]	161.9	113.9
Angola, Block 15	13.33	ExxonMobil	2004	2026-32[4]	41.8	22.6
Angola, Block 31	13.33	BP	2012	2031	20.9	19.0
Angola: Block 4/05[5]	20.00	Sonangol P&P	2009	2026	1.4	1.3
Nigeria: Agbami	20.21	Chevron	2008	2024	47.3	41.0
North Africa					49.6	43.6
Algeria: In Salah	31.85	Sonatrach/BP/Statoil	2004	2027	32.5	30.6
Algeria: In Amenas	45.90	Sonatrach/BP/Statoil	2006	2022	17.1	13.3
Libya: Mabruk	12.50	Mabruk Oil Operations	1995	2033	0.0	(0.0)[6]
Libya: Murzuq	10.00	Akakus Oil Operations	2003	2033	0.0	(0.2)[6]
Europe and Asia					78.3	43.9
Azerbaijan: ACG	8.56	BP	1997	2024	54.3	24.2
Azerbaijan: Shah Deniz [7]	15.50	BP	2006	2041	12.0	10.0
Russia: Kharyaga	30.00	Total	1999	2032	9.4	7.1
UK: Alba	17.00	Chevron	1994	2018	2.5	2.5
UK: Jupiter	30.00	ConocoPhillips	1995	HBP[2]	0.1	0.1
Ireland: Corrib[8]	36.50	Shell	2015	2031	0.0	0.0
Total Development and Production International (DPI)					727.0	568.5
Equity accounted production						
Venezuela: Petrocedeño[9]	9.68	Petrocedeño	2008	2033	11.6	11.6
Total Development and Production International (DPI) including share of equity accounted					738.7	580.2

1) Statoil's actual working interest can vary depending on wells and area
2) Held by Production (HBP): A company's right to own and operate an oil and gas lease is perpetuated beyond its original primary term, as long thereafter as oil and gas is produced in paying quantities. In the case of Canada, besides continue being in production status, other regulatory requirements must be met
3) Statoil's working interests are 5.0% in Hibernia and 9.0% in Hibernia southern extension
4) Varies by field
5) Statoil relinguished Block 4/05 in September 2015
6) Zero production in 2015, adjustment of 2014 volume
7) Statoil divested the asset on 30 April 2015
8) New gas field which started production on 30 December 2015
9) Petrocedeño is a non-consolidated company and accounted for pursuant to the equity accounting method

The table below provides information about production per country in 2015.

Country	Average daily equity production mboe/day[1]	Average daily entitlement production mboe/day
North America	282.3	239.7
US	252.2	209.6
Canada	30.1	30.1
South America	43.5	43.5
Brazil	43.5	43.5
Sub-Saharan Africa	273.3	197.8
Angola	226.0	156.8
Nigeria	47.3	41.0
North Africa	49.6	43.6
Algeria	49.6	43.9
Libya	0.0	-0.3
Europe and Asia	78.3	43.9
Azerbaijan	66.3	34.2
Russia	9.4	7.1
UK	2.6	2.6
Total Development and Production International (DPI)	727.0	568.5
Equity accounted production		
Venezuela: Petrocedeño[2]	11.6	11.6
Total Development and Production International (DPI) including share of equity accounted production	738.7	580.2

1) In PSA countries our share of capital expenditures and operational expenses are computed on the basis of equity production.

2) Petrocedeño is accounted for pursuant to the equity accounting method.

The following sections provide information about the main producing assets internationally. See section 4.1.5 *DPI profit and loss analysis* for a discussion of the results of operations for year end 2015.

3.6.2.1 North America

Production in North America comprises the US and Canada.

US

Statoil is positioned in the fast-growing US onshore oil and gas industry. Statoil has had strong growth in production within US shale since entering the first play in 2008.

Statoil entered the **Marcellus** shale gas play, located in the Appalachian region in north east US, in 2008 through a partnership with Chesapeake Energy Corporation, acquiring 32.5% of Chesapeake's 1.8 million acres in Marcellus. Statoil has continued to acquire acreage within the play, with a net acreage position of 410,000 acres. The most recent divestments occurred in 2014 with Southwestern. The divested share represents approximately 30,000 acres. Southwestern took over operatorship in this US southern Marcellus area through a transaction with Chesapeake in December 2014.

Statoil entered the **Bakken** tight oil play through the acquisition of Brigham Exploration Company in December 2011. Statoil's net acreage position in Bakken and Three Forks shale formation at the end of 2015 was 249,000 acres.

Statoil entered the **Eagle Ford** shale formation located in southwest Texas in 2010. Through agreements with Enduring Resources LLC and Talisman Energy Inc., Statoil acquired 67,000 net acres. In 2013, Statoil became operator for 50% of the Eagle Ford acreage in 2010 and gradually took over full operatorship of the Statoil operated acreage in 2013. As part of a global transaction in December 2015 with Repsol, which acquired Talisman in May 2015, Statoil increased its working interest and took full operatorship of all of the assets in the Eagle Ford Shale. As a consequence, Statoil has a total working interest of 63% representing an addition of 15,000 net acres for a total of 72,000 leaseholds. Our joint venture partner, Repsol, continues to hold 37% working interest.

Statoil is positioned in the Gulf of Mexico for the following offshore developments:

The **Tahiti** oil field is located in the Green Canyon area. The development includes a floating spar facility. As of 31 December 2015, there were nine production and three water injection wells in operation, and additional wells will be phased in over time to fully develop the field.

The **Caesar Tonga** oil field is located in the Green Canyon area. As of 31 December 2015, there were six producing wells tied back to the Anadarko-operated Constitution spar host, and additional production wells will be phased in over time.

The **Jack** and **St. Malo** oil fields are located in the Walker Ridge area. The fields are subsea tie-backs to the Chevron operated Walker Ridge Regional Host facility. First production was achieved in December 2014. As of 31 December 2015, there were three wells producing on Jack and three wells producing for St. Malo. Additional production wells will be phased in over time.

Canada

Statoil entered the Alberta oil sands in 2007 through a corporate acquisition of North American Oil Sands Corporation. In May, 2014, Statoil and PTTEP completed a transaction to divide their respective interests in the Kai Kos Dehseh (KKD) oil sands project with an effective date of 1 January 2013.

Following the transaction with PTTEP, Statoil continues as operator and 100% working interest owner for the Leismer and Corner projects which together comprise 123,200 net acres of oil sands leases in Alberta. **The Leismer Demonstration Plant** (LDP) is the first phase of the KKD development and has been in operation since 2010. The in-situ technology known as SAGD (steam assisted gravity drainage), injects steam into the oil bearing formation to recover bitumen which is then pumped to the surface. Further oil sands development could involve expanding production capacity of the Leismer facility and/or the greenfield development of the Corner project. At this time, there are no near term plans to further develop either project.

In addition, we have interests in the Jeanne d'Arc Basin offshore the province of Newfoundland and Labrador in the partner operated producing oil fields **Terra Nova, Hibernia** and **Hibernia Southern Extension**. On 1 December 2015, Statoil's interest in Hibernia Southern Extension was reduced from 10.5% to 9.0% due to a redetermination process.

3.6.2.2 South America

Statoil's production activities in South America comprise the Peregrino operatorship in Brazil and the Petrocedeño project in Venezuela.

Brazil

The **Peregrino** field is a heavy oil field located in the Campos Basin, about 85 kilometres off the coast of Rio de Janeiro. The field came on stream in 2011.The oil is produced from two wellhead platforms with drilling capability and it is processed on the Peregrino FPSO. Statoil holds a 60% ownership interest in the field and is operator. In August 2015, the Peregrino field passed a significant milestone with 100 million barrels of oil produced since production start.

Venezuela

Petrocedeño produces extra-heavy crude oil from the Junin area in the Orinoco Belt. The oil is transported through pipeline to a plant at the Jose Industrial Complex at the coast nearby Puerta La Cruz where it is upgraded into a light crude and exported.
For information related to Venezuela's financial risk see section 5.2.2 *Managing financial risk*.

3.6.2.3 Sub-Saharan Africa

Statoil's production activities in Sub-Saharan Africa comprise Angola and Nigeria.

Angola

The deep water blocks 17, 15, 31 and 4/05 contributed with 40% of Statoil's equity liquid production outside Norway in 2015. Each block is governed by a production sharing agreement (PSA) which sets out the rights and obligations of the Parties, including mechanisms for sharing of the production with the Angolan state oil company Sonangol.

Block 17 comprises production from four FPSOs; **CLOV**, **Dalia**, **Girassol** and **Pazflor**.

Block 15 has production from four FPSOs: **Kizomba A**, **Kizomba B**, **Kizomba C-Mondo**, and **Kizomba C-Saxi Batuque**. In April 2015, the **Kizomba Satellites phase 2 project**, which consists of the fields Bavuka, Kakocha, and Mondo South started production. The fields are developed with subsea wells and infrastructure tied back to the Kizomba B and Mondo FPSO vessels.

Block 31 has production from the **PSVM** FPSO.

Statoil had production from the **Gimboa** FPSO on **Block 4/05** until the company exited the Block in September 2015.

The FPSOs serve as production hubs and receive oil from a large number of wells and more than one field each. In 2015, new wells were added and set into production on Block 15, Block 17 and Block 31.

Nigeria
In Nigeria, Statoil has a 20.2% interest in the Agbami deep water field which is located 110 km off the coast of the Central Niger Delta region. The field is developed with subsea wells connected to an FPSO. The **Agbami** field straddles the two licenses OML 127 and OML 128 and is operated by Chevron under a Unit Agreement. Statoil has 53.85% interest in OML 128.

For information related to the Agbami redetermination process and the dispute between the Nigerian National Petroleum Corporation and the partners in Oil Mining Lease (OML) 128 concerning certain terms of the OML 128 Production Sharing Contract, see section 5.3 *Legal proceedings* and note 23 *Other commitments and contingencies*.

3.6.2.4 North Africa

Statoil had in 2015 production in North Africa from Algeria.

Algeria
The **In Salah** onshore gas development, in which Statoil has a working interest of 31.85%, is Algeria's third-largest gas development. A PSA including mechanisms for revenue sharing, governs the rights and obligations of the Parties and establishes a joint operatorship between Sonatrach, BP and Statoil.

In February 2016, the In Salah Gas joint venture announced the introduction of gas in the **In Salah Southern Fields** processing facilities. Gas export from the project started in March. This project, which is led by Statoil on behalf of the Joint Venture, will mature the remaining four discoveries into production. The southern fields (Gour Mahmoud, In Salah, Garet el Befinat and Hassi Moumene) will tie in to existing facilities in the northern fields.

The **In Amenas** onshore development is the fourth-largest gas development in Algeria. It also contains significant liquid volumes. The facilities are operated through a joint operatorship between Sonatrach, BP and Statoil, where Statoil's share of financing the investments (working interest) is 45.9%. A PSA, including mechanisms for revenue sharing, governs the rights and obligations of the Parties and establishes a joint operatorship between Sonatrach, BP and Statoil.

The In Amenas plant has since April 2013 produced from two out of three trains. The production has been relatively stable. The third train, which also was damaged in the January 2013 terrorist attack, is expected to restart in the second quarter of 2016.

Libya
There has not been any oil production from the **Mabruk** or the **Murzuq** assets in 2015 due to the security situation in the country.

3.6.2.5 Europe and Asia

Statoil's production in Europe and Asia encompasses Azerbaijan, Russia, the United Kingdom and Ireland.

Azerbaijan
The **Azeri-Chirag-Gunashli (ACG)** oil field in the Caspian Sea has production from 6 fixed platforms. The oil is transported through pipelines to the Sangachal onshore terminal near Baku. From the terminal the oil is exported to the world markets.

Statoil has an 8.7% stake in the 1,760 km Baku-Tbilisi-Ceyhan (BTC) oil pipeline that is used to transport ACG oil to the southern Turkish port of Ceyhan.

In April 2015, Statoil completed the sale of its remaining 15.5% interest in **Shah Deniz** and the **South Caucasus Pipeline (SCP)** to the Malaysian oil and gas company PETRONAS. See note 4 *Acquisitions and dispositions* of the Consolidated financial statements for further details.

Russia
The **Kharyaga** oil field is located onshore in the Timan Pechora basin in north-west Russia. The field is governed by a PSA.
For information related to risk in Russia see section 5.1.1 *Risks related to our business*.

United Kingdom
The **Alba** oil field is located in the central part of the UK North Sea. **Jupiter** is a gas field located in the southern part of the UK North Sea. The decommissioning of the Jupiter wells is planned to start in 2016.

Ireland
On 30 December 2015 production started on **Corrib** gas field off Ireland's northwest coast. Corrib consists of a subsea development with a pipeline to an onshore processing terminal from which gas will be transported to the Irish market. The onshore processing terminal is located approximately 9 km inland.

3.6.3 International exploration

Statoil continued with high international exploration activity in 2015.

In 2015 Statoil carried out significant international exploration activity, as is shown by the company's involvement in 18 completed wells (including both Statoil-operated and partner-operated activities). Eight wells (exploration and appraisal) were announced as discoveries in the period, including the Piri 2, Tangawizi 2 and Mdalasini (Statoil-operated) discoveries in Tanzania.

The table below shows the exploratory wells drilled internationally in the last three years.

		2015	2014	2013
North America	- Statoil operated	8	3	7
	- Partner operated	0	0	4
South America/sub-Saharan Africa	- Statoil operated	3	8	6
	- Partner operated	5	9	4
North Africa	- Statoil operated	0	0	0
	- Partner operated	0	0	1
Europe and Asia	- Statoil operated	2	2	0
	- Partner operated	0	1	2
	Totals	18	23	24

The regions where Statoil had exploration activity in 2015 are presented below.

North America

US
Statoil operated five wells in the Gulf of Mexico (Yeti-1, Yeti Side track, Yeti Appraisal, Thorvald-1 and Power Nap). Yeti-1 and its side track were discoveries, Yeti appraisal confirmed the volumes discovered. Power Nap is ongoing at year end.

Statoil has cancelled the contract for the Discoverer Americas rig in December 2015. Statoil was in the current environment unable to secure additional activity for the rig for the remainder of the contract period, ending in May 2016.

Canada
The West Hercules rig arrived in Canada in November 2014, for a 550 days drilling campaign, which continues into early-2016. The programme has focused on appraisal and near field exploration wells in the greater Bay du Nord discovery area, as well as select exploration prospects in the greater Flemish Pass Basin.

Statoil and its partners were the successful bidders for six exploration licences in the Flemish Pass Basin, offshore Newfoundland, and two licences offshore Nova Scotia in East Coast Canada in 2015. Statoil will operate seven of the eight leases awarded.

South America and sub-Saharan Africa

Angola Kwanza
Statoil acquired a solid acreage position in the pre-salt play of the Kwanza Basin in 2011 with the operatorship in Block 38 and 39 and a partner position in Blocks 22, 25 and 40. The work program included eight commitment wells, two Statoil operated and six partner operated. So far six wells have been completed. In 2015 two partner operated wells were drilled, Umbundu in block 40, Catchimanha in Block 22. For more information see note 12 *Intangible assets*.

Brazil
All exploratory well operations during 2015 were conducted on BM-C-33 license as part of Pão de Açucar and Seat appraisal activities. The Pão de Açucar discovery was fully evaluated by drilling two wells (PdA-A1 and PdA-A2) and performing a successful DST (Drill Stem Test) on PdA-A2. The Seat-2 well was re-entered to perform a DST. In agreement with its licence partners, Statoil will assume operatorship of the BM-C-33 licence subject to receiving government approval.

Colombia
Statoil has accessed three licences in 2014, representing access at scale in relatively frontier acreage. In the COL-4 licence, an environmental and social impact study has been completed.

Statoil farmed-in to a 10% equity share in the Tayrona licence and a 20% share in the Gua Off licence in 2014. The Orca-1 well in the Tayrona licence was announced as a gas discovery in 2014.

Mozambique
The 5th licence round was announced during the third quarter of 2015. Statoil together with partners submitted a winning bid in the A5-A block located in the Angoche area. Eni is the operator of the joint venture with 34% participating interest. Statoil's equity is 25.5%. Final award is expected mid-2016 subject to successful negotiations.

Tanzania
The Tanzania drilling campaign using the Discoverer Americas rig was completed in 2015 after having drilled the Mdalasini prospect and the Tangawizi-2 appraisal well. The discoveries of natural gas in Mdalasini-1, Piri-1 and Giligiliani-1 have significantly increased the total in-place volumes in Block 2.

South Africa
Statoil completed a farm-in transaction in October 2015 with ExxonMobil acquiring a 35% interest in the ER 12/3/154 Tugela South Exploration Right. The Operator is Exxon with 40% equity. The farm-in represents a country entry for Statoil into South Africa. Statoil intends to participate at an early phase of exploration with a step-wise exploration programme.

Nicaragua
In 2015, Statoil together with partner Empresa Nicaraguense del Petroleo (Petronic) has been awarded four licences offshore the Nicaraguan Pacific. Statoil is the operator with 85% equity with the Petronic holding the remaining equity. 2D seismic data has been acquired and processed during 2015 and subsurface studies are underway.

North Africa

Algeria
Statoil and Shell were awarded the Timissit licence in the Berkin basin onshore Algeria in September 2014. Statoil is the operator with 30% equity.

The award represents an opportunity to test a potentially large unconventional (shale) resource play.

The work commitment (up to the first exit point in 2018) is 3D seismic and two vertical wells.

Europe (excluding Norway), Asia and Australia

UK
In 2014 Statoil was awarded interests in 12 exploration licences in the UK 28th licensing round, nine as operator. Significant positions have been taken both in mature parts of the Central North Sea, such as in the vicinity of the Mariner and Bressay projects, and in plays largely untested in UK waters. 11 of the licences are in the North Sea and one is west of the Hebrides. In 2015 two exploration wells were drilled. The Boatswain well in licence P1758 west of the Mariner field was a discovery. The Wall well in licence P2067 was dry. Work now continues to mature the broader UK exploration portfolio.

Greenland
Statoil, along with partners ConocoPhillips and Nunaoil, was awarded block 6 in the East Greenland licence round in December 2013. Statoil is the operator of the block. The licence has a 16-year exploration period.

Russia
Statoil is engaged in a strategic cooperation with Rosneft Oil Company (Rosneft) including a joint cooperation project aimed at undertaking seismic surveys and geological exploration, appraisal, development and production of potential hydrocarbons in four licences on the Russian continental shelf - the Magadan 1, Lisyansky and Kashevarovsky licences in the Sea of Okhotsk (south of the Arctic Circle), and the Perseevsky licence in the Barents Sea (north of the Arctic Circle). Two exploration wells are to be drilled in the Magadan 1 and Lisyansky licences in 2016. Additionally there are two joint cooperation projects onshore; pilot drilling and testing of the onshore heavy oil reservoir layer PK1 in the North Komsomolsky discovery, and the Domanik Sediments Difficult-to-Extract Hydrocarbons Project, aimed at pilot drilling and testing of the limestone Domanik formation in the Russian Volga-Urals basin. For each of these projects, Rosneft holds the majority interest, while Statoil holds a minority interest.

See section 5.1.1 *Risks related to our business* for information regarding sanctions against Russia.

Azerbaijan
The Joint Study Agreement (JSA) with SOCAR for the North Absheron area was completed in 2014. Exploration screening and prospect evaluation is being carried out on an ongoing basis for Azerbaijan offshore areas in order to identify new access opportunities.

Indonesia
Statoil signed the new offshore Aru Trough I PSC licence agreement in May 2015. The licence is adjacent to Statoil's existing exploration acreage in the Aru and West Papua IV licences. This is a low-cost access route into a frontier area with potential where Statoil is already present. This position strengthens the optionality in Statoil's long-term portfolio and secures potential upsides from existing exploration acreage.

Myanmar
Statoil and ConocoPhillips were awarded one exploration block (AD-10) in the Myanmar waters of the Bay of Bengal in 2014. A production sharing contract was signed in May 2015. Statoil (as operator) has completed the IEE (Initial Environmental Examination) and has set up a country office in Yangon.

Australia
In the Ceduna sub-basin in the Great Australian Bight, Statoil holds 30% interest in four exploration licences with BP as operator.

In October 2014, Statoil obtained 100% equity share in an exploration licence in the Exmouth Plateau in North Carnarvon basin.

New Zealand

Statoil is operator with 100% equity share in petroleum exploration permits 55781 and 57057 in the Reinga Basin offshore Northland's west coast. The licences were awarded in the New Zealand Block Offer 2013 and 2014 respectively.

The work programme is designed to fully evaluate the prospectivity of the licences in a step-wise manner within the 15-year licence time frame. Statoil completed 2D seismic data early 2015. Following an analysis and interpretation of this data, Statoil will decide whether to enter into the second exploration phase by mid-2017.

In the New Zealand Block Offer 2014 Statoil was also awarded 50% working interest in blocks 57083, 57085 and 57087 with Chevron as operator. The licences are located in the East Coast and Pegasus basins, southeast off New Zealand's North Island. The partnership is committed to acquire 2D seismic and 3D seismic within the first exploration period.

Faroe Islands

Following disappointing exploration activities, Statoil have relinquished all licences. The Statoil office in Torshavn closed down in 2015.

3.6.4 Fields under development internationally

The sanctioned development projects in which DPI is involved are in Algeria, Brazil, Canada, the UK, and the US.

This section covers selected projects under development and significant pre-sanctioned projects.

Sanctioned projects	Operator	Statoil's equity share	Time of sanctioning	Production start
US: Julia	Exxon Mobil	50.00%	2013	2016
US: Heidelberg	Anadarko	12.00%	2013	2016
US: Stampede	Hess	25.00%	2014	2018
US: Big foot	Chevron	27.50%	2010	2018
Canada: Hebron	Exxon Mobil	9.01%	2012	2017
Algeria: In Amenas Compression project	Sonatrach/BP/Statoil	45.90%	2010	2016
UK, Mariner	Statoil	65.11%	2012	2018
Brazil, Peregrino Phase II[1)]	Statoil	60.00%	2015	2019/20

1) Statoil made the investment decision on Peregrino Phase II project in December 2014 and submitted the Plan of Development to Brazilian authorities in January 2015.

3.6.4.1 North America

Statoil has a number of significant ongoing development projects in North America.

US Gulf of Mexico

The **Julia** oil field is located in the Walker Ridge area of the Gulf of Mexico near Jack and St Malo, and will be developed with subsea wells tied back to the shared JSM host facility. First oil is expected within mid-2016.

The **Heidelberg** oil field is located in the Green Canyon area. The development includes a Spar facility and first oil is expected within early-2016.

The **Stampede** oil field is located in the Green Canyon area. The development includes a tension-leg platform (TLP) with downhole gas lift and water injection from start of production. First oil is expected in 2018.

The **Big foot** oil field is located in Walker Ridge area. The development includes a dry tree TLP with a drilling rig. The operator Chevron expects first oil from Big Foot in 2018. Initial plans called for production to start in late 2015, however, installation was halted and the TLP moved to sheltered waters following damage to subsea installation tendons in late May 2015

US Onshore
US Onshore operations use hydraulic fracturing to liberate resources. Despite reduction in investment and activity level in recent years in shale plays **Bakken**, **Eagle Ford** and **Marcellus**, production growth continues. The increase in onshore production despite investment reduction is attributed to higher recovery per well due to enhanced completion and improved operational efficiency. See section 3.6.2.1 *North America* for further information.

Canada
The **Hebron** field is located in the Jeanne d'Arc basin offshore Newfoundland near the partner-operated producing fields Terra Nova, Hibernia and Hibernia Southern Extension. The Hebron field will be developed using a fixed gravity base structure (GBS) and first oil is expected in 2017. Effective January 1, 2016, Statoil's interest in Hebron was reduced from 9.7% to 9.0% due to a redetermination process.

Statoil has made oil discoveries in the Flemish Pass offshore Newfoundland comprising the **Bay du Nord** project, and work is on-going to assess options for developing this project. Statoil is the operator of Bay du Nord and holds a 65% working interest.

3.6.4.2 South America

In January 2015 Statoil submitted the Plan of Development (PoD) for Peregrino Phase II project in Brazil.

In December 2014, Statoil approved the investment decision for the development of the second phase of the Peregrino oil field. In January 2015 the PoD was submitted to the Brazilian National Agency of Petroleum, Natural Gas and Biofuels (ANP) for approval. **Peregrino Phase II** project includes the Peregrino South and South West discoveries. The development consists of one wellhead platform tied back to the existing FPSO.

3.6.4.3 Sub-Saharan Africa

In Sub-Saharan Africa, Statoil is participating in the planning and development of Block 2 in Tanzania.

Tanzania
Statoil has made several large gas discoveries in Block 2 offshore Tanzania. Statoil is the operator of Block 2 and holds a 65% working interest. Work is on-going to assess options for developing the discoveries, including the construction of an onshore LNG plant jointly with the co-venturers in Blocks 1, 3 and 4 operated by BG.

3.6.4.4 North Africa

In 2015, Statoil's field developments in the North Africa were in Algeria.

The **In Amenas Gas Compression** project in Algeria, which is led by BP, was sanctioned in late 2010. The compressors are expected to come on stream in the fourth quarter of 2016. This will make it possible to reduce wellhead pressure and maintain plateau production. The In Amenas facilities are operated through a joint operatorship between Sonatrach, BP and Statoil.

In February 2016, the In Salah Gas joint venture announced the start- up of operations at the **In Salah Southern Fields** project in Algeria. For more information see section 3.6.2.4 *North Africa*.

3.6.4.5 Europe and Asia

In Europe and Asia, Statoil is participating in the planning and development of projects in the UK

United Kingdom
Statoil is the operator for the **Mariner** heavy oil project. In December 2012, Statoil made the investment decision to develop the Mariner oil field. The field development plan was approved by the UK authorities in February 2013. The concept selected includes a production, drilling and quarters platform based on a steel jacket, with a floating storage unit. Statoil expects production start in 2018.

The field development plan for Mariner includes a possibility of a future subsea tie-in of Mariner East, a small heavy oil discovery. Statoil is the operator of Mariner East.

Following completion of the farm down of 20.89% of P.726 (Mariner East) and 28.89% of P.979 (Mariner South) by Statoil to JX Nippon in third quarter 2015, Statoil holds a 65.11% interest in all Mariner licences.

Statoil is the operator for, and holds an 81.6% interest in **Bressay**. Bressay is also a heavy oil discovery. In February 2016, Statoil decided to pause the concept selection work on Bressay.

In November 2015, Statoil completed the purchase of First Oil's 24% equity share in the UK continental shelf (UKCS) licence P312. This UK licence and licence PL046 on the NCS comprise the **Alfa Sentral**, a gas and condensate field planned to be developed as a tie-back to the existing Sleipner infrastructure on the NCS. A pre unit agreement is in place between the UKCS and NCS Alfa Sentral Licenses, with an unitisation agreement to be negotiated prior to the investment decision.

In February 2016, Statoil signed an agreement with Talisman Sinopec North Sea Limited to acquire their 31% interest in the UK Alfa Sentral Licence P312. The transaction is pending government approval. The transaction will increase Statoil's ownership interest from 24% to 55% when completed. JX remains the operator with a 45% interest.

3.7 Marketing, Midstream and Processing (MMP)

3.7.1 MMP overview

Marketing, Midstream and Processing (MMP) is responsible for marketing and trading of crude oil, natural gas, gas liquids, refined products, for transportation and processing of commodities and for operation of refineries, terminals and processing plants.

MMP markets Statoil's own volumes, the Norwegian state's direct financial interest (SDFI) equity production of crude oil and third-party volumes, approximately 50% of all Norwegian liquids exports. MMP is also responsible for marketing SDFI's gas. In total, Statoil is responsible for marketing approximately 70% of all Norwegian gas exports. See sections 3.12.3 *The Norwegian State's participation* and 3.12.4 *SDFI oil and gas marketing and sale* for further details regarding the Norwegian state's direct financial interest.

MMP operates two refineries, two gas processing plants, one LNG plant (from 1 January 2016), one methanol plant and three crude oil terminals. In addition, MMP is responsible for developing transportation solutions for natural gas, liquids and crude oil from the Statoil assets including pipelines, shipping, trucking and rail.

In 2015, MMP sold 36.9 billion cubic metres (bcm) of natural equity gas from the Norwegian continental shelf (NCS) on our own behalf, in addition to approximately 37.2bcm of NCS gas on behalf of the Norwegian state. Statoil's total US gas sales, including third-party gas, amounted to 11.2 bcm in 2015. In 2015, MMP also sold 644 million barrels of crude oil and condensate, approximately 15 million tonnes of natural gas liquids (NGL), and approximately 1.2 million tonnes of methanol. Of the total 644 million barrels sold in 2015, approximately 50% represented Statoil equity volumes, while approximately 37% of the total 15 million tonnes of NGL sold in 2015 were Statoil equity volumes.

In 2015 the European gas market was characterised by falling prices due to record supplies and stagnating demand. Statoil's overall gas production increased somewhat compared to 2014. In the US the cold winter in North East US and Canada created large regional arbitrage margins. The LNG market showed continued regional price differences and geographical arbitrage margins. An oversupplied oil market globally has resulted in weak oil prices in 2015.

Refinery margins were higher than in 2014. Facilities have been operated with good regularity. HSE results are at the same level as in 2014 for Serious Incident Frequency (SIF) and Total Recordable Incident Frequency (TRIF), while there has been an increase in number of oil and gas leakages mainly due technical and operational issues. With effect from 1 June 2015, the Renewable Energy business cluster was transferred from MMP to New Energy Solutions (NES). The remaining business activities are organised in the following business clusters: Marketing and Trading; Asset Management and Processing and Manufacturing.

Key events in 2015:

- The operatorship for Azerbaijan Gas Supply Company and the commercial operatorship for South Caucasus Pipeline Company were transferred from Statoil to The State Oil Company of Azerbaijan Republic (SOCAR) effective from 1 May 2015 following the completion of the sale of Statoil's shares to SOCAR, BP and PETRONAS in 2014
- Following the divestment of its share in the Shah Deniz gas field in Azerbaijan, Statoil agreed to sell its 20% interest in Trans Adriatic Pipeline AG (TAP) to the Italian gas infrastructure company Snam
- Edvard Grieg oil pipeline and Utsira High gas pipeline became operational late 2015 and provide export of oil and gas for the Edvard Grieg field and in the future also for the Ivar Aasen field currently under construction
- The 482 kilometer long Polarled pipeline was laid at the Aasta Hansteen field at a depth of 1,260 meters in the Norwegian Sea
- Statoil signed an agreement with Centrica in May to increase the volume of gas supplies under an existing supply agreement. The gas supplied to the UK from the ten year agreement will increase from 5 bcm/year to 7.3 bcm/year from October 2015
- Statoil extended gas supply agreement with UK's SSE. Starting 1 October 2015, the gas supplied from the six year agreement will increase from approximately 0.5 bcm/year to approximately 2.5 bcm/year

The profitability of our industry continues to be challenged. Statoil's response to the industrial challenge characterised by escalating cost and declining returns is addressed in the Section *Strategy and market overview*.

3.7.2 Marketing and Trading

The Marketing and Trading business cluster (MT) is responsible for the marketing and trading of all the products from Statoil's upstream, processing and refining business.

3.7.2.1 Marketing and trading of gas and LNG

MMP is responsible for Statoil's marketing and trading of natural gas worldwide, for power and emissions trading and for overall gas supply planning and optimisation, including the SFDI.

The gas marketing and trading business is conducted from Norway (Stavanger) and from offices in Belgium, the UK, Germany and the US.

Statoil transports and markets approximately 70% of all NCS gas and continues to develop its position in the US.

A significant proportion of Statoil's gas sales are sold under long-term contracts. These sales are carried out with large industrial customers, power producers and local distribution companies. Gas is also sold through short-term contracts and through trading on European and US liquid marketplaces. In the US, gas is sold through bilateral contracts.

A few of Statoil's long-term gas contracts contain contractual price review mechanisms that can be triggered by the buyer or seller at regular intervals, or under certain given circumstances. Statoil is currently in price reviews with some of its customers.

Statoil expects to continue to optimise the market value of the gas delivered to Europe through a mix of long-term contracts and short-term marketing and trading. This is done both as a response to customer needs and in order to capture new business opportunities as the markets become more liberalised and liquid. Statoil has flexibility in terms of production and transportation systems. Combined with its downstream assets this is used to optimise the value of the gas sold.

Europe
The major export markets for gas from the NCS are Germany, France, the UK, Belgium, the Netherlands, Italy and Spain. Our longer term customers include large national or regional gas companies such as ENGIE, ENI Gas & Power, British Gas Trading (a subsidiary of Centrica), RWE and GasTerra.

Our European gas trading business conducts activities with over 85 counterparties on all European liquid trading locations. MMP is active on both physical and exchange markets such as Intercontinental Exchange (ICE).

US
The US is the world's largest and most liquid gas market. Statoil Natural Gas LLC (SNG), a wholly-owned subsidiary, has a gas marketing and trading organization in Stamford, Connecticut that markets natural gas to local distribution companies, industrial customers and power generators.

SNG also markets the gas equity production from Statoil's assets in the US Gulf of Mexico.

Statoil's entry into the Marcellus and the Eagle Ford shale gas plays has resulted in a significant increase in the volume of gas marketed and traded by Statoil in the US over the last few years.

SNG has entered into gas transportation agreements which enable Statoil to transport some of the produced gas from the Northern Marcellus production area to Manhattan, NY and to the US/Canadian border at Niagara, providing access to the greater Toronto area in Canada.

In addition SNG has long-term capacity contracts with Dominion Resources Inc., which owns the Cove Point LNG re-gasification terminal in Maryland, with a total capacity of 10.4 bcm per year. LNG is sourced from the Snøhvit LNG facility in Norway. Due to continuing low gas prices in the US, most of Statoil's LNG cargoes have been diverted away from the US and delivered into higher-priced markets in Europe, South-America and Asia.

Algeria
Statoil has a participating interest in the In Salah gas field, Algeria's third-largest gas development. The field is operated by a joint venture constituted by Statoil, BP and Sonatrach. Statoil receives its income from gas which is sold under long-term contracts.

3.7.2.2 Marketing and trading of liquids

MMP is responsible for the sale of the group's and the Norwegian state's direct financial interest (SDFI) production of crude oil and natural gas liquids.

Statoil is among the world's major net sellers of crude oil. The company operates from sales offices in Stavanger, Oslo, London, Singapore, Stamford and Calgary and markets and trades crude oil, condensate, NGLs as well as refined products.

The main crude oil market for Statoil is northwest Europe. Most of the crude oil volumes are sold in the spot market, based on publicly quoted market prices.

The liquids marketing and trading business is responsible for commercial optimisation of the Mongstad and Kalundborg refineries as well as crude terminals located at Mongstad, Sture and South Riding Point in the Bahamas. MMP is also responsible for Statoil's liquefied petroleum gas (LPG) liftings at the Sture terminal, as well as Statoil's naphtha lifting from Kårstø and Braefoot Bay, liftings of LPG from Kårstø, Mongstad, Braefoot Bay and Teesside terminals in addition to marketing of condensate and LPG from the In Amenas field In Algeria. Statoil lifts waterborne ethane from Kårstø and Teesside, condensate from Nyhamna, and condensate and LPG volumes from Melkøya.

In addition, MMP markets equity crude oil, condensate and NGL production from Statoil's unconventional assets in North America. They include the Alberta oil sands, Bakken, Eagle Ford, and Marcellus. Unconventional volumes were mostly sold in the spot market based on publicly quoted prices. Production from Eagle Ford is primarily transported by pipeline while the most part of crude oil from Bakken is transported to the best paying markets by rail.

MMP also markets equity volumes from DPI assets located in Canada, US, Brazil, Angola, Nigeria, Algeria, Russia, Azerbaijan and UK, as well as third party volumes.

Value is maximised through the use of own and leased capacity such as terminals, storages, pipelines, railcars and vessels.

3.7.3 Asset Management

The Asset Management business cluster (AM) is the owner of all mid- and downstream assets in Statoil, ranging from refineries to pipelines, storage terminals, shipping activities and other infrastructure lease commitments.

AM is responsible for securing flow assurance for gas and oil in order to bring production to the markets. This includes management and development of existing assets and contracts as well as being responsible for Statoil's mid and downstream investment projects. Furthermore AM ensures that the Marketing and Trading business cluster (MT) has efficient access to assets for trading purposes.

3.7.3.1 Production plants

AM is the owner of Statoil`s two refineries in Norway and Denmark and a combined heat and power plant in Norway. AM manages Statoil`s majority ownership share of a methanol production plant, as well as Statoil`s minority share in an NGL and condensate processing facility.

Mongstad
Statoil holds 100% ownership and is operator of the Mongstad refinery in Norway. The refinery was built in 1975, and significantly expanded and upgraded in the late 1980s. In addition it has been subject to considerable investments over the last 15 years in order to meet new product specifications and to improve energy efficiency. The refinery is a medium-sized, modern refinery, with a crude oil and condensate distillation capacity of 226,000 barrels per day.

The refinery is directly linked to offshore fields through two crude oil pipelines, through a natural gas liquids (NGL)/condensate pipeline to the crude oil terminal at Sture and the gas processing plant at Kollsnes, and by a gas pipeline to Kollsnes, making it an attractive site for landing and processing of hydrocarbons.

In addition to the refinery, the main facilities at Mongstad consist of a crude oil terminal (Mongstad terminal), an NGL processing unit and terminal (Vestprosess), and a combined heat and power plant (Mongstad Heat and Power Plant).

Statoil owns 34% of Vestprosess, which transports and processes NGL and condensate. The Vestprosess pipeline connects the Kollsnes and Sture plants to Mongstad. The NGL is fractionated in the Vestprosess NGL unit to produce naphtha, propane and butane.

Statoil is the owner of Mongstad Heat and Power Plant, which produces electrical heat and power from gas received from Kollsnes and from the refinery. The combined heat and power plan started commercial operation in 2010 and improved the Mongstad refinery's energy efficiency. It has a capacity of approximately 280 megawatts of electric power and 350 megawatts of process heat.

Kalundborg
Statoil holds 100% ownership and is operator of the Kalundborg refinery in Denmark, which has a crude oil and condensate distillation capacity of 108,000 barrels per day. The Kalundborg refinery is a small, carbon dioxide efficient and flexible oil refinery. While this enables it to produce a variety of products, its main products are low-sulphur gasoline and diesel for markets in Denmark and Sweden. The refinery is connected via one gasoline and one gas oil pipeline to the terminal at Hedehusene near Copenhagen, and most of its products are sold locally.

Tjeldbergodden
The methanol plant at Tjeldbergodden, the largest in Europe, receives natural gas from the Heidrun field in the Norwegian Sea through the Haltenpipe pipeline. Statoil has an ownership interest of 82,0% in Statoil Metanol ANS at Tjeldbergodden. In addition, Statoil holds a 50.9% ownership interest in Tjeldbergodden Luftgassfabrikk DA, which is one of the largest air separation units (ASU) in Scandinavia.

3.7.3.2 Terminals and storage

AM has ownership in two crude oil terminals in Norway. AM also operates the South Riding Point crude oil terminal in the Bahamas.

Mongstad terminal
Statoil has a 65% ownership interest in Mongstad crude oil terminal, while the State holds 35%. Crude oil is landed at Mongstad via two pipelines from Troll and by crude tankers from the market. The Mongstad terminal has a storage capacity of 9.4 million barrels of crude oil. The terminal supports Statoil's global trading, blending and trans-shipment of crude. It is an important tool in the marketing of North Sea crude.

Sture terminal
The Sture crude oil terminal receives crude oil via two pipelines from the Oseberg and Grane areas in the North Sea. The terminal is part of the Oseberg Transportation System (Statoil interest 36.2%). The processing facilities at Sture stabilise Oseberg crude oil and recover LPG mix (propane and butane) and naphtha. Oseberg blend, Grane blend and LPG mix are exported. LPG and naphtha are also transported through the Vestprosess pipeline to Mongstad.

South Riding Point terminal
AM operates the South Riding Point Terminal, which is located on Grand Bahamas Island, and consists of two shipping berths and ten storage tanks of crude oil, with a storage capacity of 6.75 million barrels of crude oil. The terminal has been upgraded to also enable the blending of crude oils, including heavy oils. The blending is carried out onshore and from ship to ship at the jetty. The terminal is intended to both support our global trading activity and improve our handling capacity for heavy oils. The terminal is an integral part of our marketing of equity volumes of heavy oil.

Aldbrough Gas Storage
Statoil UK holds one third share of the interests in the Aldbrough Gas Storage in UK, operated by SSE Hornsea Ltd. At the end of 2015 six out of nine caverns were operational.

Etzel Gas Lager
Statoil Deutschland Storage GmbH holds a 23.7% stake in the Etzel Gas Lager in North Germany which has a total of nineteen caverns and secures regularity for gas deliveries from the NCS.

Teesside terminal
Statoil UK holds a 27.3% stake in the Teesside terminal, which stabilises unstable oil from the Ekofisk area and several other Norwegian and UK fields and recovers NGL.

3.7.3.3 Pipelines

AM is responsible for Statoil's ownership in pipelines globally as well as gathering and initial processing in the US.

Pipelines in operations
Statoil is a significant shipper in the NCS gas pipeline system. This network links gas fields on the Norwegian continental shelf (NCS) with processing plants on the Norwegian mainland and with terminals at six landing points located in France, Germany, Belgium and the UK.

The total length of Norway's gas pipelines is currently 8,100 kilometres, and most gas pipelines on the NCS that are accessed by third-party customers are owned by a single joint venture, Gassled, with regulated third-party access. The Gassled system is operated by the independent system operator Gassco AS, which is wholly owned by the Norwegian state. When new gas infrastructure facilities are merged into Gassled, the ownership interests are adjusted to reflect each owner's relative interest. Hence, Statoil's future ownership interest in Gassled may change. AM is managing Statoil's current 5% ownership share in Gassled.

In addition AM manage Statoil's ownership in the following pipelines in the Norwegian gas transportation system: Oseberg oil transportation system, Grane oil pipeline, Kvitebjørn oil pipeline, Troll oil pipeline I and II, Edvard Grieg oil pipeline, Utsira High gas pipeline, Valemon rich gas pipeline, Haltenpipe,Norpipe and Mongstad gas pipeline.

Statoil Deutschland GmbH indirect holds a 30.8% stake in the Norddeutche Erdgas Transversale (NETRA) overland gas transmission pipeline.

Pipelines under construction
Statoil is the operator and holds a 37.1% ownership share in the Polarled project which will secure a gas export pipeline for fields in the Norwegian Sea. The project is aligned with the Aasta Hansteen field development.

Statoil is the operator and holds a 40% ownership share in the Johan Sverdrup oil and gas pipelines. The pipelines will provide oil and gas export for the Johan Sverdrup field and is scheduled to start-up in 2019.

In the fourth quarter of 2015 Statoil entered into an agreement with Snam to sell our 20% interest in the Trans Adriatic Pipeline (TAP). See note 4 *Acquistitions and dispositions* for further details.

US gathering system
AM is responsible for Statoil's participation in gathering and facilities for initial processing of oil and gas in the Bakken, Eagle Ford and Marcellus assets in the US. This includes crude and natural gas gathering systems, fresh water supply systems, salt water disposal wells, oil and gas treatment and processing facilities to provide flow assurance for Statoil's upstream production. Midstream assets in Bakken are owned and operated 100% by Statoil. In Eagle Ford, Statoil will transition to operator for 100% of the midstream assets outside of the Oak, Karnes, DeWitt and Bee (KDB) area with a working interest of 63%. In the KDB area of Eagle Ford, Statoil has an ownership interest of 25.2% in Edwards Lime Gathering LLC, which is operated by Energy Transfer Partners L.P. For Marcellus Statoil has operated assets in Marcellus South while in the Marcellus non-operated areas both in the North and South, Statoil's working interest ranges from 16.25% to 32.5% depending on gathering system and number of JV partners.

3.7.4 Processing and Manufacturing

The Processing and Manufacturing business cluster (PM) is responsible for the operation of all of Statoil's onshore facilities in Norway and Denmark except for Snøhvit related facilities, and a substantial part of the oil and gas pipelines on the NCS.

This includes the following Statoil operated plants and pipelines: The refineries at Mongstad and Kalundborg, the methanol production plant at Tjeldbergodden, Oseberg transportation system including the Sture Terminal, Vestprosess, Mongstad Terminal, the Grane, Kvitebjørn, Troll and Edvard Grieg oil pipelines and Mongstad gas pipeline.

The following table shows operating statistics for the plants at Mongstad, Kalundborg and Tjeldbergodden.

	Throughput[1]			Distillation capacity[2]			On stream factor %[3]			Utilisation rate %[4]		
Refinery	2015	2014	2013	2015	2014	2013	2015	2014	2013	2015	2014	2013
Mongstad	**11.9**	9.2	11.8	**9.3**	9.3	9.3	**97.6**	93.4	98.9	**93.4**	90.0	95.0
Kalundborg	**5.2**	4.5	5.0	**5.4**	5.4	5.4	**98.5**	91.8	98.2	**91.0**	82.0	86.5
Tjeldbergodden	**0.92**	0.83	0.79	**0.95**	0.95	0.95	**98.5**	88.4	94.4	**98.5**	97.1	96.6

1) Actual throughput of crude oils, condensates, NGL, feed and blendstock, measured in million tonnes.
Higher than distillation capacity for Mongstad due to high volumes of fuel oil and NGL not going through the crude distillation unit.
Higher than distillation capacity for Kalundborg, due to volumes of kero, naphta, gasoil and biodiesel-additive not going through the crude-/condensate units.
2) Nominal crude oil and condensate distillation capacity, and methanol production capacity, measured in million tonnes.
3) Composite reliability factor for all processing units, excluding turnarounds.
4) Composite utilisation rate for all processing units, stream day utilisation.

In addition PM performs the role of technical service provider (TSP) for the Kårstø and Kollsnes gas processing plants in accordance with the technical service agreement between Statoil and the operator Gassco. PM also performs the TSP role for the larger share of the Gassco operated gas pipeline infrastructure.

The processing that takes place at Kollsnes involves separating out the NGL, and compressing the dry gas for export via the Gassled pipeline network to receiving terminals in Europe. The Kollsnes plant was initially developed to receive gas from the Troll field. Kollsnes now also receives gas from the Visund, Kvitebjørn and Fram fields.

Kårstø processes rich gas and condensate from the NCS received via the Statpipe pipeline, the Åsgard Transport pipeline and the Sleipner condensate pipeline. Products produced at Kårstø include ethane, propane, iso-butane, normal butane, naphtha and stabilised condensate. The dry gas is transported to customers through the Gassled pipeline network via receiving terminals in Europe.

As of 1 January 2016 responsibility for operation of Snøhvit onshore facilities has been transferred from DPN to MMP.

For further information about Statoil's operated onshore facilities and pipelines see section 3.7.3 *Asset Management*.

3.8 Other Group

The Other reporting segment includes activities in New Energy Solutions (NES), Global Strategy and Business Development (GSB), Technology, Projects and Drilling (TPD) and corporate staffs and support functions.

3.8.1 New Energy Solutions (NES)

The NES business area reflects Statoil's aspirations to gradually complement its oil and gas portfolio with profitable renewable energy and other low-carbon energy solutions. Offshore wind and carbon capture and storage have been key focus areas in 2015.

In February 2016, Statoil launched a new energy investment fund dedicated to investing in attractive and ambitious growth companies in renewable energy, supporting its strategy of growth in new energy solutions. The new fund, Statoil Energy Ventures, will invest up to USD 200 million over a period of four to seven years.

Key events in 2015:
- In October Statoil made a final investment decision to build the world's first floating offshore wind park: The Hywind pilot park, to be located outside Peterhead in Scotland
- In June Statoil announced that that it would establish NES as a new business area to create new profitable solutions within renewable energy and other low-carbon solutions, combining Statoil's oil and gas portfolio, project delivery capacity and ability to integrate technological solutions. As a starting point the existing offshore wind portfolio constitutes the main activities in this area. The ambition is to grow and potentially expand into other sources of renewable energy

Sheringham Shoal
The Sheringham Shoal wind farm, located off the coast of Norfolk, UK, was formally opened in September 2012. The wind farm is in full production with 88 turbines and an installed capacity of 317 megawatt (MW). Following divestment in 2014, it is now owned 40% by Statkraft, a Norwegian wholly state-owned company, 40% by Statoil and 20% by the UK Green Investment Bank (GIB). The wind farm's annual production is approximately 1.1 terawatt hours (TWh) and it has the capacity to provide power to approximately 220,000 households.

Dudgeon offshore wind project
Statoil acquired a 70% share in the Dudgeon offshore wind farm project in October 2012 together with Statkraft (30%). In 2014 Statoil reduced its share to 35%, bringing in Masdar as a new partner. The project is located in the Greater Wash Area off the English east coast, not far from Sheringham Shoal. A final investment decision for the 402 MW project was made in July 2014. All construction contracts are awarded and construction has started. The wind farm is expected to produce 1.7 TWh yearly from 67 turbines, with the capacity to provide power for approximately 410,000 households. It is expected to be in full operation by year end 2017.

Dogger Bank
Statoil and Statkraft, together with RWE and SSE, are partners in the Forewind consortium, each with a 25% equity stake. The Dogger Bank area has a total consented capacity of 4.8 GW, and is potentially the largest offshore wind farm development in the world. The consortium received consent for four projects, each with a capacity of 1200 MW by the UK Government in February and August 2015.

Hywind
The world's first full-scale floating offshore wind turbine has been in operation as a demonstration facility off the coast of Karmøy for six years. Hywind's overall performance has exceeded expectations and has experienced several storms with extreme wind of over 40m/s and maximum waves of 19 m height without any damage influencing technical integrity of the structure or turbine. Statoil is continuously working on improving the operating model. Statoil`s strategy has been to utilise the experience gained from this demo project to develop a floating wind park pilot, which Statoil has achieved with Hywind Scotland.

Hywind Scotland pilot project
Hywind Scotland is a floating wind pilot park using the Hywind concept developed and owned by Statoil. The business case is to demonstrate cost-efficient and low risk solutions for commercial scale parks. This will be done by verifying the use of larger Wind Turbine Generators (WTG), optimising the design and demonstrating scale effects in a wind farm layout. Statoil will install 5 Siemens 6.0MW turbines, a total capacity of 30MW. The project is located at Buchan Deep, approximately 25 km off Peterhead on the West coast of Scotland. Production is expected to be 0.14 TWh/year. The project was sanctioned in October 2015 and planned first deliveries to the grid is fourth quarter 2017. This is the next step in our strategy towards deployment of our first utility scale floating wind farms.

Carbon capture and Storage (CCS)
Since 1996 Statoil has proven experience in CCS and has continued to develop competence through research engagement in the Technical Centre Mongstad (TCM) and offshore operations in Sleipner and Snøhvit. Statoil will seek to deploy our competence and experience in other CCS projects, continue to evaluate opportunities to reduce carbon dioxide emissions and explore carbon dioxide for enhanced oil recovery (EOR) possibilities.

3.8.2 Global Strategy and Business Development (GSB)

The Global Strategy and Business Development (GSB) business area is Statoil's functional centre for strategy and business development.

GSB is responsible for Statoil's global strategy processes, and identifies, develops and delivers inorganic business development opportunities. This is achieved through close collaboration across geographic locations and business areas. Statoil's strategy forms the basis for guiding the company's business development focus.

GSB's business activities are organised in the following areas:
- **Corporate strategy and analysis:** Managing corporate strategy development processes, competitor intelligence, industry analysis
- **Political Analysis:** Monitoring political developments nationally, regionally and globally. The unit assesses geopolitical issues and trends impacting our business, political risk related to specific countries and projects, and changes to the broader security threat picture
- **Corporate Sustainability:** Shaping Statoil's strategic response to sustainability issues, development of relevant policies and reporting on the company's sustainability performance
- **Business Development Origination**: Identifying and originating business development opportunities, sharing on-the-ground context and intelligence across the organisation
- **Mergers, Acquisitions and Divestments**: Executing of business development and merger/corporate acquisition/divestment options, sharing deal activity context and intelligence across the organisation
- **Project Support and Execution**: Commercial negotiation support, commercial and technical valuation, business development best practice

3.8.3 Technology, Projects and Drilling (TPD)

Technology, Projects and Drilling (TPD) business area is responsible for delivering projects and wells and providing global support on standards and procurement. TPD is also responsible for developing Statoil as a technology company.

Key events in 2015:
- 117 offshore wells were delivered, including 29 exploration wells
- Drilling efficiency has been significantly enhanced over the last three years. During 2015, the average number of metres drilled per day increased 25% from 2014
- Valemon came on stream: Statoil's first platform to be controlled remotely from shore. Once drilling is completed, the platform will transform into a normally unmanned platform
- The first subsea gas compression plant in the world was brought on line at Åsgard. Another subsea gas compression plant is being developed at Gullfaks
- Fast-track projects Oseberg Delta 2, Smørbukk South extension and Gullfaks South improved oil recovery were brought on stream
- The construction of the fast-track project Gullfaks Rimfaksdalen started
- Three major pipelays were completed: Polarled gas pipeline, Edvard Grieg oil export pipeline and Utsira high gas export pipeline
- The world's largest system for four-dimensional permanent reservoir monitoring was installed at Snorre and Grane, improving the oil recovery rate. 700 kilometres of seismic cables were installed on the seabed
- Two new compressors were brought on line on the Troll A platform
- A new floating storage vessel was brought into operation at Heidrun
- The development of Aasta Hansteen, Gina Krog and Mariner fields continued through 2015
- The construction of the Johan Sverdrup project started. In 2015, contracts worth more than NOK 50 billion were awarded
- The plan for development and operation of Oseberg Vestflanken 2 was submitted to the Ministry of Petroleum and Energy. The field is being developed using an unmanned wellhead platform, a new, cost-effective solution in Statoil's field development toolbox
- A decision was made to develop Hywind Scotland pilot park. The commercial scale, floating wind farm is being developed using Hywind, a floating wind turbine concept developed and owned by Statoil. The construction of Dudgeon offshore wind farm progressed through 2015
- There has been a certain overcapacity in the offshore rig portfolio owing to reduced demand and increased efficiency
- 18 specific and profitable projects aimed at reducing the environmental footprint have been established under the General Electric/Statoil powering collaboration, launched in 2015
- During 2015, 101 new technologies were developed. 20 selected high-value technologies were implemented in 59 different locations, a 50% increase from 2014
- Statoil has captured significant market effects through renegotiating and rebidding most of the agreement portfolio with suppliers during 2015

From 1 January 2016, Statoil has gathered all project expertise in TPD, into one integrated, cost-effective Project Development organisation (PRD), to ensure lean and effective execution and decision-making. From the same date, Technology Excellence and Research, Development and Innovation were merged into one integrated Research and Technology organisation (R&T), reinforcing innovation and technology effectiveness.

TPD business activities were in 2015 organised in the following business clusters:

Research, Development and Innovation (RDI)
RDI is responsible for carrying out research and technology development to meet Statoil's business needs on short and long term.

RDI is organised in four research programmes closely aligned with Statoil's technology strategy: Exploration, Mature area developments and improved oil recovery, Frontier developments and Un-conventionals. In addition, there are two other units: Innovation and Projects. RDI has four research centres in Norway with world-leading laboratories and large-scale test facilities. Internationally, RDI is currently active in our operations in Rio de Janeiro (Brazil), Houston and Austin (the US), St. Johns (Canada) and Beijing (China). Cooperation with external environments plays an important role for R&D in Statoil, and RDI has an Academia programme which coordinates cooperation with Norwegian and international universities.

Technology Excellence (TEX)
TEX is globally responsible for delivering technical expertise to projects, business developments and assets, and for implementing new technologies.

TEX is responsible for driving simplification and standardisation and delivers technological expertise within the areas of petroleum, subsea and marine, facilities and operations, and safety and sustainability technologies enhancing Statoil's operational performance. Technology development and implementation are used to achieve corporate targets for production growth, improved efficiency and regularity, reserve growth and reduced costs. Through Statoil technology invest (STI), TEX supports innovators and entrepreneurs with technology development and commercialisation activities.

Projects (PRO)
PRO is responsible for planning and executing all major facilities development, modification and field decommissioning projects in Statoil.

The project portfolio is diverse, ranging from major new field developments to both small and large development projects on the NCS and internationally. During 2015, around 50 projects were in the execution phase, and at year-end, 30 projects were in the early phase. The proportion of larger projects in the portfolio has increased over the last three years.

Drilling and Well (D&W)
D&W is responsible for providing cost-efficient well delivery, ensuring fit-for-purpose drilling facilities and providing expertise and advice to Statoil's global drilling and well operations.

D&W operated 35 rig years in 2015, compared to 40 in 2014, and delivered production and exploration wells offshore on the NCS and Brazil, and exploration wells in Canada, the Gulf of Mexico, Tanzania and the UK.

Procurement and Supplier Relations (PSR)
PSR is responsible for global procurement aligned with Statoil's business needs, and for managing Statoil's supply chain. Statoil's procurements originate from approximately 12,000 active suppliers.

The procurement process is based on competition and the principles of openness, non-discrimination and equality. PSR encourages and facilitates collaboration with suppliers through communication and by managing supplier relations. By maintaining strong relations with high-quality suppliers, Statoil aims to ensure lasting, long-term competitive advantages. PSR has a strategy for increasing diversity, competition and flexibility in the market to better utilise industry capacity and expertise.

3.8.4 Corporate staffs and support functions

Corporate Staffs and support functions comprise the non-operating activities supporting Statoil.

They include headquarters and central functions that provide business support such as corporate communication, safety, audit, legal services and people and organisation.

3.9 Significant subsidiaries

The following table shows significant subsidiaries and equity accounted companies as of 31 December 2015.

Our voting interest in each company is equivalent to our equity interest.

Ownership in certain subsidiaries and other equity accounted companies

Name	in %	Country of incorporation	Name	in %	Country of incorporation

3.10 Production volumes and prices

The business overview is in accordance with our segment's operations as of 31 December 2015, whereas certain disclosures on oil and gas reserves are based on geographical areas as required by the Securities and Exchange Commission (SEC).

For further information about extractive activities, see sections 3.5 *Development and Production Norway* and 3.6 *Development and Production International*, respectively.

Statoil prepares its disclosures for oil and gas reserves and certain other supplemental oil and gas disclosures by geographical area, as required by the SEC. The geographical areas are defined by country and continent. They are Norway, Eurasia excluding Norway, Africa and the Americas.

For further information about disclosures concerning oil and gas reserves and certain other supplemental disclosures based on geographical areas as required by the SEC, see section 3.11 *Proved oil and gas reserves.*

3.10.1 Entitlement production

This section describes our oil and gas production and sales volumes.

The following table shows Statoil's Norwegian and international entitlement production of oil and natural gas for the periods indicated. The stated production volumes are the volumes to which Statoil is entitled, pursuant to conditions laid down in licence agreements and production-sharing agreements. The production volumes are net of royalty oil paid in kind, and of gas used for fuel and flaring. Our production is based on our proportionate participation in fields with multiple owners and does not include production of the Norwegian State's oil and natural gas. Production of an immaterial quantity of bitumen is included as oil production. NGL includes both LPG and naphtha. The only field containing more than 15% of total proved reserves based on oil equivalent barrels is the Troll field. For further information on production volumes see section 9 *Terms and definitions*.

	For the year ended 31 December		
Entitlement production	2015	2014	2013
Norway			
Oil and Condensate (mmbbls)	174	173	174
NGL (mmbbls)	44	42	42
Natural gas (bcf)	1,306	1,229	1,264
Combined oil, condensate, NGL and gas (mmboe)	450	434	441
Eurasia excluding Norway			
Oil and Condensate (mmbbls)	13	14	15
Natural gas (bcf)	16	56	72
Combined oil, condensate, NGL and gas (mmboe)	16	24	28
Africa			
Oil and Condensate (mmbbls)	75	64	58
NGL (mmbbls)	3	2	1
Natural gas (bcf)	63	38	40
Combined oil, condensate, NGL and gas (mmboe)	88	72	66
Americas			
Oil and Condensate (mmbbls)	62	55	50
NGL (mmbbls)	7	7	4
Natural gas (bcf)	215	242	196
Combined oil, condensate, NGL and gas (mmboe)	107	106	89
Total			
Oil and Condensate (mmbbls)	324	306	298
NGL (mmbbls)	54	51	47
Natural gas (bcf)	1,600	1,565	1,571
Combined oil, condensate, NGL and gas (mmboe)	662	635	625
Troll field [1)]			
Oil and Condensate (mmbbls)	14	14	14
NGL (mmbbls)	2	2	2
Natural gas (bcf)	386	317	304
Combined oil, condensate, NGL and gas (mmboe)	85	73	70

1) Note that Troll is also included in Norway stated above.

3.10.2 Sales prices

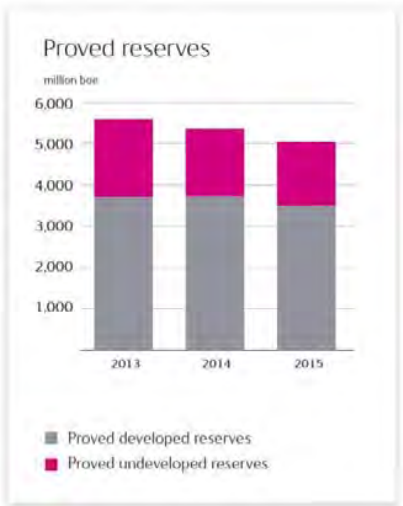
The following tables present realised sales prices.

	Norway	Eurasia excluding Norway	Africa	Americas
Year ended 31 December 2015				
Average sales price oil and condensate in USD per bbl	52.2	50.7	49.4	39.4
Average sales price NGL in USD per bbl	30.1	-	26.2	12.5
Average sales price natural gas in NOK per Sm3	2.2	1.4	1.7	0.8
Year ended 31 December 2014				
Average sales price oil and condensate in USD per bbl	98.3	101.3	95.6	78.3
Average sales price NGL in USD per bbl	59.3	-	59.7	37.3
Average sales price natural gas in NOK per Sm3	2.3	1.3	2.2	1.0
Year ended 31 December 2013				
Average sales price oil and condensate in USD per bbl	109.1	110.5	107.3	89.1
Average sales price NGL in USD per bbl	67.4	-	69.7	59.2
Average sales price natural gas in NOK per Sm3	2.4	0.9	2.1	0.8

3.11 Proved oil and gas reserves

Proved oil and gas reserves were estimated to be 5,060 mmboe at year end 2015, compared to 5,359 mmboe at the end of 2014.

Statoil's proved reserves are estimated and presented in accordance with the Securities and Exchange Commission (SEC) Rule 4-10 (a) of Regulation S-X, revised as of January 2009, and relevant Compliance and Disclosure Interpretations (C&DI) and Staff Accounting Bulletins, as issued by the SEC staff. For additional information, see section Proved oil and gas reserves in note 2 *Significant accounting policies* to the Consolidated financial statements. For further details on proved reserves, see also note 27 *Supplementary oil and gas information (unaudited)* in the Consolidated financial statements.



Changes in proved reserves estimates are most commonly the result of revisions of estimates due to observed production performance, extensions of proved areas through drilling activities or the inclusion of proved reserves in new discoveries through the sanctioning of new development projects. These are sources of additions to proved reserves that are the result of continuous business processes and can be expected to continue to add reserves in the future.

Proved reserves can also be added or subtracted through the acquisition or disposal of assets. Changes in proved reserves can also be due to factors outside management control, such as changes in oil and gas prices. Lower oil and gas prices normally allow less oil and gas to be recovered from the accumulations. However for fields with production sharing agreements (PSAs) and similar contracts a reduced oil price may result in higher entitlement to the produced volume. These changes are included in the revisions category in the table below.

The principles for booking proved gas reserves are limited to contracted gas sales or gas with access to a robust gas market.

In Norway and the UK, Statoil recognises reserves as proved when a development plan is submitted, as there is reasonable certainty that such a plan will be approved by the regulatory authorities. Outside these territories, reserves are generally booked as proved when regulatory approval is received, or when such approval is imminent. Reserves from new discoveries, upward revisions of reserves and purchases of proved reserves are expected to contribute to maintaining proved reserves in future years. Undrilled well locations onshore are generally booked as proved undeveloped reserves when a development plan has been adopted and the well locations are scheduled to be drilled within five years,

Approximately 89% of our proved reserves are located in OECD countries. Norway is by far the most important contributor in this category, followed by the United States of America (US), Canada, Ireland and the United Kingdom (UK).

Of Statoil's total proved reserves, 9% are related to production-sharing agreements (PSAs) in non-OECD countries such as Azerbaijan, Angola, Algeria, Nigeria, Libya and Russia. Other non-OECD reserves are related to concessions in Brazil and Venezuela, representing less than 3% of Statoil's total proved reserves. These are included in proved reserves in the Americas.

Significant changes in our proved reserves in 2015 were:

- Negative revisions due to lower commodity prices compared to last year, which resulted in a reduction of approximately 350 million boe. A large portion of this is related to undeveloped fields where lower commodity prices resulted in earlier economic cut-off, such as the Mariner field in the UK which is under development and is expected to start production in 2018, and uneconomic undeveloped well locations onshore US. The negative revisions are partly offset by positive revisions due to better performance of producing fields, maturing of improved recovery projects, and reduced uncertainty due to further drilling and production experience. The net effect of the positive and negative revisions is a reduction of 42 million boe in 2015. The estimated reduction due to change in prices is a rough estimate derived by using last year's prices on this year's volume base. In the calculation no adjustments have been made for the possible effect on the activity level, operating cost or development cost. For more information regarding prices see section 27 *Supplementary oil and gas information (unaudited)*
- Proved reserves from new discoveries have also been added through the sanctioning of new field development projects in 2015, Johan Sverdrup being the largest contributor. The new projects added a total of 476 million boe
- Further drilling in the Bakken, Marcellus and Eagle Ford onshore plays in the US increased the proved reserves in 2015, and some of these additions are presented as extensions. Extension of proved area on existing field added a total of 150 million boe of new proved reserves in 2015
- The net effect of purchase and sale reduced the reserves by 221 million boe in 2015
- The 2015 entitlement production was 662 million boe, an increase of 4.3% compared to 2014. New discoveries with proved reserves booked in 2015 are all expected to start production within a period of five years

Summary of proved reserves as of 31 December 2015

	Proved reserves			
Reserves category	Oil and Condensate (mmboe)	NGL (mmboe)	Natural Gas (bcf)	Total oil and gas (mmboe)
Developed				
Norway	505	235	10,664	2,641
Eurasia excluding Norway	48	-	32	53
Africa	248	9	206	294
Americas	303	45	999	526
Total Developed proved reserves	1,104	290	11,901	3,515
Undeveloped				
Norway	711	56	2,278	1,173
Eurasia excluding Norway	29	-	161	57
Africa	30	6	160	64
Americas	217	12	124	251
Total Undeveloped proved reserves	987	74	2,723	1,546
Total proved reserves	2,091	364	14,624	5,060

Statoil's proved reserves of bitumen in the Americas are included as oil in the table above since they represent less than 2% of Statoil's proved reserves, which is regarded as immaterial.

The basis for equivalents is presented in the section *Terms and definitions*.

Reserves replacement

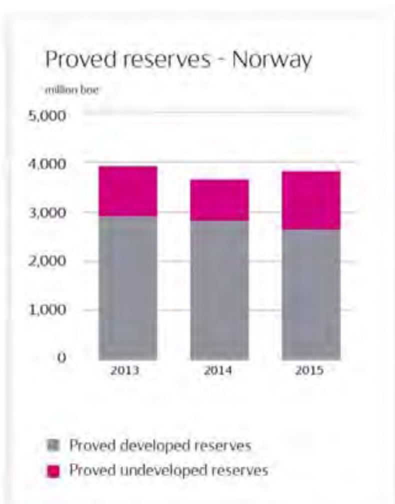
The reserves replacement ratio is defined as the sum of additions and revisions of proved reserves divided by produced volumes in any given period. The following table presents the changes in reserves in each category relating to the reserve replacement ratio for the years 2015, 2014 and 2013.

	For the year ended 31 December		
(million boe)	2015	2014	2013
Revisions and improved recovery	(42)	356	395
Extensions and discoveries	627	253	523
Purchase of petroleum-in-place	13	20	14
Sales of petroleum-in-place	(235)	(233)	(131)
Total reserve additions	363	395	802
Production	(662)	(635)	(625)
Net change in proved reserves	(299)	(240)	177

The reserves replacement ratio for 2015 was 0.55 compared to 0.62 in 2014. The 2015 reserves replacement ratio, excluding purchases and sales of petroleum in place, was 0.88. The average replacement ratio for the last three years was 0.81, or 1.10 excluding purchases and sales.

	For the year ended 31 December		
Reserves replacement ratio (including purchases and sales)	2015	2014	2013
Annual	0.55	0.62	1.28
Three-year-average	0.81	0.97	1.15

The usefulness of the reserves replacement ratio is limited by the volatility of oil prices, the influence of oil and gas prices on PSA reserve booking, sensitivity related to the timing of project sanctions and the time lag between exploration expenditure and the booking of reserves.

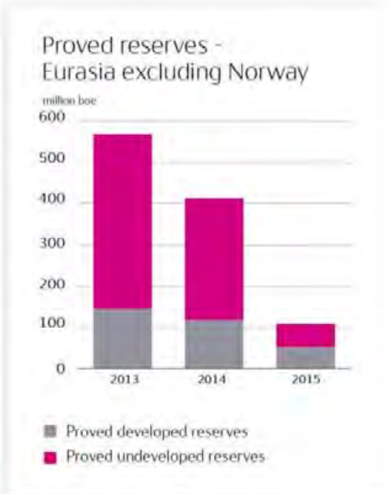


Proved reserves in Norway

A total of 3,814 million boe is recognised as proved reserves in 58 fields and field development projects on the NCS, representing 75% of Statoil's total proved reserves. Of these, 54 fields and field areas are currently in production, 42 of which are operated by Statoil. Four new field development projects added reserves during 2015, Johan Sverdrup, Oseberg Vestflanken 2, Fram C-Øst Brent and Opal categorised as extensions and discoveries. Production experience, further drilling and improved recovery on several of Statoil's producing fields in Norway also contributed positively to the revisions of the proved reserves in 2015.

Sales of reserves are related to the agreement with Repsol. This has reduced Statoil's share of proved reserves on Gudrun.

Of the proved reserves on the NCS, 2,641 million boe, or 69%, are proved developed reserves. Of the total proved reserves in this area, 60% are gas reserves related to large offshore gas fields such as Troll, Snøhvit, Oseberg, Ormen Lange, Tyrihans, Visund, Aasta Hansteen and Åsgard and 40% are liquid reserves.

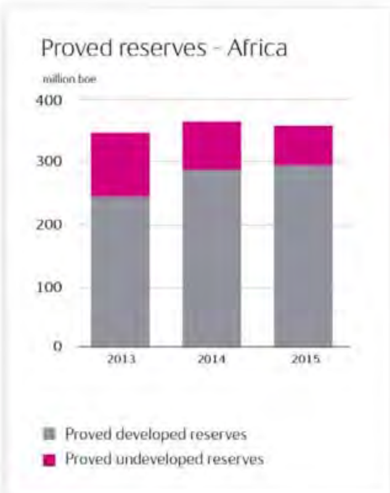


Proved reserves in Eurasia, excluding Norway

In this area, Statoil has proved reserves of 111 million boe related to four fields and field developments in Azerbaijan, the UK, Ireland and Russia. Eurasia excluding Norway represents 2% of Statoil's total proved reserves, Azerbaijan being the main contributor with the Azeri-Chirag-Gunashli fields. All fields are producing. The effect of the farm out of Shah Deniz reduced the proved reserves at year end 2015.

Proved undeveloped reserves were reduced due to negative revisions linked to lower commodity prices resulting in earlier economic cut-off for the fields, primarily the Mariner field in the UK which is under development and is expected to start production in 2018.

Of the proved reserves in Eurasia, 53 million boe or 48% are proved developed reserves. Of the total proved reserves in this area, 69% are liquid reserves and 31% are gas reserves.



Proved reserves in Africa

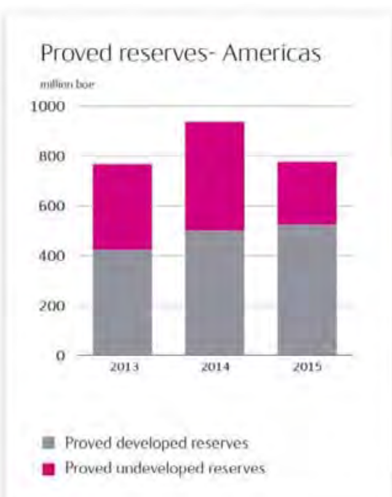
Statoil recognises proved reserves of 358 million boe related to 29 fields and field developments in several West and North African countries, including Algeria, Angola, Libya and Nigeria. Africa represents 7% of Statoil's total proved reserves. Angola is the primary contributor to the proved reserves in this area, with 24 of the 29 fields.

In Angola, Statoil has proved reserves in three blocks, Block 15, Block 17 and Block 31, with production from all blocks. During 2015 Statoil exited Block 4/05, Gimboa is therefore removed from proved reserves this year.

All fields are in production in Algeria and Nigeria. Murzuq and Mabruk are currently not producing due to the unrest in Libya.

The disputed equity determination at Agbami will potentially alter Statoil's equity share in this field. The effect on the proved reserves will be included once the redetermination is finalised and the effect is known.

Of the total proved reserves in Africa, 294 million boe, or 82%, are proved developed reserves. Of the total proved reserves in this area, 82% are liquid reserves and 18% are gas reserves.



Proved reserves in the Americas

In North and South America, Statoil has proved reserves equal to 777 million boe in a total of 17 fields and field development projects. This represents 15% of Statoil's total proved reserves. Ten of these fields are located in the US, seven of which are offshore field developments in the Gulf of Mexico and three are onshore tight reservoir assets. Five are located in Canada and two in South America.

In the US, four of the seven fields in the Gulf of Mexico are in production. Field development is ongoing on Big Foot, Heidelberg and Stampede. The onshore tight reservoir assets Marcellus, Eagle Ford and Bakken are all in production. In Canada, proved reserves are related both to offshore field developments, and to the Leismer field in the Kai Kos Dehseh oil sands project in Alberta.

Proved undeveloped reserves were reduced due to negative revisions linked to lower commodity prices, primarily resulting in undeveloped well locations onshore US becoming uneconomic.

Several transactions were completed during 2015, both purchases and sales. The largest were the transaction with Southwestern Energy reducing the reserves in Marcellus, and the agreement with Repsol increasing the reserves in Eagle Ford. The transactions offset each other and the net effect on proved reserves is zero.

Of the total proved reserves in the Americas, 526 million boe, or 68%, are proved developed reserves. Of the total proved reserves in this area, 74% are liquid reserves and 26% gas reserves.

3.11.1 Development of reserves

In 2015, approximately 438 million boe were converted from undeveloped to developed proved reserves.

The start-up of production from Edvard Grieg, Oseberg Delta 2 and Valemon in Norway together with Bavuca and Kakocha in Angola and Corrib in Ireland increased the developed reserves by 69 million boe during 2015. The rest of the converted volume is related to development activities on producing fields.

Net proved reserves in million barrels oil equivalent	Total	Developed	Undeveloped
At 31 December 2014	5,359	3,725	1,635
Revisions and improved recovery	(42)	96	(138)
Extensions and discoveries	627	-	627
Purchase of reserves-in-place	13	6	7
Sales of reserves-in-place	(235)	(88)	(147)
Production	(662)	(662)	-
Moved from undeveloped to developed	-	438	(438)
At 31 December 2015	5,060	3,515	1,546

The new development projects in Norway, added a total of 476 million boe of proved undeveloped reserves in 2015, the largest being Johan Sverdrup. Further drilling in the Bakken, Marcellus and Eagle Ford onshore plays in the US increased the proved area and added proved undeveloped reserves. These additions are categorised as extensions and together with extensions on existing fields and new discoveries this added a total of 627 million boe of proved undeveloped reserves.

Revision of estimate on existing fields added 96 million boe proved developed reserves and reduced proved undeveloped reserves by 138 million boe. These revisions are based on new information available either from drilling of new wells or from production experience, resulting in an improved understanding of the fields. The negative revisions are mainly linked to lower commodity prices resulting in earlier economic cut-off for the fields and undeveloped well locations becoming uneconomic.

The net effect of the transactions done in 2015, reduced the proved undeveloped reserves by 139 million boe.

		Oil and Condensate (mmboe)	NGL (mmboe)	Natural gas (bcf)	Total (mmboe)
2015	**Proved reserves end of year**	**2,091**	**364**	**14,624**	**5,060**
	Developed	1,104	290	11,901	3,515
	Undeveloped	987	74	2,723	1,546
2014	**Proved reserves end of year**	**1,942**	**403**	**16,919**	**5,359**
	Developed	1,156	310	12,677	3,725
	Undeveloped	786	93	4,242	1,635
2013	**Proved reserves end of year**	**1,877**	**441**	**18,416**	**5,600**
	Developed	1,052	330	13,073	3,711
	Undeveloped	826	111	5,343	1,888

As of 31 December 2015, the total proved undeveloped reserves amounted to 1,546 million boe, 76% of which are related to fields in Norway. The Troll, Snøhvit, Visund, Grane and Oseberg fields, which have continuous development activities, represent the largest undeveloped assets in Norway together with fields not yet in production, such as Johan Sverdrup, Aasta Hansteen, Gina Krogh, Ivar Aasen and Goliat. The largest assets with respect to undeveloped proved reserves outside Norway are Bakken and Stampede in the US, Peregrino in Brazil, Hebron in Canada, Corrib in Ireland and In Salah in Algeria.

In 2015, Statoil incurred NOK 85 billion in development costs relating to assets carrying proved reserves, NOK 70 billion of which was related to proved undeveloped reserves.

Large fields with continuous development activity may contain reserves that are expected to remain undeveloped for five years or more. Examples are Johan Sverdrup, Troll, Snøhvit, Gina Krogh and Aasta Hansteen in Norway. These are large field developments with several billion dollars invested in complex infrastructure and with continuous development that will require extensive, sustained drilling of wells for a long period of time. It is highly unlikely that these field development projects will be prematurely terminated, since this would result in a significant loss of capital.

Additional information about proved oil and gas reserves is provided in note 27 *Supplementary oil and gas information (unaudited)* to the Consolidated financial statements.

3.11.2 Preparations of reserves estimates

Statoil's annual reporting process for proved reserves is coordinated by a central team.

The corporate reserves management (CRM) team consists of qualified professionals in geosciences, reservoir and production technology and financial evaluation. The team has an average of more than 20 years' experience in the oil and gas industry. CRM reports to the senior vice president of finance and control in the Technology, Drilling and Projects business area and is thus independent of the Development & Production business areas in Norway, North America and International. All the reserves estimates have been prepared by Statoil's technical staff.

Although the CRM team reviews the information centrally, each asset team is responsible for ensuring that it is in compliance with the requirements of the SEC and Statoil's corporate standards. Information about proved oil and gas reserves, standardised measures of discounted net cash flows related to proved oil and gas reserves and other information related to proved oil and gas reserves, is collected from the local asset teams and checked by CRM for consistency and conformity with applicable standards. The final numbers for each asset are quality-controlled and approved by the responsible asset manager, before aggregation to the required reporting level by CRM.

The aggregated results are submitted for approval to the relevant business area management teams and the corporate executive committee.

The person with primary responsibility for overseeing the preparation of the reserves estimates is the chair of the CRM team. The person who presently holds this position has a bachelor's degree in earth sciences from the University of Gothenburg, and a master's degree in petroleum exploration and exploitation from Chalmers University of Technology in Gothenburg, Sweden. She has 30 years' experience in the oil and gas industry, 29 of them with Statoil. She is a member of the Society of Petroleum Engineering (SPE) and vice-chair of the UNECE Expert Group on Resource Classification (EGRC).

DeGolyer and MacNaughton report

Petroleum engineering consultants DeGolyer and MacNaughton have carried out an independent evaluation of Statoil's proved reserves as of 31 December 2015. The evaluation accounts for 100% of Statoil's proved reserves. The aggregated net proved reserves estimates prepared by DeGolyer and MacNaughton do not differ materially from those prepared by Statoil when compared on the basis of net equivalent barrels.

Net proved reserves at 31 December 2015	Oil and Condensate (mmbbls)	NGL/LPG (mmbbl)	Sales Gas (bcf)	Oil Equivalent (mmboe)
Estimated by Statoil	2,091	364	14,624	5,060
Estimated by DeGolyer and MacNaughton	2,159	379	14,309	5,087

A reserves audit report summarising this evaluation is included as Exhibit 15 (a)(iv).

3.11.3 Operational statistics

Operational statistics include information about acreage and the number of wells drilled.

Developed and undeveloped acreage

The table below shows the total gross and net developed and undeveloped oil and gas acreage, in which Statoil had interests at 31 December 2015.

A gross value reflects wells or acreage in which Statoil has interests (presented as 100%). The net value corresponds to the sum of the fractional working interests owned in gross wells or acres.

At 31 December 2015 (in thousands of acres)		Norway	Eurasia excluding Norway	Africa	Americas	Oceania	Total
Developed and undeveloped oil and gas acreage							
Acreage developed	- gross	871	90	858	494	-	2,312
	- net	322	21	271	114	-	729
Acreage undeveloped	- gross	9,038	41,146	13,569	23,075	18,531	105,359
	- net	3,419	17,495	4,637	10,073	11,160	46,784

The largest concentrations of developed acreage in Norway are in the Troll, Skarv, Snøhvit, Ormen Lange and Oseberg areas. In Africa, the Algerian gas development projects In Amenas and In Salah represent the largest concentrations of developed acreage (gross and net).

Statoil's largest undeveloped acreage concentration is in Russia with 18% of the total acreage and 48% of the total acreage in Eurasia excluding Norway. In Russia, Statoil participates in a joint venture with Rosneft. The net acreage given in the table above represents Statoil's share of the joint venture. The largest concentration of undeveloped acreage in the Americas is Nicaragua, with 33% of the total for this geographic area. In Africa, the largest acreage concentration is in Angola, representing 56% of the total for this geographic area.

Statoil holds acreage in numerous concessions, blocks and leases. The terms and conditions regarding expiration dates vary significantly from property to property. Work programs are designed to ensure that the exploration potential of any property is fully evaluated before expiration.

Acreage related to several of these concessions, blocks and leases are scheduled to expire within the next three years. Any acreage which has already been evaluated to be non-profitable may be relinquished prior to the current expiration date. In other cases, Statoil may decide to apply for an extension if more time is needed in order to fully evaluate the potential of the properties. Historically, Statoil has generally been successful in obtaining such extensions.

Most of the undeveloped acreage that will expire within the next three years is related to early exploration activities where no production is expected in the foreseeable future. The expiration of these leases, blocks and concessions will therefore not have any material impact on our reserves.

Productive oil and gas wells

The number of gross and net productive oil and gas wells, in which Statoil had interests at 31 December 2015, are shown in the table below.

At 31 December 2015		Norway	Eurasia excluding Norway	Africa	Americas	Total
Number of productive oil and gas wells						
Oil wells	- gross	821	166	468	3,130	4,585
	- net	281.4	24.2	71.3	706.4	1,083.2
Gas wells	- gross	189	6	85	1,953	2,233
	- net	81.6	1.9	32.7	486.3	602.4

The total gross number of productive wells as of end 2015 includes 383 oil wells and 12 gas wells with multiple completions or wells with more than one branch.

Net productive and dry oil and gas wells drilled

The following tables show the net productive and dry exploratory and development oil and gas wells completed or abandoned by Statoil in the past three years. Productive wells include exploratory wells in which hydrocarbons were discovered, and where drilling or completion has been suspended pending further evaluation. A dry well is one found to be incapable of producing sufficient quantities to justify completion as an oil or gas well.

	Norway	Eurasia excluding Norway	Africa	Americas	Oceania	Total
Year 2015						
Net productive and dry exploratory wells drilled	10.2	1.0	2.5	2.6	-	16.3
- Net dry exploratory wells drilled	4.6	0.4	0.5	0.9	-	6.4
- Net productive exploratory wells drilled	5.6	0.7	2.0	1.7	-	9.9
Net productive and dry development wells drilled	32.1	4.1	10.6	228.8	-	275.6
- Net dry development wells drilled	3.6	-	4.3	0.3	-	8.2
- Net productive development wells drilled	28.6	4.1	6.3	228.5	-	267.4
Year 2014						
Net productive and dry exploratory wells drilled	12.0	1.0	4.7	3.4	3.6	24.7
- Net dry exploratory wells drilled	3.4	1.0	2.7	1.6	3.6	12.2
- Net productive exploratory wells drilled	8.6	-	2.0	1.9	-	12.5
Net productive and dry development wells drilled	26.9	2.7	8.5	386.1	-	424.2
- Net dry development wells drilled	3.5	-	1.1	1.2	-	5.8
- Net productive development wells drilled	23.4	2.7	7.4	384.9	-	418.4
Year 2013						
Net productive and dry exploratory wells drilled	19.3	0.3	2.2	2.3	-	24.0
- Net dry exploratory wells drilled	7.3	0.3	2.2	2.3	-	12.0
- Net productive exploratory wells drilled	12.0	-	-	-	-	12.0
Net productive and dry development wells drilled	26.7	2.3	5.9	321.9	-	356.7
- Net dry development wells drilled	1.7	-	0.7	1.3	-	3.7
- Net productive development wells drilled	24.9	2.3	5.3	320.6	-	353.1

Exploratory and development drilling in process

The following table shows the number of exploratory and development oil and gas wells in the process of being drilled by Statoil at 31 December 2015.

At 31 December 2015		Norway	Eurasia excluding Norway	Africa	Americas	Total
Number of wells in progress						
Development wells	- gross	68	4	13	202	287
	- net	24.5	0.3	2.7	67.7	95.2
Exploratory wells	- gross	1	-	-	8	9
	- net	0.4	-	-	5.4	5.8

3.11.4 Delivery commitments

This section describes the long-term NCS commitments for the contract gas years 2015-2018.

On behalf of the Norwegian State's direct financial interest (SDFI), Statoil is responsible for managing, transporting and selling the Norwegian state's oil and gas from the Norwegian continental shelf (NCS). These reserves are sold in conjunction with Statoil's own reserves. As part of this arrangement, Statoil delivers gas to customers under various types of sales contracts. In order to meet the commitments, we utilise a field supply schedule that ensures the highest possible total value for Statoil and SDFI's joint portfolio of oil and gas.

The majority of our gas volumes in Norway are sold under long-term contracts with take-or-pay clauses. Statoil's and SDFI's annual delivery commitments under these agreements are expressed as the sum of the expected off-take under these contracts. As of 31 December 2015, the long-term commitments from NCS for the Statoil/SDFI arrangement totalled approximately 14.51 trillion cubic feet (tcf) (411 bcm).

Statoil and SDFI's delivery commitments, expressed as the sum of expected off-take for the gas years 2015, 2016, 2017 and 2018, are 2.28, 1.89, 1.56 and 1.22 tcf (64.7, 53.5, 44.2 and 44.0 bcm), respectively. The remaining volumes are sold to large industrial end users or on the short-term market.

Statoil's currently developed gas reserves in Norway are more than sufficient to meet our share of these commitments for the next three years.

3.12 Applicable laws and regulations

Statoil operates in more than 30 countries and is exposed to, and committed to compliance with, a number of laws and regulations globally.

This article focuses primarily on Norwegian laws, taking into account that the majority of Statoil's production is produced on the NCS, the ownership structure of the company and that Statoil is registered and has its headquarters in Norway.

3.12.1 Norwegian petroleum laws and licensing system

The principal laws governing Statoil's petroleum activities in Norway are the Norwegian Petroleum Act and the Norwegian Petroleum Taxation Act.

Norway is not a member of the European Union (EU), but Norway is a member of the European Free Trade Association (EFTA). The EU and the EFTA Member States have entered into the Agreement on the European Economic Area, referred to as the EEA Agreement, which provides for the inclusion of EU legislation covering the four freedoms - the free movement of goods, services, persons and capital - in the national law of the EFTA Member States (except Switzerland). An increasing volume of regulations affecting Statoil is adopted in the EU and then applied to Norway under the EEA Agreement. As a Norwegian company operating within both EFTA and the EU, Statoil's business activities are subject to both the EFTA Convention governing intra-EFTA trade and EU laws and regulations adopted pursuant to the EEA Agreement.

For further information about the jurisdictions in which Statoil operates, see sections 3 *Business overview and* 5 *Risk review.*

Under the Petroleum Act, the Norwegian Ministry of Petroleum and Energy is responsible for resource management and for administering petroleum activities on the NCS. The main task of the Ministry of Petroleum and Energy is to ensure that petroleum activities are conducted in accordance with the applicable legislation, the policies adopted by the Norwegian Parliament (the Storting) and relevant decisions of the Norwegian State.

The Storting's role in relation to major policy issues in the petroleum sector can affect Statoil in two ways: firstly, when the Norwegian State acts in its capacity as majority owner of Statoil shares and, secondly, when the Norwegian State acts in its capacity as regulator:

- The Norwegian State's shareholding in Statoil is managed by the Ministry of Petroleum and Energy. The Ministry of Petroleum and Energy will normally decide how the Norwegian State will vote on proposals submitted to general meetings of the shareholders. However, in certain exceptional cases, it may be necessary for the Norwegian State to seek approval from the Storting before voting on a certain proposal. This will normally be the case if Statoil issues additional shares and such issuance would significantly dilute the Norwegian State's holding, or if such issuance would require a capital contribution from the Norwegian State in excess of government mandates. A decision by the Norwegian State to vote against a proposal on Statoil's part to issue additional shares would prevent Statoil from raising additional capital in this manner and could adversely affect Statoil's ability to pursue business opportunities. For more information about the Norwegian State's ownership, see sections 5.1.3 *Risks related to state ownership* and 6.8 *Major shareholders*

- The Norwegian State exercises important regulatory powers over Statoil, as well as over other companies and corporations on the NCS. As part of its business, Statoil or the partnerships to which Statoil is a party, frequently need to apply for licences and other approval of various kinds from the Norwegian State. In respect of certain important applications, such as for the approval of major plans for the operation and development of fields, the Ministry of Petroleum and Energy must obtain the consent of the Storting before it can approve the relevant partnership's application. This may take additional time and affect the content of the decision. Although Statoil is majority-owned by the Norwegian State, it does not receive preferential treatment with respect to licences granted by or under any other regulatory rules enforced by the Norwegian State

The principal laws governing Statoil's petroleum activities in Norway and on the NCS are the Norwegian Petroleum Act of 29 November 1996 (the "Petroleum Act") and the regulations issued thereunder, and the Norwegian Petroleum Taxation Act of 13 June 1975 (the "Petroleum Taxation Act"). The Petroleum Act sets out the principle that the Norwegian State is the owner of all subsea petroleum on the NCS, that exclusive right to resource management is vested in the Norwegian State and that the Norwegian State alone is authorised to award licences for petroleum activities as well as determine its terms. Licensees are required to submit a plan for development and operation (PDO) to the Ministry of Petroleum and Energy for approval. For fields of a certain size, the Storting has to accept the PDO before it is formally approved by the Ministry of Petroleum and Energy. Statoil is dependent on the Norwegian State for approval of its NCS exploration and development projects and its applications for production rates for individual fields.

Production licences are the most important type of licence awarded under the Petroleum Act and are normally awarded for an initial exploration period, which is typically six years, but which can be shorter. The maximum period is ten years. During this exploration period, the licensees must meet a specified work obligation set out in the licence. If the licensees fulfil the obligations set out in the initial license period, they are entitled to require that the licence be prolonged for a period specified at the time when the licence is awarded, typically 30 years.

However, the Ministry of Petroleum and Energy is not entitled to award Statoil a licence in an area until the Storting has decided to open the area in question for exploration. The terms of the production licences are decided by the Ministry of Petroleum and Energy. A production licence grants the holder an exclusive right to explore for and produce petroleum within a specified geographical area. The licensees become the owners of the petroleum produced from the field covered by the licence. Production licences are awarded to group of companies forming a joint venture at the Ministry's discretion. The members of the joint venture are jointly and severally responsible to the Norwegian State for obligations arising from petroleum operations carried out under the licence. The Ministry of Petroleum and Energy decides the form of the joint operating agreements and accounting agreements.

The governing body of the joint venture is the management committee. In licences awarded since 1996 where the state's direct financial interest (SDFI) holds an interest, the Norwegian State, acting through Petoro AS, may veto decisions made by the joint venture management committee, which, in the opinion of the Norwegian State, would not be in compliance with the obligations of the licence with respect to the Norwegian State's exploitation policies or financial interests. This power of veto has never been used.

Interests in production licences may be transferred directly or indirectly subject to the consent of the Ministry of Petroleum and Energy and the approval of the Ministry of Finance of a corresponding tax treatment position. In most licences, there are no pre-emption rights in favour of the other licensees. However, the SDFI, or the Norwegian State, as appropriate, still holds pre-emption rights in all licences.

The day-to-day management of a field is the responsibility of an operator appointed by the Ministry of Petroleum and Energy. The operator is in practice always a member of the joint venture holding the production licence, although this is not legally required. The terms of engagement of the operator are set out in the joint operating agreement. A change of operator requires the consent of the Ministry of Petroleum and Energy. In special cases, the Ministry of Petroleum and Energy can order a change of operator.

Licensees are required to submit a plan for development and operation (PDO) to the Ministry of Petroleum and Energy for approval. For fields of a certain size, the Storting has to accept the PDO before it is formally approved by the Ministry of Petroleum and Energy.

If important public interests are at stake, the Norwegian State may instruct Statoil and other licensees on the NCS to reduce the production of petroleum. The last time the Norwegian State instructed a reduction in oil production was in 2002.

A licence from the Ministry of Petroleum and Energy is also required in order to establish facilities for the transportation and utilisation of petroleum. Ownership of most facilities for the transportation and utilisation of petroleum in Norway and on the NCS is organised in the form of joint ventures. The participants' agreements are similar to the joint operating agreements.

Licensees are required to prepare a decommissioning plan before a production licence or a licence to establish and use facilities for the transportation and utilisation of petroleum expires or is relinquished, or the use of a facility ceases. On the basis of the decommissioning plan, the Ministry of Petroleum and Energy makes a decision as to the disposal of the facilities.

For an overview of Statoil's activities and shares in Statoil's production licences on the NCS, see section 3.5 *Development and Production Norway (DPN).*

3.12.2 Gas sales and transportation from the NCS

Statoil markets gas from the NCS on its own behalf and on the Norwegian State's behalf. Gas is transported through the Gassled pipeline network to customers in the UK and mainland Europe.

Most of Statoil's and the Norwegian State's gas produced on the NCS is sold under gas contracts to customers in the European Union (EU). The EU internal energy market has been high on the European Commission's agenda, and this market has thus been subject to continuous legislative initiatives. Such changes in EU legislation may affect Statoil's marketing of gas.

The Norwegian gas transport system, consisting of the pipelines and terminals through which licensees on the NCS transport their gas, is owned by a joint venture called Gassled. The Norwegian Petroleum Act of 29 November 1996 and the pertaining Petroleum Regulation establish the basis for non-discriminatory third-party access to the Gassled transport system. The ownership structure in Gassled and the pertaining regulations are intended to ensure the effectiveness of the system and to prevent conflicts of interest.

To ensure neutrality, the petroleum regulations also stipulate that all booking and allocation of capacity is administrated by Gassco AS, an independent system operator wholly owned by the Norwegian State. Spare capacity is released and allocated to shippers by Gassco based on standard procedures. Capacity that has already been allocated to a shipper may also be transferred bilaterally between shippers.

The tariffs for the use of capacity in the transport system are determined by applying a formula set out in separate tariff regulations stipulated by the Ministry of Petroleum and Energy. The tariffs are paid on the basis of booked capacity, not on the basis of the volumes actually transported. The Ministry's main objective when setting the tariffs is to ensure that the profits are extracted in the production fields on the NCS and not in the transport system.

For further information see section 3.7.3.3 *Pipelines.*

3.12.3 The Norwegian State's participation

The Norwegian State's policy as a shareholder in Statoil has been and continues to be to ensure that petroleum activities create the highest possible value for the Norwegian State.

Initially, the Norwegian State's participation in petroleum operations was largely organised through Statoil. In 1985, the Norwegian State established the State's direct financial interest (SDFI) through which the Norwegian State has direct participating interests in licences and petroleum facilities on the NCS. As a result, the Norwegian State holds interests in a number of licences and petroleum facilities in which Statoil also hold interests. Petoro AS, a company wholly owned by the Norwegian State, was formed in 2001 to manage the SDFI assets.

3.12.4 SDFI oil and gas marketing and sale

Statoil markets and sells the Norwegian State's oil and gas together with Statoil's own production. The arrangement has been implemented by the Norwegian State.

At an extraordinary general meeting held on 27 February 2001, the Norwegian State, as sole shareholder, revised Statoil's articles of association by adding a new article that requires Statoil to continue to market and sell the Norwegian State's oil and gas together with its own oil and gas. At an extraordinary general meeting held on 25 May 2001, the Norwegian State, as sole shareholder, approved an instruction to Statoil setting out specific terms for the marketing and sale of the Norwegian State's oil and gas. This resolution is referred to as the Owner's instruction.

The Norwegian State has a coordinated ownership strategy aimed at maximising the aggregate value of its ownership interests in Statoil and the Norwegian State's oil and gas. This is reflected in the Owner's instruction. It contains a general requirement that, in Statoil's activities on the NCS, it must take account of these ownership interests in decisions that could affect the execution of this marketing arrangement.

The principal provisions of the Owner's instruction are set out below.

Objectives
The overall objective of the marketing arrangement is to obtain the highest possible total value for Statoil's oil and gas and the Norwegian State's oil and gas, and to ensure an equitable distribution of the total value creation between the Norwegian State and Statoil.

Statoil's tasks
Statoil's main tasks under the Owner's instruction are to market and sell the Norwegian State's oil and gas and to carry out all the necessary related activities, other than those carried out jointly with other licensees under production licences. This includes, but is not limited to, responsibility for processing, transport and marketing.

Costs
The Norwegian State does not pay Statoil a specific consideration for performing these tasks, but reimburses its proportionate share of certain costs, which, under the Owner's instruction, may be Statoil's actual costs or an amount specifically agreed.

Price mechanisms
Payment to the Norwegian State for sales of the Norwegian State's natural gas, both to Statoil and to third parties, is based either on the prices achieved, a net back formula or market value. Statoil purchases all of the Norwegian State's oil and NGL. Pricing of the crude oil is based on market-reflective prices. NGL prices are based on either achieved prices, market value or market-reflective prices.

Lifting mechanism
To ensure neutral weighting between the Norwegian State's and Statoil's own natural gas volumes, a list has been established for deciding the lifting priority between each individual field. The different fields are ranked in accordance with their assumed total value creation for the Norwegian State and Statoil, assuming that all of the fields meet our profitability requirements if we participate as a licensee and the Norwegian State's profitability requirements if the State is a licensee. Within each individual field in which both the Norwegian State and Statoil are licensees, the Norwegian State and Statoil will deliver volumes and share income in proportion to our respective participating interests.

The Norwegian State's oil and NGL is lifted together with our oil and NGL in accordance with applicable lifting procedures for each individual field and terminal.

Withdrawal or amendment
The Norwegian State may at any time utilise its position as majority shareholder of Statoil to withdraw or amend the owner's instruction.

3.12.5 HSE regulation

Statoil's petroleum operations are subject to extensive laws and regulations relating to health, safety and the environment (HSE).

With business operations in more than 30 countries, Statoil is subject to a wide variety of HSE laws and regulations concerning its products, operations and activities. Laws and regulations may be jurisdiction specific, but also international regulations, conventions or treaties, as well as EU directives and regulations, are relevant.

In Norway, under the Norwegian Petroleum Act of 29 November 1996, Statoil's oil and gas operations must be conducted in compliance with a reasonable standard of care, taking into consideration the safety of employees, the environment and the economic values represented by installations and vessels. The Petroleum Act specifically requires that petroleum operations be carried out in such a manner that a high level of safety is maintained and developed in step with technological developments. Statoil is also required at all times to have a plan to deal with emergency situations in our petroleum operations. During an emergency, the Norwegian Ministry of Labour/Norwegian Ministry of Fisheries and Coastal Affairs/Norwegian Coastal Administration may decide that other parties should provide the necessary resources, or otherwise adopt measures to obtain the necessary resources, to deal with the emergency for the licensees' account.

As a result of the Macondo incident, in 2011, the US Department of the Interior created two new agencies to administer operations and activities in the Gulf of Mexico - the Bureau of Safety and Environmental Enforcement (BSEE) and the Bureau of Offshore Energy Management (BOEM). The department also issued new regulations to address the respective roles of the new agencies. Application of these regulations has the potential to affect Statoil's operations in the US. Similarly, the effects from implementing the EU offshore Safety Directive in EU-member states' legislation will affect operations in relevant EU member countries.

See also section 5.1 *Risk factors.*

3.12.6 Taxation of Statoil

Statoil is subject to ordinary Norwegian corporate income tax and to a special petroleum tax relating to its offshore activities in Norway. Internationally, Statoil's activities are mainly subject to tax in the countries where it operates.

Taxation in Norway
Statoil's Norwegian petroleum activities are subject to ordinary corporate income tax and to a special petroleum tax. In addition, there are taxes on both carbon dioxide emissions and emissions of nitrogen oxide (NOx).

Corporate income tax

Statoil's profits, both from offshore oil and natural gas activities and from onshore activities, are subject to Norwegian corporate income tax. The standard corporate income tax rate has been reduced from 27% in 2015 to 25% in 2016. Statoil's profits are computed in accordance with ordinary Norwegian corporate income tax rules, subject to certain modifications that apply to companies engaged in petroleum operations. Gross revenue from oil production is determined on the basis of norm prices. Norm prices are decided on a daily basis by the Petroleum Price Board, and published quarterly. The Petroleum Tax Act states that the norm prices shall correspond to the prices that could have been obtained in a sale of petroleum between independent parties in a free market.

The maximum rate of depreciation of development costs relating to offshore production installations and pipelines is 16.67% per year. Depreciation starts when the cost is incurred. Exploration costs may be deducted in the year in which they are incurred. Financial costs related to the offshore activity are calculated directly based on a formula set out in the Petroleum Tax Act. The financial costs deductible under the offshore tax regime are the total interest costs and exchange gains and losses related to interest-bearing debt multiplied by 50% of the tax values covered by the petroleum tax regime divided by the average interest-bearing debt. All other financial costs and income are allocated to the onshore tax regime.

Abandonment costs incurred can be deducted as operating expenses. Provisions for future abandonment costs are not tax deductible.

Any tax losses can be carried forward indefinitely against subsequent income earned. 50% of losses relating to activity conducted onshore in Norway can be deducted from NCS income subject to the standard income tax rate (reduced from 27% in 2015 to 25% in 2016). Losses on foreign activities cannot be deducted from NCS income.

By using group contributions between Norwegian companies in which Statoil holds more than 90% of the shares and votes, tax losses and taxable income can be offset to a great extent. Group distributions are not deductible from Statoil's NCS income.

Dividends received are subject to tax in Norway. The basis for taxation is 3% of the dividends received, which is subject to the standard income tax rate (reduced from 27% in 2015 to 25% in 2016). Dividends received from Norwegian companies and from similar companies resident in the EEA for tax purposes, in which the recipient holds more than 90% of the shares and votes, are fully exempt from tax. Dividends from companies resident in the EEA that are not similar to Norwegian companies, companies in low-tax countries and portfolio investments outside the EEA will, under certain circumstances, be subject to the standard income tax rate (reduced from 27% in 2015 to 25% in 2016) based on the full amounts received.

Capital gains from the realisation of shares are exempt from tax. Exceptions apply to shares held in companies resident in low-tax countries or portfolio investments in companies resident outside the EEA for tax purposes, where, under certain circumstances, capital gains will be subject to the standard income tax rate (reduced from 27% in 2015 to 25% in 2016) and capital losses will be deductible.

Special petroleum tax

A special petroleum tax is levied on profits from petroleum production and pipeline transportation on the NCS. The special petroleum tax rate has been increased from 51% in 2015 to 53% in 2016. The special petroleum tax rate is applied to relevant income in addition to the standard income tax rate, resulting in a 78% marginal tax rate on income subject to the special petroleum tax. The basis for computing the special petroleum tax is the same as for income subject to ordinary corporate income tax, except that onshore losses are not deductible from the special petroleum tax basis, and a tax-free allowance, or uplift, is granted at a rate of 5.5% per year. The uplift is computed on the basis of the original capitalised cost of offshore production installations. The uplift can be deducted from taxable income for a period of four years, starting in the year in which the capital expenditure is incurred. Unused uplift can be carried forward indefinitely. For further information see note 9 *Income taxes*.

Taxation outside Norway

Statoil's international petroleum activities are subject to tax pursuant to local legislation. Fiscal regulation of Statoil's upstream operations is generally based on corporate income tax regimes and/or production sharing agreements (PSA). Royalties may apply in either case. Statoil is subject to excess (or "windfall") profit tax in some of the countries in which it produces crude oil or condensate.

Production sharing agreements (PSA)

Under a PSA, the host government typically retains the right to the hydrocarbons in place. The contractor normally receives a share of the oil produced to recover its costs, and is also entitled to an agreed share of the oil as profit ("profit oil"). The state's share of profit oil typically increases based on a success factor, such as surpassing certain specified internal rates of return, production rates or accumulated production. The contractor is usually subject to income tax on its own share of the profit oil. Normally, the contractors carry the exploration costs and risk prior to a commercial discovery and are then entitled to recover those costs during the production phase. Fiscal provisions in a PSA are to a large extent negotiable and are unique to each PSA.

Income tax regimes

Under an income tax/royalty regime, companies are granted licences by the government to extract petroleum, and the state may be entitled to royalties, which are generally assessed on gross revenue from production, and a profit tax, which is generally based on the company's net taxable income from production as defined in a country's domestic tax legislation. In some countries, income from petroleum activities is also subject to a special petroleum tax in addition to ordinary corporate tax. In general, the fiscal terms surrounding these licences are non-negotiable and the company is subject to legislative changes in the tax laws.

3.13 Property, plant and equipment

Statoil has interests in real estate in many countries throughout the world. However, no individual property is significant.

Statoil's head office is located at Forusbeen 50, NO-4035, Stavanger, Norway and comprises approximately 135,000 square metres of office space. In June 2015 Statoil closed a sales transaction for the sale of the company's head office building in Stavanger, and at the same time, Statoil entered into a 15 year operating lease agreement for the building. For more information see note 4 *Acquisitions and disposals* to the Consolidated financial statements.

In October 2012, Statoil moved into a new 65,500-square-metre office building located at Fornebu on the outskirts of Norway's capital Oslo. Statoil as tenant has signed a long-term lease agreement with the owner of the office building, IT-Fornebu AS. The new office building provides an environmentally friendly workplace for up to 2,500 employees.

For a description of our significant reserves and sources of oil and natural gas, see note 27 *Supplementary oil and gas information (unaudited)* to the Consolidated financial statements.

3.14 Related party transactions

See note 24 *Related parties* to the Consolidated financial statements for information concerning related parties.

3.15 Insurance

Statoil maintains insurance coverage that includes coverage for physical damage to its oil and gas properties, third-party liability, workers' compensation and employers' liability, general liability, sudden pollution and other coverage.

Statoil's insurance coverage includes deductibles that must be met prior to recovery. Statoil's external insurance is subject to caps, exclusions and limitations, and there is no assurance that such coverage will adequately protect Statoil against liability from all potential consequences and damages.

Our well control policies, which cover costs relating to well control incidents (including pollution and clean-up costs) are subject to the following limits for the two of the areas Statoil operates:

NCS
- NOK 2,500 million plus USD 1,500 million per incident for exploration wells
- NOK 2,000 million per incident for production wells

Gulf of Mexico
- Local well control limit (typically in the area of USD 300 million) plus USD 1,500 million per incident for exploration wells
- Local well control limit (typically in the area of USD 300 million) for production wells

The above limits assume a 100% ownership interest in a given well and would scaled to be equivalent to our percentage ownership interest in a given well. In addition to the well control insurance programmes, we have in place a third-party liability insurance programme with a gross limit of USD 800 million per incident.

3.16 People and the group

3.16.1 Employees in Statoil

The Statoil group employs approximately 21,600 employees. Of these, approximately 19,000 are employed in Norway and approximately 2,600 outside Norway.

	Number of employees			Women		
Permanent employees and percentage of women in the Statoil group	2015	2014	2013	2015	2014	2013
Norway	18,977	19,670	20,336	30%	30%	30%
Rest of Europe	855	909	935	29%	31%	30%
Africa	98	117	140	35%	34%	33%
Asia	97	135	140	36%	52%	53%
North America	1,265	1,375	1,559	35%	34%	35%
South America	289	310	303	38%	40%	38%
TOTAL	21,581	22,516	23,413	30%	31%	31%
Non-OECD	**590**	**677**	**690**	**40%**	**40%**	**39%**

Total workforce by region, employment type and new hires in the Statoil group in 2015

Geographical Region	Permanent employees	Consultants	Total Workforce[1]	Consultants (%)	Part time (%)	New hires
Norway	18,977	424	19,401	2%	3%	103
Rest of Europe	855	99	954	10%	1%	70
Africa	98	5	103	5%	NA	6
Asia	97	5	102	5%	NA	2
North America	1,265	112	1,377	8%	0%	142
South America	289	3	292	1%	0%	8
TOTAL	21,581	648	22,229	3%	3%	331
Non-OECD	590	15	605	2%	na	19

1) Enterprise personnel, defined as third-party service providers who work at our onshore and offshore operations, are not included. These were roughly estimated to be around 30,500 in 2015.

Statoil works systematically with recruitment and development programmes in order to build a diverse workforce by attracting, recruiting and retaining people of both genders and different nationalities and age groups across all types of positions.

In 2015, 19% of employees and 22% of our managerial staff held nationalities other than Norwegian. Outside Norway, Statoil aims to increase the number of people and managers who are locally recruited and to reduce the long-term use of expats in business operations. In 2015, 73% of new hires in Statoil were non-Norwegians and 35% were women.

In Statoil, the total turnover rate for 2015 was 3.6%. On 31 December 2015, the Statoil group employed 21.581 permanent employees and 3% of the workforce worked part-time. In the annual organisational and working environment survey, which continued to have a high response of 85%, our employees reported an overall satisfaction of 4.6. This is a slight increase from the score of 4.5 in 2014.

Our people performance data relates to permanent employees in our direct employment. Statoil defines consultants as contracted personnel that are mainly based in our offices. Temporary employees and enterprise personnel are not included in the workforce table. Enterprise personnel are defined as third party service providers and work on our on-shore and off-shore operations. These were roughly estimated to be around 30,500 in 2015. The information about people policies applies to Statoil ASA and its subsidiaries.

3.16.2 Equal opportunities

We are committed to building a workplace that promotes diversity and inclusion through its people processes and practices.

We promote diversity among our employees. We try to create the same opportunities for everyone and do not tolerate discrimination or harassment of any kind in our workplace. In 2015, we continued to focus on strengthening women in leadership and professional positions and on building broad international experience in our workforce. Our commitment to diversity and inclusion was demonstrated in the 2015 Global People Survey, where we maintained our high score of 5.1 (6 being the highest) for the existence of zero tolerance for discrimination and harassment within the workplace.

In 2015, the overall percentage of women in the company was 30%. The percentage of women in the board of directors is 50% (67% among the employee representatives and 43% among members elected by the shareholders). In the corporate executive committee the female representation has increased from last year's 11% to 18% in 2015. We pay close attention to male-dominated positions and discipline areas, and in 2015 the proportion of female engineers remained stable at 27% in Statoil ASA. Among staff engineers with up to 20 years' experience, the proportion of women increased to 31%. We continue to strive to increase the number of female managers through our development programmes, and in 2015 despite the overall reduction of 181 leadership positions, we increased the share of women in management by 0.5%. The percentage of appointment of women in new leadership positions in 2015 was 36%.

At Statoil we reward our people on the basis of their performance, giving equal emphasis to delivery and behaviour. Our reward approach is adapted to local market conditions at the locations in which we operate and is transparent, non-discriminatory and supports equal opportunities. Given the same position, experience and performance, our employees will be at the same remuneration level relative to the local market. This is demonstrated in the salary ratio between women and men at different levels in Statoil ASA. In 2015 we have maintained a high ratio, with an average of 98%.

The intake of apprentices in Norway is an important part of the company's recruitment of skilled workers and commitment to the education and training of young technicians and operators in the oil and gas industry. In 2015, apprenticeships were given to 130 new students; of these 42 were female. The total number of apprentices in Statoil is 282.

3.16.3 Unions and representatives

Statoil's cooperation with employee representatives and trade unions is based on confidence, trust and continuous dialogue between management and the people in various cooperative bodies.

In Statoil ASA, 70% of the employees in the parent company are members of a trade union. Work councils and working environment committees are established where required by law or agreement. Town hall meetings are also used for information and consultations in accordance with requirements and usage in each country.

In Norway, the formal basis for collaboration with labour unions is established in the Basic Agreements between the Confederation of Norwegian Enterprise (NHO) and the corresponding respective national labour confederations (unions).

Statoil promotes good employee and industrial relations practices through various networks and forums, including IndustriALL Global Union (IndustriAll) and International Labour Organisation (ILO).

In 2015, management and employee representatives collaborated closely, in particular on the three corporate change initiatives Statoil technical efficiency programme (STEP), Organisational efficiency programme (OE) and Corporate Review 2015. In addition, the European Works Council continued to be an important channel between the company and employees.

We collaborate with employee representatives in the change processes, and we strive to find solutions that are satisfactory both for our employees and for the company. To handle redundancies resulting from the ongoing change processes in 2015, we used measures such as internal deployment, severance packages and early retirement.

3.17 Safety, security and sustainability

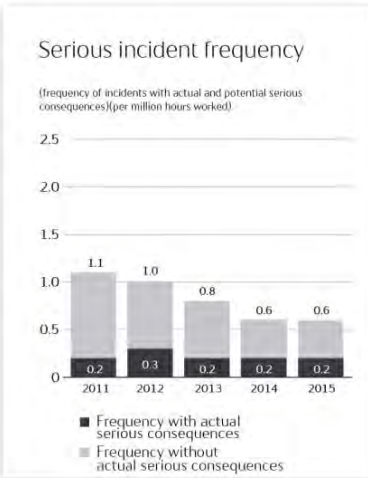
Statoil's ambition is to be an industry leader in safety, security and carbon efficiency.

Safety and security

Statoil's ambition is to ensure safe and secure operations that protect people, the environment, communities and assets. Statoil's approach to safety and security entails preventing accidents and incidents, avoiding oil spills, ensuring a healthy work environment and developing a strong security culture.

Statoil works closely with industry peers on incident prevention and emergency preparedness. Through assurance activities, and by analysing Statoil's own incidents along with those of the industry at large, Statoil aims to ensure a dynamic approach to safety and security performance management. A global oil spill response system has been established, which includes close collaboration with industry peers and national and local communities. Trained response teams and sufficient equipment are ready to be mobilised when and where needed.

Everyone working for Statoil, and in the joint ventures controlled by Statoil, is required to comply with Statoil's safety, health and security standards. Statoil actively engages with contractors and joint ventures to encourage the embedding of a strong safety and security culture in the workforce.



Statoil uses serious incident frequency (SIF) as a key indicator to monitor safety performance. This indicator (number of serious incidents, including near misses, per million hours worked) combines actual consequences of incidents and the potential for incidents to develop into serious or major accidents. The SIF has significantly improved over the last years, from 1.1 incidents per million hours worked in 2011 to 0.6 incidents per million hours worked in 2015.

Total recordable injuries per million hours worked (TRIF) improved from 3.0 in 2014 to 2.7 in 2015. The TRIF for Statoil's employees was 2.3 and the TRIF for Statoil's contractors was 2.8.

Regrettably, there were three fatalities related to Statoil's operations in 2015. One person died and two persons were injured as a result of a breaking wave that hit the drilling rig COSL Innovator on 30 December 2015. Two separate road accidents in the USA resulted in two fatalities.

Accidental oil spills were significantly reduced from 2014 to 2015. The total volume spilt was 23 m^3 in 2015, down from 125 m^3 in 2014.

Preventing oil and gas leakages is important to avoid major accidents. In 2015, the total number of serious leakages (leakages above 0.1kg/sec) increased to 21, up from 13 in 2014. All leakages are undergoing formal investigations and in-depth studies in order to capture learning and prevent similar incidents in the future.

Security is a key issue for the oil and gas industry because it operates in many unstable regions. At Statoil, security risk is systematically assessed on a continuous basis in order to achieve effective and proportionate security risk management. No security incidents with major consequences for Statoil were recorded in 2015. The two-year Security Improvement Programme, established to significantly raise security capabilities and develop a stronger security culture, was finished on schedule in 2015. A road map has been established to further strengthen our security culture and capabilities by 2020.

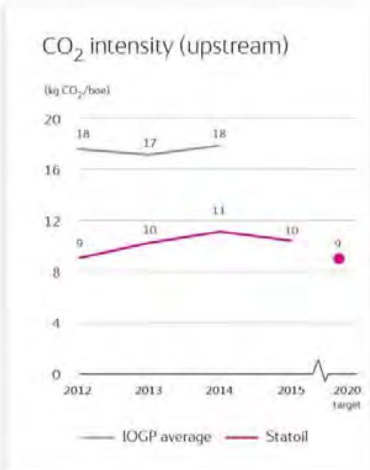
Climate change

Statoil recognises the ambition to limit the average global temperature rise to below two degrees centigrade compared to pre-industrial levels. The Paris agreement on climate change negotiated at the UN Conference of Parties (COP21) in December 2015 provides the prospect of improved policy support around the world for accelerating the shift to low carbon solutions. Statoil welcomes the agreement and believes that the company is well positioned to play its part.

Statoil's approach to climate change entails four key aspects:

- supporting the development of viable global climate policies
- managing climate risks and opportunities
- managing emissions
- developing low carbon energy solutions

Statoil carefully monitors and assesses the potential impact of climate change. Both the corporate executive committee and board of directors frequently discuss the business risks and opportunities associated with climate change, including market, regulatory and physical risk factors. Tools such as internal carbon pricing, scenario planning and stress testing of projects against various oil and gas price assumptions, are used. Statoil regularly assesses how the development of technologies and changes in regulations, including the introduction of stringent climate policies, may impact the oil price, the costs of developing new oil and gas assets, and the demand for oil and gas.



Statoil's efforts to reduce direct greenhouse gas (GHG) emissions includes improving energy efficiency; reducing methane emissions; eliminating routine flaring and scaling up carbon capture and storage.

The production from Statoil-operated assets increased from 997 mmboe in 2014 to 1073 mmboe in 2015[1]. The total direct GHG emissions from Statoil's operated assets remained stable at 16.3 million tonnes CO_2 equivalents in 2015. GHG emissions include carbon dioxide (CO_2) and methane (CH_4), where CO_2 constitutes the largest part (15.4 million tonnes in 2015).

In 2015, Statoil established a 2020 carbon intensity target of 9 kg CO_2/boe for its upstream activities. Statoil's upstream carbon intensity was 10kg CO_2/boe in 2015 – less than 60% of the industry average of 18kg as measured by the International Association of Oil and Gas Producers (Environmental Performance Indicators, 2014 data).

Indirect (scope 2) GHG emissions were 0.3 million tonnes CO_2 equivalents in 2015, using a location based emission factor. Scope 3 GHG emissions (emissions from the use of Statoil's equity production) were estimated to 295 million tonnes CO_2 equivalents.

Statoil's operations in Europe are subject to emissions allowances according to the EU Emissions Trading System (EU ETS). Statoil's Norwegian operations are subject to both the Norwegian offshore CO_2 tax and EU ETS quotas. In 2015, Statoil paid some NOK 4.0 billion in CO_2 tax and quotas.

In 2015, Statoil announced a new business area for New Energy Solutions. Statoil's approach to growth opportunities within renewables and new energy solutions includes both commercial investments and research and development (R&D). Statoil has made investments in offshore wind projects and continues to be engaged in carbon capture and storage. A significant proportion of Statoil's R&D efforts address energy efficiency, carbon capture and renewables. See section 3.8.1 *New Energy Solutions (NES)* for more information.

Environmental impact and resource efficiency

Statoil is committed to using resources efficiently and strives to apply high standards for waste management, emissions to air and impact on ecosystems – in all operations. Statoil's fresh water consumption decreased from 14.8 million cubic metres in 2014 to 14.5 million cubic metres in 2015. Improving water efficiency in the onshore activities in North America through means such as water recycling and substituting fresh water with brackish water, is a priority.

Working with suppliers

Statoil is committed to using suppliers who operate consistently in accordance with Statoil's values and who maintain high standards of safety, security and sustainability. These aspects are incorporated in all phases of the procurement process. All potential suppliers must meet Statoil's minimum requirements in order to qualify as a supplier and these include safety, security and sustainability criteria.

After awarding a contract, a supplier follow-up strategy is established, based on a risk assessment. Statoil's expectations regarding safety, security and sustainability are communicated to the supplier in the contract start-up meeting and throughout the contract period. Assurance activities are conducted, such as follow-up meetings, verifications and audits to manage identified risks. Supply chain personnel are trained in safety, security and sustainability risk handling through classroom courses, e-learning courses and awareness sessions.

Human rights

Statoil seeks to conduct its business in a way that is consistent with the ten UN Guiding Principles on Business and Human Rights (the UN Guiding Principles), the UN Global Compact principles and the Voluntary Principles on Security and Human Rights. Statoil is committed to respecting internationally recognised human rights as laid out in the International Bill of Human Rights, the International Labour Organisation's 1998 Declaration on Fundamental Rights and Principles at Work, and applicable standards of international humanitarian law.

Throughout 2015, a stand-alone human rights policy was developed, to give greater weight to Statoil's long-standing commitment to respect human rights. The policy was based on consultations and workshops with relevant experts and stakeholders. A gap analysis has been initiated to identify how Statoil's human rights processes and practices need to further evolve to reflect the new policy. Human rights aspects are integrated into relevant internal management processes, tools and training. On-going activities, business relationships and new business opportunities are assessed for potential human rights impacts and aspects, following a risk-based approach. In 2015, supplier verification practices were enhanced. Human rights training is provided to employees based on risk and relevance.

[1] Climate and environmental performance data represent total figures from Statoil-operated assets (operational control), except from scope 3 emissions, which are calculated based on Statoil's equity production.

4 Financial review

4.1 Operating and financial review

4.1.1 Sales volumes

Sales volumes include lifted entitlement volumes, the sale of SDFI volumes and marketing of third-party volumes.

In addition to Statoil's own volumes, we market and sell oil and gas owned by the Norwegian State through the Norwegian State's share in production licences. This is known as the State's Direct Financial Interest or SDFI. For additional information, see section 3.12.4 *SDFI oil and gas marketing and sale*. The following table shows the SDFI and Statoil sales volume information on crude oil and natural gas for the periods indicated. The Statoil natural gas sales volumes include equity volumes sold by the MMP segment, natural gas volumes sold by the DPI segment and ethane volumes.

	For the year ended 31 December		
Sales Volumes[1]	2015	2014	2013
Statoil:[2]			
Crude oil (mmbbls)[3]	**378**	353	347
Natural gas (bcf)	**1,645**	1,596	1,622
Combined oil and gas (mmboe)	**671**	637	636
Third party volumes:[4]			
Crude oil (mmbbls)[3]	**290**	304	303
Natural gas (bcf)	**304**	285	434
Combined oil and gas (mmboe)	**344**	355	380
SDFI assets owned by the Norwegian State:[5]			
Crude oil (mmbbls)[3]	**149**	148	155
Natural gas (bcf)[1]	**1,400**	1,254	1,351
Combined oil and gas (mmboe)	**398**	371	396
Total:			
Crude oil (mmbbls)[3]	**816**	805	805
Natural gas (bcf)	**3,348**	3,134	3,407
Combined oil and gas (mmboe)	**1,413**	1,363	1,412

1) The volumes in columns 2014 and 2013 are updated to reflect total sales volumes of crude oil (mmbbls) and natural gas (bcf). Previously only volumes from MMP were disclosed.

2) The Statoil volumes included in the table above are based on the assumption that volumes sold were equal to lifted volumes in the relevant year. Volumes lifted by DPI but not sold by MMP, and volumes lifted by DPN or DPI and still in inventory or in transit may cause these volumes to differ from the sales volumes reported elsewhere in this report by MMP.

3) Sales volumes of crude oil include NGL and condensate. All sales volumes reported in the table above include internal deliveries to our manufacturing facilities.

4) Third party volumes of crude oil include both volumes purchased from partners in our upstream operations and other cargos purchased in the market. The third party volumes are purchased either for sale to third parties or for our own use. Third party volumes of natural gas include third party LNG volumes related to our activities at the Cove Point regasification terminal in the US.

5) The line item SDFI assets owned by the Norwegian State include sales of both equity production and third party gas.

4.1.2 Group profit and loss analysis

Net operating income was down by 86% in 2015, impacted by significantly lower prices and increased net impairment losses.

Operational data	For the year ended 31 December 2015	2014	2013	15-14 change	14-13 change
Prices					
Average Brent oil price (USD/bbl)	**55.3**	98.9	108.7	(44%)	(9%)

Liftings (mboe per day)					
Liquids liftings	**1035**	**967**	**950**	7%	2%
Gas liftings	**802**	**779**	**792**	3%	(2%)
Total liquids and gas liftings	**1837**	**1,746**	**1,742**	5%	0%
Marketing, Midstream and Processing sales volumes					
Crude oil sales volumes (mmbl)	**829**	811	809	2%	0%
Natural gas sales Statoil entitlement (bcm)	**44.0**	43.1	44.3	2%	(3%)
Natural gas sales third-party volumes (bcm)	**8.6**	8.1	12.3	6%	(34%)
Production cost (NOK/boe, last 12 months)					
Production cost entitlement volumes	**52**	55	50	(5%)	10%
Production cost equity volumes	**48**	49	44	(2%)	11%

Total equity liquids and gas production (see section 9 *Terms and definitions)* was 1,971 mboe, 1,927 mboe and 1,940 mboe per day in 2015, 2014 and 2013, respectively.

The 2% increase in total equity production from 2014 to 2015 was primarily due to start-up and ramp-up on various fields, higher gas sales from the NCS and improved operational performance. Expected natural decline and reduced ownership shares as a result of divestments and redeterminations partially offset the increase.

The total equity production in 2014 was slightly lower compared to 2013. Start-up and ramp-up of production on various fields and higher production regularity compared to last year were offset by expected natural decline and reduced ownership shares from divestments.

Total entitlement liquids and gas production was 1,812 mboe per day in 2015 compared to 1,729 mboe in 2014 and 1,719 mboe per day in 2013.

The total entitlement production in 2015 was up 5% for the same reasons as described above. The benefit of lower effect from production sharing agreements (PSA effect) mainly driven by the reduction in prices, added to the increase in entitlement production. From 2013 to 2014 the development in total entitlement production was almost flat for the same reasons as described above and the benefit from lower PSA-effects.

The PSA effect was 116 mboe, 157 mboe and 182 mboe per day in 2015, 2014 and 2013, respectively.

Over time, the volumes lifted and sold will equal our entitlement production, but they may be higher or lower in any period due to differences between the capacity and timing of the vessels lifting our volumes and the actual entitlement production during the period, see section 9 *Terms and definitions* for more information.

Income statement under IFRS (in NOK billion)	For the year ended 31 December 2015	2014 (restated)	2013 (restated)	15-14 change	14-13 change
Revenues	465.3	606.8	616.6	(23%)	(2%)
Net income from equity accounted investments	(0.3)	(0.3)	0.1	2%	>(100%)
Other income	17.8	16.1	17.8	11%	(10%)
Total revenues and other income	482.8	622.7	634.5	(22%)	(2%)
Purchases [net of inventory variation]	(211.2)	(301.3)	(306.9)	(30%)	(2%)
Operating expenses and selling, general and administrative expenses	(91.9)	(80.2)	(81.9)	15%	(2%)
Depreciation, amortisation and net impairment losses	(133.8)	(101.4)	(72.4)	32%	40%
Exploration expenses	(31.0)	(30.3)	(18.0)	2%	69%
Net operating income	14.9	109.5	155.5	(86%)	(30%)
Net financial items	(10.6)	(0.0)	(17.0)	>100%	(100%)
Income before tax	4.3	109.4	138.4	(96%)	(21%)
Income tax	(41.6)	(87.4)	(99.2)	(52%)	(12%)
Net income	(37.3)	22.0	39.2	>(100%)	(44%)

Total revenues and other income amounted to NOK 482.8 billion in 2015 compared to NOK 622.7 billion in 2014 and NOK 634.5 billion in 2013. Revenues are generated from both the sale of lifted crude oil, natural gas and refined products produced and marketed by Statoil, and from the sale of liquids and gas purchased from third parties. In addition, we market and sell the Norwegian State's share of liquids from the NCS. All purchases and sales of the Norwegian State's production of liquids are recorded as Purchases [net of inventory variations] and Revenues, respectively, while sales of the Norwegian State's share of gas from the NCS are recorded net.

The 23% decrease in **revenues** from 2014 to 2015 was mainly due to the significant reduction in both liquids and gas prices measured in NOK. Stronger refinery margins in 2015 and higher volumes of both liquids and gas sold partially offset the decrease.

The 2% decrease in revenues from 2013 to 2014 was mainly due to decreased prices for liquids and European gas and reduced volumes of liquids and gas sold, partly offset increased US gas prices and the exchange rate development (USD/NOK). Also, revenues in 2014 were positively impacted by gains from derivatives, mainly due to a significant drop in the forward curve in the oil market.

Other income was NOK 17.8 billion in 2015 compared to NOK 16.1 billion in 2014 and NOK 17.8 billion in 2013. Other income in 2015 was mainly related to gains from sales of certain ownership interest the Shah Deniz project (NOK 12.4 billion), the Trans Adriatic Pipeline (NOK 1.4 billion) and the Gudrun field (NOK 1.2 billion). Also, gain from sales of office buildings in Norway (NOK 2.1 billion) impacted other income in 2015.

Other income in 2014 consisted of the gain from the sale of certain ownership interests on the NCS to Wintershall (NOK 5.9 billion) and the divestment of working interests in the Shah Deniz Project and South Caucasus Pipeline (NOK 5.4 billion.) In addition, an arbitration settlement (NOK 2.8 billion) following an arbitration ruling in Statoil's favour, impacted other income in 2014. In 2013, other income consisted of gains from sale of certain ownership interests on the NCS to OMV (NOK 10.1 billion) and Wintershall (NOK 6.4 billion).

As a result of the factors explained above, **total revenue and other income** decreased by 22% in 2015. In 2014, the decrease was 2%.

Purchases [net of inventory variation] include the cost of liquids purchased from the Norwegian State, which is pursuant to the Owner's instruction, and the cost of liquids and gas purchased from third parties. See section 3.12.4 *SDFI oil and gas marketing and sale* for more details.

Purchases [net of inventory variation] amounted to NOK 211.2 billion in 2015 compared to 301.3 billion in 2014 and NOK 306.9 billion in 2013. The 30% decrease from 2014 to 2015 was mainly related to the significant lower prices for liquids and gas and other oil products and a write-down of inventories from cost to market value of NOK 3.9 billion, partially offset by the USD/NOK exchange rate development. The 2% decrease from 2013 to 2014 was mainly related to lower prices for liquids and gas including the write-down of inventories from cost-to-market value of NOK 4.0 billion and reduced third-party volumes. These effects were partially offset by the USD/NOK exchange rate development.

Operating expenses and selling, general and administrative expenses amounted to NOK 91.9 billion in 2015 compared to NOK 80.2 billion in 2014, and NOK 81.9 billion in 2013.

The 15% increase from 2014 to 2015 was mainly due to the USD/NOK exchange rate development in 2015 and because a curtailment gain related to the change of pension plan was included in 2014 (discussed below). Lower operation and maintenance costs, lower royalties due to reduced liquids prices, lower transportation costs and portfolio changes in addition to positive effects from on-going cost initiatives, partially offset the increase. Excluding the USD/NOK exchange rate development and the effect of the curtailment gain in 2014, operating expenses and selling, general and administrative expenses decreased by 3%.

The 2% decrease from 2013 to 2014 was mainly due to a curtailment gain of NOK 3.5 billion recognised upon the decision to change the company's pension plan in Norway in 2014 and an onerous contract provision of NOK 4.9 billion related to the Cove Point terminal in the US recognised in 2013. These effects were offset by increased expenses in 2014 mainly due to new fields coming on stream, onshore production ramp-up and increased transportation costs in the North America. In addition, the exchange rate development (NOK/USD) increased the expenses in 2014 compared to 2013.

Depreciation, amortisation and net impairment losses amounted to NOK 133.8 billion in 2015 compared to NOK 101.4 billion in 2014 and NOK 72.4 billion in 2013. Included in these totals were net impairment losses of NOK 47.8 billion, NOK 26.9 billion and NOK 7.0 billion for 2015, 2014 and 2013 respectively, related to the continuously falling commodity prices.

Net impairment losses of NOK 47.8 billion in 2015 were mainly related to unconventional onshore assets in the USA and other conventional assets in the DPI segment (NOK 42.7 billion), conventional offshore assets in the development phase in the DPN segment (NOK 8.7 billion) and a net impairment reversal of NOK 3.5 mainly related to a refinery in the MMP segment. See note 11 *Property, plant and equipment* to the Consolidated financial statements for further details.

Compared to 2014, the 32% increase in 2015 was mainly due to increased impairment charges primarily as a result of the further declining long-term commodity price assumptions in the first quarter of 2015. In addition, the USD/NOK exchange rate development and start-up and ramp-up of production of several fields added to the increase in depreciation. Reduced overall depreciation because of net impairments of assets in both 2014 and 2015 with a corresponding lower basis for depreciation partially offset the increase.

Depreciation, amortisation and net impairment losses increased by 40% in 2014 compared to 2013, mainly due to impairment losses related to Statoil's international operations, primarily driven by reduced short-term oil price forecasts. Also, new investments, higher production and increased asset retirement obligation, with a corresponding higher basis for depreciation, partly offset by increased estimates of proved reserves, added to increased depreciation costs in 2014 compared to 2013.

Exploration expenses (in NOK billion)	For the year ended 31 December 2015	2014	2013	15-14 change	14-13 change
Exploration expenditures (activity)	**23.1**	23.9	21.8	(3%)	10%
Expensed, previously capitalised exploration expenditures	**1.7**	2.4	1.9	(28%)	26%
Capitalised share of current period's exploration activity	**(9.2)**	(7.3)	(6.9)	27%	6%
Impairments, net of reversals	**15.4**	11.3	1.2	36%	>100%
Exploration expenses	**31.0**	30.3	18.0	2%	69%

In 2015, **exploration expenses** were NOK 31.0 billion, a 2% increase compared to 2014 when exploration expenses were NOK 30.3 billion. In 2013, exploration expenses were NOK 18.0 billion

Exploration expenses were up 2% in 2015 mainly due to the USD/NOK exchange rate development and increased impairment of exploration prospects and signature bonuses in 2015. A lower level of drilling activity, a higher capitalisation rate and a lower portion of previously capitalised expenditures being expensed in 2015, partially offset the increase.

The increase in exploration expenses in 2014 compared to 2013 was mainly due to increased impairments of exploration prospects and signature bonuses internationally. Also, the cancellation of a rig contract in 2014 impacted exploration expenses negatively in 2014 compared to 2013.

As a result of the factors explained above, **net operating income** was NOK 14.9 billion in 2015, compared to NOK 109.5 billion in 2014. In 2013, net operating income was NOK 155.5 billion.

Net financial items were negative NOK 10.6 billion in 2015, compared to NOK 0.0 billion in 2014 and negative NOK 17.0 billion in 2013. The decrease in 2015 was mainly related to loss of NOK 3.8 billion on derivatives related to the long term debt portfolio in 2015, compared to a gain of NOK 5.8 billion in 2014, mainly due to changes in the interest yield curves.

In 2014, net financial items improved from negative NOK 17.0 billion in 2013 to NOK 0.0 billion mainly due to a positive change in currency derivatives used for currency and liquidity risk management as a result of changes in underlying currency positions and strengthening of USD towards NOK of 22.2% in 2014 compared to a strengthening of USD towards NOK of 9.3% in 2013. The improvement in 2014 also reflected a positive change on interest rate swap positions related to interest rate management of non-current bonds mainly due to decreased long term USD interest rates by an average of 0.6%-points in 2014 compared to an increase in 2013 by an average of 1.0%-points. These positive changes were partially offset by increased interest and other finance expenses in 2014.

Income taxes were NOK 41.6 billion in 2015, equivalent to an effective tax rate of more than 100%, compared to NOK 87.4 billion, equivalent to an effective tax rate of 79.9% in 2014. In 2013, income taxes were NOK 99.2 billion, equivalent to an effective tax rate of 71.7%.

In 2015, aggregated accounting losses were recognised in countries with higher than average tax rates, hence the "weighted average statutory tax rate" was negative. The **effective tax rate** in 2015 was primarily influenced by losses, mainly caused by impairments recognised in countries where deferred tax assets could not be recognised (NOK 23.5 billion), partially offset by tax exempted gains on sale of assets including Statoil's interest in the Shah Deniz project (NOK 3.7 billion) and the tax effect of foreign exchange losses in entities that are taxable in other currencies than the functional currency (NOK 5.8 billion). These losses are tax deductible, but do not impact the Consolidated statement of income. Furthermore, the effective tax rate in 2015 was influenced by the de-recognition of deferred tax assets within the Development and Production International segment, due to uncertainty related to future taxable income (NOK 4.7 billion), as described in Note 9 *Income taxes* to the Consolidated financial statements.

The effective tax rate in 2014 was primarily influenced by losses, mainly caused by impairments, recognised in countries where deferred tax assets could not be recognised (NOK 12.1 billion), partially offset by tax exempted gains on sale of assets including Norwegian continental shelf (NCS) and Statoil's interest in the Shah Deniz project (NOK 6.2 billion) and the tax effect of foreign exchange losses in entities that are taxable in other currencies than the functional currency (NOK 5.1 billion). These losses are tax deductible, but do not impact the Consolidated statement of income. The effective tax rate in 2014 was also influenced by the recognition of a non-cash tax income (NOK 2.0 billion) following a verdict in the Norwegian Supreme Court in February 2014. The Supreme Court voted in favour of Statoil in a tax dispute regarding the tax treatment of foreign exploration expenditures.

The effective tax rate is calculated as income taxes divided by income before taxes. Fluctuations in the effective tax rates from year to year are principally the result of non-taxable items (permanent differences) and changes in the relative composition of income between Norwegian oil and gas production, taxed at a marginal rate of 78%, and income from other tax jurisdictions. Other Norwegian income, including the onshore portion of net financial items, is taxed at 27% (28% in 2013), and income in other countries is taxed at the applicable income tax rates in those countries.

In 2015, **net income** was negative NOK 37.3 billion compared to positive NOK 22.0 billion in 2014 and NOK 39.2 billion in 2013.

The significant decrease from 2014 to 2015 was mainly due to the drop in prices, leading to lower earnings and impairment losses. Increased losses on net financial items related to derivatives added to the decrease, which was partially offset by the reduction in income taxes.

The 44% decrease in net income from 2013 to 2014 was mainly due to lower prices, resulting in reduced earnings and impairment losses. Increased exploration expenditures added to the decrease, whilst lower income taxes partially offset the decrease.

The board of directors proposes a dividend of USD 0.2201 per share for the fourth quarter 2015 and the introduction of a two-year scrip dividend programme starting from the fourth quarter 2015, subject to approval at the annual general meeting in line with the authorisation from May 2015. The scrip programme will give shareholders the option to receive quarterly dividends in cash or in newly issued shares in Statoil, at a 5% discount for the fourth quarter 2015. The Norwegian Government, as majority shareholder, supports the proposal and will seek the Norwegian Parliament's approval to vote in favour of the proposal at the annual general meeting. The Norwegian government will match subscription of shares by minority shareholders, and thereby maintain its ownership share at 67% throughout the programme. See section 6.1 *Dividend policy* for more information.

Annual ordinary dividends for 2015 amounted to an aggregate total of NOK 23.5 billion. Annual ordinary dividends amounted to an aggregate total of NOK 22.9 billion and NOK 22.3 billion in 2014 and 2013, respectively.

In 2014, following a regular review process of Statoil's 2012 Consolidated financial statements, the Financial Supervisory Authority of Norway (the FSA), concluded that it had identified three errors related to interpretation and application of IFRS accounting principles for determination of cash generating units (CGUs) and impairment evaluations. For two of the matters, Statoil accepted the FSA's interpretations and has applied such interpretations in preparing the Consolidated financial statements. Statoil did not restate prior period financial statements as the impact was immaterial. For the third matter, Statoil does not accept the FSA's conclusion. In accordance with due process for such matters under Norwegian regulation, Statoil has appealed the order to the Norwegian Ministry of Finance, and has been granted a stay in carrying out the FSA's order pending the final outcome of the appeal. See note 23 *Other commitments, contingent liabilities and contingent assets* to the Consolidated financial statements for further details.

With effect from first quarter of 2016, Statoil will change to USD as presentation currency. The change reflects the company`s underlying exposure to the USD as well as better alignment of its reporting to peers.

4.1.3 Segment performance and analysis

Internal transactions in oil and gas volumes occur between our reporting segments before being sold in the market. The pricing policy for internal transfers is based on estimated market prices.

We eliminate intercompany sales when combining the results of reporting segments. Intercompany sales include transactions recorded in connection with our oil and natural gas production in DPN or DPI and also in connection with the sale, transportation or refining of our oil and natural gas production in MMP.

DPN produces oil and natural gas which is sold internally to MMP. A large share of the oil produced by DPI is also sold from MMP. The remaining oil and gas from DPI is sold directly in the market. For intercompany sales and purchases, Statoil has established a market-based transfer pricing methodology for the oil and natural gas that meets the requirements as to applicable laws and regulations.

Effective from the fourth quarter of 2013, revenues generated by the upstream segment in the United States are reported net of royalty interest. This change does not result in a change in net operating income. Historical information has been aligned to the current presentation, reflected in the following tables.

In 2015, the average transfer price for natural gas was NOK 1.58 per scm. The average transfer price was NOK 1.57 per scm in 2014 and NOK 1.92 in 2013. For oil sold from DPN to MMP, the transfer price is the applicable market-reflective price minus a cost recovery rate.

The following table shows certain financial information for the four reporting segments, including intercompany eliminations for each of the years in the three-year period ending 31 December 2015. For additional information please refer to note 3 *Segments* to the Consolidated financial statements.

	For the year ended 31 December		
(in NOK billion)	2015	2014	2013
Development & Production Norway			
Total revenues and other income	**139.5**	182.2	202.2

4.1.4 DPN profit and loss analysis

DPN net operating income was NOK 57.6 billion, down 48% compared to 2014 mainly driven by the drop in liquids prices and increased net impairment charges. Production of liquids and gas was up 3.9%.

The average daily production of liquids and gas (see section 9 *Terms and definitions*) was 1,232 mboe, 1,183 mboe and 1,217 mboe per day in 2015, 2014 and 2013, respectively.

The average daily total production of liquids and gas increased by 4% from 2014 to 2015, mainly due to ramp up of new fields, increased gas sales and good operational performance, partly offset by expected natural decline and divestments.

The average daily production of liquids and gas decreased by 3% from 2013 to 2014. This decrease was mainly due to expected natural decline and divestments, partially offset by new fields in production and higher production regularity in 2014 compared to 2013.

Over time, the volumes lifted and sold will equal entitlement production, but may be higher or lower in any period due to differences between the capacities and timing of the vessels lifting the volumes and the actual entitlement production during the period. See section 9 *Terms and definitions* for more information.

Income statement under IFRS (in NOK billion)	For the year ended 31 December 2015	2014	2013	15-14 change	14-13 change
Revenues	**138.1**	175.3	188.9	(21%)	(7%)
Net income from equity accounted investments	**0.0**	0.1	0.1	(62%)	18%
Other income	**1.4**	6.8	13.2	(79%)	(48%)
Total revenues and other income	**139.5**	182.2	202.2	(23%)	(10%)
Operating expenses and selling, general and administrative expenses	**(25.8)**	(25.2)	(27.4)	3%	(8%)
Depreciation, amortisation and net impairment losses	**(51.4)**	(40.0)	(32.2)	29%	24%
Exploration expenses	**(4.6)**	(5.4)	(5.5)	(14%)	(2%)
Net operating income	**57.6**	111.7	137.1	(48%)	(19%)

Total revenues and other income were NOK 139.5 billion in 2015, NOK 182.2 billion in 2014 and NOK 202.2 billion in 2013.

The 21% decrease in **revenues** from 2014 to 2015 was mainly due to reduced liquids prices. This was partly offset by a positive exchange rate development (NOK/USD), increased lifted volumes and increased gas prices. In addition, in 2015 a re-assessed valuation estimate of earn-out derivatives resulted in an unrealised fair value loss on derivatives and impacted revenues negatively.

The 7% decrease in **revenues** from 2013 to 2014 was mainly due to reduced gas and liquids prices and reduced lifted volumes of both liquids and gas, mainly caused by divestments and expected natural decline. This was partly offset by a positive exchange rate development (NOK/USD). In 2013, a re-assessed valuation estimate of earn-out derivatives resulted in an unrealised fair value loss on derivatives and impacted revenues negatively.

Other income in 2015 was impacted by gains from the sale of certain ownership interest on the NCS to Repsol of NOK 1.2 billion. Other income in 2014 was impacted by gains from the sale of certain ownership interests on the NCS to Wintershall of NOK 5.9 billion. Other income in 2013 was impacted by gains from sale of certain ownership interests on the NCS to OMV and Wintershall (NOK 13.0 billion).

As a result of the factors explained above, **total revenues and other income** decreased by 23% and 10% in 2015 and 2014, respectively.

Operating expenses and selling, general and administrative expenses were NOK 25.8 billion in 2015, compared to NOK 25.2 billion in 2014 and NOK 27.4 billion in 2013. In 2015, expenses increased compared to 2014 mainly due to gain related to changes in pension scheme in 2014 and ramp up of new field during 2015. This was partly offset by cost improvements and reduced turnaround activity level on several fields. In 2014 expenses decreased compared to 2013 mainly due to a gain related to changes in pension scheme and reduced operating costs at several fields due to divestments. This was partly offset by increased environmental tax expenses, operating preparations for new fields coming on stream and new fields commencing production during 2014.

Depreciation, amortisation and net impairment losses were NOK 51.4 billion in 2015, compared to NOK 40.0 billion in 2014 and NOK 32.2 billion in 2013. The increase of 29% from 2014 to 2015 was mainly due to a net impairment loss of NOK 8.6 billion in 2015 (primarily resulting from the reduced oil price forecast), new fields commencing production and ramp-up of new fields in 2015.The increase from 2013 to 2014 was mainly due to increased investments, new fields commencing production, increased asset retirement obligation with a corresponding higher basis for depreciations and an impairment loss. These effects were partly offset by reduced depreciation due to portfolio changes.

Exploration expenses were NOK 4.6 billion in 2015, compared to NOK 5.4 billion in 2014 and NOK 5.5 billion in 2013. The reduction from 2014 to 2015 was mainly due to lower drilling activity, a lower portion of previously capitalised exploration expenditures being expensed in 2015, and idle rig costs in 2014. The reduction from 2013 to 2014 was mainly due to lower drilling activity and less field development work due to sanctioning of Johan Sverdrup, offset by a higher portion of exploration expenditures capitalised in previous periods being expensed in 2014.

Net operating income in 2015 was NOK 57.6 billion, compared to NOK 111.7 billion in 2014 and NOK 137.1 billion in 2013. The NOK 54.0 billion decrease from 2014 to 2015 was mainly due to lower prices on liquids and increased depreciation and net impairment losses. The NOK 25.4 billion decrease from 2013 to 2014 was mainly due to lower prices on liquids and gas and increased depreciation and net impairment losses.

4.1.5 DPI profit and loss analysis

DPI results in 2015 were heavily impacted by lower prices and impairment losses. DPI delivered 6% growth in entitlement production, averaging 580 mboe per day.

The average daily equity liquids and gas production (see section 9 *Terms and definitions*) was 739 mboe in 2015, compared to 744 mboe in 2014 and 723 mboe in 2013. The decrease of 0.7% from 2014 to 2015 was driven primarily by the effect of the divestment of Shah Deniz (Azerbaijan) and a portion of Marcellus (US), and natural decline, primarily at mature fields in Angola. The decrease was partly offset by the ramp-up of fields, mainly CLOV (Angola) and Jack/St. Malo (US).

The increase of 3% from 2013 to 2014 was driven primarily by the ramp-up of fields, including Marcellus (US), CLOV and PSVM (Angola). The increase was partly offset by natural decline, primarily at mature fields in Angola, and the effect of the farm-down of Shah Deniz (Azerbaijan).

The average daily entitlement production of liquids and gas (see section 9 *Terms and definitions*) was 580 mboe per day in 2015, compared to 546 mboe per day in 2014 and 502 mboe per day in 2013. Entitlement production in 2015 was up by 6% due to the benefit of lower effect from production sharing agreements (PSA effect), mainly driven by the decrease in prices. The increase from 2013 to 2014 was driven by increased equity production as described above and a relatively lower PSA effect. The PSA effect was 116 mboe, 157 mboe and 182 mboe per day in 2015, 2014 and 2013, respectively.

Over time, the volumes lifted and sold will equal our entitlement production, but they may be higher or lower in any period due to differences between the capacity and timing of the vessels lifting our volumes and the actual entitlement production during the period. See section 9 *Terms and definitions* for more information.

Income statement under IFRS (in NOK billion)	For the year ended 31 December 2015	2014	2013	15-14 change	14-13 change
Revenues	**57.0**	80.2	78.1	(29%)	3%
Net income from equity accounted investments	**(0.8)**	(0.8)	(0.0)	1%	>100%
Other income	**12.2**	5.8	3.9	>100%	50%
Total revenues and other income	**68.4**	85.2	81.9	(20%)	4%
Purchases [net of inventory]	**(0.1)**	(0.0)	(0.1)	>100%	(85%)
Operating expenses and selling, general and administrative expenses	**(27.3)**	(22.9)	(21.0)	19%	9%
Depreciation, amortisation and net impairment losses	**(81.6)**	(56.8)	(31.9)	44%	78%
Exploration expenses	**(26.3)**	(25.0)	(12.5)	6%	100%
Net operating income	**(66.9)**	(19.5)	16.4	>100%	>(100%)

DPI generated **total revenues and other income** of NOK 68.4 billion in 2015 compared to NOK 85.2 billion in 2014 and NOK 81.9 billion in 2013.

Revenues in 2015 were negatively impacted by lower realised liquids and gas prices, partly offset by a positive currency effect from the NOK/USD development and an increase in lifted volumes. In addition, higher provisions relating to commercial disputes in 2015 compared to 2014 added to the decrease in total revenues. The increase from 2013 to 2014 was mainly caused by an increase in lifted volumes. In addition, lower provisions relating to commercial disputes in 2014 compared to 2013 positively impacted revenues. The increase was partly offset by lower realised liquids and gas prices, partly offset by a positive currency effect from the NOK/USD development.

Other income in 2015 was positively impacted by gains from sales of assets of NOK 12.2 billion in 2015 and NOK 5.8 billion in 2014, related primarily to the sale of ownership interest in the Shah Deniz project and the South Caucasus Pipeline. Other income in 2014 was also positively impacted by increased gains from sales of assets of NOK 2.3 billion.

As a result of the factors explained above, **total revenues and other income** decreased by 20% in 2015. In 2014, total revenues and other income increased by 4%.

Operating expenses and selling, general and administrative expenses were NOK 27.3 billion in 2015, compared to NOK 22.9 billion in 2014 and NOK 21.0 billion in 2013. The 19% increase from 2014 to 2015 was mainly due to the currency effect from the NOK/USD development. Production ramp-up on CLOV in Angola and start-up of the new fields Jack/St Malo in the US in 2014 added to the increase. Reduced operations and maintenance costs, lower royalties caused by lower prices and portfolio changes partially offset the increase. Excluding the USD/NOK exchange rate development, operating expenses and selling, general and administrative expenses decreased by 6%. The 9% increase from 2013 to 2014 was mainly due to higher operating and transportation expenses caused by production growth, primarily in North America. In addition, operating expenses increased due to the start-up of CLOV in 2014.

Depreciation, amortisation and net impairment losses were NOK 81.6 billion in 2015, compared to NOK 56.8 billion in 2014 and NOK 31.9 billion in 2013. The 44% increase from 2014 to 2015 was primarily caused by net impairment losses of NOK 42.7 billion in 2015, mainly related to unconventional onshore assets in North America and certain conventional upstream assets within the DPI reporting segment. The impairment losses resulted primarily from reduced short-term forward prices in combination with reduced long-term oil price forecasts. In addition, depreciation increased due to the NOK/USD development and higher production from start-up and ramp-up on various fields (CLOV, Jack/St Malo). The increases were partly offset by effect from net impairments in 2014 and 2015 and reduced depreciation from higher reserves estimates.

The 78% increase from 2013 to 2014 was mainly due to net impairment losses of NOK 23.8 billion in 2014, mainly related to the Kai Kos Dehseh oil sands project in Canada, unconventional onshore assets in North America and certain conventional upstream assets within the DPI reporting segment. The impairment losses were primarily resulting from reduced short-term oil price forecast. In addition, depreciation increased due to start-up and ramp-up of production from various fields (CLOV, PSVM, Eagle Ford and Bakken). The increases were partly offset by reduced depreciation from increased reserves and divestment of assets.

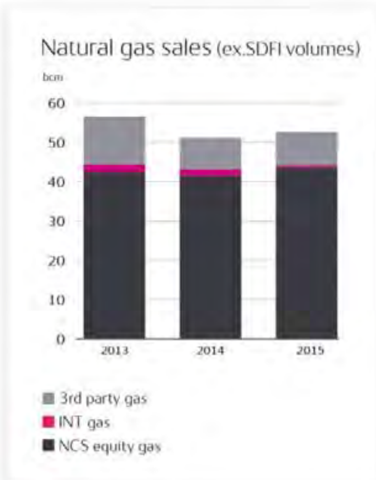
Exploration expenses were NOK 26.3 billion in 2015, compared to NOK 25.0 billion in 2014 and NOK 12.5 billion in 2013. The increase from 2014 to 2015 was mainly due to increased impairments of oil and gas prospects in the Gulf of Mexico, partly offset by a higher portion of exploration expenditure being capitalised in 2015.

Exploration expenses increased by NOK 12.5 billion from 2013 to 2014, primarily due to increased impairments of oil and gas prospects and signature bonuses and write-offs of exploration expenditures, mainly in Angola and the Gulf of Mexico. Also, the cancellation of a rig contract in 2014 impacted exploration expenses negatively in 2014.

Net operating income in 2015 was negative NOK 66.9 billion, compared to negative NOK 19.5 billion in 2014 and positive NOK 16.4 billion in 2013. The negative development from 2014 to 2015 was caused primarily by lower realised liquids and gas prices and impairment losses, and also by higher depreciations and higher operating expenses. The decrease from 2013 to 2014 was caused primarily by impairment losses, and also by lower realised liquids and gas prices, higher depreciations and higher operating expenses.

4.1.6 MMP profit and loss analysis

The 2015 results for MMP have been influenced by improved refining margins, solid liquids trading results and reversal of impairment losses from previous periods. The results were negatively impacted by lower margins for the European gas sales.

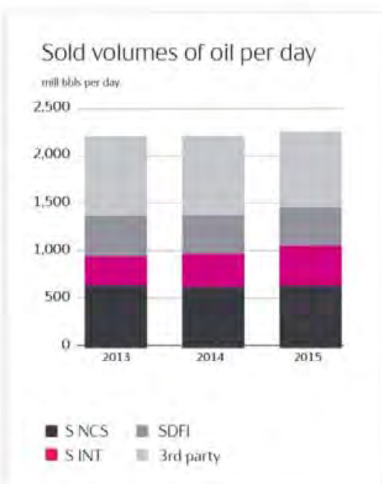


Total natural gas sales volumes were 52.6 bcm in 2015 (1.86 tcf), 51.2 bcm in 2014 (1.80 tcf) and 56.6 bcm (2.00 tcf) in 2013. The 3% increase in total gas volumes sold from 2014 to 2015 was related to higher entitlement production on the NCS in addition to higher third party volumes in Europe, partially offset by lower entitlement production internationally and lower third party volumes in the US. The 9% decrease in gas volumes sold from 2013 to 2014 was mainly related to lower third party volumes primarily in the US, and lower entitlement production on the NCS.

Third party natural gas sales volumes, as presented in the chart do not include volumes sold on behalf of the Norwegian State's direct financial interest (SDFI). MMP sold 37.2, 33.4 bcm and 35.0 bcm of NCS gas on behalf of SDFI in 2015, 2014 and 2013, respectively.

In 2015, the average invoiced natural gas sales price in Europe was NOK 2.16 per scm compared to NOK 2.28 per scm in 2014, a decrease of 5% mainly due to higher share of gas indexation in the gas contract portfolio and effect from drop in oil product prices on oil indexed contracts. LNG has a positive contribution on the European Gas price but less in 2015 as the LNG prices decreased by 23% from 2014 to 2015. The average invoiced natural gas sales price in Europe was approximately 7% lower in 2014 than in 2013, mainly due to general decrease in gas market prices partially offset by improved price premium vs. gas market prices in our gas contract portfolio. In 2015, the average invoiced natural gas sales price in North Americas was NOK 0.80 per scm compared to NOK 1.04 per scm in 2014, a decrease of 23% mainly due to a generally weaker gas market partially offset by USD/NOK exchange rate development. The average invoiced natural gas sales price in North Americas was approximately 25% higher in 2014 than in 2013, mainly due to high market prices in first quarter 2014 as a result of exceptionally cold weather in North East combined with long term pipeline capacity agreements enabling access to premium markets in Toronto and Manhattan.

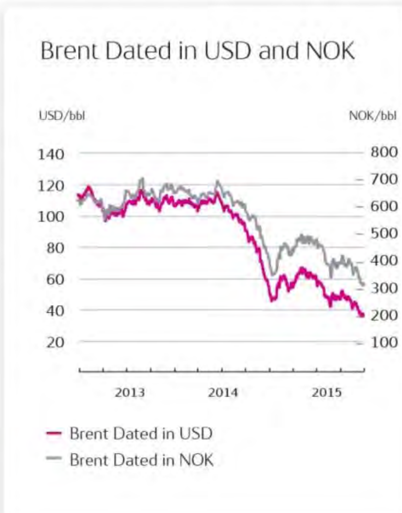
All of Statoil's gas produced on the NCS is sold by MMP, purchased from DPN at a market-based internal price reduced by a cost cover element. Our average internal purchase price for gas was NOK 1.58 per scm in 2015, up 1% from NOK 1.57 per scm in 2014. Reduction in the market-based prices is offset by decreased cost element from 2014 to 2015.



Average crude, condensate and NGL sales were 2.3 mmbbl per day in 2015 of which approximately 1.07 mmbbl were sales of our equity volumes, 0.79 mmbbl sales of third-party volumes and 0.41 mmbbl sales of volumes purchased from SDFI. Our average sales volume was 2.2 mmbbl per day in 2014 and 2013. The average daily third-party volumes sold were 0.83 mmbbl in 2014 and 2013.

MMP's refining margin remained at a high level throughout 2015 reflecting lower crude oil prices and a strong demand for gasoline both in the US and China, while demand in Europe stopped falling. The outlook is that margins will continue to depend on gasoline markets with anticipated further growth in demand in Asia and with limited global capacity additions. Increasing global diesel demand, however, is offset by even higher production capacity. Statoil's refining reference margin was 8.0 USD/bbl in 2015, compared to 4.7 USD/bbl in 2014, an increase of 70%. The refining reference margin was 4.1 USD/bbl in 2013.

Income statement under IFRS (in NOK billion)	For the year ended 31 December 2015	2014 (restated)	2013 (restated)	15-14 change	14-13 change
Revenues	**465.3**	593.0	607.7	(22%)	(2%)
Net income from equity accounted investments	**0.4**	0.5	0.1	(6%)	>100%
Other income	**1.7**	3.8	0.7	(55%)	>100%
Total revenues and other income	**467.4**	597.3	608.6	(22%)	(2%)
Purchases [net of inventory]	**(406.5)**	(544.2)	(565.2)	(25%)	(4%)
Operating expenses and selling, general and administrative expenses	**(37.6)**	(33.2)	(33.7)	13%	(2%)
Depreciation, amortisation and net impairment losses	**0.4**	(3.6)	(7.0)	>(100%)	(48%)
Net operating income	**23.7**	16.2	2.6	47%	>100%



Total revenues and other income were NOK 467.4 billion in 2015, compared to NOK 597.3 billion in 2014 and NOK 608.6 billion in 2013.

The decrease in **revenues** from 2014 to 2015 was mainly due to decrease in crude and gas prices, partially offset by higher volumes for crude, other oil products and gas sold. The average crude price in USD declined by approximately 47% in 2015 compared to 2014, partially offset by weakening USD/NOK average daily exchange rate by approximately 28% in 2015. Revenues in 2015 were positively impacted by gains from derivatives, mainly due to significant drop in the forward curve in the oil and gas market.

The decrease in revenues from 2013 to 2014 was mainly due to decrease in gas and crude prices plus lower volumes of gas sold. The average crude price in USD declined by approximately 9% in 2014 compared to 2013, partially offset by weakening USD/NOK average daily exchange rate by approximately 7% in 2014. Revenues in 2014 were positively impacted by gains from derivatives, mainly due to significant drop in the forward curve in the oil market.

Other income in 2015 was positively impacted by gain on sale of assets of NOK 1.7 billion. In 2014, other income was positively impacted by the Sonatrach Arbitration Settlement of NOK 2.8 billion, following an arbitration ruling in Statoil's favour.

As a result of the factors explained above, **total revenues and other income** decreased by 22% and 2% in 2015 and 2014, respectively.

Purchases [net of inventory] were NOK 406.5 billion in 2015, compared to NOK 544.2 billion in 2014 and NOK 565.2 billion in 2013. The decrease from 2014 to 2015 was mainly due to decrease in crude and gas prices and lower volumes of crude, other oil products and gas sold. The decrease from 2013 to 2014 was mainly due to decrease in gas and crude prices, lower volumes of gas sold and losses on storages due to a significant price reduction.

Operating expenses and selling, general and administrative expenses were NOK 37.6 billion in 2015, compared to NOK 33.2 billion in 2014 and NOK 33.7 billion in 2013. The increase from 2014 to 2015 was mainly due to negative USD/NOK currency effects and onerous contract provisions of NOK 1.6 billion in 2015. This was partially offset by cost reduction due to improvement initiatives. Excluding the USD/NOK exchange rate development, operating expenses and selling, general and administrative expenses were at the same level as last year.

The Cove Point onerous contract provision of NOK 4.1 billion influenced expenses in 2013. Excluding that item, 2014 figures would show an increase in expenses as compared to 2013. The increase was mainly caused by increased activity in the US in addition to negative NOK/USD currency effects.

Depreciation, amortisation and net impairment losses amounted to an income of NOK 0.4 billion in 2015, compared to losses of NOK 3.6 billion in 2014 and NOK 7.0 billion in 2013. The decrease in depreciation, amortisation and net impairment losses from 2014 to 2015 was mainly caused by net reversal of impairment charges of NOK 3.5 billion in 2015. The reversal of impairment was triggered by increased refinery margins and operational improvements. The decrease in depreciation, amortisation and net impairment losses from 2013 to 2014 was mainly as a result of impairment losses of the refineries made in 2013.

Net operating income was NOK 23.7 billion, NOK 16.2 billion, NOK 2.6 billion in 2015, 2014 and 2013, respectively. The increase of NOK 7.5 billion from 2014 to 2015 was mainly due to higher refining margins and solid liquids trading results in addition to negative USD/NOK foreign exchange rate development and net reversal of impairment charges of NOK 3.5 billion, These increases were partially offset by the Sonatrach Arbitration Settlement of NOK 2.8 billion in 2014 in Statoil's favour, and lower margins for the European gas sales.

The increase of NOK 13.6 billion from 2013 to 2014 was mainly due to lower impairment losses in 2014 compared to 2013, the Sonatrach Arbitration Settlement of NOK 2.8 billion in 2014 in Statoil's favour, the onerous contract provision related to Cove Point of NOK 4.1 billion in 2013, and improved margins on gas in Europe including LNG arbitrage and stronger contribution from US gas sales due to an exceptionally cold winter in the North East US.

Further, net operating income increased due to improved refining margins and increased result related to ownership in infrastructure. These increases were partially offset by losses on operational storages in 2014 due to reduced prices.

4.1.7 Other operations

The Other reporting segment includes activities within New Energy Solutions; Global Strategy and Business Development; Technology, Projects and Drilling; and Corporate staffs and support functions.

In 2015, the Other reporting segment recorded a net operating loss of NOK 0.8 billion compared to a net operating loss of NOK 1.5 billion in 2014 and a net operating loss of NOK 1.1 billion in 2013.

4.2 Liquidity and capital resources

We believe that our established liquidity reserves, credit rating and access to capital markets provide us with sufficient working capital for our foreseeable requirements.

4.2.1 Review of cash flows

Statoil`s cash flows in 2015 reflect a high investment level, continued portfolio optimisation and issuance of new debt resulting in a small decrease in cash and cash equivalents and increase in short-term financial investments.

CONSOLIDATED STATEMENT OF CASH FLOWS

(in NOK billion)	Note	2015	2014	Full year 2013
Income before tax		4.3	109.4	138.4
Depreciation, amortisation and net impairment losses	11, 12	133.8	101.4	72.4
Exploration expenditures written off	12	17.1	13.7	3.1
(Gains) losses on foreign currency transactions and balances		(0.4)	(3.1)	4.8
(Gains) losses from dispositions	4	(17.3)	(12.4)	(17.6)
(Increase) decrease in other items related to operating activities		19.8	3.9	6.6
(Increase) decrease in net derivative financial instruments	25	9.2	(2.8)	11.7
Interest received		2.9	2.1	2.1
Interest paid		(3.6)	(3.4)	(2.5)
Cash flows provided by operating activities before taxes paid and working capital items		165.8	208.8	218.8
Taxes paid		(65.7)	(96.6)	(114.2)
(Increase) decrease in working capital		8.9	14.2	(3.3)

Effect of exchange rate changes on cash and cash equivalents		7.1	5.7	2.9
Cash and cash equivalents at the beginning of the period (net of overdraft)	16	82.4	85.3	64.9
Cash and cash equivalents at the end of the period (net of overdraft)	16	75.9	82.4	85.3

Cash flows provided by operations
The most significant drivers of cash flows provided by operations were the level of production and prices for liquids and natural gas that impact revenues, purchases [net of inventory], taxes paid and changes in working capital items.

Cash flows provided by operating activities were NOK 109.0 billion in 2015 compared to NOK 126.5 billion in 2014, which is a decrease of NOK 17.5 billion. Cash flows provided by operating activities before taxes paid and working capital items were reduced by NOK 43.0 billion compared to 2014, driven by a significant reduction in both liquids and gas prices measured in NOK. The decrease was partially offset by positive changes in working capital and lower taxes paid in 2015 compared to 2014.

Cash flows provided by operating activities were NOK 126.5 billion in 2014 compared to NOK 101.3 billion in 2013, an increase of NOK 25.2 billion. Cash flows provided by operating activities before taxes paid and working capital items were reduced by NOK 10.0 billion compared to 2013, driven by decreased profitability mainly caused by lower prices for liquids and European gas. The decrease was more than offset by positive changes in working capital and lower taxes paid in 2014 compared to 2013.

Cash flows used in investing activities
Cash flows used in investing activities were NOK 115.1 billion in 2015 compared to NOK 112.0 billion in 2014, an increase of NOK 3.1 billion mainly due to increased capital expenditures, financial investments and additions through business combinations, partially offset by higher proceeds from sale of assets and businesses. The proceeds from sale of assets in 2015 of NOK 33.2 billion were mainly related to the divestment of the remaining interests in the Shah Deniz field and the South Caucasus pipeline, sale of office buildings, sale of interest in the Marcellus onshore play, sale of interests in Trans Adriatic pipeline AG and the sale of interests in licences on the NCS.

Cash flows used in investing activities were NOK 112.0 billion in 2014 compared to NOK 110.4 billion in 2013, an increase of NOK 1.6 billion mainly due to increased capital expenditures, partly offset by lower investments in deposits with more than three months maturity. The proceeds from sale of assets in 2014 of NOK 22.6 billion were mainly related to the divestment of interests in the Shah Deniz field and the South Caucasus pipeline and the sale of interests in licences on the NCS.

Cash flows provided by (used in) financing activities
Cash flows used in financing activities were NOK 7.5 billion in 2015 and were mainly related to payments of dividends NOK 22.9 and repayments of debt NOK 11.4, partially offset by issuance of new debt of NOK 32.2 billion. Cash flows used in financing activities were NOK 23.1 billion in 2014 and were mainly related to payments of dividends and repayments of debt, partly offset by issuance of new debt in November 2014 of NOK 20.6 billion. The amounts reported in 2013 were influenced by debt issuances of NOK 62.8 billion in total.

4.2.2 Financial assets and debt

Statoil has a strong balance sheet and considerable financial flexibility. The net debt ratio before adjustments was 25.6% at the end of 2015. Net interest-bearing debt before adjustments increased by NOK 32.8 billion in 2015 and was NOK 122.0 billion at the end of 2015.

Financial position and liquidity
Statoil's financial position is strong although its net debt ratio before adjustments at year end increased from 19.0% in 2014 to 25.6% in 2015. Net interest-bearing debt increased from NOK 89.2 billion to NOK 122.0 billion. During 2015 Statoil's total equity decreased from NOK 381.2 billion to NOK 355.1 billion, mainly due to impairments recognised in 2015. Current level of net debt ratio is below levels from previous periods of low prices. Cash flows provided by operating activities were reduced in 2015 mainly due to lower prices and increased cash flows used in investments. Statoil introduced USD as its dividend declaration currency in the second quarter of 2015 announcement and has paid out four quarterly dividends in 2015. For the fourth quarter of 2015 the board of directors will propose to the annual general meeting (AGM) to maintain a dividend of USD 0.2201 per share for the fourth quarter 2015 and to introduce a two-year scrip dividend programme starting from the fourth quarter 2015. For details see section 6.1.1 *Dividends*.

Statoil believes that, given its current liquidity reserves, including committed credit facilities of USD 5.0 billion and its access to various capital markets, Statoil will have sufficient capital available to meet its liquidity needs.

Funding needs arise as a result of Statoil's general business activity. Statoil generally seek to establish financing at the corporate level. Project financing may be used in cases involving joint ventures with other companies. Statoil aims to have access at all times to a variety of funding sources in respect of markets and instruments as well as maintaining relationships with a core group of international banks that provide various kinds of banking services.

Statoil has credit ratings from Moody's and Standard & Poor's (S&P). These ratings ensure necessary predictability when it comes to funding access at attractive terms and conditions. Our current long-term ratings are Aa2 and A+ from Moody's and S&P, respectively. The S&P rating was revised from AA- on credit watch negative to A+ with stable outlook on 22 February 2016. Moody's placed Statoil and its peers on review for downgrade on 22 January 2016. As of the date of this Annual Report on Form 20-F, Moody`s review of Statoil's rating had not yet concluded. Both rating agency reviews have been triggered by low oil prices. The short-term ratings are P-1 from Moody's and A-1 from S&P. In order to maintain financial flexibility going forward, we intend to keep key financial ratios at levels consistent with our objective of maintaining Statoil's long-term credit rating at least within the single A category on a stand-alone basis.

The management of financial assets and liabilities takes into consideration funding sources, the maturity profile of non-current debt, interest rate risk, currency risk and available liquid assets. Statoil's borrowings are denominated in various currencies and normally swapped into USD. In addition, interest rate derivatives, primarily interest rate swaps are used, to manage the interest rate risk of our long-term debt portfolio. The Group's central treasury unit manages the funding and liquidity activities at Group level.

We have diversified our cash investments across a range of financial instruments and counterparties to avoid concentrating risk in any one type of investment or any single country. As of 31 December 2015, approximately 6% of our liquid assets were held in USD-denominated assets, 17% in NOK, 51% in EUR, 7% in DKK, 15% in SEK, and 1% in GBP, before the effect of currency swaps and forward contracts. Approximately 72% of our liquid assets were held in treasury bills and commercial papers, 23% in time deposits, 3% in money market funds and 2% at available bank deposits. As of 31 December 2015, approximately 3% of our liquid assets were classified as restricted cash (including collateral deposits).

Our general policy is to keep a liquidity reserve in the form of cash and cash equivalents or other current financial investments in our balance sheet, as well as committed, unused credit facilities and credit lines in order to ensure that we have sufficient financial resources to meet our short-term requirements.

Long-term funding is raised when we identify a need for such financing based on our business activities, cash flows and required financial flexibility or when market conditions are considered to be favourable. Bond transactions were made in 2015 at very favourable terms, pre-funding longer-term commitments.

The group's borrowing needs are usually covered through the issuing of short-, medium- and long-term securities, including utilisation of a US Commercial Paper Programme (programme limit USD 4.0 billion) and a Shelf Registration Statement (unlimited) filed with the Securities and Exchange Commission (SEC) in the USA as well as through issues under a Euro Medium-Term Note (EMTN) Programme (programme limit updated to EUR 20.0 billion 5 February, 2016) listed on the London Stock Exchange. Committed credit facilities and credit lines may also be utilised. After the effect of currency swaps, the major part of our borrowings is in USD.

During 2015 Statoil issued bonds with maturities from four to 20 years for a total amount of EUR 3.75 billion (NOK 32.1 billion). The bonds were issued in EUR and swapped into USD. All of the bonds are unconditionally guaranteed by Statoil Petroleum AS. For more information see note 18 *Finance debt*.

Statoil issued new debt securities in 2014 equivalent to NOK 20.5 billion and in 2013 equivalent to NOK 62.8 billion.

Financial indicators

Financial indicators (in NOK billion)	For the year ended 31 December 2015	2014	2013
Gross interest-bearing financial liabilities [1]	**284.5**	231.6	182.5
Net interest-bearing liabilities before adjustments	**122.0**	89.2	58.0
Net debt to capital employed ratio [2]	**25.6%**	19.0%	14.0%
Net debt to capital employed ratio adjusted [3]	**26.8%**	20.0%	15.2%
Cash and cash equivalents	**76.0**	83.1	85.3
Current financial investments	**86.5**	59.2	39.2
ROACE [4]	**(8.0%)**	2.7%	11.3%
Ratio of earnings to fixed charges [5]	**1.1**	9.4	7.5

1) Defined as non-current and current finance debt.

2) As calculated according to IFRS. Net debt to capital employed ratio is the net debt divided by capital employed. Net debt is interest-bearing debt less cash and cash equivalents and current financial investments. Capital employed is net debt, shareholders' equity and minority interest.

3) In order to calculate the net debt to capital employed ratio adjusted, Statoil makes adjustments to capital employed as it would be reported under IFRS to adjust for project financing exposure that does not correlate to the underlying exposure and to add into the capital employed measure interest-bearing elements which are classified together with non-interest-bearing elements under IFRS. See section 4.4.2 *Net debt to capital employed ratio* below for a reconciliation of capital employed and a description of why Statoil makes use of this measure.

4) ROACE is equal to net income adjusted for financial items after tax, divided by average capital employed over the last 12 months. See section 4.4.1 *Return on average capital employed (ROACE)* for a reconciliation of ROACE and a description of why Statoil makes use of this measure.

5) Based on IFRS. For the purpose of these ratios, earnings consist of the income before (i) tax, (ii) minority interest, (iii) amortisation of capitalised interest and (iv) fixed charges (which have been adjusted for capitalised interest) and after adjustment for unremitted earnings from equity accounted entities. Fixed charges consist of interest (including capitalised interest) and estimated interest within operating leases.

Gross interest-bearing debt

Gross interest-bearing debt was NOK 284.5, NOK 231.6 billion and NOK 182.5 billion at 31 December 2015, 2014 and 2013, respectively. The NOK 52.9 billion increase from 2014 to 2015 was due to an increase in non-current finance debt of NOK 58.9 billion, offset by a reduction in current finance debt of NOK 6.0 billion. The NOK 49.0 billion increase from 2013 to 2014 was due to an increase in current finance debt of NOK 9.4 billion and an increase in non-current finance debt of NOK 39.6 billion. Our weighted average annual interest rate was 3.39%, 3.78% and 4.06% at 31 December 2015, 2014 and 2013, respectively. Our weighted average maturity on finance debt was nine years at 31 December 2015, compared to nine years at 31 December 2014 and 10 years at 31 December 2013.

Net interest-bearing debt
Net interest-bearing debt before adjustments were NOK 122.0 billion, NOK 89.2 billion and NOK 58.0 billion at 31 December 2015, 2014 and 2013, respectively. The increase of NOK 32.8 billion from 2014 to 2015 was mainly related to an increase in gross interest-bearing debt of NOK 52.9 billion offset in part by an increase in cash and cash equivalents and current financial investments of NOK 20.1 billion mainly due to negative net cash flow in 2015. The increase of NOK 31.2 billion from 2013 to 2014 was mainly related to an increase in gross interest-bearing debt of NOK 49.0 billion offset in part by an increase in cash and cash equivalents and current financial investments of NOK 17.9 billion.

The net debt to capital employed ratio
The net debt to capital employed ratio before adjustments was 25.6%, 19.0% and 14.0% in 2015, 2014 and 2013 respectively.

The net debt to capital employed ratio adjusted (non-GAAP financial measure, see footnote three above) was 26.8%, 20.0% and 15.2% in 2015, 2014, and 2013, respectively. The 6.8 percentage points increase in net debt to capital employed ratio adjusted from 2014 to 2015 was related to the increase in net interest-bearing debt adjusted of NOK 34.4 billion in combination with an increase in capital employed adjusted of NOK 8.3 billion. The 4.8 percentage points increase in net debt to capital employed ratio adjusted from 2013 to 2014 was related to an increase in net interest-bearing debt adjusted of NOK 31.9 billion in combination with an increase in capital employed adjusted of NOK 57.0 billion.

Cash, cash equivalents and current financial investments
Cash and cash equivalents were NOK 76.0 billion, NOK 83.1 billion and NOK 85.3 billion at 31 December 2015, 2014 and 2013 respectively. See note 16 *Cash and cash equivalents* to the Consolidated financial statements for information concerning restricted cash. Current financial investments, which are part of our liquidity management, amounted to NOK 86.5 billion, NOK 59.2 billion and NOK 39.2 billion at 31 December 2015, 2014 and 2013, respectively.

4.2.3 Investments

Organic capital expenditures (excluding acquisitions, capital leases and other investments with significant different cash flow pattern) amounted to USD 14.7 billion, or NOK 118.8 billion, for the year ended 31 December 2015.

Capital expenditures, defined as additions to property, plant and equipment (including capitalised financial leases), capitalised exploration expenditures, intangible assets, long-term share investments and investments in equity accounted companies, amounted to NOK 125.5 billion for the year ended 2015. The capital expenditure level ended below original guidance due to reduced activity level and increased efficiency. This was partly offset by the development in the USDNOK exchange rate.

In 2014, capital expenditures were NOK 125.1 billion compared to NOK 117.4 billion in 2013. The increase was primarily related to higher activity level in Development and Production International.

Organic capital expenditures (excluding acquisitions, capital leases and other investments with significant different cash flow pattern) amounted to NOK 118.8 billion for the year ended 2015, or USD 14.7 billion. In 2014, organic capital expenditures amounted to NOK 121.6 billion, or USD 19.6 billion.

The section describes our estimated organic capital expenditure for 2016 relating to potential capital expenditure requirements for the principal investment opportunities available to us and other capital projects currently under consideration. The figure is based on Statoil developing organically, and it excludes possible expenditures relating to acquisitions. The expenditure estimates and descriptions of investments in the segment descriptions below could therefore differ materially from the actual expenditure. Organic capital expenditures are estimated to be around USD 13 billion in 2016.

Statoil finances its capital expenditures both internally and externally. For more information see section 4.2.2 *Financial assets and debt*.

In Norway a substantial proportion of our 2016 capital expenditures will be spent on ongoing development projects such as Johan Sverdrup, Gina Krog and Aasta Hansteen, in addition to various extensions, modifications and improvements on currently producing fields like Gullfaks, Oseberg and Troll.

Internationally we currently estimate that a substantial proportion of our 2016 capital expenditure will be spent on the following ongoing and planned development projects: Mariner in UK and Julia, Stampede and Bakken in the US.

In midstream and downstream we currently estimate that most of the 2016 capital expenditures will be spent on Polarled and Johan Sverdrup export pipelines, in addition to processing and transportation solutions related to Bakken, Marcellus and Eagle Ford in the US.

As illustrated in the section 4.2.5 *Principal contractual obligations,* Statoil have committed to certain investments in the future. The further into the future, the more flexibility we will have to revise expenditure. This flexibility is partly dependent on the expenditure our partners in joint ventures agree to commit to. A large part of the capital expenditure for 2016 is committed.

Statoil may alter the amount, timing or segmental or project allocation of our capital expenditures in anticipation of or as a result of a number of factors outside our control.

4.2.4 Impact of reduced prices

Our results are affected by the development in the price of raw materials and services that are necessary for the development and operation of oil and gas producing assets.

Cost development in the prices of goods, raw materials and services that are necessary for the development and operation of oil and gas producing assets can vary considerably over time and between each market segment.

The reduction in the oil price has been driving a decrease in commodities prices. Prices in supplier markets have been reduced and in several supplier market segments Statoil has achieved reduced rates compared to the 2013/2014 level. Such savings have been achieved both in new and renegotiated contracts. While some of the cost reductions relates to capitalised expenditures and thus only affects our annual results through decreased depreciation, certain elements of operating expenditures have also been affected by this cost reduction.

See the analysis of profit and loss in section 4.1 *Operating and financial review* as well section 2.3 *Group Outlook*.

4.2.5 Principal contractual obligations

The table summarises our principal contractual obligations and other commercial commitments as of 31 December 2015.

The table includes contractual obligations, but excludes derivatives and other hedging instruments as well as asset retirement obligations, as these obligations for the most part are expected to lead to cash disbursements more than five years in the future. Obligations payable by Statoil to unconsolidated equity affiliates are included gross in the table. Where Statoil includes both an ownership interest and the transport capacity cost for a pipeline in the consolidated accounts, the amounts in the table include the transport commitments that exceed Statoil's ownership share. See section 5.2.3 *Disclosures about market risk* for more information.

Contractual obligations (in NOK billion)	As at 31 December 2015 Payment due by period 1) Less than 1 year	1-3 years	3-5 years	More than 5 years	Total
Undiscounted non-current finance debt	19.0	72.0	81.1	207.5	379.6
Minimum operating lease payments	25.6	28.8	17.6	27.8	99.8
Nominal minimum other long-term commitments 2)	13.5	24.6	23.1	77.9	139.1
Total contractual obligations	58.1	125.4	121.8	313.2	618.5

1) "Less than 1 year" represents 2015; "1-3 years" represents 2016 and 2017, "3-5 years" represents 2018 and 2019, while "More than 5 years" includes amounts for later periods.

2) For further information see note 23 *Other commitments and contingencies* to the Consolidated financial statements.

Non-current finance debt in the table represents principal payment obligations. For information on interest commitments relating to long-term debt, reference is made to note 18 *Finance debt* and note 22 *Leases* to the Consolidated financial statements.

Statoil had contractual commitments of NOK 62.3 billion at 31 December 2015. The contractual commitments reflect Statoil's share and mainly comprise construction and acquisition of property, plant and equipment.

Statoil's projected pension benefit obligation was NOK 60.1 billion, and the fair value of plan assets amounted to NOK 45.2 billion as of 31 December 2015. Company contributions are mainly related to employees in Norway. In 2014 Statoil ASA made a decision to change the company's pension plan in Norway from a defined benefit plan to a defined contribution plan. The actual transitioning to the defined contribution plan took place in 2015, see note 19 *Pensions* to the Consolidated financial statements for more information.

4.2.6 Off balance sheet arrangements

This section describes various agreements that are not recognised in the balance sheet, such as operational leases and transportation and processing capacity contracts.

We have entered into various agreements, such as operational leases and transportation and processing capacity contracts, that are not recognised in the balance sheet. For more information, see section 4.2.5 *Principal contractual obligations* and note 22 *Leases* to the Consolidated financial statements.

Statoil is party to certain guarantees, commitments and contingencies that, pursuant to IFRS, are not necessarily recognised in the balance sheet as liabilities. See note 23 *Other commitments and contingencies* to the Consolidated financial statements for more information.

4.3 Accounting Standards (IFRS)

We prepare our Consolidated financial statements in accordance with International Financial Reporting Standards (IFRS) as adopted by the EU and as issued by the International Accounting Standards Board.

We prepared our first set of Consolidated financial statements pursuant to IFRS for 2007. The IFRS standards have been applied consistently to all periods presented in the Consolidated financial statements and when preparing an opening IFRS balance sheet as of 1 January 2006 (subject to certain exemptions allowed by IFRS 1) for the purpose of the transition to IFRS.

See note 2 *Significant accounting policies* to the Consolidated financial statements for a discussion of key accounting estimates and judgements.

4.4 Non-GAAP measures

This section describes the non-GAAP financial measures that are used in this report.

We are subject to SEC regulations regarding the use of "non-GAAP financial measures" in public disclosures. Non-GAAP financial measures are defined as numerical measures that either exclude or include amounts that are not excluded or included in the comparable measures calculated and presented in accordance with generally accepted accounting principles, which in our case refers to IFRS.

The following financial measures may be considered non-GAAP financial measures:

- Return on average capital employed (ROACE)
- Net debt to capital employed ratio before adjustments
- Net debt to capital employed ratio adjusted
- Organic capital expenditures
- Production cost per boe of entitlement volumes

For information regarding Organic capital expenditures see section 4.2.3 *Investments*.
For information regarding Production cost per barrel of entitlement volumes see note 27 *Supplementary oil and gas information (unaudited)* to the Consolidated financial statements.

4.4.1 Return on average capital employed (ROACE)

We use ROACE to measure the return on capital employed, regardless of whether the financing is through equity or debt.

In the group's view, this measure provides useful information for both the group and investors about performance during the period under evaluation. We make regular use of this measure to evaluate our operations. Our use of ROACE should not be viewed as an alternative to income before financial items, income taxes and minority interest, or to net income, which are measures calculated in accordance with generally accepted accounting principles or ratios based on these figures.

ROACE was negative 8.0% in 2015 compared to 2.7% in 2014 and 11.3% in 2013. The decrease from last year is due to the negative development in net income adjusted for financial items, combined with an increase in average capital employed.

PUBLIC COPY - CONFIDENTIAL INFORMATION REMOVED

Calculation of numerator and denominator used in ROACE calculation (in NOK billion, except percentages)	For the year ended 31 December 2015	2014	2013	15-14 change	14-13 change
Net income for the year	(37.3)	22.0	39.2		
-Net financial items	(10.6)	(0.0)			
-Tax on financial items	10.2	9.2			
+Accretion expense net after tax	(1.0)	(1.1)			
+Net financial items adjusted after tax[1]			4.6		
Net income adjusted for financial Items after tax (A1)	(37.9)	11.8	43.9	>(100%)	(73%)
Capital employed before adjustments to net interest-bearing debt: [2]					
Year End 2015	477.1				
Year End 2014	470.4	470.4			
Year End 2013		414.0	414.0		
Year End 2012			359.2		
Sum of capital employed for two years (B1)	947.5	884.4	773.2		
Calculated average capital employed: Average capital employed before adjustments to net interest-bearing debt (B1/2)	473.8	442.2	386.6	7%	14%
Calculated ROACE: Return on average capital employed (A1/(B1/2))	(8.0%)	2.7%	11.3%	>(100%)	(77%)

1) Calculation of financial items is revised for 2015 and 2014 ROACE definition. Net financial items after tax for 2013 includes financial items adjusted of negative NOK 4.6 billion and tax on financial items of NOK 9.2 billion.

2) Capital employed before adjustments for each year is reconciled in the table in the section 4.4.2 *Net debt to capital employed ratio*.

4.4.2 Net debt to capital employed ratio

In the Company's view, the calculated net debt to capital employed ratio gives a more complete picture of the Group's current debt situation than gross interest-bearing financial liabilities.

The calculation uses balance sheet items relating to gross interest bearing financial liabilities and adjusts for cash, cash equivalents and current financial investments. Certain adjustments are made, since different legal entities in the Group lend to projects and others borrow from banks. Project financing through an external bank or similar institution will not be netted in the balance sheet and will over-report the debt stated in the balance sheet in relation to the underlying exposure in the Group. Similarly, certain net interest-bearing debts incurred from activities pursuant to the Owners Instruction from the Norwegian State are set off against receivables on the Norwegian State's direct financial interest (SDFI).

The net interest-bearing debt adjusted for these two items is included in the average capital employed.

The table below reconciles the net interest-bearing liabilities adjusted, capital employed and net debt to capital employed adjusted ratio with the most directly comparable financial measure or measures calculated in accordance with IFRS.

Calculation of capital employed and net debt to capital employed ratio (in NOK billion, except percentages)	2015	For the year ended 31 December 2014	2013
Shareholders' equity	**354.7**	380.8	355.5
Non-controlling interests (Minority interest)	**0.3**	0.4	0.5
Total equity (A)	**355.1**	381.2	356.0
Current bonds, bank loans, commercial papers and collateral liabilities	**20.5**	26.5	17.1
Bonds, bank loans and finance lease liabilities	**264.0**	205.1	165.5
Gross interest-bearing financial liabilities (B)	**284.5**	231.6	182.5
Cash and cash equivalents	**76.0**	83.1	85.3
Current financial investments	**86.5**	59.2	39.2
Cash and cash equivalents and current financial investments (C)	**162.4**	142.3	124.5
Net interest-bearing liabilities before adjustments (B1) (B-C)	**122.0**	89.2	58.0
Other interest-bearing elements [1)]	**9.8**	8.0	7.1
Marketing instruction adjustment [2)]	**(1.9)**	(1.6)	(1.3)
Adjustment for project loan [3)]	**0.0**	(0.1)	(0.2)
Net interest-bearing liabilities adjusted (B2)	**129.9**	95.6	63.6
Calculation of capital employed:			
Capital employed before adjustments to net interest-bearing liabilities (A+B1)	**477.1**	470.4	414.0
Capital employed adjusted (A+B2)	**485.0**	476.7	419.6
Calculated net debt to capital employed:			
Net debt to capital employed before adjustments (B1/(A+B1)	**25.6%**	19.0%	14.0%
Net debt to capital employed adjusted (B2/(A+B2)	**26.8%**	20.0%	15.2%

1) Other interest-bearing elements are cash and cash equivalents adjustments regarding collateral deposits classified as cash and cash equivalents in the Consolidated balance sheet but considered as non-cash in the non-GAAP calculations as well as financial investments in Statoil Forsikring AS classified as current financial investments.

2) Marketing instruction adjustment is an adjustment to gross interest bearing financial debt due to the SDFI part of the financial lease in the Snøhvit vessels that are included in Statoil's Consolidated balance sheet.

3) Adjustment for project loan is adjustment to gross interest-bearing debt due to the BTC project loan structure.

5 Risk review

Statoil's overall risk management includes identifying, evaluating and managing risk in all its activities to ensure safe operations and to achieve Statoil's corporate goals.

5.1 Risk factors

Statoil is exposed to a number of risks that could affect its operational and financial performance. In this section, some of the key risk factors are addressed.

5.1.1 Risks related to our business

This section describes the most significant potential risks relating to Statoil's business:

A prolonged period of low oil and/or natural gas prices would have a material adverse effect on Statoil.
The prices of oil and natural gas have fluctuated greatly in response to changes in many factors. Currently, Statoil is in a situation where oil and natural gas prices have declined substantially compared to levels seen over the last few years. There are several reasons for this decline, but fundamental market forces beyond the control of Statoil or other similar market participants have impacted and can continue to impact oil and natural gas prices in the future.

Generally, Statoil does not and will not have control over the factors that affect the prices of oil and natural gas. These factors include:
- economic and political developments in resource-producing regions
- global and regional supply and demand
- the ability of the Organisation of the Petroleum Exporting Countries (Opec) and/or other producing nations to influence global production levels and prices
- prices of alternative fuels that affect the prices realised under Statoil's long-term gas sales contracts
- government regulations and actions; including changes in energy and climate policies
- global economic conditions
- war or other international conflicts
- changes in population growth and consumer preferences
- the price and availability of new technology and
- weather conditions

It is impossible to predict future price movements for oil and/or natural gas with certainty. A prolonged period of low oil and natural gas prices will adversely affect Statoil's business, the results of operations, financial condition, liquidity and Statoil's ability to finance planned capital expenditure, including possible reductions in capital expenditures which could lead to reduced reserve replacement. In addition to the adverse effect on revenues, margins and profitability from any fall in oil and natural gas prices, a prolonged period of low prices or other indicators could, if deemed to have longer term impact, lead to further reviews for impairment of the group's oil and natural gas properties. Such reviews would reflect the management's view of long-term oil and natural gas prices and could result in a charge for impairment that could have a significant effect on the results of Statoil's operations in the period in which it occurs. Changes in management's view on long-term oil and/or natural gas prices or further material reductions in oil, gas and/or product prices could have an adverse impact on the economic viability of projects that are planned or in development.

Statoil's crude oil and natural gas reserves are only estimates and Statoil's future production, revenues and expenditures with respect to its reserves may differ materially from these estimates.
The reliability of proved reserve estimates depends on:
- the quality and quantity of Statoil's geological, technical and economic data
- the production performance of Statoil's reservoirs
- extensive engineering judgments and
- whether the prevailing tax rules and other government regulations, contracts and oil, gas and other prices will remain the same as on the date estimates are made

Proved reserves are calculated based on the U.S. Securities and Exchange Commission (SEC) requirements and may therefore differ substantially from Statoil's view on expected reserves.

Many of the factors, assumptions and variables involved in estimating reserves are beyond Statoil's control and may prove to be incorrect over time. The results of drilling, testing and production after the date of the estimates may require substantial upward or downward revisions in Statoil's reserve data. The prices used for proved reserves are defined by the SEC and are calculated based on a 12 month un-weighted arithmetic average of the first-day-of-the-month price for each month during the reporting year, leading to a forward price strongly linked to last year's price environment. Fluctuations in oil and gas prices will have a direct impact on Statoil's proved reserves. For fields governed by production sharing agreements (PSAs), a lower price may lead to higher entitlement to the production and increased reserves for those fields. Adversely, a lower price environment may also lead to lower activity resulting in reduced reserves. For PSAs these two effects may to some degree offset each other. In addition a low price environment may result in earlier shutdown due to uneconomic production. This will affect both PSAs and fields with concession types of agreement.

Exploratory drilling involves numerous risks, including the risk that Statoil will encounter no commercially productive oil or natural gas reservoirs. This could materially adversely affect Statoil's results. Statoil's exploration activities include accessing new acreage and maturing resources through high risk exploration drilling activities. These risks include risks associated with the execution of drilling and seismic operations and those associated with maturing unproven resources.

New acreage is primarily acquired through concessions, bidding rounds and acquisitions. Geological interpretations and successful exploration drilling and appraisal work leads to maturing and commercially attractive resources. Additionally, Statoil also needs to be focused on optimising its rig capacity by thoughtful deployment and redeployment. Given these risks and operational requirements, Statoil may not effectively acquire acreage, successfully conduct its drilling and appraisal work or optimise its rig capacity, which could result in a material adverse effect on the results of its operations and financial condition. Exploration activities involve the risk of accidents and environmental incidents. Exploration activities also involve technical challenges related to operating in harsh environments as well as technologically demanding subsurface/geological challenges which Statoil may not effectively manage.

If Statoil fails to acquire or discover and develop additional reserves, its reserves and production will decline materially from their current levels. Successful implementation of Statoil's group strategy for value growth is critically dependent on sustaining its long-term reserve replacement. If upstream resources are not progressed to proved reserves in a timely manner, Statoil's reserve base and thereby future production will gradually decline and future revenue will be reduced.

Statoil's future production is highly dependent on its success in acquiring or finding and developing additional reserves adding value. If unsuccessful, future total proved reserves and production will decline.

If the low price environment continues for a substantial time, this may result in undeveloped acreage not being considered economically viable and consequently discovered resources not being matured to reserves. This may also lead to exploration areas not being explored for new resources and subsequently not being matured for development resulting in less future proved reserves. Successful implementation of Statoil's improvement initiatives may partly offset this effect to some degree making new exploration areas and undeveloped acreage more economically attractive for exploration and development.

In a number of resource-rich countries, national oil companies control a significant proportion of oil and gas reserves that remain to be developed. To the extent that national oil companies choose to develop their oil and gas resources without the participation of international oil companies, or if Statoil is unable to develop partnerships with national oil companies, its ability to find and acquire or develop additional reserves will be more limited.

Statoil is exposed to a wide range of health, safety and environmental risks that could result in significant losses.
Exploration for, and the development, production, processing and transportation of oil and natural gas can be hazardous and technical integrity failures, operational failures, natural disasters or other occurrences can result in: loss of life, oil spills, gas leaks, loss of containment of hazardous materials, water contamination, blowouts, cratering, fires and equipment failure, among other things.

The risks associated with Statoil's activities are affected by the difficult geographies, climate zones and environmentally sensitive regions in which Statoil operates. All modes of transportation of hydrocarbons - including road, rail, sea or pipeline - are particularly susceptible to a loss of containment of hydrocarbons and other hazardous materials, and, given the high volumes involved, these could represent a significant risk to people and the environment. Offshore operations and transportation are subject to marine perils, including severe storms and other adverse weather conditions and vessel collisions. Onshore operations and transportation are subject to adverse weather conditions and accidents. Both onshore and offshore operations and transportation are subject to interruptions, restrictions or termination by government authorities based on safety, environmental or other considerations.

Policy and regulatory change due to rising climate change concerns, and the physical effects of climate change, could impact Statoil's business.
Statoil expects and is preparing for policy and regulatory changes targeted at reducing greenhouse gas emissions of its upstream operations/activities. Statoil expects greenhouse gas emission costs to increase from current levels beyond 2020 and to have a wider geographical range than today. There is continuing uncertainty over these regulatory and policy developments, including the mechanisms that will be employed, and the level of global co-ordination and hence efficiency and uniformity of measures. This in turn leads to uncertainty over the eventual long-term implications to development project cost or operating cost and constraints. As an example, new technological solutions could be required. This could result in increased cost or longer lead times, or have an impact on investment decisions for future projects. Climate related policy changes may also reduce access to prospective geographical areas in the future and affect the demand for and prices of Statoil's products.

Regulatory changes and other factors may encourage the development of low-carbon energy technologies such as renewable energy which could impact the demand for oil and gas, particularly in specific regions. As an example, development of battery technologies could allow more intermittent renewables to be used in the power sector. This could especially impact Statoil's gas sales, particularly if subsidies of renewable energy in Europe were to increase.

Statoil carefully monitors and assesses the potential impact of climate change. Developments in climate change could have a significant impact on Statoil's financial performance, profitability and outlook, whether directly through changes in taxation and regulation, or indirectly through changes in consumer behaviour.

Statoil has assessed the sensitivity of its project portfolio (equity production and expected production from accessed exploration acreage) against the assumptions regarding commodity and carbon prices in the International Energy Agency's (IEA) Current Policies scenario, the IEA New Policies scenario and the IEA 450 scenario, as laid out in their "World Economic Outlook 2015" report. The assessment demonstrated that the IEA's "450 ppm scenario", which is compatible with a global warming of maximum of two degrees Celsius with more than 50% probability, could have a negative impact of approximately 5% on Statoil's net present value compared to Statoil's internal planning assumptions as of December 2015. This assessment is based on Statoil's and the IEA's assumptions which may not be accurate and which are likely to change over time as new information becomes available. Accordingly, there can be no assurance that the assessment, which is presented in Statoil ASA's 2015 Sustainability report, is a reliable indicator of the actual impact of climate change on Statoil.

It is not possible to predict the exact magnitude of the physical impact of climate change on Statoil's operations. However, effects of climate change could result in less stable weather patterns, which would result in more severe storms and other weather conditions that could interfere with Statoil's operations. Changes in physical climate parameters could impact the costs of Statoil's operations, for example through restrained water availability and prolonged droughts, or through increasing frequency of other extreme weather events.

Statoil is exposed to risks as a result of its hydraulic fracturing usage.
Statoil's US operations use hydraulic fracturing which is subject to a range of applicable federal, state and local laws, including those discussed under the heading "Legal and Regulatory Risks". Fracturing is an important and common practice that is used to stimulate production of crude oil and/or natural gas from dense subsurface rock formations. Statoil's hydraulic fracturing and fluid handling operations are designed and operated to minimise the risk, if any, of subsurface migration of hydraulic fracturing fluids and spillage or mishandling of hydraulic fracturing fluids, however, a proven case of subsurface migration of hydraulic fracturing fluids or a case of spillage or mishandling of hydraulic fracturing fluids during these activities could potentially subject Statoil to civil and/or criminal liability and the possibility of substantial costs, including environmental remediation, depending on the circumstances of the underground migration, spillage, or mishandling, the nature and scope of the underground migration, spillage, or mishandling, and the applicable laws and regulations.

In addition, various states and local governments have implemented, or are considering, increased regulatory oversight of hydraulic fracturing through additional permit requirements, operational restrictions, disclosure requirements and temporary or permanent bans. New or further changes in laws and regulations imposing reporting obligations on, or otherwise banning or limiting, the hydraulic fracturing process could make it more difficult to complete oil and natural gas wells in shale formations, cause operational delays, increase costs of regulatory compliance or in exploration and production, which could adversely affect Statoil's US onshore business and the demand for fracturing services.

Statoil is exposed to security threats that could have a materially adverse effect on Statoil's results of operations and financial condition.
Although Statoil has security barriers, policies and risk management processes in places which are designed to protect its assets against a range of security threats, no assurances can be made that such attacks will not occur and adversely impact its operations. Security threats such as acts of terrorism and cyber-attacks against Statoil's production and exploration facilities, offices, pipelines, means of transportation or computer systems or breaches of Statoil's security system, could result in significant losses. Failure to manage the foregoing risks could result in injury or loss of life, damage to the environment, damage to or the destruction of wells and production facilities, pipelines and other property. Statoil could face, among other things, regulatory action, legal liability, damage to its reputation, a significant reduction in revenues, an increase in costs, a shutdown of operations and a loss of its investments in affected areas. Statoil does not purchase cyber risks insurance because the available insurance products do not provide satisfactory coverage.

Statoil's crisis management systems may prove inadequate.
Statoil has crisis management plans and capability to deal with emergencies at every level of its operations. If Statoil does not respond or is perceived not to have responded in an appropriate manner to either an external or internal crisis, its business, operations and reputation could be severely affected. For Statoil's most important activities, it has also developed business continuity plans to carry on or recover operations following a disruption or incident. Inability to restore or replace critical capacity to an agreed level within an agreed time frame could prolong the impact of any disruption and could severely affect Statoil's business and operations.

Statoil encounters competition from other oil and gas companies in all areas of its operations.
Some of Statoil's larger, financially stronger competitors may be able to pay more to gain access to resources, while its smaller competitors may be able to move faster and gain earlier access than Statoil. Gaining access to profitable resources either through the acquisition of licences, exploratory prospects or producing properties is key to ensuring the long-term health and sustainability of the business and Statoil's failure to do so could have an adverse impact on its performance.

Technology is a key competitive advantage in Statoil's industry and a larger company may be able to invest more in developing or acquiring intellectual property rights to technology that Statoil may require. Should Statoil's innovation lag behind the industry, its performance could be impeded.

Statoil's development projects and production activities involve many uncertainties and operating risks that can prevent Statoil from realising profits and cause substantial losses.
Oil and gas projects may be curtailed, delayed or cancelled for many reasons, including equipment shortages or failures, natural hazards, unexpected drilling conditions or reservoir characteristics, irregularities in geological formations, accidents, mechanical and technical difficulties or challenges due to new technology. This is particularly relevant because of the physical environments in which some of Statoil's projects are situated. Many of Statoil's development and production projects are located in deep waters or other harsh environments - such as the Gulf of Mexico in the US, the Flemish Pass in Canada or the Barents Sea in Norway, or have challenging field characteristics such as its heavy oil projects in Brazil (Peregrino), Norway (Grane) and the UK (Mariner). In US onshore, low regional prices may cause certain areas to be unprofitable and the company may curtail production until prices recover. There is therefore a risk that Statoil undertakes development projects that do not yield expected returns, especially in the current environment of decreasing oil and gas prices combined with the relatively high levels of tax and government take in several jurisdictions, including Norway.

Capital expenditures in the oil and gas industry have increased over the last few years due to a high activity level and more complex and capital intensive development projects. This, combined with prolonged low oil and gas prices, could reduce the returns and erode the profitability of some of Statoil's projects and capital programs.

As a response to these challenges, Statoil will need at all times to evaluate profitability and robustness of projects and consider postponing or stopping projects, adjusting strategies and targets or withdrawing from certain geographical areas.

Statoil faces challenges in achieving its strategic objective of successfully exploiting profitable growth opportunities.
An important element of Statoil's strategy is to continue to pursue attractive and profitable growth opportunities available to it by both enhancing and repositioning its asset portfolio and expanding into new markets. The opportunities that Statoil is actively pursuing may involve the acquisition of businesses or properties that complement or expand its existing portfolio. The challenges related to the renewal of Statoil's upstream portfolio is growing due to increasing global competition for access to opportunities.

Statoil's ability to successfully implement this strategy will depend on a variety of factors, including its ability to:

- identify acceptable opportunities
- negotiate favourable terms
- develop new market opportunities or acquire properties or businesses promptly and profitably
- integrate acquired properties or businesses into Statoil's operations
- arrange financing, if necessary and
- comply with legal regulations

As Statoil pursues business opportunities in new and existing markets, it anticipates significant investments and costs in connection with the development of such opportunities. Statoil may incur or assume unanticipated liabilities, losses or costs associated with assets or businesses acquired. Any failure by Statoil to successfully pursue and exploit new business opportunities could result in financial losses and inhibit growth. Any such new projects Statoil acquires will require additional capital expenditure and will increase the cost of its discoveries and development. These projects may also have different risk profiles than Statoil's existing portfolio. These and other effects of such acquisitions could result in Statoil having to revise either or both of Statoil's forecasts with respect to unit production costs and production.

In addition, the pursuit of acquisitions or new business opportunities could divert financial and management resources away from Statoil's day-to-day operations to the integration of acquired operations or properties. Statoil may require additional debt or equity financing to undertake or consummate future acquisitions or projects, and such financing may not be available on terms satisfactory to Statoil, if at all, and it may, in the case of equity, be dilutive to Statoil's earnings per share.

The profitability of Statoil's oil and gas production may be affected by limited transportation infrastructure when a field is in a remote location.
Statoil's ability to exploit economically any discovered petroleum resources beyond its proved reserves will depend, among other factors, on the availability of the infrastructure required to transport oil and gas to potential buyers at a commercially acceptable price. Oil is transported by vessels, rail or pipelines to refineries, and natural gas is usually transported by pipeline or by vessels (for liquid natural gas) to processing plants and end users. Statoil may not be successful in its efforts to secure transportation and markets for all of its potential production.

Statoil is exposed to security threats on its information systems and digital infrastructure that could harm its assets and operations.
Statoil's security barriers protect its information systems and digital infrastructure from being compromised by unauthorised parties. Failure to maintain and develop these barriers may affect the confidentiality, integrity and availability of its information systems and digital infrastructure, including those critical to Statoil's operations. Threats to Statoil's information systems could result in significant financial damage to Statoil. Threats to Statoil's industrial control systems are not limited by geography as Statoil's digital infrastructure is accessible globally, and incidents in the industry in recent years have shown that parties who are able to circumvent barriers aimed at securing industrial control systems are capable and willing to perform attacks that destroy, disrupt or otherwise compromise operations. Such attacks could result in material losses or loss of life with consequent financial implications.

Some of Statoil's international interests are located in regions where political, social and economic instability could adversely impact Statoil's business.
Statoil has assets and operations located in politically, socially and economically diverse regions around the world where potential developments such as expropriation, nationalisation of property, unilateral change of contracts or regulations, civil strife, strikes, political unrest, war, terrorism, border disputes, guerrilla activities, insurrections, piracy and the imposition of international sanctions or other events could occur. Political risks and security threats require continuous monitoring. Adverse and hostile actions against Statoil's staff, its facilities, its transportation systems and its digital infrastructure (cybersecurity) could cause harm to people and disrupt Statoil's operations and further business opportunities in these or other regions, lead to a decline in production and otherwise adversely affect Statoil's business. This could have a materially adverse effect on Statoil's results of operations and its financial condition.

Statoil's operations are subject to dynamic political and legal factors in the countries in which it operates.
Statoil has assets in a number of countries with emerging or transitioning economies that, in part or in whole, lack well-functioning and reliable legal systems, where the enforcement of contractual rights is uncertain or where the governmental and regulatory framework is subject to unexpected change. Statoil's exploration and production activities in these countries are often undertaken together with national oil companies and are subject to a significant degree of state control. In recent years, governments and national oil companies in some regions have begun to exercise greater authority and impose more stringent conditions on companies engaged in exploration and production activities. Intervention by governments in such countries can take a wide variety of forms, including:

- restrictions on exploration, production, imports and exports
- the awarding or denial of exploration and production interests
- the imposition of specific seismic and/or drilling obligations
- price and exchange controls
- tax or royalty increases, including retroactive claims
- nationalisation or expropriation of Statoil's assets
- unilateral cancellation or modification of Statoil's licence or contractual rights
- the renegotiation of contracts
- payment delays and
- currency exchange restrictions or currency devaluation

The likelihood of these occurrences and their overall effect on Statoil vary greatly from country to country and are hard to predict. If such risks materialise, they could cause Statoil to incur material costs and/or cause Statoil's production to decrease, potentially having a materially adverse effect on Statoil's operations or financial condition.

Statoil is exposed to potentially adverse changes in the tax regimes of each jurisdiction in which Statoil operates.
Statoil has business operations in many countries around the world. Changes in the tax laws of the countries in which Statoil operates could have a material adverse effect on its liquidity and results of operations.

Statoil faces foreign exchange risks that could adversely affect the results of Statoil's operations.
Statoil's business faces foreign exchange risks and this is managed with USD as the base currency. Statoil has a large percentage of its revenues and cash receipts denominated in USD and sales of gas and refined products are mainly denominated in EUR and GBP. Further, Statoil pays a large portion of its income taxes, and a share of our operating expenses and capital expenditures, in NOK. The majority of Statoil's long term debt has USD exposure.

Statoil is exposed to risks relating to trading and supply activities.
Statoil is engaged in substantial trading and commercial activities in the physical markets. Statoil also uses financial instruments such as futures, options, over-the-counter (OTC) forward contracts, market swaps and contracts for differences related to crude oil, petroleum products, natural gas and electricity in order to manage price volatility. Statoil also uses financial instruments to manage foreign exchange and interest rate risk. Although Statoil believes it has established appropriate risk management procedures, trading activities involve elements of forecasting, and Statoil bears the risk of market movements, the risk of losses if prices develop contrary to expectations, and the risk of default by counterparties.

Non-compliance with anti-bribery, anti-corruption and other applicable laws, including failure to meet Statoil's ethical requirements, exposes Statoil to legal liability and damage to its reputation, business and shareholder value.
Statoil has activities in countries which present corruption risks and which may have weak legal institutions, lack of control and transparency. In addition, governments play a significant role in the oil and gas sector, through ownership of resources, participation, licensing and local content which leads to a high level of interaction with public officials. Statoil is, through its international activities, subject to anti-corruption and bribery laws in multiple jurisdictions, including the Norwegian Penal code, the US Foreign Corrupt Practices Act and the UK Bribery Act. A violation of any applicable anti-corruption and bribery laws could expose Statoil to investigations from multiple authorities, and any violations of laws may lead to criminal and/or civil liability with substantial fines. Incidents of non-compliance with applicable anti-corruption and bribery laws and regulations and the Statoil Code of Conduct could be damaging to Statoil's reputation, competitiveness and shareholder value.

Statoil's insurance coverage may not provide adequate protection.
Statoil maintains insurance coverage that includes coverage for physical damage to its oil and gas properties, third-party liability, workers' compensation and employers' liability, general liability, sudden pollution and other coverage. Statoil's insurance coverage includes deductibles that must be met prior to recovery. Statoil's external insurance is subject to caps, exclusions and limitations, and there is no assurance that such coverage will adequately protect Statoil against liability from all potential consequences and damages.

Statoil's efficiency change agenda may impact the development of Statoil's business and its financial results.
In 2014, Statoil announced an extensive efficiency change strategy in order to improve efficiency across the organisation in light of the decline in oil and gas prices. Two programmes were launched, the Statoil Technical Efficiency Programme (STEP) and the organisational efficiency programme (OE). There is a risk of Statoil not being able to define and implement the activities related to cost savings without adversely effecting Statoil's business goals or achieving the necessary cost savings and increases in efficiency

Statoil may fail to secure the right level of workforce competence and capacity over the short and medium term
The external uncertainty of the future of the oil industry in light of reduced oil and natural gas prices and climate policy changes, creates a risk in ensuring a robust workforce through industry cycles. The oil industry is a long term business and needs to take a long term perspective on workforce capacity and competence. Given the current extensive change agenda there is a risk that Statoil will fail to secure the right level of workforce competence and capacity.

Statoil's activities in certain countries may be affected by international sanctions.
Statoil, like other major international energy companies, has a geographically diverse portfolio of reserves and operational sites, which may expose its business and financial affairs to political and economic risks, including operations in areas subject to international sanctions or with sanctioned entities.

Russia
Statoil holds a 30% non-operating interest in a production sharing agreement related to the Kharyaga field in the Nenets Autonomous Area in the Russian Federation. The Kharyaga field produces conventional oil from the Timan Pechora basin onshore in North West Russia. Statoil is further engaged in a

strategic cooperation with Rosneft Oil Company (Rosneft) including a joint cooperation project aimed at undertaking seismic surveys and geological exploration, appraisal, development and production of potential hydrocarbons in four licences on the Russian continental shelf - the Magadan 1, Lisyansky and Kashevarovsky licences in the Sea of Okhotsk (south of the Arctic Circle), and the Perseevsky licence in the Barents Sea (north of the Arctic Circle). Additionally there are two joint cooperation projects onshore; pilot drilling and testing of the onshore heavy oil reservoir layer PK1 in the North Komsomolsky discovery, and the Domanik Sediments Difficult-to-Extract Hydrocarbons Project, aimed at pilot drilling and testing of the limestone Domanik formation in the Russian Volga-Urals basin. For each of these projects, Rosneft holds the majority interest, while Statoil holds a minority interest.

Sanctions imposed by Norway, the EU and the USA target, among others, Russia's financial and energy sectors, including certain companies such as Rosneft and various affiliates, and specific activities related to oil exploration and production in the Arctic offshore area, and in deepwater or shale formation projects. Aspects of those measures affect Statoil's business activities in Russia. The continued progress and financing of the joint projects are, in part, dependent on Statoil and the joint ventures securing various governmental authorisations and clarifications from such governmental authorities also going forward. Statoil continues to pursue the above-described projects within the limitations of current sanctions. However, due to current and possible future sanctions, there is no certainty that the projects can be progressed and concluded as initially planned.

Iran
Certain countries, including Iran, have been identified by the US government as state sponsors of terrorism.

Historically, Statoil held interests in the Iranian South Pars offshore phase 6, 7 and 8 gas development project in the Persian Gulf. Statoil was also an owner of a significant interest in the Anaran block and held a 100% interest in the Khorramabad exploration block - both in Iran. Due to the increase of international sanctions against Iran, Statoil in 2009 voluntarily offered officials from the US State Department information about its Iranian business activity. In October 2010 the US State Department announced under the Comprehensive Iran Sanctions, Accountability and Divestment Act of 2010 (CISADA), Statoil to be eligible to avoid retaliatory measures relating to its activities in Iran, due to Statoil's pledge to end its investments in Iran's energy sector.

Following the January 2016 sanctions relief, offered Iran by the US in accordance with the Joint Comprehensive Plan of Action entered into by Iran and the P5+1, secondary US nuclear sanctions on Iran have been scaled back. Despite this, other secondary and primary US sanctions on Iran remain in place. Since 2010, Statoil's activities relating to Iran have consisted of closing its historic projects in an orderly and compliant manner consistent with applicable sanctions. This has also included efforts to settle, to the extent possible, outstanding tax and social security obligations and recovery rights related to the above mentioned projects. Statoil has at regular intervals kept both relevant Norwegian as well as US authorities updated of such continued efforts.

A company found to have violated US sanctions against Iran could become subject to various types of sanctions, including (but not limited to) denial of US bank loans, restrictions on the importation of goods produced by the sanctioned entity, the prohibition on property transactions by the sanctioned entity in which the property is subject to the jurisdiction of the United States and prohibition of transfers of credit or payments via financial institutions in which the sanctioned entity has any interest.

General
The legislation and rules governing sanctions are complex, constantly evolving and may not be consistent across jurisdictions. Changes in any of these laws or policies or the implementation thereof can be unpredictable. Statoil's business is dynamic and the above facts accordingly, may change over time. Moreover, the description does not fully reflect all parts of Statoil's business where a particular focus on sanctions compliance might be warranted. Lastly, it should be understood that Statoil in the future could also decide to take part in additional business activity also involving sanctioned targets in various parts of the world whilst still remaining compliant with applicable sanctions laws. Statoil is committed to doing business in compliance with all applicable laws, however there can be no assurance that Statoil or affiliates of Statoil or their respective officers, directors, employees or agents are not in violation of such laws. Any such violation could result in substantial civil and/or criminal penalties and might materially adversely affect Statoil's business and results of operations or financial condition.

Statoil is also aware of initiatives by certain US states and institutional investors, such as pension funds, to adopt or consider adopting laws, regulations or policies requiring, among other things, divestment from, reporting of interests in, or agreements not to make future investments in, companies that do business with countries that, among other things, are designated as state sponsors of terrorism. These policies could have an adverse impact on investments by certain investors in Statoil's securities.

Disclosure Pursuant to Section 13 (r) of the Exchange Act
The Iran Threat Reduction and Syria Human Rights Act of 2012 ("ITRA") created a new subsection (r) in Section 13 of the Exchange Act which requires a reporting issuer to provide disclosure if the issuer or any of its affiliates engaged in certain enumerated activities relating to Iran, including activities involving the Government of Iran. Statoil is providing the following disclosure pursuant to Section 13(r).

Statoil is a party to agreements with the National Iranian Oil Company (NIOC), namely, a Development Service Contract for South Pars Gas Phases 6, 7 & 8 (offshore part), an Exploration Service Contract for the Anaran Block and an Exploration Service Contract for the Khorramabad Block, which are located in Iran. Statoil's operational obligations under these agreements have terminated and the licenses have been abandoned.

The cost recovery program for these contracts was completed in 2012, except for the recovery of tax and obligations to the Social Security organisation (SSO). Statoil's activity in Iran during 2015 was focused on a final settlement with the Iranian tax authorities and the SSO relating to the above mentioned agreements. During 2015 Statoil paid the equivalent of USD 3.20 million in tax and SSO to Iranian authorities in local currency (Iranian Rials), from which USD 0.04 million has been booked as expenses in 2015 and the rest have been reversed from previous years' accruals. Also during 2015 Statoil paid USD 0.02 million stamp duty to Iran Tax Organisation. The funds utilised for these purposes were held by Statoil in EN Bank (Iran).

During 2015 Statoil also received the equivalent of USD 0.48 million as insurance payment related to its legacy South Pars business. Also this insurance payment has been booked as revenue in 2015.

During 2015 NIOC, on behalf of Statoil, paid a tax obligation of USD 1.6 million equivalent in Iranian Rial to the local tax authorities. The amount was settled towards recoverable costs from NIOC to Statoil. Statoil is not involved in any other activities in Iran.

Since 2009 Statoil has transparently and regularly provided information about its Iran related activity to the US State Department as well as to the Norwegian Ministry of Foreign Affairs. In a letter from the US State Department of 1November 2010, Statoil was informed that the company was not considered to be a company of concern based on its previous Iran-related activities.

Statoil generated no net profit from the aforementioned activity in 2015. Payments of the above mentioned nature are expected to be made also in 2016, in relation to Statoil's continued winding-down efforts.

In addition, Statoil has in the course of 2015 paid four annual patent fees in Iran of in total EUR 347 (appr. USD 420). The payment of these patent fees will be discontinued in 2016.

5.1.2 Legal and regulatory risks

This section discusses potential legal and regulatory risks related to the legal context of our business operations, such as having to comply with new laws and regulations.

Compliance with health, safety and environmental laws and regulations that apply to Statoil's operations could materially increase its costs. The enactment of such laws and regulations in the future is uncertain.

Statoil incurs, and expects to continue to incur, substantial capital, operating, maintenance and remediation costs relating to compliance with increasingly complex laws and regulations for the protection of the environment and human health and safety, including:

- costs as a result of stricter climate regulations and a higher price on greenhouse gas emissions
- costs of preventing, controlling, eliminating or reducing certain types of emissions to air and discharges to the sea, including costs incurred in connection with government action to address the risk of spills and concerns about the impacts of climate change
- remediation of environmental contamination and adverse impacts caused by Statoil's activities or accidents at various facilities owned or previously owned by Statoil and at third-party sites where Statoil's products or waste have been handled or disposed of
- compensation of persons and/or entities claiming damages as a result of Statoil's activities or accidents and
- costs in connection with the decommissioning of drilling platforms and other facilities

For example, under the Norwegian Petroleum Act of 29 November 1996, as a holder of licences on the Norwegian continental shelf (NCS), Statoil is subject to statutory strict liability in respect of losses or damage suffered as a result of pollution caused by spills or discharges of petroleum from petroleum facilities covered by any of Statoil's licences. This means that anyone within the state or the delineation of the NCS who suffers losses or damage as a result of pollution caused by operations in any of Statoil's NCS licence areas can claim compensation from Statoil without having to demonstrate that the damage is due to any fault on Statoil's part.

Furthermore, in countries where Statoil operates or expects to operate in the near future, new laws and regulations, the imposition of stricter requirements on licences, increasingly strict enforcement of or new interpretations of existing laws and regulations, the aftermath of operational catastrophes in which Statoil or members of its industry are involved or the discovery of previously unknown contamination may require future expenditure in order to, among other things:

- modify operations
- install pollution control equipment
- implement additional safety measures
- perform site clean-ups
- curtail or cease certain operations
- temporarily shut down Statoil's facilities
- meet technical requirements
- increase monitoring, training, record-keeping and contingency planning and
- establish credentials in order to be permitted to commence drilling

Compliance with laws, regulations and obligations relating to climate change and other environmental regulations could result in substantial capital expenditure, reduced profitability as a result of changes in operating costs, and adverse effects on revenue generation and strategic growth opportunities. Statoil regularly assesses how changes in regulations, including introduction of stringent climate policies, may impact the oil price, the costs of developing new oil and gas assets, and the demand for oil and gas.

Statoil's operations in Norway are subject to emissions taxes as well as emissions allowances granted for Statoil's larger European operations under the EU Emissions Trading System. The agreed strengthening of the European Union's emission trading scheme may result in a significant reduction in the total emissions from relevant energy and industry installations which includes Statoil's installations at the NCS. The price of the emissions allowances is also expected to increase significantly towards 2030. At the 21st Conference of Parties (COP21) in Paris in December 2015, 195 countries adopted a new universally applicable climate agreement, to be effective from 2020. The Norwegian Parliament decided that Norway should negotiate with the European

Union to develop the terms for a collective delivery of 40% reductions in greenhouse gas emissions by 2030 compared to 1990. Individual countries' climate plans, the so-called 'Intended Nationally Determined Contributions', are to be strengthened every five years. The implications for the industry are not yet clear, however requirements to reduce emissions could imply increased costs.

The EU Fuel Quality Directive 2009/30/EC and its Implementation Directive 2015/652/EU require fuel suppliers to reduce their carbon intensity for transportation fuels by 6% in 2020 compared to the baseline of 2010. Fuel suppliers can use biofuels, low carbon fuels (i.e. natural gas), charging of electric vehicles and upstream emission reductions to achieve the target. Member States may set penalties on fuels suppliers for not achieving the target. The EU Commission will submit a non-legislative guidance document before April 2017 which will propose common principles on verification and accounting of upstream emissions reductions. The regulation could indirectly impact Statoil if it results in incentives for service station companies to increase the share of biofuels on behalf of fossil fuels.

In the US, the Environmental Protection Agency has taken steps to regulate greenhouse gas emissions under the *Clean Air Act* authority by proposing a Clean Power Plan (CPP). The plan aims to reduce emissions from the US power sector by setting performance standards for power plants. The regulation, if approved, could stimulate increased gas demand. In 2015, the EPA also proposed new source performance standards, in addition to those issued in 2012, targeting volatile organic compound emissions, that are intended to further reduce oil and gas methane emissions. This could imply additional costs for oil and gas producers.

Statoil incorporates a cost for carbon in the assessment of all new projects. This guides Statoil's strategy and its investment decisions. For investment decisions pertaining to oil and gas projects in Norway, Statoil includes an internal cost of USD 64 per tonne of CO_2-equivalent (based on the average annual exchange rate in 2015), based on the cost of the Norwegian CO_2 tax. In 2014, Statoil began to apply an internal cost of USD 50 per tonne of CO_2-equivalent in its investment decisions for all new oil and gas projects outside of Norway.

Many of Statoil's mature fields are producing increasing quantities of water with oil and gas. Statoil's ability to dispose of this water in environmentally acceptable ways may have an impact on its oil and gas production. Statoil's investments in North American onshore producing assets will be subject to evolving regulations which are common to all energy companies with investments in this region. This could affect Statoil's operations and profitability with respect to these operations.

If Statoil does not succeed in overcoming the perceived trade-off between global access to energy and the protection or improvement of the natural environment, Statoil could fail to live up to its aspirations of zero or minimal damage to the environment and of contributing to human progress.

Statoil is exposed to risk of supervision, review and sanctions for violations of regulatory laws at the supranational and national level. These include, among others, competition and antitrust laws and financial and trading.
Statoil's products are marketed and traded worldwide and therefore subject to competition and antitrust laws at the supranational and national level in multiple jurisdictions. Statoil is exposed to investigations from competition and antitrust authorities, and violations of the applicable laws and regulations may lead to substantial fines. In December 2015, the European Commission announced that it currently will not pursue its investigation against Statoil and certain other oil and gas producers concerning alleged crude oil price manipulation. The investigation had been on-going since May 2013 when the EFTA Surveillance Authority conducted an unannounced inspection at Statoil's head office in Stavanger, Norway, on behalf of the European Commission. The authorities suspected participation by several companies, including Statoil, in anti-competitive practices and/or market manipulation related to Platts Market-On-Close price assessment process.

Statoil is also exposed to financial review from financial supervisory authorities such as the Norwegian Financial Supervisory Authority (FSA) and the US Securities and Exchange Commission (the SEC). Reviews performed by these authorities could result in changes to previous accounts and future accounting policies. On 10 March 2014, the FSA concluded a review of Statoil's 2012 financial statements. Statoil has accepted two of the FSA's conclusions following this review but has appealed the third to the Norwegian Ministry of Finance.

Statoil is listed on both the Oslo Børs and New York Stock Exchange (NYSE), and is registered with the SEC. Statoil is required to comply with the continuing obligations of these regulatory authorities, and violation of these obligations may result in imposition of fines or other sanctions.

The Norwegian Petroleum Supervisor (Ptil) supervises all aspects of Statoil's operations, from exploration drilling through development and operation, to cessation and removal. Its regulatory authority covers the whole NCS as well as petroleum-related plants on land in Norway. Statoil is exposed to supervision from Ptil, and such supervision could result in audit reports, orders and investigations.

The formation of a competitive internal gas market within the European Union (EU) and the general liberalisation of European gas markets could adversely affect Statoil's business.
The continuing liberalisation of EU gas markets following legislative instruments rolled out in 2011 and the implementation of these legislative instruments by member states, could create new business opportunities for Statoil, but could also affect Statoil's market position or result in a reduction in prices in Statoil's gas sales contracts. Statoil's exposure to hub gas prices has increased and correspondingly increased Statoil's exposure to price volatility. Statoil continually monitors its contractual obligations and makes efforts to negotiate the most competitive pricing and other conditions available in the market.

The EU-wide quantity of carbon allowances issued each year under the Emission Trading Scheme (ETS) for greenhouse gas emission allowances began to decrease in a linear manner in 2013. The ETS can have a positive or negative impact on Statoil, depending on the price of carbon, which will consequently have an impact on the development of gas-fired power generation in the EU. Until now, the carbon price has been too low to replace coal with gas fired generation capacity. This effect has been worsened by heavy subsidising of renewables which has caused gas fired power plants to shut down. Current EU climate and energy policies do not address this problem, but there is a tendency towards more market based subsidies in the new guidelines on environment and energy aid.

Political and economic policies of the Norwegian State could affect Statoil's business.
The Norwegian State plays an active role in the management of NCS hydrocarbon resources. In addition to its direct participation in petroleum activities through the State's direct financial interest (SDFI) and its indirect impact through legislation, such as tax and environmental laws and regulations, the Norwegian State, among other things, awards licences for exploration, production and transportation, approves exploration and development projects and applications for production rates for individual fields and may, if important public interests are at stake, also instruct Statoil and other oil companies to reduce petroleum production. Furthermore, in the production licences in which the SDFI holds an interest, the Norwegian State has the power to direct petroleum licences' actions in certain circumstances.

If the Norwegian State were to take additional action under its activities on the NCS or to change laws, regulations, policies or practices relating to the oil and gas industry, Statoil's NCS exploration, development and production activities and the results of its operations could be affected.

5.1.3 Risks related to state ownership

This section discusses some of the potential risks relating to Statoil's business that could derive from the Norwegian State's majority ownership and from Statoil's involvement in the SDFI.

The interests of Statoil's majority shareholder, the Norwegian State, may not always be aligned with the interests of Statoil's other shareholders, and this may affect Statoil's decisions relating to the NCS.
The Norwegian Parliament, known as the Storting, and the Norwegian State have resolved that the Norwegian State's shares in Statoil and the SDFI's interest in NCS licences must be managed in accordance with a coordinated ownership strategy for the Norwegian State's oil and gas interests. Under this strategy, the Norwegian State has required Statoil to continue to market the Norwegian State's oil and gas together with Statoil's own oil and gas as a single economic unit.

Pursuant to this coordinated ownership strategy, the Norwegian State requires Statoil, in its activities on the NCS, to take account of the Norwegian State's interests in all decisions that may affect the development and marketing of Statoil's own and the Norwegian State's oil and gas.

The Norwegian State directly held 67% of Statoil's ordinary shares as of 31 December 2015. Based on the Norwegian Public Limited Companies Act, the Norwegian State effectively has the power to influence the outcome of any vote of shareholders due to the percentage of Statoil's shares it owns, including amending its articles of association and electing all non-employee members of the corporate assembly. The employees are entitled to be represented by up to one-third of the members of the board of directors and one-third of the corporate assembly.

The corporate assembly is responsible for electing Statoil's board of directors. It also makes recommendations to the general meeting concerning the board of directors' proposals relating to the company's annual accounts, balance sheet, allocation of profit and coverage of loss. The interests of the Norwegian State in deciding these and other matters and the factors it considers when casting its votes, especially under the coordinated ownership strategy for the SDFI and Statoil's shares held by the Norwegian State, could be different from the interests of Statoil's other shareholders.

If the Norwegian State's coordinated ownership strategy is not implemented and pursued in the future, then Statoil's mandate to continue to sell the Norwegian State's oil and gas together with its own oil and gas as a single economic unit is likely to be prejudiced. Loss of the mandate to sell the SDFI's oil and gas could have an adverse effect on Statoil's position in the markets in which it operates.

For further information about the mandate to sell the Norwegian State's oil and gas see section 3.12.4 *SDFI oil and gas marketing and sale.*

5.2 Risk management

Statoil's overall risk management approach includes identifying, evaluating and managing risk in all its activities. In order to achieve optimal corporate solutions, Statoil bases its risk management on an enterprise-wide risk management approach.

Statoil defines risk as a deviation from a specified reference value and the uncertainty associated with it. A positive deviation is defined as an upside risk, while a negative deviation is a downside risk. The reference value is most commonly a forecast, percentile or target. Statoil has an enterprise risk management (ERM) approach, which means that:

- focus is on the value impact for Statoil
- risk is managed to make sure that Statoil's operations are safe and in compliance with Statoils' requirements and
- focus is on risk and reward at all levels in the organisation

Statoil's corporate risk committee (CRC) is headed by the chief financial officer and its members include representatives of the principal business areas. It is an enterprise risk management advisory body that primarily advises the chief financial officer, but also the business areas' management on specific issues. The CRC assesses and advises on measures aimed at managing the overall risk to the group, and it proposes appropriate measures to adjust risk at the corporate level. The CRC is also responsible for reviewing and developing Statoil's risk policies. The committee meets regularly during the year to support Statoil's risk management strategies, including hedging and trading strategies, as well as risk management methodologies. It regularly receives risk information that is relevant to it from Statoil's corporate risk department.

Risk is managed in the business line and is an integrated part of any manager's responsibility. However, some risks are managed at corporate level to avoid suboptimisation. This includes oil and natural gas price risks, interest and currency risks, risk dimension in the strategy work, prioritisation processes and capital structure discussions.

The following section describes in some detail the market risks to which Statoil is exposed and how Statoil manages these risks.

5.2.1 Managing operational risk

Statoil manages risk in order to ensure safe operations and to achieve its corporate goals in compliance with its requirements.

All risks are related to Statoil's value chain, which denotes the value that is added in each step - from access, maturing, project execution and operation to market. In addition to the economic impact these risks could have on Statoil's cash flows, Statoil has have a strong focus on avoiding HSE and integrity-related incidents (such as accidents, fraud and corruption). Most of the risks are managed by the principal business area line managers. Some operational risks are insurable and insured by Statoil's captive insurance company operating in the Norwegian and international insurance markets.

Statoil's risk management process is based on ISO31000 Risk management – principles and guidelines. The process provides a standardised framework and methodology for assessing and managing risk. A standardisation of the process across the entire enterprise allows for comparable risk levels and efficiency in decisions and it enables the organisation to create sustainable value while avoiding incidents. The process ensures that risks are identified, analysed, evaluated and managed. Risk adjusting actions are subject to a cost benefit evaluation (except certain safety related risks which are subject to specific regulations).

5.2.2 Managing financial risk

The results of Statoil's operations depend on a number of factors, most significantly those that affect the price it receives for the products.

Statoil has developed policies aimed at managing the financial volatility inherent in some of the business exposures. In accordance with these policies, Statoil enters into various financial and commodity-based transactions (derivatives). While the policies and mandates are set at the company level, the business areas are responsible for marketing and trading commodities are also responsible for managing commodity-based price risks. Interest, liquidity, liability and credit risks are managed by the company's central finance department.

The factors that influence the results of Statoil's operations include: the level of crude oil and natural gas prices, trends in the exchange rate between the USD, in which the trading price of crude oil is generally stated, EUR and GBP where Statoil has a large share of its natural gas sales, and NOK, in which its accounts are reported and a substantial proportion of the costs are incurred; Statoil's oil and natural gas production volumes, which in turn depend on entitlement volumes under PSAs and available petroleum reserves, and Statoil's own, as well as partners' expertise and cooperation in recovering oil and natural gas from those reserves; and changes in Statoil's portfolio of assets due to acquisitions and disposals.

Statoil's results will also be affected by trends in the international oil industry, including possible actions by governments and other regulatory authorities in the jurisdictions in which Statoil operates, or possible or continued actions by members of the Organization of Petroleum Exporting Countries (Opec) and/or other producing nations that affect price levels and volumes, refining margins, the cost of oilfield services, supplies and equipment, competition for exploration opportunities and operatorships, and deregulation of the natural gas markets, all of which may cause substantial changes to existing market structures and to the overall level and volatility of prices and price differentials.

The following table shows the yearly averages for quoted Brent Blend crude oil prices, natural gas average sales prices, refining reference margins and the USDNOK exchange rates for 2015, 2014 and 2013.

Yearly average	2015	2014	2013
Crude oil (USD/bbl Brent blend)	55.3	98.9	108.7
Average invoiced gas prices - Europe (NOK/scm)	2.16	2.28	2.45
Refining reference margin (USD/bbl)	8.0	4.7	4.1
USDNOK average daily exchange rate	8.07	6.30	5.88

The illustration shows the indicative full-year effect on the financial result for 2016 given certain changes in the crude oil price, natural gas contract prices and the USD/NOK exchange rate. The estimated price sensitivity of Statoil's financial results to each of the factors has been estimated based on the assumption that all other factors remain unchanged.

Significant downward adjustments of Statoil's commodity price assumptions will result in impairment losses on certain producing and development assets in the portfolio. Subsequent to year end 2015, commodity prices have continued to be volatile. See note 11 *Property, plant and equipment* and note 12 *Intangible assets* to the Consolidated financial statements for sensitivity analysis related to impairment losses.

Statoil assesses oil and gas price hedging opportunities on a regular basis as a tool with regard to financial robustness and flexibility.

Fluctuating foreign exchange rates can have a significant impact on the operating results. Statoil's revenues and cash flows are mainly denominated in or driven by USD, while a large portion of the operating expenses, capital expenditures and income taxes payable accrue in NOK. Statoil seeks to manage this currency mismatch by issuing or swapping non-current financial debt in USD. This long-term funding policy is an integrated part of our total risk management programme. Statoil also engages in foreign currency management in order to cover the non-USD needs, which are primarily in NOK. In general, an increase in the value of USD in relation to NOK can be expected to increase Statoil's reported earnings.

Historically, Statoil's revenues have largely been generated by the production of oil and natural gas on the NCS. Norway imposes a 78% marginal tax rate on income from offshore oil and natural gas activities (a symmetrical tax system). For more information see section 3.12.6 *Taxation of Statoil*.

Statoil's earnings volatility is moderated as a result of the significant proportion of its Norwegian offshore income that is subject to a 78% tax rate in profitable periods, and the significant tax assets generated by its Norwegian offshore operations in any loss-making periods. Most of the taxes Statoil pays are paid to the Norwegian State. Dividends received in Norway are 97% exempt from tax, with the remaining 3% taxed at the ordinary rate of 27%. For dividends received from companies in a low-tax jurisdiction within the European Economic Area (EEA), the 97% exemption only applies if real business activities are conducted in that jurisdiction. Dividends received from companies in non-EEA countries are 97% exempt if the Norwegian recipient has held at least 10% of the shares for a minimum of two years and the foreign country is not a low-tax jurisdiction.

Government fiscal policy is an issue in several of the countries in which Statoil operates, such as, but not limited to, Algeria, Angola, Nigeria, Brazil, the USA and Venezuela. However, Statoil's exposure in Venezuela is low. For instance, government fiscal policy could require royalties in cash or in kind, increased tax rates, increased government participation and changes in terms and conditions as defined in various production or income-sharing contracts. Statoil's financial statements are based on currently enacted regulations and on any current claims from tax authorities regarding past events. Developments in government fiscal policy may have a negative effect on future net income.

Financial risk management

Statoil's business activities naturally expose the group to financial risk. The group's approach to risk management includes identifying, evaluating and managing risk in all activities using a top-down approach for the purpose of avoiding sub-optimisation and utilising correlations observed from a group perspective. Summing up the different market risks without including the correlations will overestimate Statoil's total market risk. For this reason, Statoil utilises correlations between all of the most important market risks, such as oil and natural gas prices, product prices, currencies and interest rates, to calculate the overall market risk and thereby utilise the natural hedges embedded in its portfolio. This approach also reduces the number of unnecessary transactions, which reduces transaction costs and avoids sub-optimisation.

In order to achieve the above effects, Statoil has centralised trading mandates (financial positions taken to achieve financial gains, in addition to established policies) so that all major/strategic transactions are coordinated through the CRC. Local trading mandates are therefore relatively small.

Statoil's activities expose the company to the following financial risks: market risks (including commodity price risk, interest rate risk and currency risk), liquidity risk and credit risk. For a discussion of financial risk management see note 5 *Financial risk management* in the Consolidated financial statements.

5.2.3 Disclosures about market risk

Statoil uses financial instruments to manage commodity price risks, interest rate risks, currency risks and liquidity risks. Significant amounts of assets and liabilities are accounted for as financial instruments.

See note 25 *Financial instruments: fair value measurement and sensitivity analysis of market risk* in the Consolidated financial statements, for details of the nature and extent of such positions, and for qualitative and quantitative disclosures of the risks associated with these instruments.

5.3 Legal proceedings

Statoil is involved in a number of proceedings globally concerning matters arising in connection with the conduct of its business.

Statoil is currently not aware of any regulatory, judicial or arbitration proceedings or claims that it believes may have, or have had in the recent past, individually or in the aggregate, significant effects on Statoil's financial position or profitability or on the results of its operations or liquidity. This includes the legal proceedings described hereafter:

Agbami redetermination, Nigeria:
Through its ownership in OML 128 in Nigeria, Statoil is party to an ownership interest redetermination process for the Agbami field. In October 2015 Statoil received the expert's final ruling which implies a reduction of 5.17 percentage points in Statoil's equity interest in the field from 20.21% to 15.04%. In 2013, Statoil initiated arbitration proceedings to set aside interim decisions made by the expert in the redetermination process, but this was declined by the arbitration tribunal in its November 2015 judgment. Statoil has initiated proceedings before the Federal High Court in Lagos to set aside the arbitration award, and also intends to initiate a new arbitration to set aside the expert's final ruling.

As of 31 December 2015 Statoil has made a provision of NOK 9.5 billion, net of tax, which reflects a reduction of 5.17 percentage points in Statoil's equity interest in the Agbami field.

Royalty Litigation, US Onshore:
Statoil is currently defending multiple, but individually immaterial, royalty litigations and arbitrations, some on behalf of large classes of mineral owners, relating to its operated and non-operated positions in the Marcellus and Eagle Ford shale plays. Mineral owners in these proceedings generally allege that Statoil has breached their oil and gas leases by first paying royalty on the basis of an impermissibly-low unit price, and second taking prohibited and/or excessive deductions for post-production costs. The cases are in various procedural stages and are typical disputes for oil companies in the US onshore business. None of the litigations or arbitrations is currently set for trial or final hearing.

In the ordinary course of business, companies in the Statoil group are subject to a number of other loss contingencies arising from litigation and claims raised by governmental and private parties, for instance contractors, tax authorities, land owners for on-shore activities and buyers of Statoil's products.

See also note 9 *Income taxes* and note 23 *Other commitments and contingencies* in Consolidated financial statements.

6 Shareholder information

Statoil is the largest company listed on the Oslo Børs, where it trades under the ticker code STL. Statoil is also listed on the New York Stock Exchange under the ticker code STO.

STATOIL SHARE	2015	2014	2013	2012	2011
Shareprice STL (low) (NOK)	116.30	120.00	147.70	162.40	160.50

1) Share price at year end divided by EPS.

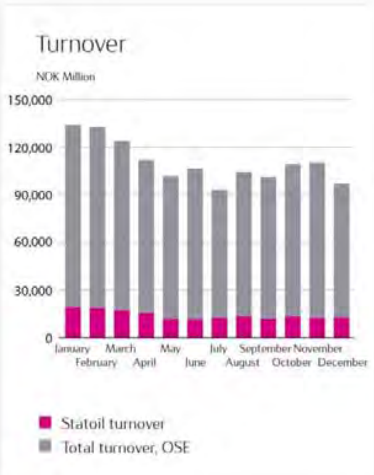
2) Proposed cash dividend for 2015. For 2015, the NOK amount covers first quarter while the USD amount is for second, third and fourth quarter. See section 6.1 *Dividend policy*.

3) Excluding special dividend and share buy-back.

4) Conversions between NOK and USD are conducted by applying the year end exchange rate for the respective year.

5) Total dividend per share in NOK divided by EPS.

6) Total dividend per share in NOK divided by year end share price.



As of 31 December 2015, Statoil represented 14.68% of the total value of all companies registered on the Oslo Børs, with a market value of NOK 394 billion.

Statoil's share price closed at NOK 123.70 at the end of 2015.

Taking into consideration the total dividend paid out in 2015 of NOK 7.20 per share, which includes four quarterly payments of NOK 1.80 per share for the third and fourth quarter of 2014 and first and second quarter of 2015, the total return was negative NOK 0.30 per share. The graph above, "Quote history", shows the development of the Statoil share price compared to the oil price and the Oslo Børs Benchmark Index (OSEBX). The board of directors proposes a dividend of USD 0.2201 per share for the fourth quarter 2015, for approval by the annual general meeting on 11 May 2016. Diluted earnings per share amounted to negative NOK 11.80, compared to positive NOK 6.87 in 2014.

The turnover of shares is a measure of traded volumes. On average, 5.1 million Statoil shares were traded on the Oslo Børs every day in 2015 compared to 3.7 million shares in 2014. In 2015, Statoil shares accounted for 15% of the total market value traded throughout the year (see illustration), compared to 12% in 2014.

Statoil ASA has one class of shares, and each share confers one vote at the general meeting. Statoil ASA had 3,188,647,103 ordinary shares outstanding at year end.

As of 31 December 2015, Statoil had 91,774 shareholders registered in the Norwegian Central Securities Depository (VPS), down from 92,692 shareholders at 31 December 2014.

6.1 Dividend policy

It is Statoil's ambition to grow the annual cash dividend measured in USD per share in line with long-term underlying earnings.

Statoil's board approves first, second and third quarter interim dividends, based on an authorisation from the annual general meeting (AGM), while the AGM approves the fourth quarter dividend and the implicit the total dividend based on a proposal from the board. When deciding the interim dividends and recommending the total annual dividend level, the board will take into consideration expected cash flow, capital expenditure plans, financing requirements and appropriate financial flexibility. In addition to cash dividend, Statoil might buy back shares as part of total distribution of capital to the shareholders. The shareholders at the AGM may vote to reduce, but may not increase, the fourth quarter dividend proposed by the board of directors. It is Statoil's intention to have this authorisation approved at the AGM. Statoil announces dividend payments in connection with quarterly results. Payment of quarterly dividends is expected to take place approximately four months after the announcement of each quarterly dividend.

The board of directors updated the dividend policy in 2015 to reflect USD as the declaration currency.

The board of directors proposes to the AGM a dividend of USD 0.2201 per share for the fourth quarter 2015 and the introduction of a two-year scrip dividend programme for eligible shareholders starting from the fourth quarter 2015. The scrip programme will give shareholders the option to receive quarterly dividends in cash or in newly issued shares in Statoil at a 5% discount for the fourth quarter 2015. The Norwegian Government, as majority shareholder, supports the proposal and will seek the Norwegian Parliament's approval to vote in favour of the proposal at the AGM. The Norwegian government intends to match subscription of shares by minority shareholders, and thereby maintain its ownership share at 67% throughout the programme.

6.1.1 Dividends

In 2014 Statoil implemented quarterly dividend payments and from second quarter 2015 Statoil implemented USD as dividend declaration currency.

Although we currently intend to pay quarterly dividends on our ordinary shares, we cannot give an assurance that dividends will be paid, or predict the amount of any dividends. Future dividends will depend on a number of factors prevailing at the time our board of directors considers any dividend payment. The following table shows the cash dividend amounts to all shareholders since 2010 on a per share basis and in aggregate.

				Ordinary dividend per share						Ordinary dividend per
Fiscal year	Curr.	Q1	Curr.	Q2	Curr.	Q3	Curr.	Q4	Curr.	share
2011									NOK	6.5000
2012									NOK	6.7500
2013									NOK	7.0000
2014	NOK	1.8000	NOK	1.8000	NOK	1.8000	NOK	1.8000	NOK	7.2000
2015	NOK	1.8000							NOK	1.8000
2015			USD	0.2201	USD	0.2201	USD	0.2201	USD	0.6603

Statoil commenced quarterly dividends in 2014. During 2015 Statoil paid four quarterly dividends. The third quarter 2014 dividend was paid out in February 2015, the fourth quarter 2014 dividend was paid out in May 2015, the first quarter 2015 dividend was paid out in August 2015 and the second quarter 2015 dividend was paid out in November 2015. The third quarter 2015 dividend was paid out in February 2016. The proposed fourth quarter 2015 dividend will be considered at the annual general meeting 11 May 2016. The Statoil share will be traded ex dividend 12 May 2016 and if approved, the dividend will be disbursed around late June 2016. For US ADR holders, the ex-dividend date will be 12 May 2016 and expected payment date for ADR holders will be in June 2016.

From the second quarter 2015 Statoil implemented declaring dividends in USD. As from the third quarter 2015 only dividend in USD per share will be announced. Dividends in NOK per share will be communicated four business days after record date for shareholders at Oslo Børs. Since we will declare dividends in USD, exchange rate fluctuations will affect the amounts in NOK received by shareholders on the Oslo Børs.

Share repurchase
In addition to a cash dividend, Statoil may buy back shares as part of its total distribution of capital to its shareholders. For the period 2013-2015, the board of directors was authorised by the annual general meeting of Statoil to repurchase Statoil shares in the market for subsequent annulment. We have not undertaken any share repurchase based on this authorisation.

It is Statoil's intention to renew this authorisation at the annual general meeting. Statoil intends to use share buybacks more actively going forward, based on balance sheet strength considerations.

6.2 Shares purchased by issuer

Shares are acquired in the market for transfer to employees under the share savings scheme in accordance with the limits set by the board of directors. No shares were repurchased in the market for the purpose of subsequent annulment in 2015.

6.2.1 Statoil's share savings plan

Since 2004, Statoil has had a share savings plan for employees of the company. The purpose of this plan is to strengthen the business culture and encourage loyalty through employees becoming part-owners of the company.

Through regular salary deductions, employees can invest up to 5% of their base salary in Statoil shares. In addition, the company contributes 20% of the total share investment made by employees in Norway, up to a maximum of NOK 1,500 per year (approximately USD 170). This company contribution is a tax-free employee benefit under current Norwegian tax legislation. After a lock-in period of two calendar years, one extra share will be awarded for each share purchased. Under current Norwegian tax legislation, the share award is a taxable employee benefit, with a value equal to the value of the shares and taxed at the time of the award.

The board of directors is authorised to acquire Statoil shares in the market on behalf of the company. The authorisation may be used to acquire own shares for a total nominal value of up to NOK 35 million. Shares acquired under this authorisation may only be used for sale and transfer to employees of the Statoil group as part of the company's share savings plan as approved by the board of directors. The minimum and maximum amount that may be paid per share is NOK 50 and 500, respectively.

The authorisation is valid until the next annual general meeting, but not beyond 30 June 2016. This authorisation replaces the previous authorisation to acquire Statoil's own shares for implementation of the share savings plan granted by the annual general meeting 14 May 2014. It is Statoil's intention to renew this authorisation at the annual general meeting. Statoil intends to use share buybacks more actively going forward, based on balance sheet strength considerations.

The nominal value of each share is NOK 2.50. With a maximum overall nominal value of NOK 35 million, the authorisation for the repurchase of shares in connection with the group's share savings plan covers the repurchase of no more than 14 million shares.

Period in which shares were repurchased	Number of shares repurchased	Average price per share in NOK	Total number of shares purchased as part of programme	Maximum number of shares that may yet be purchased under the programme authorisation[1]
Jan-15	713,771	130.6301	4,713,258	6,286,742

Jun-15	664,037	140.9826	664,037	13,335,963
Jul-15	661,604	141.2402	1,325,641	12,674,359
Aug-15	707,278	132.0766	2,032,919	11,967,081
Sep-15	781,215	119.1604	2,814,134	11,185,866
Oct-15	661,646	140.4563	3,475,780	10,524,220
Nov-15	717,182	129.8833	4,192,962	9,807,038
Dec-15	750,203	123.5585	4,943,165	9,056,835
Jan-16	878,834	102.6997	5,821,999	8,178,001
Feb-16	745,858	117.5826	6,567,857	7,432,143
TOTAL	9,813,810 [2]	132.4013 [3]		

1) The authorisation to repurchase a maximum of 11 million shares with a maximum overall nominal value of NOK 27.5 million for repurchase of shares in connection with the share savings plan was given by the annual general meeting on 14 May 2014. The authorisation was maintained by the annual general meeting on 19 May 2015 at a maximum of 14 million shares with a maximum overall nominal value of 35 million for repurchase of shares, valid until 30 June 2016.

2) All shares repurchased have been purchased in the open market and pursuant to the authorisation mentioned above.

3) Weighted average price per share.

6.3 Information and communications

Updated information about Statoil's financial performance and future prospects forms the basis for assessing the value of the company.

Information provided to the stock market must be transparent and ensure equal treatment of all shareholders, and it must aim to provide shareholders with correct, clear, relevant and timely information that forms the basis for assessing the value of the company.

Statoil shares are listed on the Oslo Børs, and its American Depositary Receipts (ADRs) are listed on the New York Stock Exchange. We distribute share price-sensitive information through the international wire services, the Oslo Børs in Norway, the Securities and Exchange Commission in the US, and our website Statoil.com.

Our registrar manages our shares listed on the Oslo Børs on our behalf and provides the connection to the Norwegian Central Securities Depository (VPS). Important services provided by the registrar are investor services for private shareholders, the disbursement of dividends and assistance at our general meetings. DnB Bank is currently the account registrar for Statoil.

6.3.1 Investor contact

Our investor relations staff function (IR) coordinates the dialogue with our shareholders.

We place great emphasis on ensuring that relevant and timely information is distributed to the capital markets. Given the size and diversity of our shareholder base, the opportunities for direct shareholder interaction are limited. Our "Investor Centre" web pages are therefore specially designed for investors and analysts who wish to follow the company's progress - Statoil.com/IR.

We broadcast our quarterly presentations and other relevant presentations by management directly on the internet, and the related reports are made available together with other relevant information on our website.

6.4 Market and market prices

The principal trading market for our ordinary shares is the Oslo Børs. The ordinary shares are also listed on the New York Stock Exchange, trading in the form of American Depositary Shares (ADS).

Statoil's shares have been listed on the Oslo Børst since our initial public offering on 18 June 2001. The ADSs traded on the New York Stock Exchange are evidenced by American Depositary Receipts (ADR), and each ADS represents one ordinary share. Statoil has a sponsored ADR facility with Deutsche Bank Trust Company Americas as depositary.

6.4.1 Share prices

These are the reported high and low quotations at market closing for the ordinary shares on the Oslo Børs and New York Stock Exchange for the periods indicated.

They are derived from the Oslo Børs Daily Official List, and the highest and lowest sales prices of the ADSs as reported on the New York Stock Exchange composite tape.

6.4.2 Statoil ADR programme fees

Fees and charges payable by a holder of ADSs.

As depositary from 31 January 2013, Deutsche Bank Trust Company Americas collects its fees for the delivery and surrender of ADSs directly from investors depositing shares or surrendering ADSs for the purpose of withdrawal, or from intermediaries acting for them. The depositary collects fees from investors by deducting the fees from the amounts distributed or by selling a portion of distributable property to pay the fees. The depositary may refuse to provide fee-attracting services until its fees for those services are paid.

The charges of the depositary payable by investors are as follows:

Persons depositing or withdrawing shares must pay:	For:
USD 5.00 (or less) per 100 ADSs (or portion of 100 ADSs)	• Issuance of ADSs, including issuances resulting from a distribution of shares or rights or other property • Cancellation of ADSs for the purpose of withdrawal, including if the deposit agreement terminates
USD 0.02(or less) per ADS, subject to the company's consent	• Any cash distribution to ADS registered holders
USD 0.05 (or less) per ADS, subject to the company's consent	• For the operation and maintenance costs in administering the ADR program
A fee equivalent to the fee that would be payable if securities distributed to you had been shares and the shares had been deposited for issuance of ADSs	• Distribution of securities distributed to holders of deposited securities which are distributed by the Depositary to ADS registered holders
Registration or transfer fees	• Transfer and registration of shares on our share register to or from the name of the Depositary or its agent when you deposit or withdraw shares
Expenses of the Depositary	• Cable, telex and facsimile transmissions (as provided in the deposit agreement) • Converting foreign currency to US dollars
Taxes and other governmental charges the Depositary or the custodian have to pay on any ADS or share underlying an ADS, for example, stock transfer taxes, stamp duty or withholding taxes	• As necessary
Any charges incurred by the Depositary or its agents for servicing the deposited securities	• As necessary

Reimbursements and payments made and fee waivers granted by the depositary
The depositary has agreed to reimburse certain company expenses related to the company's ADR programme and incurred by the company in connection with the programme. In the year ended 31 December 2015, the depositary reimbursed approximately USD 1.43 million to the company in relation to certain expenses including investor relations expenses, expenses related to the maintenance of the ADR programme, legal counsel fees, printing and ADR certificates.

The depositary has also agreed to waive fees for costs associated with the administration of the ADR programme, and it has paid certain expenses directly to third parties on behalf of the company. The expenses paid to third parties include expenses relating to reporting services and access charges to its online platform, re-registration costs borne by the custodian. For the year ended 31 December 2015, the depositary paid expenses of approximately USD 69,576 directly to third parties.

6.5 Taxation

This section describes the material Norwegian tax consequences that apply to shareholders resident in Norway and to non-resident shareholders in connection with the acquisition, ownership and disposal of shares and American Depositary Shares (ADS). The term “shareholder” refers to both holders of shares and holders of ADSs, unless otherwise explicitly stated.

Norwegian tax matters

The outline does not provide a complete description of all tax regulations that might be relevant (i.e. for investors to whom special regulations may be applicable), and is based on current law and practice. Shareholders should consult their professional tax adviser for advice about individual tax consequences.

Taxation of dividends

Corporate shareholders (i.e. limited liability companies and similar entities) residing in Norway for tax purposes are generally subject to tax in Norway on dividends received from Norwegian companies. The basis for taxation is 3% of the dividends received, which is subject to the standard income tax rate. The standard income tax rate has been reduced from 27% in 2015 to 25% in 2016.

Individual shareholders resident in Norway for tax purposes are subject to the standard income tax rate (reduced from 27% in 2015 to 25% in 2016) in Norway for dividend income exceeding a basic tax free allowance. However, in 2016 dividend income exceeding the basic tax free allowance is grossed up with a factor of 1.15 before taken to taxation, resulting in an effective tax rate of 28.75% (25% x 1.15). The tax free allowance is computed for each individual share or ADS on the basis of the cost price of that share or ADS multiplied by a risk-free interest rate. The risk-free interest rate will be determined every income year. Any part of the calculated allowance for one year that exceeds the dividend distributed for the share or ADS ("unused allowance") may be carried forward and set off against future dividends received for (or gains upon the realisation of, see below) the same share or ADS. Any unused allowance will also be added to the basis for computation of the allowance for the same share or ADS the following year.

Non-resident shareholders are as a rule subject to withholding tax at a rate of 25% on dividends distributed by Norwegian companies. This withholding tax does not apply to corporate shareholders in the EEA area that document that they are genuinely established and carry on genuine economic business activity within the EEA area, provided that Norway is entitled to receive information from the state of residence pursuant to a tax treaty or other international treaty. If no such treaty exists with the state of residence, the shareholder may instead present confirmation issued by the tax authorities of the state of residence verifying the documentation. Individual shareholders resident for tax purposes in the EEA area may apply to the Norwegian tax authorities for a refund if the tax withheld by the distributing company exceeds the tax that would have been levied on individual shareholders resident in Norway.

The withholding rate of 25% is often reduced in tax treaties between Norway and other countries. Generally, the treaty rate does not exceed 15% and, in cases where a corporate shareholder holds a qualifying percentage of ownership in the distributing company, the withholding tax rate on dividends may be further reduced. The withholding tax rate in the tax treaty between the United States and Norway is currently 15% in all cases. It is the responsibility of the distributing company to deduct the withholding tax when dividends are paid to non-resident shareholders.

The reduced withholding rate will generally only apply to dividends paid on shares held by shareholders who are able to properly demonstrate to the company that they are entitled to the benefits of the tax treaty.

For holders of shares and ADSs deposited with Deutsche Bank Trust Company Americas (Deutsche Bank), documentation establishing that the holder is eligible for the benefits under the tax treaty with Norway, may be provided to Deutsche Bank. Deutsche Bank has been granted permission by the Norwegian tax authorities to receive dividends from us for redistribution to a beneficial owner of shares and ADSs at the applicable treaty withholding rate.

Dividends paid to shareholders (either directly or through a depositary) who have not provided the relevant documentation to the relevant party that they are eligible for the reduced rate, will be subject to withholding tax of 25%. The beneficial owners will in this case have to apply to the Central Office - Foreign Tax Affairs (COFTA) for a refund of the excess amount of tax withheld.

According to information provided by the Central Office of Foreign Tax Affairs (COFTA), an application for a refund of withholding tax from shareholders must contain the following:

1. Full name, address and tax identification number of the claimant.
2. Payment details, including name of account holder, either a Norwegian bank account number or IBAN and SWIFT/BIC code. The IBAN account must be able to receive NOK as the refund will be transferred in NOK.
3. A specification of the Norwegian company(ies) involved, the exact amount of shares, the date of each dividend payment, the dividend per share, the total dividend payment, the Norwegian withholding tax rate, and the reclaimed amount. All amounts must be given in NOK.
4. Documentation that confirms the claimant's residency.
    - A claim according to a tax treaty must contain a Certificate of Residence issued by the competent local tax authorities with reference to the claimant's tax identification number. The certificate of residence must state that the claimant was resident according to the tax treaty with Norway during the year when the decision to distribute the dividend was made. The confirmation must be in original. The Certificate of Residence must mention solely the claimant's name

- A claim according to the tax exemption method cf. tax act section 2-38 must contain confirmation that the claimant is registered and based within the EEA and genuinely established in that country

5. A credit advice, certifying that the claimant has received the dividends and has been subject to Norwegian withholding tax on the dividends. The credit advice must fill the following criteria:
   - It must document the chain of transactions, including information about the foreign custodian/bank/clearing central registered in Norway that initially received the dividends. If the dividends have been paid through a chain of transactions, each transaction must be documented with a credit advice issued to the initial receiver
   - It must be issued by the bank that credits the claimant the dividend payment. It must contain the following details:
     - Name of the payment recipient, i.e. the claimant
     - Name and ISIN of the stock etc
     - The exact amount of shares
     - The gross amount and withholding tax in NOK
     - The ex-date, the record date and the pay-date
     - The dividend per share

   Please note that the credit advice must specify that the dividend payment has been subject to withholding tax, not just tax. This clarification will be a definite requirement on claims made from 1 January 2014 onward.
6. Power of attorney/attestation, a general power of attorney from the beneficial owner to authorise the claimant to claim a refund.
   The power of attorney does not need to mention the specific dividend payments. Still, COFTA requires that the claimant makes a spreadsheet listing the names of the companies from which the dividends were received, with the dates and the amounts of withholding tax. This spreadsheet should accompany the application and has to be approved and signed by the beneficial owner.
   Please note that only one refund claim can be made regarding each dividend payment, and applications for the same claim must not be filed several times, neither directly nor via custodians.
7. A claim should also contain general information about the claimant as regards legal, corporate and taxable aspects. Please note that only the beneficial owner may apply for a refund of withholding tax. An entity that is acting on behalf of someone else as either trustee or investment manager, and who is as such the registered or indirect owner of the dividends, is not entitled to a refund. Neither is an entity that receives the dividend payments and passes them directly on to other entities/persons entitled to a refund.

In some cases COFTA may request further, and more specific, information about the claim for refund and the claimant. An assessment of the entity and of the validity of the claim is made in each individual case.

The application should be sent to the following address: Central Office Foreign Tax Affairs/Sentralskattekontoret for utenlandssaker, Postboks 8031, 4068 Stavanger, NORWAY

Corporate shareholders that carry on business activities in Norway, and whose shares or ADSs are effectively connected with such activities are not subject to withholding tax. For such shareholders, 3% of the received dividends are subject to the standard income tax rate (reduced from 27% in 2015 to 25% in 2016).

Taxation on the realisation of shares and ADSs

Corporate shareholders resident in Norway for tax purposes are not subject to tax in Norway on gains derived from the sale, redemption or other disposal of shares or ADSs in Norwegian companies. Capital losses are not deductible.

Individual shareholders residing in Norway for tax purposes are subject to tax in Norway on the sale, redemption or other disposal of shares or ADSs. Gains or losses in connection with such realisation are included in the individual's ordinary taxable income in the year of disposal, which is subject to the standard income tax rate, being reduced from 27% in 2015 to 25% in 2016. However, in 2016 the taxable gain or deductible loss is grossed up with a factor of 1.15 before included in the ordinary taxable income, resulting in an effective tax rate of 28.75% (25% x 1.15).

The taxable gain or deductible loss (before gross up) is calculated as the sales price adjusted for transaction expenses minus the taxable basis. A shareholder's tax basis is normally equal to the acquisition cost of the shares or ADSs. Any unused allowance pertaining to a share may be deducted from a taxable gain on the same share or ADS, but may not lead to or increase a deductible loss. Furthermore, any unused allowance may not be set off against gains from the realisation of the other shares or ADSs.

If the shareholder disposes of shares or ADSs acquired at different times, the shares or ADSs that were first acquired will be deemed to be first sold (the "FIFO" principle) when calculating the taxable gain or loss.

A corporate shareholder or an individual shareholder who ceases to be tax resident in Norway due to domestic law or tax treaty provisions may, in certain circumstances, become subject to Norwegian exit taxation on capital gains related to shares or ADSs.

Shareholders not residing in Norway are generally not subject to tax in Norway on capital gains, and losses are not deductible on the sale, redemption or other disposal of shares or ADSs in Norwegian companies, unless the shareholder carries on business activities in Norway and such shares or ADSs are or have been effectively connected with such activities.

Wealth tax

The shares or ADSs are included in the basis for the computation of wealth tax imposed on individuals resident in Norway for tax purposes. Norwegian limited companies and certain similar entities are not subject to wealth tax. The current marginal wealth tax rate is 0.85% of the value assessed. The assessment value of listed shares (including ADSs) is 100% of the listed value of such shares or ADSs on 1 January in the assessment year.

Non-resident shareholders are not subject to wealth tax in Norway for shares and ADSs in Norwegian limited companies unless the shareholder is an individual and the shareholding is effectively connected with the individual's business activities in Norway.

Inheritance tax and gift tax
No inheritance or gift tax is imposed in Norway.

Transfer tax
No transfer tax is imposed in Norway in connection with the sale or purchase of shares or ADSs.

United States tax matters
This section describes the material United States federal income tax consequences for US holders (as defined below) of owning shares or ADSs. It only applies to you if you hold your shares or ADSs as capital assets for tax purposes. This section does not apply to you if you are a member of a special class of holders subject to special rules, including:

- dealers in securities
- traders in securities that elect to use a mark-to-market method of accounting for their securities holdings
- tax-exempt organisations
- life insurance companies
- persons liable for alternative minimum tax
- persons that actually or constructively own 10% or more of the voting stock of Statoil
- persons that hold shares or ADSs as part of a straddle or a hedging or conversion transaction
- persons that purchase or sell shares or ADSs as part of a wash sale for tax purposes or
- persons whose functional currency is not USD

This section is based on the Internal Revenue Code of 1986, as amended, its legislative history, existing and proposed regulations, published rulings and court decisions, and the Convention between the United States of America and the Kingdom of Norway for the Avoidance of Double Taxation and the Prevention of Fiscal Evasion with Respect to Taxes on Income and Property (the "Treaty"). These laws are subject to change, possibly on a retroactive basis. In addition, this section is based in part upon the representations of the depositary and the assumption that each obligation in the deposit agreement and any related agreement will be performed in accordance with its terms. For United States federal income tax purposes, if you hold ADRs evidencing ADSs, you will generally be treated as the owner of the ordinary shares represented by those ADRs. Exchanges of shares for ADRs and ADRs for shares will not generally be subject to United States federal income tax.

If a partnership holds the shares or ADSs, the United States federal income tax treatment of a partner will generally depend on the status of the partner and the tax treatment of the partnership. A partner in a partnership holding the shares or ADSs should consult its tax adviser with regard to the United States federal income tax treatment of an investment in the shares or ADSs.

You are a "US holder" if you are a beneficial owner of shares or ADSs and you are for United States federal income tax purposes:

- a citizen or resident of the United States;
- a United States domestic corporation;
- an estate whose income is subject to United States federal income tax regardless of its source; or
- a trust if a United States court can exercise primary supervision over the trust's administration and one or more United States persons are authorised to control all substantial decisions of the trust.

You should consult your own tax adviser regarding the United States federal, state and local and Norwegian and other tax consequences of owning and disposing of shares and ADSs in your particular circumstances.

Taxation of dividends
If you are a US holder, the gross amount of any dividend paid by Statoil out of its current or accumulated earnings and profits (as determined for United States federal income tax purposes) is subject to United States federal income taxation. If you are a non-corporate US holder, dividends paid to you will be eligible to be taxed at the preferential rates applicable to long-term capital gains as long as, in the year that you receive the dividend, the shares or ADSs are readily tradable on an established securities market in the United States or Statoil is eligible for benefits under the Treaty. To qualify for the preferential rates, you must hold the shares or ADSs for more than 60 days during the 121-day period beginning 60 days before the ex-dividend date and meet certain other requirements. Furthermore, these tax consequences would be different if Statoil were to be treated as a PFIC as discussed below.

You must include any Norwegian tax withheld from the dividend payment in this gross amount even though you do not in fact receive the amount withheld as tax. The dividend is taxable for you when you, in the case of shares, or the depositary, in the case of ADSs, receive the dividend, actually or constructively. The dividend will not be eligible for the dividends-received deduction generally allowed to United States corporations in respect of dividends received from other United States corporations.

The amount of the dividend distribution that you must include in your income as a US holder will be the value in USD of the payments made in NOK determined at the spot NOK/USD rate on the date the dividend distribution is includible in your income, regardless of whether or not the payment is in fact converted into USD. Distributions in excess of current and accumulated earnings and profits, as determined for United States federal income tax purposes, will be treated as a non-taxable return of capital to the extent of your tax basis in the shares or ADSs and, to the extent in excess of your tax basis, will be treated as capital gain.

Subject to certain limitations, the 15% Norwegian tax withheld in accordance with the Treaty and paid to Norway will be creditable or deductible against your United States federal income tax liability. Special rules apply when determining the foreign tax credit limitation with respect to dividends that are subject to the preferential rates. To the extent that a refund of the tax withheld is available to you under Norwegian law, the amount of tax withheld that is refundable will not be eligible for credit against your United States federal income tax liability. Dividends will be income from sources outside the United States and will generally, depending on your circumstances, be either "passive" or "general" income for purposes of computing the foreign tax credit allowable to you.

Any gain or loss resulting from currency exchange rate fluctuations during the period from the date you include the dividend payment in income until the date you convert the payment into USD will generally be treated as ordinary income or loss and will not be eligible for the special tax rate. Such gain or loss will generally be income or loss from sources within the United States for foreign tax credit limitation purposes.

Taxation of capital gains

Subject to the PFIC rules discussed below, if you are a US holder and you sell or otherwise dispose of your shares or ADSs, you will generally recognise a capital gain or loss for United States federal income tax purposes equal to the difference between the value in USD of the amount that you realise and your tax basis, determined in USD, in your shares or ADSs. A capital gain of a non-corporate US holder is generally taxed at preferential rates if the property is held for more than one year. The gain or loss will generally be income or loss from sources within the United States for foreign tax credit limitation purposes.

If you receive any foreign currency on the sale of shares or ADSs, you may recognise ordinary income or loss from sources within the United States as a result of currency fluctuations between the date of the sale of the shares or ADSs and the date the sales proceeds are converted into USD. You should consult your own tax adviser regarding how to account for payments made or received in a currency other than USD.

PFIC rules

We believe that the shares and ADSs should not be treated as stock of a PFIC for United States federal income tax purposes, but this conclusion is a factual determination that is made annually and thus may be subject to change. If we were to be treated as a PFIC, unless a US holder elects to be taxed annually on a mark-to-market basis with respect to the shares or ADSs, a gain realised on the sale or other disposition of the shares or ADSs would in general not be treated as a capital gain. Instead, if you are a US holder, you would be treated as if you had realised such gain and certain "excess distributions" ratably over your holding period for the shares or ADSs. Amounts allocated to the year in which the gain is realised or the “excess distribution” is received or to a taxable year before we were classified as a PFIC would be subject to tax at ordinary income tax rates, and amounts allocated to all other years would be taxed at the highest tax rate in effect for each such year to which the gain or distribution was allocated, together with an interest charge in respect of the tax attributable to each such year. With certain exceptions, the shares or ADSs will be treated as stock in a PFIC if we were a PFIC at any time during the period you held the shares or ADSs. Dividends that you receive from us will not be eligible for the preferential tax rates if we are treated as a PFIC with respect to you, either in the taxable year of the distribution or the preceding taxable year, but will instead be taxable at rates applicable to ordinary income.

Tax Filings

You should consult your own advisers regarding any tax filing or reporting obligations that arise out of the acquisition, ownership or disposition of shares or ADSs. Failure to comply with certain US tax filing or reporting obligations can cause you to be subject to significant penalties.

6.6 Exchange controls and limitations

Under Norwegian foreign exchange controls currently in effect, transfers of capital to and from Norway are not subject to prior government approval.

An exception applies to the physical transfer of payments in currency exceeding certain thresholds, which must be declared to the Norwegian custom authorities.

This means that non-Norwegian resident shareholders may receive dividend payments without Norwegian exchange control consent as long as the payment is made through a licensed bank or other licensed payment institution.

There are no restrictions affecting the rights of non-Norwegian residents or foreign owners to hold or vote for our shares.

6.7 Exchange rates

The table below shows the high, low, average and end-of-period exchange rates for the Norwegian krone for USD 1.00 as announced by Norges Bank (Norway's central bank).

The average is computed using the monthly average exchange rates announced by Norges Bank during the period indicated.

For the year ended 31 December	Low	High	Average	End of Period
2011	5.2369	6.0315	5.6059	5.9927
2012	5.5349	6.1471	5.8172	5.5664
2013	5.4438	6.2154	5.8753	6.0837
2014	5.8611	7.6111	6.3011	7.4332
2015	7.3593	8.8090	8.0637	8.8090

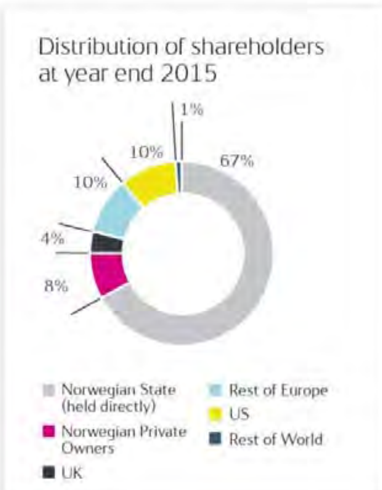
	Low	High
2015		
September	8.0891	8.5783
October	8.0524	8.5700
November	8.4636	8.6929
December	8.4842	8.8090
2016		
January	8.6641	8.9578
February	8.5111	8.7294
March (up to and including 8 March 2016)	8.5441	8.6791

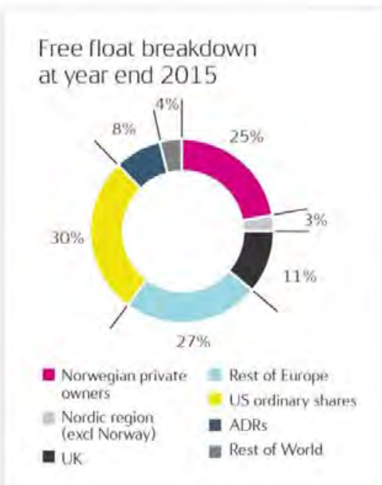
On 8 March 2016, the exchange rate announced by the Norges Bank for the Norwegian krone was USD 1.00 = NOK 8.5496.

Fluctuations in the exchange rate between the Norwegian krone and the US dollar will affect the amounts in US dollars received by holders of American Depositary Shares (ADSs) on the conversion of dividends, if any, paid in Norwegian kroner on the ordinary shares, and they may affect the US dollar price of the ADSs on the New York Stock Exchange.

6.8 Major shareholders

The Norwegian State is the largest shareholder in Statoil, with a direct ownership interest of 67%. Its ownership interest is managed by the Norwegian Ministry of Petroleum and Energy.





Pursuant to the exchange ratio agreed in connection with the merger with Hydro's oil and gas activities, the State's ownership interest in the merged company was 62.5%, or 1,992,959,739 shares, on 1 October 2007. In accordance with the Norwegian parliament's decision of 2001 concerning a minimum state shareholding in Statoil of two-thirds, the Government built up the State's ownership interest in Statoil by buying shares in the market during the period from June 2008 to March 2009. In March 2009, the Government announced that the State's direct ownership interest had reached 67%, and the Government's direct purchase of Statoil shares was completed.

As of 31 December 2015, the Norwegian State had a 67% direct ownership interest in Statoil and a 3.23% indirect interest through the National Insurance Fund (Folketrygdfondet), totaling 70.23%.

The Norwegian State is the only person or entity known to us to own beneficially, directly or indirectly, more than 5% of our outstanding shares. We have not been notified of any other beneficial owner of 5% or more of our ordinary shares as of 31 December 2015.

Statoil has one class of shares, and each share confers one vote at the general meeting. The Norwegian State does not have any voting rights that differ from the rights of other ordinary shareholders. Pursuant to the Norwegian Public Limited Liability Companies Act, a majority of at least two-thirds of the votes cast as well as of the votes represented at a general meeting is required to amend our articles of association. As long as the Norwegian State owns more than one-third of our shares, it will be able to prevent any amendments to our articles of association. Since the Norwegian State, acting through the Norwegian Minister of Petroleum and Energy, has in excess of two-thirds of the shares in the company, it has sole power to amend our articles of association. In addition, as majority shareholder, the Norwegian State has the power to control any decision at general meetings of our shareholders that requires a majority vote, including the election of the majority of the corporate assembly, which has the power to elect our board of directors and approve the dividend proposed by the board of directors.

The Norwegian State endorses the principles set out in "The Norwegian Code of Practice for Corporate Governance", and it has stated that it expects companies in which the State has ownership interests to adhere to the code. The principle of ensuring equal treatment of different groups of shareholders is a key element in the State's own guidelines. In companies in which the State is a shareholder together with others, the State wishes to exercise the same rights and obligations as any other shareholder and not act in a manner that has a detrimental effect on the rights or financial interests of other shareholders. In addition to the principle of equal treatment of shareholders, emphasis is also placed on transparency in relation to the State's ownership and on the general meeting being the correct arena for owner decisions and formal resolutions.

	Shareholders at December 2015	Number of Shares	Ownership in %
1	Government of Norway	2,136,393,559	67.00%
2	Folketrygdfondet	103,124,812	3.20%
3	SAFE Investment Company Limited	32,256,434	1.00%
4	BlackRock Institutional Trust Company, N.A.	31,513,618	1.00%
5	INVESCO Asset Management Limited	26,461,451	0.80%
6	Schroder Investment Management Ltd. (SIM)	23,330,607	0.70%
7	The Vanguard Group, Inc.	19,539,470	0.60%
8	Allianz Global Investors GmbH	18,371,484	0.60%
9	KLP Forsikring	16,642,798	0.50%
10	Storebrand Kapitalforvaltning AS	14,448,698	0.50%

7 Corporate governance

Statoil's objective is to create long-term value for its shareholders through the exploration for and production, transportation, refining and marketing of petroleum and petroleum-derived products and other forms of energy.

In pursuing its corporate objective, Statoil is committed to the highest standard of governance and to cultivating a values-based performance culture that rewards exemplary ethical practices, respect for the environment and personal and corporate integrity. Statoil believes that there is a link between high-quality governance and the creation of shareholder value.

The work of the board of directors is based on the existence of a clearly defined division of roles and responsibilities between the shareholders, the board of directors and the company's management.

Statoil's governing structures and controls help to ensure that Statoil runs its business in a profitable manner for the benefit of shareholders, employees and other stakeholders in the societies in which Statoil operates.

The following principles underline Statoil's approach to corporate governance:
- All shareholders will be treated equally
- Statoil will ensure that all shareholders have access to up-to-date, reliable and relevant information about its activities
- Statoil will have a board of directors that is independent (as defined by Norwegian Standards) of the group's management. The board focuses on preventing conflicts of interest between shareholders, the board of directors and the company's management
- The board of directors will base its work on the principles for good corporate governance applicable at all times

Corporate governance in Statoil is subject to regular review and discussion by the board of directors.

Statoil's board of directors endorses the "Norwegian Code of Practice for Corporate Governance". The company's compliance with, and deviations from, the code's recommendations are commented on in a separate corporate governance statement issued by Statoil's board of directors. This statement, which contains further details on the corporate governance of Statoil, is available at www.statoil.com/cg.

7.1 Articles of association

The articles of association and the Norwegian Public Limited Liability Companies Act form the legal framework for Statoil's operations.

Statoil's current articles of association were adopted at the annual general meeting of shareholders on 14 May 2013.

Summary of Statoil's articles of association:

Name of the company
The registered name is Statoil ASA. Statoil is a Norwegian public limited company.

Registered office
Statoil's registered office is in Stavanger, Norway, registered with the Norwegian Register of Business Enterprises under number 923 609 016.

Object of the company
The object of Statoil is, either by itself or through participation in or together with other companies, to engage in the exploration, production, transportation, refining and marketing of petroleum and petroleum-derived products, and other forms of energy, as well as other business.

Share capital
Statoil's share capital is NOK 7,971,617,757.50 divided into 3,188,647,103 ordinary shares.

Nominal value of shares
The nominal value of each ordinary share is NOK 2.50.

Board of directors
Statoil's articles of association provide that the board of directors shall consist of nine to 11 directors. The board, including the chair and the deputy chair, shall be elected by the corporate assembly for a period of up to two years.

Corporate assembly
Statoil has a corporate assembly comprising 18 members who are normally elected for a term of two years. The general meeting elects 12 members with four deputy members, and six members with deputy members are elected by and from among the employees.

General meetings of shareholders
Statoil's annual general meeting is held no later than 30 June each year.

The meeting will consider the annual report and accounts, including the distribution of any dividend, and any other matters required by law or the articles of association.

Documents relating to matters to be dealt with at general meetings do not need to be sent to all shareholders if the documents are accessible on Statoil's website. A shareholder may nevertheless request that such documents be sent to him/her.

Shareholders may vote in writing, including through electronic communication, for a period before the general meeting. In order to practise advance voting, the board of directors must stipulate applicable guidelines. Statoil's board of directors adopted guidelines for such advance voting in March 2012, and these guidelines are described in the notices of the annual general meetings.

Marketing of petroleum on behalf of the Norwegian State
Statoil's articles of association provide that Statoil is responsible for marketing and selling petroleum produced under the SDFI's shares in production licences on the Norwegian continental shelf (NCS) as well as petroleum received by the Norwegian State paid as royalty together with its own production. Statoil's general meeting adopted an instruction in respect of such marketing on 25 May 2001, as most recently amended by authorisation of the annual general meeting on 19 May 2011.

Nomination committee
The tasks of the nomination committee are to make recommendations to the general meeting regarding the election of and fees for shareholder-elected members and deputy members of the corporate assembly, to make recommendations to the corporate assembly regarding the election of and fees for shareholder-elected members of the board of directors, to make recommendations to the corporate assembly regarding the election of the chair and the deputy chair of the board and to make recommendations to the general meeting regarding the election of and fees for members of the nomination committee.

The general meeting may adopt instructions for the nomination committee.

The full articles of association are available at Statoil.com/articlesofassociation.

7.2 Code of Conduct

Ethics - Statoil's approach
Statoil believes that responsible and ethical behavior is a necessary condition for a sustainable business. Statoil's Code of Conduct (the Code) is based on its values and reflects Statoil's commitment to high ethical standards in all its activities.

Our Code of Conduct
The Code describes Statoil's code of business practice and the requirements to expected behavior in areas such as anti-corruption, fair competition, human rights and non-discrimination working environments with equal opportunity. The Code applies to Statoil's board members, employees and hired personnel.

Statoil seeks to work with others who share its commitment to ethics and compliance, and Statoil manages its risks through in-depth knowledge of suppliers, business partners and markets. Statoil expects its suppliers and business partners to comply with applicable laws, respect internationally recognised human rights and adhere to ethical standards which are consistent with Statoil's ethical requirements when working for or together with Statoil. In joint ventures and entities where Statoil does not have control, Statoil makes good faith efforts to encourage the adoption of ethics and anti-corruption policies and procedures that are consistent with itss standards. Anyone working for Statoil who does not comply with the Code faces disciplinary action, up to and including summery dismissal or termination of their contract.

Training and Certifying the Code
Code of Conduct training and comprehensive trainings on specific issues, including anti-corruption and anti-trust, is carried out to explain how the Code applies and to describe the tools that Statoil has made available to address risk.

All Statoil employees have to annually confirm electronically that they understand and will comply with the Code (Code certification). The Code certification reminds the individuals of their duty to comply with Statoil's values and ethical requirements and creates an environment with open dialog on ethical issues, both internally and externally.

Anti-corruption compliance programme
Statoil is against all forms of corruption including bribery, facilitation payments and trading in influence and has a company-wide anti-corruption compliance programme which implements its zero-tolerance policy. The programme includes mandatory procedures designed to comply with applicable laws and regulations and training on relevant issues such as gifts, hospitality and conflicts of interest. Compliance officers, who are responsible for ensuring that ethics and anti-corruption considerations are integrated into Statoil's business activities, constitute an important part of the programme.

In 2015, Statoil focused on the systematic support and follow up of its compliance officers in the business units and on strengthening the compliance officer network within Statoil. Further, the Statoil Code of Conduct was subject to a comprehensive review, and was updated and made more user-friendly. In 2016 , the new Code will be rolled out and implemented.

Speak Up

Statoil is committed to maintain an open dialog on ethical issues. The Code requires those who have a question or suspect misconduct to raise their concern either through internal channels or through Statoil's external Ethics Helpline. Employees are encouraged to discuss their concerns with their supervisor. Statoil recognises that raising a concern is not always easy so there are have several internal channels for taking concerns forward, including through human resources or the ethics and compliance function in the legal department. Concerns can also be expressed through the externally operated Ethics Helpline which is available 24/7, and allows for anonymous reporting and two-way communication through the use of a pin-code. Statoil has a non-retaliation policy for anyone who reports in good faith.

More information about Statoil's policies and requirements related to the Code of Conduct is available on Statoil.com/ethics.

7.3 General meeting of shareholders

The general meeting of shareholders is Statoil's supreme corporate body. The objective of the general meeting is to ensure shareholder democracy and all shareholders are encouraged to participate in person or by proxy.

The general meeting of shareholders is Statoil's supreme corporate body. The 2016 annual general meeting (AGM) is scheduled for 11 May 2016 in Stavanger, Norway, with simultaneous transmission by webcast through our website. The AGM is conducted in Norwegian, with simultaneous English translation during the webcast.

The main framework for convening and holding Statoil's AGM is as follows:

Pursuant to Statoil's articles of association, the AGM must be held by the end of June each year. Notice of the meeting and documents relating to the AGM are published on Statoil's website and notice is sent to all shareholders with known addresses at least 21 days prior to the meeting. All shareholders who are registered in the Norwegian Central Securities Depository (VPS) will receive an invitation to the AGM. Other documents relating to Statoil's AGMs will be made available on Statoil's website. A shareholder may nevertheless request that documents that relate to matters to be dealt with at the AGM be sent to him/her.

Shareholders are entitled to have their proposals dealt with at the AGM if the proposal has been submitted in writing to the board of directors in sufficient time to enable it to be included in the notice of meeting, i.e. no later than 28 days before the meeting. Shareholders who are unable to attend may vote by proxy.

As described in the notice of the general meeting, shareholders may vote in writing, including through electronic communication, for a period before the general meeting.

The deadline for registration for the AGM in Statoil is the day before the AGM is due to take place.

The AGM is normally opened and chaired by the chair of the corporate assembly. If there is a dispute concerning individual matters and the chair of the corporate assembly belongs to one of the disputing parties, or is for some other reason not perceived as being impartial, another person will be appointed to chair the AGM. This is in order to ensure impartiality in relation to the matters to be considered. As Statoil has a large number of shareholders with a wide geographical distribution, Statoil offers shareholders the opportunity to follow the AGM by webcast.

The following matters are decided at the AGM:
- Approval of the board of directors' report, the financial statements and any dividend proposed by the board of directors and recommended by the corporate assembly
- Election of the shareholders' representatives to the corporate assembly and approval of the corporate assembly's fees
- Election of the nomination committee and approval of the nomination committee's fees
- Election of the external auditor and approval of the auditor's fee
- Any other matters listed in the notice convening the AGM

All shares carry an equal right to vote at general meetings. Resolutions at general meetings are normally passed by simple majority. However, Norwegian company law requires a qualified majority for certain resolutions, including resolutions to waive preferential rights in connection with any share issue, approval of a merger or demerger, amendment of the articles of association or authorisation to increase or reduce the share capital. Such matters require the approval of at least two-thirds of the aggregate number of votes cast as well as two-thirds of the share capital represented at the general meeting.

If shares are registered by a nominee in the Norwegian Central Securities Depositary (VPS), cf. section 4-10 of the Norwegian Public Limited Liability Companies Act, and the beneficial shareholder wants to vote for their shares, the beneficial shareholder must re-register the shares in a separate VPS account in their own name prior to the general meeting. If the holder can prove that such steps have been taken and that the holder has a de facto shareholder interest in the company, the holder may, in the company's opinion, vote for the shares. Decisions regarding voting rights for shareholders and proxy holders are made by the person opening the meeting, whose decisions may be reversed by the general meeting by simple majority vote.

The minutes of the AGM are made available on Statoil's website immediately after the AGM.

As regards to extraordinary general meetings (EGM), an EGM will be held in order to consider and decide a specific matter if demanded by the corporate assembly, the chair of the corporate assembly, the auditor or shareholders representing at least 5% of the share capital. The board must ensure that an EGM is held within a month of such demand being submitted.

In the following, certain types of resolutions by the general meeting of shareholders are outlined:

New share issues
If Statoil issues any new shares, including bonus shares, the articles of association must be amended. This requires the same majority as other amendments to the articles of association. In addition, under Norwegian law, the shareholders have a preferential right to subscribe for new shares issued by Statoil. The preferential right to subscribe for an issue may be waived by a resolution of a general meeting passed by the same percentage majority as required to approve amendments to the articles of association. The general meeting may, with a majority as described above, authorise the board of directors to issue new shares, and to waive the preferential rights of shareholders in connection with such share issues. Such authorisation may be effective for a maximum of two years, and the par value of the shares to be issued may not exceed 50% of the nominal share capital when the authorisation was granted.

The issuing of shares through the exercise of preferential rights to holders who are citizens or residents of the USA may require Statoil to file a registration statement in the USA under US securities laws. If Statoil decides not to file a registration statement, these holders may not be able to exercise their preferential rights.

Right of redemption and repurchase of shares
Statoil's articles of association do not authorise the redemption of shares. In the absence of authorisation, the redemption of shares may nonetheless be decided upon by a general meeting of shareholders by a two-thirds majority on certain conditions. However, such share redemption would, for all practical purposes, depend on the consent of all shareholders whose shares are redeemed.

A Norwegian company may purchase its own shares if authorisation to do so has been granted by a general meeting with the approval of at least two-thirds of the aggregate number of votes cast as well as two-thirds of the share capital represented at the general meeting. The aggregate par value of such treasury shares held by the company must not exceed 10% of the company's share capital, and treasury shares may only be acquired if, according to the most recently adopted balance sheet, the company's distributable equity exceeds the consideration to be paid for the shares. Pursuant to Norwegian law, authorisation by the general meeting cannot be granted for a period exceeding 18 months.

Distribution of assets on liquidation
Under Norwegian law, a company may be wound up by a resolution of the company's shareholders at a general meeting passed by both a two-thirds majority of the aggregate votes cast and a two-thirds majority of the aggregate share capital represented at the general meeting. The shares are ranked equally in the event of a return on capital by the company upon winding up or otherwise.

7.4 Nomination committee

Pursuant to Statoil's articles of association, the nomination committee shall consist of four members who are shareholders or representatives of shareholders.

The committee is independent of both the board of directors and the company's management.

The duties of the nomination committee are to submit recommendations to:
- the annual general meeting for the election of shareholder-elected members and deputy members of the corporate assembly, and the remuneration of members of the corporate assembly
- the annual general meeting for the election and remuneration of members of the nomination committee
- the corporate assembly for the election of shareholder-elected members of the board of directors and remuneration of the members of the board of directors and
- the corporate assembly for the election of the chair and deputy chair of the corporate assembly

Using a form on Statoil's website, shareholders can propose candidates for the board of directors, the corporate assembly and the nomination committee.

The members of the nomination committee are elected by the annual general meeting. The chair of the nomination committee and one other member are elected from among the shareholder-elected members of the corporate assembly. Members of the nomination committee are normally elected for a term of two years.

Personal deputy members for one or more of the nomination committee's members may be elected in accordance with the same criteria as described above. A deputy member only meets for the member if the appointment of that member terminates before the term of office has expired.

The members of the nomination committee are:

- Olaug Svarva (chair), Managing director at Folketrygdfondet
- Tom Rathke, Group executive vice president Wealth Management at DnB
- Elisabeth Berge, Secretary general, Norwegian Ministry of Petroleum and Energy (personal deputy for Elisabeth Berge is Bjørn Ståle Haavik, Director at the Norwegian Ministry of Petroleum and Energy)
- Tone Lunde Bakker, Global head of cash management at Danske Bank

The nomination committee held 19 ordinary meetings and three telephone meetings in 2015.

The instructions for the nomination committee, including the rules of procedure, are available at Statoil.com/nominationcommittee.

7.5 Corporate assembly

Pursuant to the Norwegian Public Limited Liability Companies Act, companies with more than 200 employees must elect a corporate assembly unless otherwise agreed between the company and a majority of its employees.

Dag-Rune Dale	Union representative, Industri Energi, Safety officer	Kollsnes	1963	Employee-elected, observer	No	2,787	3,058	2013	2017
Sun Lehmann	Union representative, Tekna	Trondheim	1972	Employee-elected, observer	No	2,867	3,237	2015	2017
Total						19,592	22,157		

An election of the employee-elected members of the corporate assembly was held early 2015. Effective as of 28 April 2015, Brit Gunn Ersland was elected as new member (from the former position as an observer), Sun Lehmann was elected as a new observer and Oddvar Karlsen, Jorunn Birkeland and Sten Atle Jølle were elected as new deputy members of the corporate assembly. Eldfrid Irene Hognestad (member) left the corporate assembly as of the same date. The number of deputy members for the employee-elected members of the corporate assembly was also reduced from 17 to 11 deputy members.

Pursuant to Statoil's articles of association, the corporate assembly normally consists of 18 members. Twelve members with four deputy members are nominated by the nomination committee and elected at the general meeting of shareholders, and six members, three observers and deputy members are elected by and from among the employees. Such employees are non-executive personnel.

Members of the corporate assembly are normally elected for a term of two years. Members of the board of directors and the general manager cannot be members of the corporate assembly, but they are entitled to attend and to speak at meetings of the corporate assembly unless the corporate assembly decides otherwise in individual cases.

The duties of the corporate assembly are defined in section 6-37 of the Norwegian Public Limited Liability Companies Act. The corporate assembly elects the board of directors and the chair of the board. Its responsibilities also include overseeing the board and the CEO's management of the company, making decisions on investments of considerable magnitude in relation to the company's resources and making decisions involving the rationalisation or reorganisation of operations that will entail major changes in or reallocation of the workforce.

Statoil's corporate assembly held four ordinary meetings in 2015.

All members of the corporate assembly live in Norway. Members of the corporate assembly do not have service contracts with the company or its subsidiaries providing for benefits upon termination of office.

7.6 Board of directors

Pursuant to Statoil's articles of association, the board of directors consists of between nine and 11 members. The management is not represented on the board.

At present, Statoil's board of directors consists of 10 members. As required by Norwegian company law, the company's employees are entitled to be represented by three board members. There are no board member service contracts that provide for benefits upon termination of office. Statoil's board of directors has determined that, in its judgment, all of the shareholder representatives on the board, except for Wenche Agerup, are considered independent.

The board of directors of Statoil ASA is responsible for the overall management of the Statoil group, and for supervising the group's activities in general. The board of directors handles matters of major importance or of an extraordinary nature. However, it may require the management to refer any matter to it. The board of directors appoints the president and chief executive officer (CEO), and stipulates the job instructions, powers of attorney and terms and conditions of employment for the president and CEO.

The board of directors has three sub-committees - the "audit committee", "the safety, sustainability and ethics committee", and "the compensation and executive development committee".

The board held eight ordinary board meetings and four extraordinary meetings in 2015. Average attendance at these board meetings was 95.9%.

Members of the board of directors as of 31 December 2015:

Øystein Løseth

Øystein Løseth
Position: Shareholder-elected chair of the board and chair of the board's compensation and executive committee.
Born: 1958
Term of office: Member of the board of directors of Statoil ASA since 1 October 2014, and since 1 July 2015, also chair of the board and chair of the board's compensation and executive development committee. Up for election in 2016.
Independent: Yes
Other directorships: Chair of the board of Eidsiva Energi AS.

Loans from Statoil ASA: None
Experience: Franklin has broad experience from management positions in several countries, including positions with BP, Paladin Resources plc and Clyde Petroleum plc.
Education: Franklin has a Bachelor of Science in Geology from the University of Southampton, UK.
Family relations: No family relations to other members of the board, members of the corporate executive committee or the corporate assembly.
Other matters: In 2015, Franklin participated in four ordinary board meetings, three meetings of the audit committee and two meetings of the safety, sustainability and ethics committee. Franklin is a UK citizen and resident in UK.

Bjørn Tore Godal

Bjørn Tore Godal
Born: 1945
Position: Shareholder-elected member of the board, the board's compensation and executive development committee and the board's safety, sustainability and ethics committee.
Term of office: Member of the board of Statoil ASA from 1 September 2010. Up for election in 2016.
Independent: Yes
Other directorships: Chair of the Council of the Norwegian Defence University College (NDUC), and vice chair of the board of the Fridtjof Nansen Institute (FNI).
Number of shares in Statoil ASA as of 31 December 2015: None
Loans from Statoil ASA: None
Experience: Godal was a member of the Norwegian parliament for 15 years during the period 1986-2001. At various times, he served as minister for trade and shipping, minister for defense, and minister of foreign affairs for a total of eight years between 1991 and 2001. From 2007-2010, Godal was special adviser for international energy and climate issues at the Norwegian Ministry of Foreign Affairs. From 2003-2007, Godal was Norway's ambassador to Germany and from 2002-2003 he was senior adviser at the department of political science at the University of Oslo.
Education: Godal has a bachelor of arts degree in political science, history and sociology from the University of Oslo.
Family relations: No family relations to other members of the board, members of the corporate executive committee or the corporate assembly.
Other matters: In 2015, Godal participated in eight ordinary board meetings, three extraordinary board meetings, seven meetings of the compensation and executive development committee and five meetings of the safety, sustainability and ethics committee. Godal is a Norwegian citizen and resident in Norway.

Jakob Stausholm

Jakob Stausholm
Born: 1968
Position: Shareholder-elected member of the board and chair of the board's audit committee.
Term of office: Member of the board of Statoil ASA since July 2009. Up for election in 2016.
Independent: Yes
Other directorships: No
Number of shares in Statoil ASA as of 31 December 2015: 50,000
Loans from Statoil: None
Experience: Chief strategy and transformation officer of Maersk Line, the largest container shipping company in the world and part of A.P. Moller - Maersk Group. From 2008 to 2011, Stausholm was chief financial officer of the global facility services provider ISS A/S. Before joining ISS's corporate executive committee, he was employed by the Shell Group for 19 years and held a number of management positions, including vice president finance for the group's exploration and production in Asia and the Pacific, chief internal auditor and CFO of group subsidiaries.
Education: M.Sc. in economics from the University of Copenhagen.
Family relations: No family relations to other members of the board, members of the corporate executive committee or the corporate assembly.
Other matters: In 2015, Stausholm participated in eight ordinary board meetings, four extraordinary board meetings and six meetings of the audit committee. Stausholm is a Danish citizen and resident in Denmark.

Maria Johanna Oudeman

Maria Johanna Oudeman
Born: 1958
Position: Shareholder-elected member of the board and member of the board's compensation and executive development committee.
Term of office: Member of the board of Statoil ASA since 15 September 2012. Up for election in 2016.
Independent: Yes
Other directorships: Oudeman is a member of the boards of Solvay SA, Het Concertgebouw, Rijksmuseum and SHV Holdings.
Number of shares in Statoil ASA as of 31 December 2015: None
Loans from Statoil: None
Experience: Oudeman is the President of Utrecht University in the Netherlands, one of Europe's leading universities. From 2010 to 2013, Oudeman was a member of the Executive Committee of Akzo Nobel, responsible for HR and Organisational Development. Akzo Nobel is the world's largest paint and coatings company and major producer of specialty chemicals, with operations in more than 80 countries. Before joining Akzo Nobel, she was Executive Director Strip Products Division at Corus Group, now Tata Steel Europe. Oudeman has extensive experience as a line manager in the steel industry and considerable international business experience.
Education: Oudeman has a law degree from Rijksuniversiteit Groningen in the Netherlands and an MBA in business administration from the University of Rochester, New York, USA and Erasmus University, Rotterdam, the Netherlands.
Family relations: No family relations to other members of the board, members of the corporate executive committee or the corporate assembly.
Other matters: In 2015, Oudeman participated in eight ordinary board meetings, four extraordinary board meetings, six meetings of the compensation and executive development committee and one meeting of the board's safety, sustainability and ethics committee. Oudeman is a Dutch citizen and resident in the Netherlands.

PUBLIC COPY - CONFIDENTIAL INFORMATION REMOVED

Rebekka Glasser Herlofsen

Rebekka Glasser Herlofsen
Born: 1970
Position: Shareholder-elected member of the board and the board's audit committee.
Term of office: Member of the board of Statoil ASA since 19 March 2015 Up for election in 2016.
Independent: Yes
Other directorships: Member of the board of directors of DNV holding, DNV Foundation, DNV GL and member of the committee for tax and capital in the Norwegian Shipowners' Association.
Number of shares in Statoil ASA as of 31 December 2015: None
Loans from Statoil: None
Experience: Since 2012, Herlofsen has been the Chief Financial Officer in the Norwegian shipping company Torvald Klaveness. She has broad financial and strategic experience from several corporations and board directorships. Herlofsen's professional career began in the leading Nordic Investment Bank, Enskilda Securities, where she worked with corporate finance from 1995 to 1999 in Oslo and London. During the next ten years Herlofsen worked in the Norwegian shipping comp any Bergesen d.y. ASA (later BW Group). During her period with Bergesen d.y. ASA/BW Group Herlofsen held leading positions within M&A, strategy and corporate planning and was part of the group management team.
Education: MSc in Economics and Business Administration (Siviløkonom) and Certified Financial Analyst Program, the Norwegian School of Economics (NHH). Breakthrough Program for Top Executives at IMD business school, Switzerland.
Family relations: No family relations to other members of the board, members of the corporate executive committee or the corporate assembly.
Other matters: In 2015, Herlofsen participated in six ordinary board meetings, one extraordinary board meeting and four meetings of the audit committee. Herlofsen is a Norwegian citizen and resident in Norway.

Wenche Agerup

Wenche Agerup
Born: 1964
Position: Shareholder-elected member of the board, the board's compensation and executive development committee and the board's safety, sustainability and ethics committee.
Term of office: Member of the board of Statoil ASA since 21 August 2015. Up for election in 2016.
Independent: No.
Pursuant to the NYSE rules, a director will not be considered independent under the NYSE rules if the director is, or was within the past three years, an executive officer of another company at which any of the listed company's current executive officers are, or were within the past three years, members of the compensation committee. This rule also applies to foreign listed companies. Agerup was a member of Norsk Hydro ASA's management team while Irene Rummelhoff, Executive Vice President of New Energy Solutions in Statoil, was member of the board's compensation committee in Norsk Hydro. Agerup is therefore deemed as a non-independent board member in Statoil for a period of three years from 31 December 2014, i.e. until 31 December 2017.
Other directorships: Agerup is a member of the board of the seismic company TGS ASA.
Number of shares in Statoil ASA as of 31 December 2015: 2,423
Loans from Statoil: None
Experience: Agerup is an Executive Vice President and the Chief Corporate Affairs Officer in Telenor ASA. Agerup was the Executive Vice President for Corporate Staffs and the General Counsel of Norsk Hydro ASA from 2010 to 31 December 2014. She has held various executive roles in Hydro since 1997, including within the company's M&A-activities, the business area Alumina, Bauxite and Energy, as a plant manager at Hydro's metal plant in Årdal and as a project director for a Joint Venture in Australia where Hydro cooperated with the Australian listed company UMC.
Education: MA in Law from the University of Oslo, Norway (1989) and a Master of Business Administration from Babson College, USA (1991).
Family relations: No family relations to other members of the board, members of the corporate executive committee or the corporate assembly.
Other matters: In 2015, Agerup participated in three ordinary board meetings, three meetings of the compensation and executive development committee and two meetings of the safety, sustainability and ethics committee. Agerup is a Norwegian citizen and resident in Norway.

Lill-Heidi Bakkerud

Lill-Heidi Bakkerud
Born: 1963
Position: Employee-elected member of the board and member of the board's safety, sustainability and ethics committee.
Term of office: Member of the board of Statoil ASA from 1998 to 2002, and again since 2004. Up for election in 2017.
Independent: No
Other directorships: Bakkerud is a member of the executive committee of the Industry Energy (IE) trade union and holds a number of offices as a result of this.
Number of shares in Statoil ASA as of 31 December 2015: 330
Loans from Statoil: None
Experience: Bakkerud has worked as a process technician at the petrochemical plant in Bamble and on the Gullfaks field in the North Sea. She is now a full-time employee representative as the leader of the union Industri Energi's Statoil branch.
Education: Bakkerud has a craft certificate as a process/chemistry worker.
Family relations: No family relations to other members of the board, members of the corporate executive committee or the corporate assembly.
Other matters: In 2015, Bakkerud participated in eight ordinary board meetings, four extraordinary board meetings and five meetings of the safety, sustainability and ethics committee. Bakkerud is a Norwegian citizen and resident in Norway.

Ingrid Elisabeth di Valerio

Ingrid Elisabeth di Valerio
Born: 1964
Position: Employee-elected member of the board and member of the board's audit committee.
Term of office: Member of board of directors of Statoil ASA from 1 July 2013. Up for election in 2017.
Independent: No
Other directorships: Board member of First Scandinavia, Montanus AS and member of Tekna's central nomination committee.
Number of shares held in Statoil ASA as of 31 December 2015: 2,845
Loans from Statoil: None
Experience: Di Valerio has been employed by Statoil since 2005, and works within materials discipline for Technology, Projects & Drilling. Di Valerio was the union Tekna's main representative in Statoil from 2008 to 2013. She also sat on Tekna's central committee from 2005 to 2013.
Education: Chartered engineer (mathematics and physics) from the Norwegian University of Science and Technology in Trondheim (NTNU).
Familiy relations: No family relationships to other board members, members of the corporate executive committee or the corporate assembly.
Other: In 2015, di Valerio participated in eight ordinary board meetings, four extraordinary board meetings and six meetings of the audit committee. Di Valerio is a Norwegian citizen and resident in Norway.

Stig Lægreid

Stig Lægreid
Born: 1963
Position: Employee-elected member of the board and member of the board's safety, sustainability and ethics committee.
Term of office: Member of the board of directors of Statoil ASA from 1 July 2013. Up for election in 2017.
Independent: No
Other directorships: Member of The Norwegian society for Engineers and Technologists' (NITO) negotiation committee for private sector.
Number of shares held in Statoil ASA as of 31 December 2015: 1,519
Loans from Statoil: None
Experience: Employed in ÅSV and Norsk Hydro since 1985. Mainly occupied as project engineer and constructor for production of primary metals until 2005 and from 2005 as weight estimator for platform design. He is now a full-time employee representative as the leader of the union NITO, Statoil.
Education: Bachelor degree, mechanical construction from OIH.
Family relations: No family relationships to other board members, members of the corporate executive committee or the corporate assembly.
Other: In 2015, Lægreid participated in eight ordinary board meetings, four extraordinary board meetings and five meetings of the safety, sustainability and ethics committee. Lægreid is a Norwegian citizen and resident in Norway.

In addition, there are four employee-elected deputy members of the board who attend board meetings in the event an employee-elected member of the board is unable to attend.

7.6.1 Audit committee

The board of directors elects at least three of its members to serve on the board of directors' audit committee and appoints one of them to act as chair. The employee-elected members of the board of directors may nominate one audit committee member.

At year-end 2015, the audit committee members were Jakob Stausholm (chair), Roy Franklin, Rebekka Herlofsen and Ingrid di Valerio (employee-elected board member).

The audit committee is a sub-committee of the board of directors, and its objective is to act as a preparatory body in connection with the board's supervisory roles with respect to financial reporting and the effectiveness of the company's internal control system. It also attends to other tasks assigned to it in accordance with the instructions for the audit committee adopted by the board of directors. The audit committee is instructed to assist the board of directors in its supervising of matters such as:

- Monitoring the financial reporting process, including oil and gas reserves, fraudulent issues and reviewing the implementation of accounting principles and policies
- Monitoring the effectiveness of the company's internal control, internal audit and risk management systems
- Maintaining continuous contact with the statutory auditor regarding the annual and consolidated accounts
- Reviewing and monitoring the independence of the company's internal auditor and the independence of the statutory auditor, reference is made to the Norwegian Auditors Act chapter 4, and, in particular, whether services other than audits provided by the statutory auditor or the audit firm are a threat to the statutory auditor's independence

The audit committee supervises implementation of and compliance with the group's Code of Conduct in relation to financial reporting.

The internal audit function reports directly to the board of directors and to the chief executive officer.

Under Norwegian law, the external auditor is appointed by the shareholders at the annual general meeting based on a proposal from the corporate assembly. The audit committee issues a statement to the annual general meeting relating to the proposal.

The audit committee meets at least five times a year, and it meets separately with the internal auditor and the external auditor on a regular basis.

The audit committee is also charged with reviewing the scope of the audit and the nature of any non-audit services provided by external auditors. The external auditors report directly to the audit committee on a regular basis.

The audit committee is tasked with ensuring that the company has procedures in place for receiving and dealing with complaints received by the company regarding accounting, internal control or auditing matters, and procedures for the confidential and anonymous submission, via the group's ethics helpline, by company employees of concerns regarding accounting or auditing matters, as well as other matters regarded as being in breach of the group's Code of Conduct, a material violation of an applicable US federal or state securities law, a material breach of fiduciary duties or a similar material violation of any other US or Norwegian statutory provision. The audit committee is designated as the company's qualified legal compliance committee for the purposes of section 307 of the Sarbanes-Oxley Act of 2002.

In the execution of its tasks, the audit committee may examine all activities and circumstances relating to the operations of the company. In this regard, the audit committee may request the chief executive officer or any other employee to grant it access to information, facilities and personnel and such assistance as it requests. The audit committee is authorised to carry out or instigate such investigations as it deems necessary in order to carry out its tasks and it may use the company's internal audit or investigation unit, the external auditor or other external advice and assistance. The costs of such work will be covered by the company.

The audit committee is only responsible to the board of directors for the execution of its tasks. The work of the audit committee in no way alters the responsibility of the board of directors and its individual members, and the board of directors retains full responsibility for the audit committee's tasks.

The audit committee held six meetings in 2015. There was 96.3% attendance at the committee's meetings.

The board of directors has decided that a member of the audit committee, Jakob Stausholm, qualifies as an "audit committee financial expert", as defined in Item 16A of Form 20-F. The board of directors has also concluded that Jakob Stausholm, Roy Franklin and Rebekka Herlofsen are independent within the meaning of Rule 10A-3 under the Securities Exchange Act.

The committee's mandate is available at Statoil.com/auditcommittee.

7.6.2 Compensation and executive development committee

The compensation and executive development committee is a sub-committee of the board of directors that assists the board in matters relating to management compensation and leadership development.

The main responsibilities of the compensation and executive development committee are:

(1) as a preparatory body for the board, to make recommendations to the board in all matters relating to principles and the framework for executive rewards, remuneration strategies and concepts, the CEO's contract and terms of employment, and leadership development, assessments and succession planning;

(2) to be informed about and advise the company's management in its work on Statoil's remuneration strategy for senior executive and in drawing up appropriate remuneration policies for senior executives; and

(3) to review Statoil's remuneration policies in order to safeguard the owners' long-term interests.

The committee consists of up to four board members. At year-end 2015, the committee members were Øystein Løseth (chair), Bjørn Tore Godal, Maria Johanna Oudeman and Wenche Agerup. All of the committee members are non-executive directors. All members, except for Wenche Agerup, are independent.

The committee held seven meetings in 2015 and attendance was 96%.

For a more detailed description of the objective and duties of the compensation committee, please see the instructions for the compensation committee available at Statoil.com/compensationcommittee.

7.6.3 Safety, sustainability and ethics committee

The safety, sustainability and ethics committee is a sub-committee of the board of directors that assists the board in matters relating to safety, sustainability and ethics.

The safety, sustainability and ethics committee (the committee) is chaired by Roy Franklin and the other members are Bjørn Tore Godal, Wenche Agerup, Stig Lægreid (employee-elected board member) and Lill-Heidi Bakkerud (employee-elected board member).

In its business activities, Statoil is committed to comply with applicable laws and regulations and to act in an ethical, environmental, safe and socially responsible manner. The committee has been established to support our commitment in this regard, and it assists the board of directors in its supervision of the company's safety, sustainability and ethics policies, systems and principles with the exception of aspects related to "financial matters".

Establishing and maintaining a committee dedicated to safety, sustainability and ethics is intended to ensure that the board of directors has a strong focus on and knowledge of these complex, important and constantly evolving areas. The committee acts as a preparatory body for the board of directors and, among other things, monitors and assesses the effectiveness, development and implementation of policies, systems and principles in the areas of safety, sustainability and ethics, with the exception of aspects related to "financial matters".

The committee held five meetings in 2015, and attendance was 100%.

For a more detailed description of the objective, duties and composition of the committee, please see the instructions for the committee available at Statoil.com/ssecommittee.

7.7 Compliance with NYSE listing rules

Statoil's primary listing is on the Oslo Børs, but Statoil is also registered as a foreign private issuer with the US Securities and Exchange Commission and listed on the New York Stock Exchange.

American Depositary Shares represent the company's ordinary shares listed on the New York Stock Exchange (NYSE). While Statoil's corporate governance practices follow the requirements of Norwegian law, Statoil is also subject to the NYSE's listing rules.

As a foreign private issuer, Statoil is exempted from most of the NYSE corporate governance standards that domestic US companies must comply with. However, Statoil is required to disclose any significant ways in which its corporate governance practices differ from those applicable to domestic US companies under the NYSE rules. A statement of differences is set out below:

Corporate governance guidelines

The NYSE rules require domestic US companies to adopt and disclose corporate governance guidelines. Statoil's corporate governance principles are developed by the management and the board of directors, in accordance with the Norwegian Code of Practice for Corporate Governance and applicable law. Oversight of the board of directors and management is exercised by the corporate assembly.

Director independence

The NYSE rules require domestic US companies to have a majority of "independent directors". The NYSE definition of an "independent director" sets out five specific tests of independence and also requires an affirmative determination by the board of directors that the director has no material relationship with the company.

Pursuant to Norwegian company law, Statoil's board of directors consists of members elected by shareholders and employees. Statoil's board of directors has determined that, in its judgment, all of the shareholder-elected directors, except one, are independent. In making its determinations of independence, the board focuses inter alia on there not being any conflicts of interest between shareholders, the board of directors and the company's management, but it does not explicitly make its determination based on the NYSE's five specific tests. The directors elected from among Statoil's employees would not be considered independent under the NYSE rules because they are employees of Statoil. None of the employee-elected directors is an executive officer of the company.

For further information about the board of directors see section 7.6 *Board of directors*.

Board committees

Pursuant to Norwegian company law, managing the company is the responsibility of the board of directors. Statoil has an audit committee, a safety, sustainability and ethics committee and a compensation and executive development committee. They are responsible for preparing certain matters for the board of directors. The audit committee and the compensation and executive development committee operate pursuant to charters that are broadly comparable to the form required by the NYSE rules. They report on a regular basis to, and are subject to, continuous oversight by the board of directors. For further information about the board's sub-committees, see sections 7.6.1 *Audit Committee,* 7.6.2 *Compensation and executive development committee and 7.6.3 Safety, sustainability and ethics committee.*

Statoil complies with the NYSE rule regarding the obligation to have an audit committee that meets the requirements of Rule 10A-3 of the US Securities Exchange Act of 1934.

As required by Norwegian company legislation, the members of Statoil's audit committee include an employee-elected director. Statoil relies on the exemption provided for in Rule 10A-3(b)(1)(iv)(C) from the independence requirements of the US Securities Exchange Act of 1934 with respect to the employee-elected director. Statoil does not believe that its reliance on this exemption will materially adversely affect the ability of the audit committee to act independently or to satisfy the other requirements of Rule 10A-3 relating to audit committees. The other members of the audit committee meet the independence requirements under Rule 10A-3.

Among other things, the audit committee evaluates the qualifications and independence of the company's external auditor. However, in accordance with Norwegian law, the auditor is elected by the annual general meeting of the company's shareholders.

Statoil does not have a nominating/corporate governance sub-committee formed from its board of directors. Instead, the roles prescribed for a nominating/corporate governance committee under the NYSE rules are principally carried out by the corporate assembly and the nomination committee which is elected by the general meeting of shareholders. NYSE rules require the compensation committee of US companies to comprise independent directors under the NYSE rules, recommend senior management remuneration and make a determination on the independence of advisors when engaging them. Statoil, as foreign private issuer, is exempt from complying with these rules and is permitted to follow its home country regulations. Statoil considers all its compensation committee members to be independent, cf. the discussion on director independence above. Statoil's compensation committee makes recommendations to the board about management remuneration, including that of the CEO. The compensation committee assesses its own performance and has the authority to hire external advisors. The nomination committee, which is elected by the general meeting of shareholders, recommends to the corporate assembly the candidates and remuneration of the board of directors. Also, the nomination committee recommends to the general meeting of shareholders the candidates and remuneration of the corporate assembly and the nomination committee.

Shareholder approval of equity compensation plans

The NYSE rules require that, with limited exemptions, all equity compensation plans must be subject to a shareholder vote. Under Norwegian company law, although the issuance of shares and authority to buy back company shares must be approved by Statoil's annual general meeting of shareholders, the approval of equity compensation plans is normally reserved for the board of directors.

7.8 Management

The president and CEO has overall responsibility for day-to-day operations in Statoil and appoints the corporate executive committee (CEC). Each of the members of the CEC is head of a separate business area or staff function.

The president and CEO has overall responsibility for day-to-day operations in Statoil. The president and CEO is responsible for developing Statoil's business strategy and presenting it to the board of directors for decision, for the execution of the business strategy and for cultivating a performance-driven, value-based culture.

The president and CEO appoints the corporate executive committee. Members of the CEC have a collective duty to safeguard and promote Statoil's corporate interests and to provide the president and CEO with the best possible basis for deciding the company's direction, making decisions and executing and following up business activities. In addition, each of the CEC members is head of a separate business area or staff function.

Members of Statoil's corporate executive committee as of 31 December 2015:

Eldar Sætre, President and CEO

Eldar Sætre
Born: 1956
Position: President and chief executive officer of Statoil ASA since 15 October 2014.
External offices: Member of the board of Strømberg Gruppen AS and Trucknor AS.
Number of shares in Statoil ASA as of 31 December 2015: 39,130
Loans from Statoil: None

Other matters: Dodson is a British citizen and resident in Norway.

Margareth Øvrum. Executive vice president Technology, Projects and Drilling (TPD)

Margareth Øvrum
Born: 1958
Position: Executive vice president of Statoil ASA since September 2004.
External offices: Member of the board of Atlas Copco AB (Sweden) and Alfa Laval (Sweden).
Number of shares in Statoil ASA as of 31 December 2015: 42,621
Loans from Statoil: None
Experience: Øvrum has worked for Statoil since 1982 and has held central management positions in the company, including the position of executive vice president for health, safety and the environment and executive vice president for Technology & Projects. Øvrum was the company's first female platform manager, on the Gullfaks field. She was senior vice president for operations for Veslefrikk and vice president of operations support for the Norwegian continental shelf.
Education: Master's degree in engineering (sivilingeniør) from the Norwegian Institute of Technology (NTH) in Trondheim, specialising in technical physics.
Family relations: No family relations to other members of the CEC, members of the board or the corporate assembly.
Other matters: Øvrum is a Norwegian citizen and resident in Norway.

Arne Sigve Nylund, Executive vice president Development and production Norway (DPN)

Arne Sigve Nylund
Born: 1960
Position: Executive vice president of Statoil ASA since 1 January 2014.
External offices: Member of the board of directors of The Norwegian Oil & Gas Association (Norsk Olje & Gass).
Number of shares in Statoil ASA as of 31 December 2015: 9,261
Loans from Statoil: None
Experience: Employed by Mobil Exploration Inc. from 1983-1987. Since 1987, Nylund has held several central management positions in Statoil ASA.
Education: Mechanical engineer from Stavanger College of Engineering with further qualifications in operational technology from Rogaland Regional College/University of Stavanger (UiS). Business graduate of the Norwegian School of Business and Management (NHH).
Family relations: No family relations to other members of the CEC, members of the board or the corporate assembly.
Other matters: Nylund is a Norwegian citizen and is resident in Norway.

Jens Økland, executive vice president Marketing, Midstream and Processing (MMP)

Jens Økland
Born: 1969
Position: Executive vice president of Statoil ASA since 1 June 2015.
External offices: None
Number of shares in Statoil ASA as of 31 December 2015: 10,735
Loans from Statoil ASA: None
Experience: Økland joined Statoil in 1994 and has mainly worked in the midstream and downstream sectors. Before becoming executive vice president of MMP, Økland worked as vice president of operations for the Åsgard area in Development and Production Norway. Åsgard ranks among the largest developments on the Norwegian continental shelf, supplying about 11 billion cubic metres of gas annually to Europe. Previously Økland was senior vice president of Statoil's natural gas portfolio and supply business in North America, marketing and developing infrastructure solutions for equity and non-equity production. Before heading up Statoil's downstream gas division in North America, he had senior marketing and business development positions within natural gas in Europe mainly focusing on Germany, Statoil's largest gas market.
Education: MSc in business from BI Norwegian Business School.
Family relations: No family relations to other members of the CEC, members of the board or the corporate assembly.
Other matters: Økland is a Norwegian citizen and resident in Norway.

Irene Rummelhoff, executive vice president New Energy Solutions (NES)

Irene Rummelhoff
Born: 1967
Position: Executive vice president of Statoil ASA since 1 June 2015.
External offices: Member of the board of directors of Norsk Hydro ASA.
Number of shares in Statoil ASA as of 31 December 2015: 17,082
Loans from Statoil ASA: None
Experience: Rummehoff joined Statoil in 1991. She has held a number of management positions within international business development, exploration, and the downstream business in Statoil.
Education: Master's degree in petroleum geosciences from the Norwegian Institute of Technology (NTH).
Family relations: No family relations to other members of the CEC, members of the board or the corporate assembly.
Other matters: Rummehoff is a Norwegian citizen and resident in Norway.

Statoil has granted loans to the Statoil-employed spouse of certain of the Executive Vice Presidents as part of its general loan arrangement for Statoil employees. Employees in salary grade 12 or higher may take out a car loan from Statoil in accordance with standardised provisions set by the company. The standard maximum car loan is limited to the cost of the car, including registration fees, but not exceeding NOK 300,000. Employees outside the collective labour area are entitled to a car loan up to NOK 575,000 (vice presidents and senior vice presidents) or NOK 475,000 (other positions). The car loan is interest-free, but the tax value, "interest advantage", must be reported as salary. Permanent employees in Statoil ASA may also apply for a consumer loan up to NOK 300.000. The interest rate on consumer loans is corresponding to the standard rate in effect at any time for "reasonable loans" from employer as decided by the Norwegian Ministry of Finance, i.e. the lowest rate an employer may offer without triggering taxation of the advantage for the employee.

7.9 Compensation to governing bodies

This section describes the compensation to the board of directors, the corporate executive committee and the corporate assembly.

In 2015, the aggregate compensation to the corporate assembly was NOK 1,047,143, to the members of the board of directors NOK 5,950,035 and to the members of the corporate executive committee NOK 87,763,000 (all in rounded figures).

The members of the corporate assembly and the board of directors have an annual, fixed remuneration, except for deputy members who receive remuneration per meeting. In addition, board members resident outside of Scandinavia or outside of Europe receive additional travel fees (based on two different travel fee rates) per board meeting attended. The shareholder-elected and employee-elected members of the corporate assembly and the board are entitled to the same remuneration rates.

Detailed information about the individual compensation to the members of the board of directors and members of the corporate executive committee in 2015 is provided in the tables below.

Members of the board (figures in NOK thousand)	Board of directors	Audit committee	Compensation and executive development committee	SSE committee	Total remuneration

William Maloney[8, 9]	3,933	0	4,625	4,625	1,226	14,410	138	698	0
John Knight[2, 8]	8,695	0	3,468	3,468	1,231	16,863	0	0	0

1) All figures in the table are presented on accrual basis.
2) Fixed pay consists of base salary, holiday allowance and other administrative benefits. John Knight's fixed pay also includes a cash supplement that replaces his defined contribution pension plan.
3) Cash allowance in lieu of pension accrual above 12 G (the base amount in the national insurance scheme).
4) The fixed long-term incentive (LTI) element implies an obligation to invest the net amount in Statoil shares. A lock-in period of 3 years applies for the investment. The LTI element is presented the year it is granted for the members of the corporate executive committee employed by Statoil ASA. Members of the corporate executive committee employed by non-Norwegian subsidiaries have a LTI scheme deviating from the model used in the parent company. A net amount equivalent to the annual variable pay is used for purchasing Statoil shares.
5) Annual variable pay includes holiday allowance for corporate executive committee (CEC) members resident in Norway.
6) Estimated pension cost for CEC members under defined benefit plans (Eldar Sætre, Timothy Dodson, Margareth Øvrum, Arne Sigve Nylund and Tor Martin Anfinnsen) is calculated based on actuarial assumptions and pensionable salary (mainly base salary) at 31 December 2014 and is recognised as pension cost in the statement of income for 2015. The other CEC members have defined contribution plans including notional contribution plans and the contributions in the reporting period are recognised as pension cost in the statement of income. Payroll tax is not included. For further information, see note 19 *Pensions*.
7) Torgrim Reitan, Lars Christian Bacher, Hans Jakob Hegge, Jens Økland, Irene Rummelhoff and Anders Opedal were transferred to a defined contribution plan from 1 April 2015. Paid-up policies and rights letters issued in 2015 related to the defined benefit plans as well as the notional contribution plans are included in the present value of pension obligation at 31 December 2015. Estimated present value of pension obligation for the rest of the members of CEC employed by Statoil ASA, are presented with the defined benefit obligation.
8) William Maloney and John Knight's remuneration is in local currency US Dollar and British Pound, respectively. For John Knight the figures in the table are presented in NOK, using average currency rates in 2015. For William Maloney the average currency rates for the period 1 January to 30 September 2015 are used. The change in currency rates during the year, such as strengthening of USD and GBP versus NOK, impacts the development from 2014 to 2015. William Maloney's variable compensation is paid in 2015.
9) Eldar Sætre resumed role as acting chief executive officer (CEO) from 15 October 2014 until 3 February 2015. The 4 February Eldar Sætre was appointed as CEO on a permanent basis. Tor Martin Anfinnsen acted as executive vice president for Marketing, Midstream and Processing (MMP) from 15 October 2014 until 31 May 2015. Jens Økland was appointed executive vice president for MMP from 1 June 2015. William Maloney resigned as executive vice president for Development and Production North America (DPNA) July 31 and was followed by Torgrim Reitan who started as executive vice president for Development and Production USA (DPUSA) 1 August 2015. Hans Jakob Hegge was appointed executive vice president and chief financial officer from 1. August 2015. Irene Rummelhoff was appointed executive vice president for the newly established business area New Energy Solutions (NES) on 1 June 2015. Anders Opedal was appointed on 1 April 2015 in the new position chief operating officer (COO).
10) Compensation and benefit including standard international assignment terms for Torgrim Reitan during his tenure as executive vice president in DPUSA, commencing 1 August 2015.
11) Fixed pay for Eldar Sætre includes fixed remuneration element of NOK 1 815 000 not included in pensionable salary

There are no loans from the company to members of the corporate executive committee.

Former chief executive officer Helge Lund has in 2015 paid back NOK 5 033 491 in LTI bonus received in 2012, 2013 and 2014. He has received compensations and benefits that amount to NOK 2.7 million in 2015. The amount is related to base salary for the period 1 January to 8 February 2015 and final settlement payments such as holiday allowance earned in 2014 and 2015.

	Fixed remuneration

Arne Sigve Nylund[5)]	2,984	725	1,421	108	5,239	-	773	26,646
Eldar Sætre - CEO[5)]	1,370	-	689	35	2,094	-	989	46,769
Eldar Sætre - MMP	2,685	858	901	143	4,588	-	-	-
Tor Martin Anfinnsen[5)]	817	-	239	90	1,147	-	234	22,196
William Maloney[2), 8)]	4,333	2,167	2,167	960	9,627	166	713	-
John Knight[2), 3)]	7,132	2,845	2,845	1,133	13,955	-	-	-

1) All figures in the table are presented on accrual basis.

2) William Maloney and John Knight's remuneration is in local currency US Dollar and British Pound, respectively. The figures in the table are presented in NOK, using average currency rates in 2014.

3) Fixed pay consist of base salary, holiday allowance and any other administrative benefits. The figures are presented on accrual basis. John Knight's fixed pay also includes a cash supplement that replaces his defined contribution pension plan in 2014.

4) Helge Lund resigned from his position as CEO of Statoil 15 October 2014. Helge Lund has received salary and benefits that amounts to NOK 1.8 million in 2014 after his resignation as chief executive officer, not included in the table above. The pension liability listed in the table above represents the estimated present value of his pension obligation as of 31 December 2014. In line with the company's LTI policy, resignation during the lock-in period is regarded as a non-fulfilment of the LTI obligations. Following his resignation Helge Lund was obliged to pay back to Statoil a total of NOK 5 033 491, calculated based on the value of the locked shares acquired under the LTI program.

5) Following Helge Lund's resignation, Eldar Sætre resumed role as acting CEO with immediate effect on 15 October 2014, and Tor Martin Anfinnsen replaced Eldar Sætre as acting executive vice president for Marketing, Midstream and Processing (MMP). Arne Sigve Nylund replaced Øystein Michelsen from January 2014.

6) The fixed long-term incentive (LTI) element implies an obligation to invest the net amount in Statoil shares. A lock-in period of 3 years applies for the investment. The LTI element is presented the year it is granted for the members of the corporate executive committee employed by Statoil ASA. Members of the corporate executive committee employed by non-Norwegian subsidiaries have a LTI scheme deviating from the model used in the parent company. A net amount equivalent to the annual variable pay is used for purchasing Statoil shares, and the figures are presented on accrual basis.

7) Annual variable pay includes holiday allowance, and is presented on accrual basis.

8) Estimated pension cost is calculated based on actuarial assumptions and pensionable salary (mainly base salary) at 31 December 2013 and is recognised as pension cost in the statement of income for 2014. Payroll tax is not included. William Maloney is employed by a non-Norwegian entity and his pension cost reflects the payment under the entity's defined contribution plan made in 2014.

9) Torgrim Reitan and Lars Christian Bacher was transferred to a defined contribution plan from 1 April 2015, and the Estimated present value of pension obligation per 31 December 2014 reflects this change. Estimated present value of pension obligation related to Helge Lund, Torgrim Reitan and Lars Christian Bacher, are based on the estimated value of paid-up policies and rights letters to be issued in 2015, related to Helge Lund's resignation and the termination of Torgrim Reitan and Lars Christian Bacher's defined benefit pension plan. Estimated present value of pension obligation for the rest of the members of the corporate executive committee employed by Statoil ASA, are presented with the defined benefit obligation.

1 Remuneration policy and concept for the accounting year 2016

Reference is made to the document "Statement on remuneration for Statoil's Corporate Executive Committee", which is available at www.statoil.com, for a detailed description of the remuneration and remuneration policy for executive management applicable for the years 2015 and 2016. The main elements of Statoil's executive remuneration are described in the paragraphs below.

1.1 Policy and principles

The board of directors has in 2015 decided to introduce several new elements to the company's executive remuneration concept. The revised governmental guidelines on executive remuneration as of 13 February 2015 ("2015 governmental guidelines") entailed adjustments with impact on the company's executive remuneration concept. Changes to the pension system and the long-term incentive scheme are implemented to align with the 2015 governmental guidelines on executive remuneration. In addition the company has initiated improvements to strengthen the link between executive remuneration and the company's overall performance and results.

The changes include:

- a cap on pension contribution at the maximum limit in the tax-favoured joint pension schemes in Norway (currently 12 G[2])
- adjustment to the long-term incentive scheme (LTI)
- a company performance modifier
- a threshold for variable pay

These changes are described in section 1.2-1.5 below.
The company performance modifier is subject to approval by the 2016 annual general meeting (AGM) cf. section 5.

Other than described in this section, the company's established remuneration principles and concepts as described in previous years Statements on remuneration and other employment terms for Statoil's corporate executive committee will be continued in the accounting year 2016.

The remuneration concept is an integrated part of our values based performance framework. It has been designed to:

- reflect our global competitive market strategy and local market conditions
- strengthen the common interests of employees in the Statoil group and its shareholders
- be in accordance with statutory regulations and good corporate governance
- be fair, transparent and non-discriminatory
- equally reward and recognise "what" we deliver and "how" we deliver
- differentiate on the basis of responsibilities and performance
- reward both short- and long-term contributions and results

1.2 Cap on pension contribution at the maximum limit in the tax-favoured joint pension schemes in Norway

In the White Paper no. 27 (2013- 2014) the Government announced changes to its policy relating to pension contribution in companies where the State has majority ownership. The State would no longer support pension contribution above 12 G. This policy change was manifested in 2015 governmental guidelines on executive remuneration. In order to align with the 2015 governmental guidelines, Statoil ASA has introduced a cap at 12 G for pension contribution for new members of the corporate executive committee appointed after the effective date of the 2015 governmental guidelines.

In lieu of pension contribution for income above 12 G, new internal members of the corporate executive committee will be eligible for compensation. The compensation level will be dependent on the candidate's pension terms and base salary level and will be in the range of 15 - 20% of his/her base salary.

1.3 Adjustments to the long-term incentive scheme in Statoil ASA

According to the 2015 governmental guidelines, the long-term incentive (LTI) scheme is defined as variable remuneration. Earlier this was part of the fixed remuneration and included in the basis for calculating the participants' annual variable pay. This practice will be discontinued with the effect from earning year 2016. The LTI scheme as variable remuneration will have a maximum annual grant at 30% of the participants' fixed remuneration c.f. section 1.6 below.

1.4 Threshold

The board of directors has decided to introduce a threshold in the reward concept as a pre-requisite for the payment of variable pay and grant of long-term incentive (LTI). The threshold will have effect on the long-term incentive grant in 2016 provided this is not impeded by obligations in individual agreements. From the earning year 2016 the threshold will be applied on annual variable pay payments in 2017 and onwards. The threshold is based on Statoil group's full-year adjusted earnings after tax, requiring that a minimum level of earnings must be achieved for any payments to be made. This minimum level has been set at USD 2 billion. Earnings between USD 2 and 3.3 will result in bonus payments reduced by 50%. Above USD 3.3 billion the threshold is fully achieved and variable pay payments are not affected. Prior to application of the threshold an assessment of the company's overall performance in relation to the adjusted earnings results shall be made by the board of directors based on recommendations by the board compensation and executive development committee.

1.5 Company performance modifier

Subject to approval by the 2016 annual general meeting, a company performance modifier is introduced in the calculations for variable pay schemes from 2016 with subsequent impact on variable pay from 2017 onwards. The company performance modifier determines the proportion of the bonus factor that

[2] *The base amount in the Norwegian national insurance scheme, currently NOK 90,068*

will be paid, ranging from 50% to 150%. Company performance is assessed against two equally weighted measures: relative total shareholder return (TSR) and relative return on average capital employed (RoACE).

1.6 The remuneration concept for the corporate executive committee

Statoil's remuneration concept for the corporate executive committee consists of the following main elements:

- Fixed remuneration (base salary) and as applicable cash compensation
- Variable pay (annual variable pay (AVP) and long-term Incentive (LTI))
- Benefits (primarily pension, insurance and share savings plan)

Fixed remuneration consists of base salary, and as applicable cash compensation. The cash compensation is applied in lieu of pension contribution above 12 G as described in section 1.2 above or as a fixed remuneration to be competitive in the market.

The variable pay elements for members of the corporate executive committee in the parent company are:

- annual variable pay scheme which has a maximum potential of 50% of fixed remuneration
- LTI scheme with a maximum grant of 30% of fixed remuneration. The LTI grant level is differentiated related to position level. The obligation to invest the net LTI amount in Statoil shares and keep for a lock in period of 3 years will be continued.

The annual variable pay will be subject to the company performance modifier ref. section 1.5 above. Irrespective of the performance modifier results, the annual variable pay will have a maximum at 50% of the fixed remuneration.

The main benefit programmes applicable to senior executives are the general pension scheme, the insurance scheme and the employee share savings plan. In 2015 Statoil implemented a defined contribution scheme as the new general pension scheme. With the exception of employees who were 15 years or less from regular retirement age at 31th December 2014, all employees have been transferred to the new scheme. The employees exempted from transfer will retain the defined benefit scheme.

Deviations from the general principles outlined below pertaining to one current member and one former member of the corporate executive committee, implemented with effect as of 1 January 2011, are described in the statement on executive remuneration. These deviations have also been described in previous statements on remuneration and other employment terms for Statoil's corporate executive committee.

The main elements of Statoil's executive remuneration are described in more detail in the table below.

Main Elements - Statoil Executive Remuneration			
Remuneration Element	**Objective**	**Award level**	**Performance criteria**
Base Salary	Attract and retain the right high-performing individuals providing competitive but not market-leading terms.	We offer base salary levels which are aligned with the individual's responsibility and performance at a level which is competitive in the markets in which we operate.	The evaluation of performance is based on the fulfilment of pre-defined goals; see element Annual Variable Pay below. The base salary is normally subject to annual review.
Long-Term Incentive (LTI)	Strengthen the alignment of top management and shareholder interests and retention of key employees.	The LTI system is a, monetary compensation calculated as a portion of the participant's base salary; with a maximum annual grant at 30% of fixed remuneration. On behalf of the participant, the company acquires shares equivalent to the net annual amount. The grant is subject to a three year lock-in period and then released for the participant's disposal. Deviations applicable for executive vice presidents employed outside the parent company are described in the statement on executive remuneration. The threshold principles will apply for the annual grant.	In Statoil ASA, LTI is a variable remuneration element, Participation in the LTI scheme and the size of the annual LTI element are reflective of the level and impact of the position and not directly linked to the incumbent's performance.
Annual Variable Pay	Drive and reward individuals for annual achievement of business objectives and how results are delivered. Ensure link between individual variable pay and company's overall financial performance.	Members of the corporate executive committee are entitled to an annual variable pay ranging from 0-50% of their fixed remuneration. Target value is 25% (target value reflects fully satisfactory goal achievement). Deviations applicable for members of the corporate executive committee employed outside the parent company are described in the statement on executive remuneration. The deviation will in 2016 apply for one executive vice president employed by Statoil Global Employment Company Ltd. in London. The threshold principles and the company modifier (subject to AGM approval) will apply.	Achievement of annual performance goals (how and what to deliver), in order to create long-term and sustainable shareholder value. Assessment of goals related to selected KPI's from the balanced scorecard will impact the variable remuneration for the members of the corporate executive committee.
Pension & Insurance Schemes	Provide competitive postemployment and other benefits.	The general occupational pension plan is a defined contribution scheme with a contribution level of 7%/22% below/above 7,1 G. The defined benefit scheme will be retained by a grandfathered group of employees. The benefit scheme has a pension level amounting to 66 per cent of the pensionable salary conditional on a minimum of 30 years of service. Pension from the national insurance scheme is taken into account when estimating the pension. In order to draw a full pension from Statoil's defined benefit scheme the employment with the company needs to be maintained until the pensionable age. For new internal members of the corporate executive committee a cap for pension contribution at 12 G is established.	N/A
Employee Share Savings Plan	Align and strengthen employee and shareholder interests and remunerate for long term commitment and value creation.	Offer to purchase Statoil shares in the market limited to 5% of annual base salary.	If shares are kept for two calendar years of continued employment, the participants will be allocated bonus shares proportionate to their purchase.

1.7. Base salary and remuneration mix 2016

Due to the current challenges facing our industry with falling oil and gas prices, decreasing margins and unsustainable cost levels, a salary freeze will be implemented for members of the corporate executive committee and other leaders and senior professionals in 2016.

The graphs below illustrate the chief executive officer's remuneration mix for 2016 and a typical remuneration mix for executive vice presidents. The chief executive officer's total remuneration package includes an additional fixed remuneration element compared to the executive vice presidents, and the executive vice presidents remuneration package includes, as applicable, a cash compensation in lieu of pension contribution above 12 G due to the implemented cap, see section 1.2 *Cap on pension contribution at the maximum limit in the tax-favoured joint pension schemes in Norway* above; please see further details of the chief executive officer's terms and conditions in section 1.11 *Terms and conditions for president and chief executive officer, Eldar*

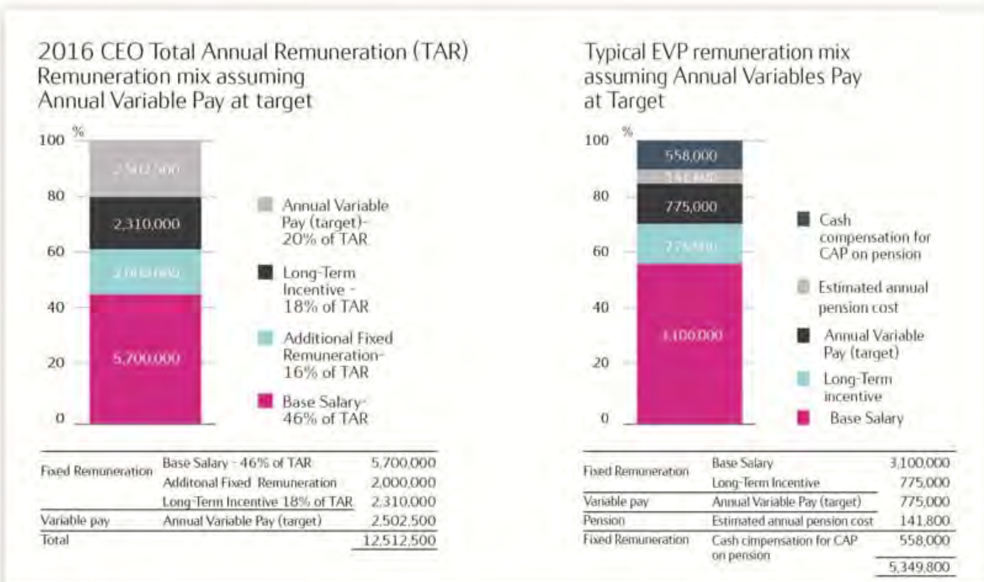

Figure 1: Illustrates chief executive officer remuneration mix for 2016. CEO's pension was fully accrued by 31 December 2014.
Figure 2: Illustrates an example of a typical remuneration mix for an executive vice president in Statoil with a cap on pension contribution.

1.8. Pension and insurance schemes

Members of the corporate executive committee are part of the general pension scheme in Statoil ASA. The chief executive officer and three executive vice presidents have individual early retirement pension agreement with the company.

The chief executive officer and one of the executive vice presidents have individual pension terms according to a previous standard arrangement implemented in October 2006. Subject to specific terms those executives are entitled to a pension amounting to 66 per cent of pensionable salary and a retirement age of 62. When calculating the number of years of membership in Statoil's general pension plan, these agreements grant the right to an extra contribution time corresponding to half a year of extra membership for each year the individual has served as executive vice president.

In addition, two members of the corporate executive committee have individually agreed retirement age of 65 and an early retirement pension level amounting to 66% of pensionable salary.

The individual pension terms for executive vice presidents outlined above are results of commitments according to previous established agreements.

Following a board decision 7 February 2012, the company's standard pension arrangements for executive vice presidents deviating from Statoil ASA's general pension plan have been discontinued and have not been applied for new appointments to the corporate executive committee.

As described in section 1.2, a cap on pension contribution for income above 12 G was in 2015 implemented for new members of the Corporate Executive Committee. The cap is applied to four executives vice presidents appointed after 13 February 2015.

Members of the corporate executive committee appointed before 13 February 2015, will maintain their pension contribution above 12 G based on obligations in established agreements.

Pension accruals for pensionable salary above 12 G are recognised as an unfunded defined benefit pension plan, i.e. not funded in a separate legal entity.

In addition to the pension benefits outlined above, the executive vice presidents in the parent company are offered disability and dependents' benefits in accordance with Statoil's general pension plan. Members of the corporate executive committee are covered by the general insurance schemes applicable within Statoil.

1.9. Severance pay arrangements

The chief executive officer and the executive vice presidents are entitled to a severance payment equivalent to six months' salary, commencing at the time of expiry of a six months' notice period, when the resignation is at the request from the company. The same amount of severance payment is also payable if the parties agree that the employment should be discontinued and the executive vice president gives notice pursuant to a written agreement with the company. Any other payment earned by the executive vice president during the period of severance payment will be fully deducted. This relates to earnings from any employment or business activity where the executive vice president has active ownership.

The entitlement to severance payment is conditional on the chief executive officer or the executive vice president not being guilty of gross misconduct, gross negligence, disloyalty or other material breach of his/her duties.

As a general rule, the chief executive officer's/executive vice president's own notice will not instigate any severance payment.

1.10. Other benefits

Statoil has a share savings plan available to all employees including members of the corporate executive committee. The share savings plan entails an offer to purchase Statoil shares in the market limited to five per cent of annual gross salary. If the shares are kept for two full calendar years of continued employment the employees will be allocated bonus shares proportionate to their purchase. Shares to be used for sale and transfer to employees are acquired by Statoil in the market, in accordance with the authorisation from the annual general meeting.

The members of the corporate executive committee have benefits in kind such as company car and electronic communication.

1.11. Terms and conditions for president and chief executive officer, Eldar Sætre

Effective 4 February 2015 Statoil's board of directors appointed Eldar Sætre as president and chief executive officer of Statoil, following an acting period since 15 October 2014. The chief executive officer's annual base salary is NOK 5,700,000. Furthermore, the CEO is entitled to an additional fixed remuneration element of NOK 2,000,000 not included in the pensionable income.

The chief executive officer will participate in an annual variable pay scheme with a target level of 25%, and participation to the Company's 2016 LTI scheme with a value of 30% (gross) of base salary. The pension terms remain unchanged according to previously established pension agreement, as described in section 1.8 above.

2. Performance management, assessment and results essential for variable pay

2.1. Performance management, assessment and results essential for variable pay for 2015

Individual salary and annual variable pay reviews are based on the performance evaluation in our performance management system.

Performance is evaluated in two dimensions; "What" we deliver and "How" we deliver. Goals on "How" we deliver are based on our core values and leadership principles and address the behaviour required and expected in order to achieve our delivery goals.

"What" we deliver (business delivery) is defined through the company's performance framework "Ambition to Action", which addresses strategic objectives, key performance Indicators (KPIs) and actions across the five perspectives; Safety, Security and Sustainability, People and Leadership, Operations, Market and Results. Generally, Statoil believes in setting ambitious targets to inspire and drive strong performance.

In 2015, the main objectives and KPIs for each perspective were as outlined below. Each perspective was in addition supported by comprehensive plans and actions. It is only the KPI's for Results that will affect variable remuneration for members of the corporate executive committee.

Strategic objectives		2015 assessment
Safety, Security and Sustainability	The strategic objectives and actions address security and sustainability (Safety - see the Results perspective below)	There were no serious well incidents, whereas the number of oil and gas leakages was above target. Total CO_2 reduction was better than targeted and future ambitions have been increased.
People and organisation	The strategic objectives and actions address high performing leaders and teams, and global and cost-effective capabilities	Employee engagement increased from 2014, during a time with extensive organisational efficiency programmes. Leadership renewal across the organisation was better than targeted.
Operations	The strategic objectives and actions address reliable and cost-efficient operations, and value-driven technology development.	Production came in well above target, partly driven by continued improvements in production efficiency and optimised gas production from our flexible gas fields. Unit production cost is now the lowest among industry peers. Unit finding cost increased due to lower than expected exploration results.
Market	The strategic objectives and actions address stakeholder trust, value chain optimisation and portfolio and project management.	The organic Reserve Replacement Ratio (RRR) ended somewhat below the target of 1, while total RRR was well below due to divestments and a number of projects being postponed to maintain financial flexibility and improve project profitability. Project cost efficiency versus peers continued to improve.
Results	The strategic objectives and actions address shareholder return, financial robustness, value creation from exploration, cost & capital discipline and for 2015 also Safety.	Relative Total Shareholder Return (TSR) improved and ended on 6th against an industry peer group of 12. Relative RoACE also ended 6th but fell as a result of high exposure to upstream margins. Capex ended well below initially guided levels. The cash flow improvement programme delivered well above target. The serious incident frequency of 0,6 was unchanged from 2014.

Board assessment of the chief executive officer's performance
In its assessment of the chief executive officer's performance, and consequently his merit and annual pay for 2015, the board has put emphasis on the solid delivery on the cashflow improvement programme as well as CAPEX reductions and TSR. Serious incident frequency also continues to improve from 2014.

Before final conclusions of the performance assessments are drawn, sound judgement and hindsight information are applied. Measured KPI results are reviewed against their strategic contribution, sustainability and significant changes in assumptions.

This balanced approach, which involves a broad set of goals defined in relation to both "What" and "How" dimensions and an overall performance evaluation, is viewed to significantly reduce the likelihood that remuneration policies may stimulate excessive risk-taking or have other material adverse effects.

2.2 Key performance indicators for the chief executive officer for 2016

For the accounting year 2016 the CEO's variable remuneration for 2016 and base salary merit increase as of 1 January 2017 will be based on assessment of results on the following KIPs:

Safety, Security and Sustainability
- CO_2 intensity for the upstream portfolio
- Serious Incident Frequency (actual)

Market
- Capex (capital expenditure)

Results
- Relative Total Shareholder Return
- Relative RoACE
- Cash flow improvement programme

3. Execution of the remuneration policy and principles in 2015

3.1 Deviations from the governmental guidelines on variable compensation 2015

Two members of the executive committee had in 2015 variable pay schemes deviating from the description in section 1.6 above. One of the executives was employed by Statoil Gulf Services LLC in Houston and resigned from the company 31 July 2015. He was entitled to a variable pay scheme with a maximum of 100% for AVP and LTI, respectively. The other is still employed by Statoil Global Employment Company Ltd. in London and his variable pay scheme entail a framework for variable pay of 75% of his base salary for each of the elements annual variable pay and LTI, and is performance based. His contract also includes a provision for severance payment of 12 months' base salary.

The board's overall assessment is that the extended framework implemented with effect from 1 January 2011 for the variable pay schemes for these executives is necessary due to local market conditions, but not market leading for positions at this level at the respective locations.

3.2 Changes to the Corporate Executive Committee in 2015

In addition to the appointment of Eldar Sætre as president and chief executive officer, several changes have in 2015 been implemented to the organisational structure and the composition of the corporate executive committee. A new corporate staff and support function, chief operating officer (COO), was established from 1 April 2015, and Anders Opedal was appointed as executive vice president and COO.

New energy Solution (NES) was established as a new business area 1 June 2015 with Irene Rummelhoff as the executive vice president. Jens Økland was appointed executive vice president in MMP from 1 June 2015 succeeding Tor Martin Anfinnsen's acting period.

William Maloney, executive vice president Development and Production North America (DPNA), resigned from the company 31 July 2015. An adjustment to the DPNA organisation is implemented and this business area is renamed to Development and Production USA (DPUSA) [3]. Torgrim Reitan assumed responsibility as executive vice president in DPUSA as of 1 August 2015. Hans Jakob Hegge succeeded Torgrim Reitan as CFO from 1 august 2015.

3.3 Changes to individual terms in 2015

Following former president and chief executive officer Helge Lund's resignation a termination agreement was entered into. Helge Lund's termination date was 9 February 2015. Helge Lund received base salary and benefits compensation up until this date. He did not receive variable pay for the performance year 2014. The LTI scheme and share savings plan was closed in accordance with the company policy, and a repayment of NOK 5,033,491 was made by Helge Lund to Statoil ASA according to the LTI agreement. The company issued a paid-up policy and pension right letters for his pension accruals, in accordance with his individual pension agreement.

4. The decision-making process

The decision-making process for implementing or changing remuneration policies and concepts, and the determination of salaries and other remuneration for corporate executive committee, are in accordance with the provisions of the Norwegian public limited liability companies act sections 5-6 and 6-16 a and the board's rules of procedure. The board's rules of procedure are available at www.statoil.com/board.

The board of directors has appointed a designated compensation and executive development committee. The compensation and executive development committee is a preparatory body for the board. The committee's main objective is to assist the board of directors in its work relating to the terms of employment for Statoil's chief executive officer and the main principles and strategy for the remuneration and leadership development of our senior executives. The board of directors determines the chief executive officer's salary and other terms of employment.

The compensation and executive development committee answers to the board of Statoil ASA for the performance of its duties. The work of the committee in no way alters the responsibilities of the board of directors or the individual board members.

For further details about the roles and responsibilities of the compensation and executive development committee, please refer to the committee's instructions available at www.statoil.com/compensationcommittee.

5. Company performance modifier

Introduction

It is recommended to introduce a company performance modifier to be applied in calculation of variable pay. The relative total shareholder return is recommended as one of the criteria in the company modifier. Thus, the case is submitted to the annual general meeting for approval, pursuant to the provisions in the Public Limited Companies Act § 5-6 third paragraph last sentence ref. § 6-16 a, first paragraph third sentence number 3.

Background

Statoil has implemented annual variable pay schemes (AVP) for members of the corporate executive committee. The schemes are described in section 1.6 of this statement. Other executives, managers and employees in defined professional positions are also eligible for individual variable pay according to the company's guidelines.

The company's current annual variable pay scheme is entirely based on the individual participants' performance. Statoil has not implemented a company performance modifier for the variable pay schemes. The prevalent trend in the market is to ensure that variable remuneration is aligned with the company's performance. The governmental guidelines on executive remuneration also underline that "there shall be a clear connection between the variable salary and the performance of the company."

Proposal

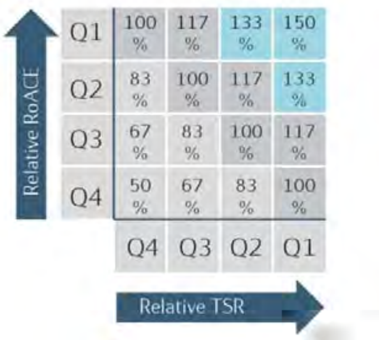
Based on this, it is proposed to strengthen the link between the company's overall financial results and the individual variable pay by introducing a company performance modifier. The company performance is planned to be assessed against two equally weighted measures: relative total shareholder return (TSR) and relative return on average capital employed (RoACE). TSR and RoACE have historically constituted important performance indicators at the company's scorecard and are currently also applied in the corporate performance management system.

---

[3] *Transfer of responsibility for the company's business in Canada from Development and Production North America (DPNA) to Development and Production International (DPI)*

The results of both of these corporate performance measures are compared to our peers and our relative position determined. A position of first quartile means that Statoil is amongst the top scoring quartile of peer companies. A position of fourth quartile means Statoil is in the bottom performing quartile. In years with strong deliveries on relative TSR and RoACE, the matrix will result in the variable pay being modified with a factor higher than one and, correspondingly, lower than one in weak years. By applying relative numbers, the effect of fluctuating oil price will be reduced.

The combination of ratings for both measures, will act as a 'multiplier' according to the matrix displayed below.



The plan is to introduce the company performance modifier in calculation of annual variable pay for members of Statoil's corporate executive committee. Further application of the company performance modifier in Long-term incentive schemes will also be assessed and decided if deemed appropriate. In Long-term incentive schemes a three years average result for the modifier will typically be applied. The company also plan to implement the modifier in variable pay schemes for employees in positions below the corporate executive level.

The annual variable pay for members of the corporate executive committee will be within a framework of 50% of the fixed remuneration irrespective of the result of the modifier. Any deviations from this framework for members of the corporate executive committee will be explicitly explained in the board's annual Statements on remuneration and other employment terms for Statoil's corporate executive committee.

A complete statement on remuneration and other employment terms for Statoil's corporate executive committee is available at www.statoil.com.

7.10 Share ownership

This section describes the number of Statoil shares owned by the members of the board of directors, the corporate assembly and the corporate executive committee.

The number of Statoil shares owned by the members of the board of directors and the executive committee and/or owned by their close associates is shown below. Individually, each member of the board of directors and the corporate executive committee owned less than 1% of the outstanding Statoil shares.

Ownership of Statoil shares (including share ownership of «close associates»)	As of 31 December 2015	As of 8 March 2016
Members of the corporate executive committee		
Eldar Sætre	39,130	40,024
Hans Jakob Hegge	22,854	23,908
Anders Opedal	14,511	14,511
Lars Christian Bacher	21,116	22,308
Torgrim Reitan	28,482	29,435
John Knight	85,731	87,565
Tim Dodson	28,614	29,438
Margareth Øvrum	42,621	44,033
Arne Sigve Nylund	9,261	9,261
Jens Økland	10,735	11,386
Irene Rummelhoff	17,082	17,639
Members of the board of directors		
Øystein Løseth	1,000	1,000
Roy Franklin	0	0
Bjørn Tore Godal	0	0
Jakob Stausholm	50,000	50,000
Maria Johanna Oudeman	0	0
Rebekka Glasser Herlofsen	0	0
Wenche Agerup	2,423	2,423
Lill-Heidi Bakkerud	330	330
Ingrid Elisabeth di Valerio	2,845	3,165
Stig Lægreid	1,519	1,807

Individually, each member of the corporate assembly owned less than 1% of the outstanding Statoil shares as of 31 December 2015 and as of 8 March 2016. In aggregate, members of the corporate assembly owned a total of 19,592 shares as of 31 December 2015 and a total of 22,157 shares as of 8 March 2016. Information about the individual share ownership of the members of the corporate assembly is presented in the section *Corporate governance - Corporate assembly*.

The voting rights of members of the board of directors, the corporate executive committee and the corporate assembly do not differ from those of ordinary shareholders.

7.11 Independent auditor

This section provides details about the independent auditor, the remuneration of the auditor and policies and procedures relating to the auditor.

Our independent registered public accounting firm (independent auditor) is independent in relation to Statoil and is elected by the general meeting of shareholders. The independent auditor's fee must be approved by the general meeting of shareholders.

Pursuant to the instructions for the board's audit committee approved by the board of directors, the audit committee is responsible for ensuring that the company is subject to an independent and effective external and internal audit.

Every year, the independent auditor presents a plan to the audit committee for the execution of the independent auditor's work.

The independent auditor attends the meeting of the board of directors that deals with the preparation of the annual accounts.

The independent auditor participates in meetings of the audit committee.

When evaluating the independent auditor, emphasis is placed on the firm's qualifications, capacity, local and international availability and the size of the fee.

The audit committee evaluates and makes a recommendation to the board of directors, the corporate assembly and the general meeting of shareholders regarding the choice of independent auditor. The committee is responsible for ensuring that the independent auditor meets the requirements in Norway and in the countries where Statoil is listed. The independent auditor is subject to the provisions of US securities legislation, which stipulates that a responsible partner may not lead the engagement for more than five consecutive years.

The audit committee considers all reports from the independent auditor before they are considered by the board of directors. The audit committee holds regular meetings with the independent auditor without the company's management being present.

The audit committee's policies and procedures for pre-approval

In its instructions for the audit committee, the board of directors has delegated authority to the audit committee to pre-approve assignments to be performed by the independent auditor. Within this pre-approval, the audit committee has issued further guidelines. The audit committee has issued guidelines for the management's pre-approval of assignments to be performed by the independent auditor.

All audit-related and other services provided by the independent auditor must be pre-approved by the audit committee. Provided that the types of services proposed are permissible under SEC guidelines, pre-approval is usually granted at a regular audit committee meeting. The chair of the audit committee has been authorised to pre-approve services that are in accordance with policies established by the audit committee that specify in detail the types of services that qualify. It is a condition that any services pre-approved in this manner are presented to the full audit committee at its next meeting. Some pre-approvals can therefore be granted by the chair of the audit committee if an urgent reply is deemed necessary.

Remuneration of the independent auditor in 2015

In the annual Consolidated financial statements and in the parent company's financial statements, the independent auditor's remuneration is split between the audit fee and the fee for audit-related and other services. The chair presents the breakdown between the audit fee and the fee for audit-related and other services to the annual general meeting of shareholders.

The following table sets out the aggregate fees related to professional services rendered by Statoil's principal accountant KPMG AS, for the fiscal year 2015, 2014 and 2013.

Auditor's remuneration (in NOK million, excluding VAT)	For the year ended 31 December 2015	2014	2013
Audit fee	49	45	38
Audit related fee	14	8	8
Tax fee	0	0	0
Other service fee	0	0	0
Total	63	53	46

All fees included in the table were approved by the board's audit committee.

Audit fee is defined as the fee for standard audit work that must be performed every year in order to issue an opinion on Statoil's Consolidated financial statements, on Statoil's internal control over annual reporting and to issue reports on the statutory financial statements. It also includes other audit services, which are services that only the independent auditor can reasonably provide, such as the auditing of non-recurring transactions and the application of new accounting policies, audits of significant and newly implemented system controls and limited reviews of quarterly financial results.

Audit-related fees include other assurance and related services provided by auditors, but not limited to those that can only reasonably be provided by the external auditor who signs the audit report, that are reasonably related to the performance of the audit or review of the company's financial statements, such as acquisition due diligence, audits of pension and benefit plans, consultations concerning financial accounting and reporting standards.

Other services fees include services provided by the auditors within the framework of the Sarbanes-Oxley Act, i.e. certain agreed procedures.

Of total increase in audit and audit related fees, NOK 3.2 million is due to currency effects, equivalent to 5%.

In addition to the figures in the table above, the audit fees and audit-related fees relating to Statoil operated licences paid to KPMG for the years 2015, 2014 and 2013 amounted to NOK 7 million, NOK 6 million and NOK 6 million, respectively.

7.12 Controls and procedures

This section describes controls and procedures relating to our financial reporting.

Evaluation of disclosure controls and procedures

The management, with the participation of our chief executive officer and chief financial officer, has evaluated the effectiveness of the design and operation of our disclosure controls and procedures pursuant to Exchange Act Rule 13a-15(b) as of the end of the period covered by the Form 20-F. Based on that evaluation, the chief executive officer and chief financial officer have concluded that these disclosure controls and procedures are effective at a reasonable level of assurance.

In order to facilitate the evaluation, the disclosure committee reviews material disclosures made by Statoil for any errors, misstatements and omissions. The disclosure committee is chaired by the chief financial officer. It consists of the heads of investor relations, accounting and financial compliance, performance management and risk, tax and the general counsel and it may be supplemented by other internal and external personnel. The head of the internal audit is an observer at the committee's meetings.

In designing and evaluating our disclosure controls and procedures, our management, with the participation of the chief executive officer and chief financial officer, recognised that any controls and procedures, no matter how well designed and operated, can only provide reasonable assurance that the desired control objectives will be achieved, and that the management must necessarily exercise judgment when evaluating the cost-benefit aspects of possible controls and procedures. Because of the limitations inherent in all control systems, no evaluation of controls can provide absolute assurance that all control issues and any instances of fraud in the company have been detected.

The management's report on internal control over financial reporting

The management of Statoil ASA is responsible for establishing and maintaining adequate internal control over financial reporting. Our internal control over financial reporting is a process designed, under the supervision of the chief executive officer and chief financial officer, to provide reasonable assurance regarding the reliability of financial reporting and the preparation of Statoil's financial statements for external reporting purposes in accordance with International Financial Reporting Standards (IFRS) as adopted by the European Union (EU). The accounting policies applied by the group also comply with IFRS as issued by the International Accounting Standards Board (IASB).

The management has assessed the effectiveness of internal control over financial reporting based on the Internal Control - Integrated Framework (2013) issued by the Committee of Sponsoring Organizations of the Treadway Commission (COSO). Based on this assessment, the management has concluded that Statoil's internal control over financial reporting as of 31 December 2015 was effective.

Statoil's internal control over financial reporting includes policies and procedures that pertain to the maintenance of records that, in reasonable detail, accurately and fairly reflect transactions and dispositions of assets, provide reasonable assurance that transactions are recorded in the manner necessary to permit the preparation of financial statements in accordance with IFRS, and that receipts and expenditures are only carried out in accordance with the authorisation of the management and directors of Statoil; and provide reasonable assurance regarding the prevention or timely detection of any unauthorised acquisition, use or disposition of Statoil's assets that could have a material effect on our financial statements.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect all misstatements. Moreover, projections of any evaluation of the effectiveness of internal control to future periods are subject to a risk that controls may become inadequate because of changes in conditions and that the degree of compliance with the policies or procedures may deteriorate.

The effectiveness of internal control over financial reporting as of 31 December 2015 has been audited by KPMG AS, an independent registered public accounting firm that also audits the Consolidated financial statements included in this annual report. Their audit report on the internal control over financial reporting is included in section 8 in the Consolidated financial statements in this report.

No changes occurred in our internal control over financial reporting during the period covered by Form 20-F that have materially affected, or are reasonably likely to materially affect, our internal control over financial reporting.

We continuously make improvement to our internal control environment.

Interest paid		**(3.6)**	(3.4)	(2.5)
Cash flows provided by operating activities before taxes paid and working capital items		**165.8**	208.8	218.8
Taxes paid		**(65.7)**	(96.6)	(114.2)
(Increase) decrease in working capital		**8.9**	14.2	(3.3)
Cash flows provided by operating activities		**109.0**	126.5	101.3
Additions through business combinations	4	**(3.5)**	0.0	0.0
Capital expenditures and investments		**(124.7)**	(122.6)	(114.9)
(Increase) decrease in financial investments		**(19.8)**	(12.7)	(23.2)
(Increase) decrease in other non-current items		**(0.3)**	0.8	0.6
Proceeds from sale of assets and businesses	4	**33.2**	22.6	27.1
Cash flows used in investing activities		**(115.1)**	(112.0)	(110.4)
New finance debt	18	**32.2**	20.6	62.8
Repayment of finance debt		**(11.4)**	(9.7)	(7.3)
Dividend paid	17	**(22.9)**	(33.7)	(21.5)
Net current finance debt and other		**(5.5)**	(0.3)	(7.3)
Cash flows provided by (used in) financing activities		**(7.5)**	(23.1)	26.6
Net increase (decrease) in cash and cash equivalents		**(13.6)**	(8.6)	17.5
Effect of exchange rate changes on cash and cash equivalents		**7.1**	5.7	2.9
Cash and cash equivalents at the beginning of the period (net of overdraft)	16	**82.4**	85.3	64.9
Cash and cash equivalents at the end of the period (net of overdraft)	16	**75.9**	82.4	85.3

Cash and cash equivalents included a bank overdraft of NOK 0.1 billion at 31 December 2015, a bank overdraft of NOK 0.7 billion at 31 December 2014 and a bank overdraft that was rounded to zero at 31 December 2013.

Interest paid in cash flows provided by operating activities is excluding capitalised interest of NOK 3.2 billion at 31 December 2015, NOK 1.6 billion at 31 December 2014 and NOK 1.1 billion at 31 December 2013. Capitalised interest is included in *Capital expenditures and investments* in cash flows used in investing activities.

8.1 Notes to the Consolidated financial statements

1 Organisation

Statoil ASA, originally Den Norske Stats Oljeselskap AS, was founded in 1972 and is incorporated and domiciled in Norway. The address of its registered office is Forusbeen 50, N-4035 Stavanger, Norway.

Statoil ASA is listed on the Oslo Børs (Norway) and the New York Stock Exchange (USA).

The Statoil group's business consists principally of the exploration, production, transportation, refining and marketing of petroleum and petroleum-derived products and other forms of energy.

All the Statoil group's oil and gas activities and net assets on the Norwegian continental shelf are owned by Statoil Petroleum AS, a 100% owned operating subsidiary. Statoil Petroleum AS is co-obligor or guarantor of certain debt obligations of Statoil ASA.

The Consolidated financial statements of Statoil for the full year 2015 were authorised for issue in accordance with a resolution of the board of directors on 9 March 2016.

2 Significant accounting policies

Statement of compliance
The Consolidated financial statements of Statoil ASA and its subsidiaries (Statoil) have been prepared in accordance with International Financial Reporting Standards (IFRSs) as adopted by the European Union (EU) and also comply with IFRSs as issued by the International Accounting Standards Board (IASB), effective at 31 December 2015.

Basis of preparation
The financial statements are prepared on the historical cost basis with some exceptions, as detailed in the accounting policies set out below. These policies have been applied consistently to all periods presented in these Consolidated financial statements. Certain amounts in the comparable years have been restated to conform to current year presentation. The subtotals and totals in some of the tables may not equal the sum of the amounts shown due to rounding.

Operating related expenses in the Consolidated statement of income are presented as a combination of function and nature in conformity with industry practice. *Purchases [net of inventory variation]* and *Depreciation, amortisation and net impairment losses* are presented in separate lines by their nature, while *Operating expenses* and *Selling, general and administrative expenses* as well as *Exploration expenses* are presented on a functional basis. Significant expenses such as salaries, pensions, etc. are presented by their nature in the notes to the Consolidated financial statements.

Standards and amendments to standards, issued but not yet adopted
At the date of these Consolidated financial statements, the following standards and amendments to standards applicable to Statoil have been issued, but were not yet effective:

- IFRS 15 *Revenue from Contracts with Customers*, issued in May 2014 and, following an amendment to the standard issued in September 2015, effective from 1 January 2018, covers the recognition of such revenue in the financial statements and related disclosure and will replace IAS 18 *Revenue*. The standard requires identification of the performance obligations for the transfer of goods and services in each contract with customers. Revenue will be recognised upon satisfaction of the performance obligations in the amounts that reflect the consideration to which the company expects to be entitled in exchange for those goods and services. The standard requires adoption either on a retrospective basis or on the basis of the cumulative effect on retained earnings. Statoil is still in the process of evaluating the potential impact of IFRS 15, and has not yet determined its adoption date or its implementation method for the standard

- The amendment to IFRS 11 *Accounting for Acquisitions of Interests in Joint Operations*, issued in May 2014 and effective from 1 January 2016, establishes requirements for the accounting for acquisitions of interests in joint operations in which the activity constitutes a business. The amendment is to be applied prospectively. Statoil has adopted the amendment on the effective date

- IFRS 9 *Financial Instruments*, issued in its final form in July 2014 and effective from 1 January 2018, will replace IAS *39 Financial Instruments: Recognition and Measurement*. IFRS 9 introduces a new model for classification and measurement of financial assets and financial liabilities, a reformed approach to hedge accounting, and a more forward-looking impairment model. The standard's transition provisions partly require retrospective adoption, and partly prospective adoption. Statoil is in the process of evaluating the potential impact of IFRS 9, and has not yet determined its adoption date for the standard

- The amendments to IFRS 10 *Consolidated Financial Statements* and IAS 28 *Investments in Associates and Joint Ventures*, issued in September 2014 and, following an amendment issued in December 2015, effective from a future date to be determined by the IASB, establish requirements for the accounting for sales or contributions of assets between an investor and its associate or joint venture. Whether or not the assets are housed in a subsidiary, a full gain or loss will be recognised in the statement of income when the transaction involves assets that constitute a business, whereas a partial gain or loss will be recognised when the transaction involves assets that do not constitute a business. The amendments are to be applied prospectively. Statoil has not determined an adoption date for the amendments

- IFRS 16 *Leases*, issued in January 2016 and effective from 1 January 2019, covers the recognition of leases and related disclosure in the financial statements, and will replace IAS 17 *Leases*. In the financial statement of lessees, the new standard requires recognition of all contracts that qualify under its definition of a lease as right-of-use assets and lease liabilities in the balance sheet, while lease payments are to be reflected as interest expense and reduction of lease liabilities. The right-of-use assets are to be depreciated in accordance with IAS 16 *Property, Plant and Equipment* over the shorter of each contract's term and the assets' useful life. The standard consequently implies a significant change in lessees' accounting for leases currently defined as operating leases under IAS 17, both as regards impact on the balance sheet and the statement of income. IFRS 16 defines a lease as a contract that conveys the right to control the use of an identified asset for a period of time in exchange for consideration. While this definition is not dissimilar to that of IAS 17, it would have required further evaluation of each contract to determine whether all leases included in Note 22 *Leases* of these financial statements, or contracts currently not defined as leases, would qualify as leases under the new standard. The standard introduces new requirements both as regards establishing the term of a lease and the related discounted cash flows that determine the amount of a lease liability to be recognised. The standard requires adoption either on a full retrospective basis, or retrospectively with the cumulative effect of initially recognising the standard as an adjustment to retained earnings at the date of initial application, and if so with a number of practical expedients in transitioning existing leases at the time of initial application. Statoil is in the early phase of evaluating the impact of IFRS 16, and has not yet determined its adoption date, its implementation method, or the expected impact of the standard on the Consolidated financial statements

- The disclosure initiative amendments to *IAS 7 Statement of Cash Flows,* issued in January 2016 and effective from 1 January 2017, establishes certain additional requirements as to disclosure of changes in financing liabilities. Statoil will implement the amendments on the effective date

Other standards and amendments to standards, issued but not yet effective, are either not expected to impact Statoil's Consolidated financial statements materially, or are not expected to be relevant to Statoil's Consolidated financial statements upon adoption.

Basis of consolidation

The Consolidated financial statements include the accounts of Statoil ASA and its subsidiaries and include Statoil's interest in jointly controlled and equity accounted investments.

Subsidiaries

Entities are determined to be controlled by Statoil, and consolidated in Statoil's financial statements, when Statoil has power over the entity, ability to use that power to affect the entity's returns, and exposure to, or rights to, variable returns from its involvement with the entity.

All intercompany balances and transactions, including unrealised profits and losses arising from Statoil's internal transactions, have been eliminated in full. Non-controlling interests are presented separately within equity in the balance sheet.

Joint operations and similar arrangements, joint ventures and associates

A joint arrangement is present where Statoil holds a long-term interest which is jointly controlled by Statoil and one or more other venturers under a contractual arrangement in which decisions about the relevant activities require the unanimous consent of the parties sharing control. Such joint arrangements are classified as either joint operations or joint ventures.

The parties to a joint operation have rights to the assets and obligations for the liabilities, relating to their respective share of the joint arrangement. In determining whether the terms of contractual arrangements and other facts and circumstances lead to a classification as joint operations, Statoil in particular considers the nature of products and markets of the arrangement and whether the substance of their agreements is that the parties involved have rights to substantially all the arrangement's assets. Statoil accounts for the assets, liabilities, revenues and expenses relating to its interests in joint operations in accordance with the principles applicable to those particular assets, liabilities, revenues and expenses. Normally this leads to accounting for the joint operation in a manner similar to the previous proportionate consolidation method.

Those of Statoil's exploration and production licence activities that are within the scope of IFRS 11 *Joint Arrangements* have been classified as joint operations. A considerable number of Statoil's unincorporated joint exploration and production activities are conducted through arrangements that are not jointly controlled, either because unanimous consent is not required among all parties involved, or no single group of parties has joint control over the activity. Licence activities where control can be achieved through agreement between more than one combination of involved parties are considered to be outside the scope of IFRS 11, and these activities are accounted for on a pro-rata basis using Statoil's ownership share. In determining whether each separate arrangement related to Statoil's unincorporated joint exploration and production licence activities is within or outside the scope of IFRS 11, Statoil considers the terms of relevant licence agreements, governmental concessions and other legal arrangements impacting how and by whom each arrangement is controlled. Subsequent changes in the ownership shares and number of licence participants, transactions involving licence shares, or changes in the terms of relevant agreements may lead to changes in Statoil's evaluation of control and impact a licence arrangement's classification in relation to IFRS 11 in Statoil's Consolidated financial statements. Currently there are no significant differences in Statoil's accounting for unincorporated licence arrangements whether in scope of IFRS 11 or not.

Joint ventures, in which Statoil has rights to the net assets, are accounted for using the equity method.

Investments in companies in which Statoil has neither control nor joint control, but has the ability to exercise significant influence over operating and financial policies, are classified as associates and are accounted for using the equity method.

Statoil as operator of joint operations and similar arrangements

Indirect operating expenses such as personnel expenses are accumulated in cost pools. These costs are allocated on an hours incurred basis to operating segments and Statoil operated joint operations under IFRS 11 and to similar arrangements (licences) outside the scope of IFRS 11. Costs allocated to the other partners' share of operated joint operations and similar arrangements reduce the costs in the Consolidated statement of income. Only Statoil's share of the statement of income and balance sheet items related to Statoil operated joint operations and similar arrangements are reflected in the Consolidated statement of income and the Consolidated balance sheet.

Reportable segments

Statoil identifies its operating segments on the basis of those components of Statoil that are regularly reviewed by the chief operating decision maker, Statoil's corporate executive committee (CEC). Statoil combines operating segments when these satisfy relevant aggregation criteria.

Statoil's accounting policies as described in this note also apply to the specific financial information included in reportable segments related disclosure in these Consolidated financial statements.

Foreign currency translation

In preparing the financial statements of the individual entities, transactions in foreign currencies (those other than functional currency) are translated at the foreign exchange rate at the dates of the transactions. Monetary assets and liabilities denominated in foreign currencies are translated to the functional currency at the foreign exchange rate at the balance sheet date. Foreign exchange differences arising on translation are recognised in the Consolidated statement of income as foreign exchange gains or losses within *Net financial items*. Foreign exchange differences arising from the translation of estimate-based provisions, however, generally are accounted for as part of the change in the underlying estimate and as such may be included within the relevant operating expense or income tax sections of the Consolidated statement of income depending on the nature of the provision. Non-monetary assets that are measured at historical cost in a foreign currency are translated using the exchange rate at the date of the transactions.

Presentation currency

For the purpose of the Consolidated financial statements, the statement of income, the balance sheet and the cash flows of each entity are translated from the functional currency into the presentation currency, Norwegian kroner (NOK). The assets and liabilities of entities whose functional currencies are other than NOK, including Statoil's parent company Statoil ASA whose functional currency is United States dollar (USD), are translated into NOK at the foreign exchange rate at the balance sheet date. The revenues and expenses of such entities are translated using the foreign exchange rates on the dates of the transactions. Foreign exchange differences arising on translation from functional currency to presentation currency are recognised separately in Other comprehensive income (OCI). The cumulative amount of such translation differences relating to an entity and previously recognised in OCI, is reclassified to the Consolidated statement of income and reflected as a part of the gain or loss on disposal of that entity.

Business combinations

Determining whether an acquisition meets the definition of a business combination requires judgement to be applied on a case by case basis. Acquisitions are assessed under the relevant IFRS criteria to establish whether the transaction represents a business combination or an asset purchase. Depending on the specific facts, acquisitions of exploration and evaluation licences for which a development decision has not yet been made, have largely been concluded to represent asset purchases.

Business combinations, except for transactions between entities under common control, are accounted for using the acquisition method of accounting. The acquired identifiable tangible and intangible assets, liabilities and contingent liabilities are measured at their fair values at the date of the acquisition. Acquisition costs incurred are expensed under *Selling, general and administrative expenses*.

Revenue recognition

Revenues associated with sale and transportation of crude oil, natural gas, petroleum products and other merchandise are recognised when risk passes to the customer, which is normally when title passes at the point of delivery of the goods, based on the contractual terms of the agreements.

Revenues from the production of oil and gas properties in which Statoil shares an interest with other companies are recognised on the basis of volumes lifted and sold to customers during the period (the sales method). Where Statoil has lifted and sold more than the ownership interest, an accrual is recognised for the cost of the overlift. Where Statoil has lifted and sold less than the ownership interest, costs are deferred for the underlift.

Revenue is presented net of customs, excise taxes and royalties paid in-kind on petroleum products. Revenue is presented gross of in-kind payments of amounts representing income tax.

Sales and purchases of physical commodities, which are not settled net, are presented on a gross basis as *Revenues* and *Purchases [net of inventory variation]* in the statement of income. Activities related to trading and commodity-based derivative instruments are reported on a net basis, with the margin included in *Revenues*.

Transactions with the Norwegian State

Statoil markets and sells the Norwegian State's share of oil and gas production from the Norwegian continental shelf (NCS). The Norwegian State's participation in petroleum activities is organised through the State's direct financial interest (SDFI). All purchases and sales of the SDFI's oil production are classified as *Purchases [net of inventory variation]* and *Revenues*, respectively. Statoil sells, in its own name, but for the Norwegian State's account and risk, the State's production of natural gas. These sales and related expenditures refunded by the Norwegian State are presented net in the Consolidated financial statements.

Employee benefits
Wages, salaries, bonuses, social security contributions, paid annual leave and sick leave are accrued in the period in which the associated services are rendered by employees of Statoil.

Research and development
Statoil undertakes research and development both on a funded basis for licence holders and on an unfunded basis for projects at its own risk. Statoil's own share of the licence holders' funding and the total costs of the unfunded projects are considered for capitalisation under the applicable IFRS requirements. Subsequent to initial recognition, any capitalised development costs are reported at cost less accumulated amortisation and accumulated impairment losses.

Income tax
Income tax in the Consolidated statement of income comprises current and deferred tax expense. *Income tax* is recognised in the Consolidated statement of income except when it relates to items recognised in OCI.

Current tax consists of the expected tax payable on the taxable income for the year and any adjustment to tax payable for previous years. Uncertain tax positions and potential tax exposures are analysed individually, and the best estimate of the probable amount for liabilities to be paid (unpaid potential tax exposure amounts, including penalties) and for assets to be received (disputed tax positions for which payment has already been made) in each case is recognised within current tax or deferred tax as appropriate. Interest income and interest expenses relating to tax issues are estimated and recognised in the period in which they are earned or incurred, and are presented within *Net financial items* in the Consolidated statement of income. Uplift benefit on the NCS is recognised when the deduction is included in the current year tax return and impacts taxes payable.

Deferred tax assets and liabilities are recognised for the future tax consequences attributable to differences between the carrying amounts of existing assets and liabilities and their respective tax bases, subject to the initial recognition exemption. The amount of deferred tax is based on the expected manner of realisation or settlement of the carrying amount of assets and liabilities, using tax rates enacted or substantively enacted at the balance sheet date. A deferred tax asset is recognised only to the extent that it is probable that future taxable income will be available against which the asset can be utilised. In order for a deferred tax asset to be recognised based on future taxable income, convincing evidence is required, taking into account the existence of contracts, production of oil or gas in the near future based on volumes of proved reserves, observable prices in active markets, expected volatility of trading profits, expected currency rate movements and similar facts and circumstances.

Oil and gas exploration, evaluation and development expenditures
Statoil uses the successful efforts method of accounting for oil and gas exploration costs. Expenditures to acquire mineral interests in oil and gas properties and to drill and equip exploratory wells are capitalised as exploration and evaluation expenditures within *Intangible assets* until the well is complete and the results have been evaluated, or there is any other indicator of a potential impairment. Exploration wells that discover potentially economic quantities of oil and natural gas remain capitalised as intangible assets during the evaluation phase of the find. This evaluation is normally finalised within one year after well completion. If, following the evaluation, the exploratory well has not found potentially commercial quantities of hydrocarbons, the previously capitalised costs are evaluated for derecognition or tested for impairment. Geological and geophysical costs and other exploration and evaluation expenditures are expensed as incurred.

Capitalised exploration and evaluation expenditures, including expenditures to acquire mineral interests in oil and gas properties, related to offshore wells that find proved reserves are transferred from exploration expenditures and acquisition costs - oil and gas prospects (*Intangible assets*) to *Property, plant and equipment* at the time of sanctioning of the development project. For onshore wells where no sanction is required, the transfer of acquisition cost - oil and gas prospects (*Intangible assets*) to *Property, plant and equipment* occurs at the time when a well is ready for production.

For exploration and evaluation asset acquisitions (farm-in arrangements) in which Statoil has made arrangements to fund a portion of the selling partner's (farmor's) exploration and/or future development expenditures (carried interests), these expenditures are reflected in the Consolidated financial statements as and when the exploration and development work progresses. Statoil reflects exploration and evaluation asset dispositions (farm-out arrangements) on a historical cost basis with no gain or loss recognition.

A gain or loss related to a post-tax based disposition of assets on the NCS includes the release of tax liabilities previously computed and recognised related to the assets in question. The resulting gross gain or loss is recognised in full in *Other income* in the Consolidated statement of income.

Consideration from the sale of an undeveloped part of an onshore asset reduces the carrying amount of the asset. The part of the consideration that exceeds the carrying amount of the asset, if any, is reflected in the Consolidated statement of income under *Other income*.

Exchanges (swaps) of exploration and evaluation assets are accounted for at the carrying amounts of the assets given up with no gain or loss recognition.

Property, plant and equipment
Property, plant and equipment is reflected at cost, less accumulated depreciation and accumulated impairment losses. The initial cost of an asset comprises its purchase price or construction cost, any costs directly attributable to bringing the asset into operation, the initial estimate of an asset retirement obligation, if any, exploration costs transferred from intangible assets and, for qualifying assets, borrowing costs. Property, plant and equipment include costs relating to expenditures incurred under the terms of profit sharing agreements (PSAs) in certain countries, and which qualify for recognition as assets of Statoil. State-owned entities in the respective countries, however, normally hold the legal title to such PSA-based property, plant and equipment.

Exchanges of assets are measured at the fair value of the asset given up, unless the fair value of neither the asset received nor the asset given up is measurable with sufficient reliability.

Expenditure on major maintenance refits or repairs comprises the cost of replacement assets or parts of assets, inspection costs and overhaul costs. Where an asset or part of an asset is replaced and it is probable that future economic benefits associated with the item will flow to Statoil, the expenditure is capitalised. Inspection and overhaul costs, associated with regularly scheduled major maintenance programs planned and carried out at recurring intervals exceeding one year, are capitalised and amortised over the period to the next scheduled inspection and overhaul. All other maintenance costs are expensed as incurred.

Capitalised exploration and evaluation expenditures, development expenditure on the construction, installation or completion of infrastructure facilities such as platforms, pipelines and the drilling of production wells, and field-dedicated transport systems for oil and gas are capitalised as producing oil and gas properties within *Property, plant and equipment.* Such capitalised costs, when designed for significantly larger volumes than the reserves from already developed and producing wells, are depreciated using the unit of production method based on proved reserves expected to be recovered from the area during the concession or contract period. Depreciation of production wells uses the unit of production method based on proved developed reserves, and capitalised acquisition costs of proved properties are depreciated using the unit of production method based on total proved reserves. In the rare circumstances where the use of proved reserves fails to provide an appropriate measure of depreciation, a more appropriate reserve estimate is used. Depreciation of other assets and transport systems used by several fields is calculated on the basis of their estimated useful lives, normally using the straight-line method. Each part of an item of property, plant and equipment with a cost that is significant in relation to the total cost of the item is depreciated separately. For exploration and production assets, Statoil has established separate depreciation categories which as a minimum distinguish between platforms, pipelines and wells.

The estimated useful lives of property, plant and equipment are reviewed on an annual basis, and changes in useful lives are accounted for prospectively. An item of property, plant and equipment is derecognised upon disposal or when no future economic benefits are expected to arise from the continued use of the asset. Any gain or loss arising on derecognition of the asset (calculated as the difference between the net disposal proceeds and the carrying amount of the item) is included in *Other income* or *Operating expenses*, respectively, in the period the item is derecognised.

Leases

Leases for which Statoil assumes substantially all the risks and rewards of ownership are reflected as finance leases. When an asset leased by a joint operation or similar arrangement to which Statoil is a party qualifies as a finance lease, Statoil reflects its proportionate share of the leased asset and related obligations. Finance leases are classified in the Consolidated balance sheet within *Property, plant and equipment* and *Finance debt*. All other leases are classified as operating leases, and the costs are charged to the relevant operating expense related caption on a straight line basis over the lease term, unless another basis is more representative of the benefits of the lease to Statoil.

Statoil distinguishes between lease and capacity contracts. Lease contracts provide the right to use a specific asset for a period of time, while capacity contracts confer on Statoil the right to and the obligation to pay for certain volume capacity availability related to transport, terminal use, storage, etc. Such capacity contracts that do not involve specified assets or that do not involve substantially all the capacity of an undivided interest in a specific asset are not considered by Statoil to qualify as leases for accounting purposes. Capacity payments are reflected as *Operating expenses* in the Consolidated statement of income in the period for which the capacity contractually is available to Statoil.

Intangible assets including goodwill

Intangible assets are stated at cost, less accumulated amortisation and accumulated impairment losses. Intangible assets include acquisition cost for oil and gas prospects, expenditures on the exploration for and evaluation of oil and natural gas resources, goodwill and other intangible assets.

Intangible assets relating to expenditures on the exploration for and evaluation of oil and natural gas resources are not amortised. When the decision to develop a particular area is made, its intangible exploration and evaluation assets are reclassified to *Property, plant and equipment*.

Goodwill is initially measured at the excess of the aggregate of the consideration transferred and the amount recognised for any non-controlling interest over the fair value of the identifiable assets acquired and liabilities assumed in a business combination at the acquisition date. Goodwill acquired is allocated to each cash generating unit, or group of units, expected to benefit from the combination's synergies. Following initial recognition, goodwill is measured at cost less any accumulated impairment losses.

Financial assets

Financial assets are initially recognised at fair value when Statoil becomes a party to the contractual provisions of the asset. For additional information on fair value methods, refer to the Measurement of fair values section below. The subsequent measurement of the financial assets depends on which category they have been classified into at inception.

At initial recognition, Statoil classifies its financial assets into the following three main categories: Financial investments at fair value through profit or loss, loans and receivables, and available-for-sale (AFS) financial assets. The first main category, financial investments at fair value through profit or loss, further consists of two sub-categories: Financial assets held for trading and financial assets that on initial recognition are designated as fair value through profit and loss. The latter approach may also be referred to as the fair value option.

Cash and cash equivalents include cash in hand, current balances with banks and similar institutions, and short-term highly liquid investments that are readily convertible to known amounts of cash, are subject to an insignificant risk of changes in fair value and have a maturity of three months or less from the acquisition date.

Trade receivables are carried at the original invoice amount less a provision for doubtful receivables which is made when there is objective evidence that Statoil will be unable to recover the balances in full.

A significant part of Statoil's investments in treasury bills, commercial papers, bonds and listed equity securities is managed together as an investment portfolio of Statoil's captive insurance company and is held in order to comply with specific regulations for capital retention. The investment portfolio is managed and evaluated on a fair value basis in accordance with an investment strategy and is accounted for using the fair value option with changes in fair value recognised through profit or loss.

Financial assets are presented as current if they contractually will expire or otherwise are expected to be recovered within 12 months after the balance sheet date, or if they are held for the purpose of being traded. Financial assets and financial liabilities are shown separately in the Consolidated balance sheet, unless Statoil has both a legal right and a demonstrable intention to net settle certain balances payable to and receivable from the same counterparty, in which case they are shown net in the balance sheet.

Inventories

Inventories are stated at the lower of cost and net realisable value. Cost is determined by the first-in first-out method and comprises direct purchase costs, cost of production, transportation and manufacturing expenses.

Impairment

Impairment of property, plant and equipment and intangible assets other than goodwill

Statoil assesses individual assets or groups of assets for impairment whenever events or changes in circumstances indicate that the carrying value of an asset may not be recoverable. Assets are grouped into cash generating units (CGUs) which are the smallest identifiable groups of assets that generate cash inflows that are largely independent of the cash inflows from other groups of assets. Normally, separate CGUs are individual oil and gas fields or plants. Each unconventional asset play is considered a single CGU when no cash inflows from parts of the play can be reliably identified as being largely independent of the cash inflows from other parts of the play. In impairment evaluations, the carrying amounts of CGUs are determined on a basis consistent with that of the recoverable amount. In Statoil's line of business, judgement is involved in determining what constitutes a CGU. Development in production, infrastructure solutions, markets, product pricing, management actions and other factors may over time lead to changes in CGUs such as the division of one original CGU into several.

In assessing whether a write-down of the carrying amount of a potentially impaired asset is required, the asset's carrying amount is compared to the recoverable amount. The recoverable amount of an asset is the higher of its fair value less cost of disposal and its value in use. Fair value less cost of disposal is determined based on comparable recent arm's length market transactions, or based on Statoil's estimate of the price that would be received for the asset in an orderly transaction between market participants. Value in use is determined using a discounted cash flow model. The estimated future cash flows applied are based on reasonable and supportable assumptions and represent management's best estimates of the range of economic conditions that will exist over the remaining useful life of the assets, as set down in Statoil's most recently approved long-term forecasts. Statoil uses an approach of regular updates of assumptions and economic conditions in establishing the long-term forecasts which are reviewed by corporate management and updated at least annually. For assets and CGUs with an expected useful life or timeline for production of expected reserves extending beyond 5 years, the forecasts reflect expected production volumes for oil and natural gas, and the related cash flows include project or asset specific estimates reflecting the relevant period. Such estimates are established on the basis of Statoil's principles and assumptions consistently applied.

In performing a value-in-use-based impairment test, the estimated future cash flows are adjusted for risks specific to the asset and discounted using a real post-tax discount rate which is based on Statoil's post-tax weighted average cost of capital (WACC). The use of post-tax discount rates in determining value in use does not result in a materially different determination of the need for, or the amount of, impairment that would be required if pre-tax discount rates had been used.

Unproved oil and gas properties are assessed for impairment when facts and circumstances suggest that the carrying amount of the asset may exceed its recoverable amount, and at least once a year. Exploratory wells that have found reserves, but where classification of those reserves as proved depends on whether major capital expenditure can be justified or where the economic viability of that major capital expenditure depends on the successful completion of further exploration work, will remain capitalised during the evaluation phase for the exploratory finds. Thereafter it will be considered a trigger for impairment evaluation of the well if no development decision is planned for the near future and there are no concrete plans for future drilling in the licence.

An assessment is made at each reporting date as to whether there is any indication that previously recognised impairment losses may no longer be relevant or may have decreased. If such an indication exists, the recoverable amount is estimated. A previously recognised impairment loss is reversed only if there has been a change in the estimates used to determine the asset's recoverable amount since the last impairment loss was recognised. If that is the case, the carrying amount of the asset is increased to its recoverable amount. That increased amount cannot exceed the carrying amount that would have been determined, net of depreciation, had no impairment loss been recognised for the asset in prior years.

Impairment losses and reversals of impairment losses are presented in the Consolidated statement of income as *Exploration expenses* or *Depreciation, amortisation and net impairment losses*, on the basis of their nature as either exploration assets (intangible exploration assets) or development and producing assets (property, plant and equipment and other intangible assets), respectively.

Impairment of goodwill

Goodwill is reviewed for impairment annually or more frequently if events or changes in circumstances indicate that the carrying value may be impaired. Impairment is determined by assessing the recoverable amount of the CGU, or group of units, to which the goodwill relates. Where the recoverable amount of the CGU, or group of units, is less than the carrying amount, an impairment loss is recognised. Once recognised, impairments of goodwill are not reversed in future periods.

Financial liabilities

Financial liabilities are initially recognised at fair value when Statoil becomes a party to the contractual provisions of the liability. The subsequent measurement of financial liabilities depends on which category they have been classified into. The categories applicable for Statoil are either financial liabilities at fair value through profit or loss or financial liabilities measured at amortised cost using the effective interest method. The latter applies to Statoil's non-current bank loans and bonds.

Financial liabilities are presented as current if the liability is due to be settled within 12 months after the balance sheet date, or if they are held for the purpose of being traded. Financial liabilities are derecognised when the contractual obligations expire, are discharged or cancelled. Gains and losses arising on the repurchase, settlement or cancellation of liabilities are recognised either in interest income and other financial items or in interest and other finance expenses within *Net financial items*.

Derivative financial instruments

Statoil uses derivative financial instruments to manage certain exposures to fluctuations in foreign currency exchange rates, interest rates and commodity prices. Such derivative financial instruments are initially recognised at fair value on the date on which a derivative contract is entered into and are subsequently re-measured at fair value through profit and loss. The impact of commodity-based derivative financial instruments is recognised in the Consolidated statement of income under *Revenues*, as such derivative instruments are related to sales contracts or revenue-related risk management for all significant purposes. The impact of other financial instruments is reflected under *Net financial items*.

Derivatives are carried as assets when the fair value is positive and as liabilities when the fair value is negative. Derivative assets or liabilities expected to be recovered, or with the legal right to be settled more than 12 months after the balance sheet date are classified as non-current, with the exception of derivative financial instruments held for the purpose of being traded.

Contracts to buy or sell a non-financial item that can be settled net in cash or another financial instrument, or by exchanging financial instruments, as if the contracts were financial instruments, are accounted for as financial instruments. However, contracts that are entered into and continue to be held for the purpose of the receipt or delivery of a non-financial item in accordance with Statoil's expected purchase, sale or usage requirements, also referred to as own-use, are not accounted for as financial instruments. This is applicable to a significant number of contracts for the purchase or sale of crude oil and natural gas, which are recognised upon delivery.

Derivatives embedded in other financial instruments or in non-financial host contracts are recognised as separate derivatives and are reflected at fair value with subsequent changes through profit and loss, when their risks and economic characteristics are not closely related to those of the host contracts, and the host contracts are not carried at fair value. Where there is an active market for a commodity or other non-financial item referenced in a purchase or sale contract, a pricing formula will, for instance, be considered to be closely related to the host purchase or sales contract if the price formula is based on the active market in question. A price formula with indexation to other markets or products will however result in the recognition of a separate derivative. Where there is no active market for the commodity or other non-financial item in question, Statoil assesses the characteristics of such a price related embedded derivative to be closely related to the host contract if the price formula is based on relevant indexations commonly used by other market participants. This applies to a number of Statoil's long-term natural gas sales agreements.

Pension liabilities

Statoil has pension plans for employees that either provide a defined pension benefit upon retirement or a pension dependent on defined contributions and related returns. A portion of the contributions are provided for as notional contributions, for which the liability increases with a promised notional return, set equal to the actual return of assets invested through the ordinary defined contribution plan. For defined benefit plans, the benefit to be received by employees generally depends on many factors including length of service, retirement date and future salary levels.

Statoil's proportionate share of multi-employer defined benefit plans are recognised as liabilities in the balance sheet to the extent that sufficient information is available and a reliable estimate of the obligation can be made.

Statoil's net obligation in respect of defined benefit pension plans is calculated separately for each plan by estimating the amount of future benefit that employees have earned in return for their services in the current and prior periods. That benefit is discounted to determine its present value, and the fair value of any plan assets is deducted. The discount rate is the yield at the balance sheet date, reflecting the maturity dates approximating the terms of Statoil's obligations. The discount rate for the main part of the pension obligations has been established on the basis of Norwegian mortgage covered bonds, which are considered high quality corporate bonds. The cost of pension benefit plans is expensed over the period that the employees render services and become eligible to receive benefits. The calculation is performed by an external actuary.

The net interest related to defined benefit plans is calculated by applying the discount rate to the opening present value of the benefit obligation and opening present value of the plan assets, adjusted for material changes during the year. The resulting net interest element is presented in the statement of income as part of net pension cost within *Net operating income*. The difference between estimated interest income and actual return is recognised in the Consolidated statement of comprehensive income.

Past service cost is recognised when a plan amendment (the introduction or withdrawal of, or changes to, a defined benefit plan) or curtailment (a significant reduction by the entity in the number of employees covered by a plan) occurs, or when recognising related restructuring costs or termination benefits. The obligation and related plan assets are re-measured using current actuarial assumptions, and the gain or loss is recognised in the statement of income.

Actuarial gains and losses are recognised in full in the Consolidated statement of comprehensive income in the period in which they occur, while actuarial gains and losses related to provision for termination benefits are recognised in the Consolidated statement of income in the period in which they occur. Due to the parent company Statoil ASA's functional currency being USD, the significant part of Statoil's pension obligations will be payable in a foreign currency (i.e. NOK). As a consequence, actuarial gains and losses related to the parent company's pension obligation include the impact of exchange rate fluctuations.

Contributions to defined contribution schemes are recognised in the statement of income in the period in which the contribution amounts are earned by the employees.

Notional contribution plans, reported in the parent company Statoil ASA, are recognised as pension liabilities with the actual value of the notional contributions and promised return at reporting date. Notional contributions and changes in fair value of notional assets are recognised in the statement of income as periodic pension cost.

Periodic pension cost is accumulated in cost pools and allocated to operating segments and Statoil operated joint operations (licences) on an hours incurred basis and recognised in the statement of income based on the function of the cost.

Onerous contracts

Statoil recognises as provisions the net obligation under contracts defined as onerous. Contracts are deemed to be onerous if the unavoidable cost of meeting the obligations under the contract exceeds the economic benefits expected to be received in relation to the contract. A contract which forms an integral part of the operations of a CGU whose assets are dedicated to that contract, and for which the economic benefits cannot be reliably separated from those of the CGU, is included in impairment considerations for the applicable CGU.

Asset retirement obligations (ARO)

Provisions for ARO costs are recognised when Statoil has an obligation (legal or constructive) to dismantle and remove a facility or an item of property, plant and equipment and to restore the site on which it is located, and when a reliable estimate of that liability can be made. The amount recognised is the present value of the estimated future expenditures determined in accordance with local conditions and requirements. Cost is estimated based on current regulations and technology, considering relevant risks and uncertainties. The discount rate used in the calculation of the ARO is a risk-free rate based on the applicable currency and time horizon of the underlying cash flows, adjusted for a credit premium which reflects Statoil's own credit risk. Normally an obligation arises for a new facility, such as an oil and natural gas production or transportation facility, upon construction or installation. An obligation may also crystallise during the period of operation of a facility through a change in legislation or through a decision to terminate operations, or be based on commitments associated with Statoil's ongoing use of pipeline transport systems where removal obligations rest with the volume shippers. The provisions are classified under *Provisions* in the Consolidated balance sheet. Some of the refining and process operations are deemed to have indefinite lives, and in consequence, no ARO has been recognised for their plants.

When a provision for ARO cost is recognised, a corresponding amount is recognised to increase the related property, plant and equipment and is subsequently depreciated as part of the costs of the facility or item of property, plant and equipment. Any change in the present value of the estimated expenditure is reflected as an adjustment to the provision and the corresponding property, plant and equipment. When a decrease in the ARO provision related to a producing asset exceeds the carrying amount of the asset, the excess is recognised as a reduction of *Depreciation, amortisation and net impairment losses* in the Consolidated statement of income. When an asset has reached the end of its useful life, all subsequent changes to the ARO provision are recognised as they occur in *Operating expenses* in the Consolidated statement of income. Removal provisions associated with Statoil's role as shipper of volumes through third party transport systems are expensed as incurred.

Measurement of fair values

Quoted prices in active markets represent the best evidence of fair value and are used by Statoil in determining the fair values of assets and liabilities to the extent possible. Financial instruments quoted in active markets will typically include commercial papers, bonds and equity instruments with quoted market prices obtained from the relevant exchanges or clearing houses. The fair values of quoted financial assets, financial liabilities and derivative instruments are determined by reference to mid-market prices, at the close of business on the balance sheet date.

Where there is no active market, fair value is determined using valuation techniques. These include using recent arm's-length market transactions, reference to other instruments that are substantially the same, discounted cash flow analysis, and pricing models and related internal assumptions. In the valuation techniques, Statoil also takes into consideration the counterparty and its own credit risk. This is either reflected in the discount rate used or through direct adjustments to the calculated cash flows. Consequently, where Statoil reflects elements of long-term physical delivery commodity contracts at fair value, such fair value estimates to the extent possible are based on quoted forward prices in the market and underlying indexes in the contracts, as well as assumptions of forward prices and margins where observable market prices are not available. Similarly, the fair values of interest and currency swaps are estimated based on relevant quotes from active markets, quotes of comparable instruments, and other appropriate valuation techniques.

Critical accounting judgements and key sources of estimation uncertainty

Critical judgements in applying accounting policies

The following are the critical judgements, apart from those involving estimations (see below), that Statoil has made in the process of applying the accounting policies and that have the most significant effect on the amounts recognised in the financial statements:

Revenue recognition - gross versus net presentation of traded SDFI volumes of oil and gas production

As described under Transactions with the Norwegian State above, Statoil markets and sells the Norwegian State's share of oil and gas production from the NCS. Statoil includes the costs of purchase and proceeds from the sale of the SDFI oil production in *Purchases [net of inventory variation]* and *Revenues*, respectively. In making the judgement, Statoil considered the detailed criteria for the recognition of revenue from the sale of goods and, in particular, concluded that the risk and reward of the ownership of the oil had been transferred from the SDFI to Statoil.

Statoil sells, in its own name, but for the Norwegian State's account and risk, the State's production of natural gas. These gas sales, and related expenditures refunded by the State, are shown net in Statoil's Consolidated financial statements. In making the judgement, Statoil considered the same criteria as for the oil production and concluded that the risk and reward of the ownership of the gas had not been transferred from the SDFI to Statoil.

Key sources of estimation uncertainty

The preparation of the Consolidated financial statements requires that management make estimates and assumptions that affect reported amounts of assets, liabilities, income and expenses. The estimates and associated assumptions are based on historical experience and various other factors that are believed to be reasonable under the circumstances, the result of which form the basis of making the judgements about carrying values of assets and liabilities that are not readily apparent from other sources. Actual results may differ from these estimates. The estimates and underlying assumptions are reviewed on an on-going basis considering the current and expected future market conditions.

Statoil is exposed to a number of underlying economic factors which affect the overall results, such as liquids prices, natural gas prices, refining margins, foreign exchange rates and interest rates as well as financial instruments with fair values derived from changes in these factors. In addition, Statoil's results are influenced by the level of production, which in the short term may be influenced by, for instance, maintenance programmes. In the long term, the results are impacted by the success of exploration and field development activities.

The matters described below are considered to be the most important in understanding the key sources of estimation uncertainty that are involved in preparing these Consolidated financial statements and the uncertainties that could most significantly impact the amounts reported on the results of operations, financial position and cash flows.

Proved oil and gas reserves

Proved oil and gas reserves may materially impact the Consolidated financial statements, as changes in the proved reserves, for instance as a result of changes in prices, will impact the unit of production rates used for depreciation and amortisation. Proved oil and gas reserves have been estimated by internal qualified professionals on the basis of industry standards and governed by criteria established by regulations of the U.S. Securities Exchange Commission (SEC), which require the use of a price based on a 12-month average for reserve estimation, and which are to be based on existing economic conditions and operating methods and with a high degree of confidence (at least 90% probability) that the quantities will be recovered. The Financial Accounting Standards Board (FASB) requirements for supplemental oil and gas disclosures align with the SEC regulations. Reserves estimates are based on subjective judgements involving geological and engineering assessments of in-place hydrocarbon volumes, the production, historical recovery and processing yield factors and installed plant operating capacity. For future development projects, proved reserves estimates are included only where there is a significant commitment to project funding and execution and when relevant governmental and regulatory approvals have been secured or are reasonably certain to be secured. The reliability of these estimates at any point in time depends on both the quality and quantity of the technical and economic data and the efficiency of extracting and processing the hydrocarbons. An independent third party has evaluated Statoil's proved reserves estimates, and the results of this evaluation do not differ materially from Statoil's estimates. Proved oil and gas reserves are those quantities of oil and gas, which, by analysis of geoscience and engineering data, can be estimated with reasonable certainty to be economically producible from a given date forward, from known reservoirs, and under existing economic conditions, operating methods and government regulations. Unless evidence indicates that renewal is reasonably certain, estimates of economically producible reserves only reflect the period before the contracts providing the right to operate expire. The project to extract the hydrocarbons must have commenced, or the operator must be reasonably certain that it will commence within a reasonable time.

Expected oil and gas reserves

Expected oil and gas reserves may materially impact the Consolidated financial statements, as changes in the expected reserves, for instance as a result of changes in prices, will impact asset retirement obligations and impairment testing of upstream assets, which in turn may lead to changes in impairment charges affecting operating income. Expected oil and gas reserves are the estimated remaining, commercially recoverable quantities, based on Statoil's judgement of future economic conditions, from projects in operation or justified for development. Recoverable oil and gas quantities are always uncertain, and the expected value is the weighted average, or statistical mean, of the possible outcomes. Expected reserves are therefore typically larger than proved reserves as defined by the SEC rules. Expected oil and gas reserves have been estimated by internal qualified professionals on the basis of industry standards and are used for impairment testing purposes and for calculation of asset retirement obligations. Reserves estimates are based on subjective judgements involving geological and engineering assessments of in-place hydrocarbon volumes, the production, historical recovery and processing yield factors, installed plant operating capacity and operating approval limits. The reliability of these estimates at any point in time depends on both the quality and quantity of the technical and economic data and the efficiency of extracting and processing the hydrocarbons.

Exploration and leasehold acquisition costs

Statoil capitalises the costs of drilling exploratory wells pending determination of whether the wells have found proved oil and gas reserves. Statoil also capitalises leasehold acquisition costs and signature bonuses paid to obtain access to undeveloped oil and gas acreage. Judgements as to whether these expenditures should remain capitalised or written down due to impairment losses in the period may materially affect the operating income for the period.

Impairment/reversal of impairment

Statoil has significant investments in property, plant and equipment and intangible assets. Changes in the circumstances or expectations of future performance of an individual asset may be an indicator that the asset is impaired, requiring the carrying amount to be written down to its recoverable amount. Impairments are reversed if conditions for impairment are no longer present. Evaluating whether an asset is impaired or if an impairment should be reversed requires a high degree of judgement and may to a large extent depend upon the selection of key assumptions about the future.

Unproved oil and gas properties are assessed for impairment when facts and circumstances suggest that the carrying amount of the asset may exceed its recoverable amount, and at least annually. If, following evaluation, an exploratory well has not found proved reserves, the previously capitalised costs are tested for impairment. Subsequent to the initial evaluation phase for a well, it will be considered a trigger for impairment testing of a well if no development decision is planned for the near future and there is no concrete plan for future drilling in the licence.

Impairment of unsuccessful wells is reversed, as applicable, to the extent that conditions for impairment are no longer present.

Estimating recoverable amounts involves complexity in estimating relevant future cash flows, based on assumptions about the future, discounted to their present value. Impairment testing requires long-term assumptions to be made concerning a number of often volatile economic factors such as future market prices, refinery margins, currency exchange rates and future output, discount rates and political and country risk among others, in order to establish relevant future cash flows. Impairment testing frequently also requires judgement regarding probabilities and probability distributions as well as levels of sensitivity inherent in the establishment of recoverable amount estimates. Long-term assumptions for major economic factors are made at a group level, and there is a high degree of reasoned judgement involved in establishing these assumptions, in determining other relevant factors such as forward price curves, in estimating production outputs and in determining the ultimate terminal value of an asset.

Employee retirement plans
When estimating the present value of defined benefit pension obligations that represent a long-term liability in the Consolidated balance sheet, and indirectly, the period's net pension expense in the Consolidated statement of income, management make a number of critical assumptions affecting these estimates. Most notably, assumptions made about the discount rate to be applied to future benefit payments and plan assets, the expected rate of pension increase and the annual rate of compensation increase, have a direct and potentially material impact on the amounts presented. Significant changes in these assumptions between periods can have a material effect on the Consolidated financial statements.

Asset retirement obligations
Statoil has significant obligations to decommission and remove offshore installations at the end of the production period. It is difficult to estimate the costs of these decommissioning and removal activities, which are based on current regulations and technology, and consider relevant risks and uncertainties. Most of the removal activities are many years into the future, and the removal technology and costs are constantly changing. The estimates include assumptions of the time required and the day rates for rigs, marine operations and heavy lift vessels that can vary considerably depending on the assumed removal complexity. As a result, the initial recognition of the liability and the capitalised cost associated with decommissioning and removal obligations, and the subsequent adjustment of these balance sheet items, involve the application of significant judgement.

Derivative financial instruments
When not directly observable in active markets, the fair value of derivative contracts must be computed internally based on internal assumptions as well as directly observable market information, including forward and yield curves for commodities, currencies and interest rates. Changes in internal assumptions, forward and yield curves could materially impact the internally computed fair value of derivative contracts, particularly long-term contracts, resulting in a corresponding impact on income or loss in the Consolidated statement of income.

Income tax
Every year Statoil incurs significant amounts of income taxes payable to various jurisdictions around the world and recognises significant changes to deferred tax assets and deferred tax liabilities, all of which are based on management's interpretations of applicable laws, regulations and relevant court decisions. The quality of these estimates is highly dependent upon management's ability to properly apply at times very complex sets of rules, to recognise changes in applicable rules and, in the case of deferred tax assets, management's ability to project future earnings from activities that may apply loss carry forward positions against future income taxes.

3 Segments

With effect from the third quarter of 2015 Statoil implemented a new corporate structure. Statoil's operations are now managed through the following operating segments: Development and Production Norway (DPN), Development and Production USA (DPUSA), Development and Production International (DPI), Marketing, Midstream and Processing (MMP), New Energy Solutions (NES) and Other.

The development and production operating segments are responsible for the commercial development of the oil and gas portfolios within their respective geographical areas: DPN on the Norwegian continental shelf, DPUSA including offshore and onshore activities in the USA and Mexico, and DPI worldwide outside of DPN and DPUSA.

Exploration activities are managed by a separate business unit, which has the global responsibility across the group for discovery and appraisal of new resources. Exploration activities are allocated to and presented in the respective development and production operating segments.

The MMP segment is responsible for marketing and trading of oil and gas commodities (crude, condensate, gas liquids, products, natural gas and liquefied natural gas), electricity and emission rights, as well as transportation, processing and manufacturing of the above mentioned commodities, operations of refineries, terminals, processing and power plants.

The NES segment is responsible for wind parks, carbon capture and storage as well as other renewable energy and low-carbon energy solutions.

Statoil reports its business through reporting segments which correspond to the operating segments, except for the operating segments DPI and DPUSA which have been aggregated into one reporting segment, Development and Production International. This aggregation has its basis in similar economic characteristics, the nature of products, services and production processes, the type and class of customers, the methods of distribution and regulatory environment. The new operating segment NES is reported in the segment Other in 2015 due to its immateriality.

The Other reporting segment includes activities within New Energy Solutions, Global Strategy and Business Development, Technology, Projects and Drilling and Corporate Staffs and Services.

The eliminations section includes the elimination of inter-segment sales and related unrealised profits, mainly from the sale of crude oil and products. Inter-segment revenues are based upon estimated market prices.

Segment data for the years ended 31 December 2015, 2014 and 2013 is presented below. The measurement basis of segment profit is *Net operating income*. In the tables below, deferred tax assets, pension assets and non-current financial assets are not allocated to the segments. Also, the line additions to PP&E, intangibles and equity accounted investments is excluding movements due to changes in asset retirement obligations.

(in NOK billion)	Development and Production Norway	Development and Production International	Marketing, Midstream and Processing	Other	Eliminations	Total

Revenues by geographical areas

Statoil has business operations in more than 30 countries. When attributing revenues third party and other income to the country of the legal entity executing the sale, Norway constitutes 76% and the USA constitutes 13%.

Non-current assets by country

(in NOK billion)	2015	2014	At 31 December 2013
Norway	277.4	289.6	269.6
USA	180.9	182.9	159.2

Natural gas liquids	44.2	59.5	64.5
Other	12.0	18.6	1.3
Total revenues	465.3	606.8	616.6

4 Acquisitions and disposals

2015

Sale of interests in the Marcellus onshore play

In January 2015 Statoil closed an agreement with Southwestern Energy, entered into in the fourth quarter 2014, reducing Statoil's average working interest in the non-operated southern Marcellus onshore play from 29% to 23%. The transaction was recognised in the Development and Production International (DPI) segment with no impact on the Consolidated statement of income. Proceeds from the sale were NOK 2.8 billion.

Sale of interests in the Shah Deniz project and the South Caucasus Pipeline

In April 2015 Statoil closed an agreement with Petronas, entered into in October 2014, to sell its remaining 15.5% interest in the Shah Deniz project and the South Caucasus Pipeline. Statoil recognised a total gain of NOK 12.4 billion. The gain was presented in the line item *Other income* in the Consolidated statement of income. In the segment reporting, the gain was recognised in the DPI and the Marketing, Midstream and Processing (MMP) segments, with NOK 12.3 billion and NOK 0.1 billion, respectively. The part of the transaction recognised in the DPI segment was tax exempt under the rules in Norway and Azerbaijan. Total proceeds from the sale were NOK 20.3 billion, of which NOK 0.7 billion was received in 2014 and NOK 19.6 billion in 2015.

Sale of head office building

In June 2015 Statoil closed a transaction with Colony Capital, Inc. for the sale of the company's head office building in Stavanger through the sale of shares in the company Forusbeen 50 AS. At the same time, Statoil entered into a 15 year operating lease agreement for the building. A gain of NOK 1.5 billion was recognised in the Other segment. The gain was presented in the line item *Other income* in the Consolidated statement of income. Proceeds from the sale were NOK 2.3 billion.

Sale of office buildings

In December 2015 Statoil closed a transaction with TRD Campus AS for the sale of the company's office buildings in Trondheim and Stjørdal through the sale of shares in the companies Strandveien 4 AS and Arkitekt Ebbelsvei 10 AS. At the same time Statoil entered into 15 year operating lease agreements for the buildings. A gain of NOK 0.6 billion was recognised in the Other segment. The gain was presented in the line item *Other income* in the Consolidated statement of income. Proceeds from the sale were NOK 1.7 billion.

Sale of interests in the Trans Adriatic Pipeline AG

In December 2015 Statoil closed an agreement with Italian gas structure company Snam SpA to sell its 20% interest in Trans Adriatic Pipeline AG. A gain of NOK 1.4 billion was recognised in the MMP segment. The gain was tax exempt and presented in the line item *Other income* in the Consolidated statement of income. Total proceeds from the sale were NOK 2.0 billion.

Sale of interests in the Gudrun field and acquisition of interests in Eagle Ford
In December 2015 Statoil closed an agreement with Repsol to sell a 15% interest in the Gudrun field on the Norwegian continental shelf (NCS). Statoil remains the operator and largest equity holder with a 36% interest. Statoil recognised a total gain of NOK 1.2 billion in the Development and Production Norway (DPN) segment. The gain was presented in the line item *Other income* in the Consolidated statement of income. The transaction was tax exempt under the Norwegian petroleum tax legislation. Proceeds from the sale were NOK 1.9 billion.

Simultaneously Statoil closed an agreement to acquire an additional 13% interest in the Eagle Ford formation with the same party. Statoil's total interest in the Eagle Ford shale play after the acquisition is 63%, and Statoil also became the sole operator. The acquisition was accounted for as a business combination using the acquisition method. The acquisition and valuation date for the purchase price allocation was 30 December 2015. The fair value of net identifiable assets was NOK 3.5 billion. The acquisition was recognised in the DPI and MMP reporting segments with the fair value of net identifiable assets of NOK 2.4 billion and NOK 1.1 billion, respectively. The total purchase price of the business combination was NOK 3.5 billion. No goodwill was recognised.

2014

Sale of interests in the Shah Deniz project and the South Caucasus Pipeline
In March 2014 Statoil closed an agreement with BP and in May 2014 Statoil closed an agreement with SOCAR, both entered into in December 2013, to divest a 3.33% working interest and a 6.67% working interest, respectively, in the Shah Deniz project and the South Caucasus Pipeline. Statoil recognised a total gain of NOK 5.4 billion, presented in the line item *Other income* in the Consolidated statement of income. In the segment reporting, the gain has been presented in the DPI segment and the MMP segment with NOK 5.2 billion and NOK 0.2 billion, respectively. The part of the transaction recognised in the DPI segment was tax exempt under the rules in Norway and Azerbaijan. Proceeds from the sale were NOK 8.2 billion.

Kai Kos Dehseh oil sands swap agreement
In May 2014 Statoil and its partner PTTEP closed an agreement to swap the two parties' respective interests in the Kai Kos Dehseh oil sands project in Alberta, Canada. Statoil paid a balancing cash consideration of NOK 2.5 billion and assumed a net liability of NOK 0.3 billion. Subsequent to the closing, Statoil continues as 100% owner of the Leismer and Corner projects, while PTTEP owns 100% of the Thornbury, Hangingstone and South Leismer areas. The transaction has been recognised in the DPI segment resulting in an increase in *Property, plant and equipment* of NOK 4.6 billion, including a transfer from *Intangible assets* of NOK 1.8 billion, and with no impact on the Consolidated statement of income.

Sale of interests in licences on the Norwegian continental shelf
In December 2014 Statoil closed an agreement with Wintershall to sell certain ownership interests in licences on the NCS. A gain of NOK 5.9 billion has been recognised in the DPN segment. The gain has been presented in the line item *Other income* in the Consolidated statement of income. The transaction was tax exempt under the rules in the Norwegian petroleum tax legislation, and the gain included a release of related deferred tax liabilities. Proceeds from the sale were NOK 8.7 billion (USD 1.25 billion).

2013

Sale of interests in exploration and production licences on the Norwegian continental shelf to Wintershall
In July 2013 a sales transaction with Wintershall of certain ownership interests in licences on the NCS was closed. Statoil recognised a gain of NOK 6.4 billion. The gain has been presented in the line item *Other income* in the Consolidated statement of income. In the segment reporting, the gain has been presented in the DPN segment in revenues third party and other income. The transaction was tax exempt under the rules in the Norwegian petroleum tax legislation. Proceeds from the sale were NOK 4.7 billion.

Sale of interests in exploration and production licences on the Norwegian continental shelf and the United Kingdom continental shelf to OMV
In October 2013 a sales transaction with OMV to sell certain ownership interests in licences on the NCS and United Kingdom continental shelf was closed. Statoil recognised a gain of NOK 10.1 billion. The gain has been presented in the line item *Other income* in the Consolidated statement of income. In the segment reporting, the gain has been presented in the DPN segment and in the DPI segment in revenues third party and other income with NOK 6.6 billion and NOK 3.5 billion, respectively. The part of the transaction covering assets on the NCS was tax exempt under the rules in the Norwegian petroleum tax legislation. Proceeds from the sale were NOK 15.9 billion.

5 Financial risk management

General information relevant to financial risks
Statoil's business activities naturally expose Statoil to financial risk. Statoil's approach to risk management includes assessing and managing risk in all activities using a holistic risk approach. Statoil utilises correlations between the most important market risks, such as oil and natural gas prices, refined oil product prices, currencies, and interest rates, to calculate the overall market risk and thereby take into account the natural hedges inherent in Statoil's portfolio. Adding the different market risks without considering these correlations would overestimate Statoil's total market risk. This approach allows Statoil to reduce the number of risk management transactions and thereby reduce transaction costs and avoid sub-optimisation.

An important element in risk management is the use of centralised trading mandates. All major strategic transactions are required to be coordinated through Statoil's corporate risk committee. Mandates delegated to the trading organisations within crude oil, refined products, natural gas and electricity are relatively small compared to the total market risk of Statoil.

The corporate risk committee, which is headed by the chief financial officer and includes representatives from the principal business segments, is responsible for defining, developing and reviewing Statoil's risk policies. The chief financial officer, assisted by the committee, is also responsible for overseeing and developing Statoil's Enterprise Risk Management and proposing appropriate measures to adjust risk at the corporate level. The committee meets at least six times per year and regularly reviews risk information relevant to Statoil.

Financial risks

Statoil's activities expose Statoil to the following financial risks:

- Market risk (including commodity price risk, currency risk and interest rate risk)
- Liquidity risk
- Credit risk

Market risk

Statoil operates in the worldwide crude oil, refined products, natural gas, and electricity markets and is exposed to market risks including fluctuations in hydrocarbon prices, foreign currency rates, interest rates, and electricity prices that can affect the revenues and costs of operating, investing and financing. These risks are managed primarily on a short-term basis with a focus on achieving the highest risk-adjusted returns for Statoil within the given mandate. Long-term exposures are managed at the corporate level, while short-term exposures are managed according to trading strategies and mandates approved by Statoil's corporate risk committee.

In the marketing of commodities Statoil has established guidelines for entering into derivative contracts in order to manage commodity price, foreign currency rate, and interest rate risks. Statoil uses both financial and commodity-based derivatives to manage the risks in revenues, financial items and the present value of future cash flows.

For more information on sensitivity analysis of market risk see note 25 *Financial instruments: fair value measurement and sensitivity analysis of market risk*.

Commodity price risk

Statoil's most important long term commodity risk (oil and natural gas) is related to future market prices as Statoil's risk policy is to be exposed to both upside and downside price movements. To manage short-term commodity risk, Statoil enters into commodity- based derivative contracts, including futures, options, over-the-counter (OTC) forward contracts, market swaps and contracts for differences related to crude oil, petroleum products, natural gas and electricity.

Derivatives associated with crude oil and refined oil products are traded mainly on the Inter Continental Exchange (ICE) in London, the New York Mercantile Exchange (NYMEX), the OTC Brent market, and crude and refined products swap markets. Derivatives associated with natural gas and electricity are mainly OTC physical forwards and options, NASDAQ OMX Oslo forwards and futures traded on the NYMEX and ICE.

The term of crude oil and refined oil products derivatives is usually less than one year, and the term for natural gas and electricity derivatives is usually three years or less. For more detailed information about Statoil's commodity based derivative financial instruments, see note 25 *Financial instruments: fair value measurement and sensitivity analysis of market risk*.

Currency risk

Statoil's operating results and cash flows are affected by foreign currency fluctuations and the most significant currency is Norwegian Krone (NOK) against United States Dollar (USD). Statoil manages its currency risk from operating activities with USD as the base currency. Foreign exchange risk is managed at corporate level in accordance with established policies and mandates.

Statoil's cash flows from operating activities deriving from oil and gas sales, operating expenses and capital expenditures are mainly in USD, but taxes and dividends to shareholders on the Oslo Stock Exchange are in NOK. Accordingly, Statoil's currency management is primarily linked to mitigate currency risk related to tax and dividend payments in NOK. This means that Statoil regularly purchases substantial NOK amounts on a forward basis using conventional derivative instruments.

Interest rate risk

Bonds are normally issued at fixed rates in a variety of local currencies (among others USD, Euro and Great Britain Pound). Bonds may be converted to floating USD bonds by using interest rate and currency swaps. Statoil manages its interest rates exposure on its bond debt based on risk and reward considerations from an enterprise risk management perspective. This means that the fix/floating mix on interest rate exposure may vary from time to time. For more detailed information about Statoil's long-term debt portfolio see note 18 *Finance debt*.

Liquidity risk

Liquidity risk is the risk that Statoil will not be able to meet obligations of financial liabilities when they become due. The purpose of liquidity management is to make certain that Statoil has sufficient funds available at all times to cover its financial obligations.

Statoil manages liquidity and funding at the corporate level, ensuring adequate liquidity to cover Statoil's operational requirements. Statoil has a high focus and attention on credit and liquidity risk. In order to secure necessary financial flexibility, which includes meeting the financial obligations, Statoil maintains a conservative liquidity management policy. To identify future long-term financing needs, Statoil carries out three-year cash forecasts at least monthly.

The main cash outflows are the quarterly dividend payments and Norwegian petroleum tax payments paid six times per year. If the monthly cash flow forecast shows that the liquid assets one month after tax and dividend payments will fall below the defined policy level, new long-term funding will be considered.

Short-term funding needs will normally be covered by the USD 4.0 billion US Commercial Papers Programme (CP) which is backed by a revolving credit facility of USD 5.0 billion, supported by 21 core banks, maturing in 2020. The facility supports secure access to funding, supported by the best available short-term rating. As at 31 December 2015 it has not been drawn.

Statoil raises debt in all major capital markets (USA, Europe and Asia) for long-term funding purposes. The policy is to have a smooth maturity profile with repayments not exceeding five percent of capital employed in any year for the nearest five years. Statoil's non-current financial liabilities have a weighted average maturity of approximately nine years.

For more information about Statoil's non-current financial liabilities, see note 18 *Finance debt*.

The table below shows a maturity profile, based on undiscounted contractual cash flows, for Statoil's financial liabilities.

	At 31 December	
(in NOK billion)	2015	2014
Due within 1 year	104.9	131.4
Due between 1 and 2 years	73.7	43.3
Due between 3 and 4 years	86.9	81.3
Due between 5 and 10 years	93.8	90.5
Due after 10 years	115.5	84.3
Total specified	474.7	430.8

Credit risk

Credit risk is the risk that Statoil's customers or counterparties will cause Statoil financial loss by failing to honour their obligations. Credit risk arises from credit exposures with customer accounts receivables as well as from financial investments, derivative financial instruments and deposits with financial institutions.

Key elements of the credit risk management approach include:
- A global credit risk policy
- Credit mandates
- An internal credit rating process
- Credit risk mitigation tools
- A continuous monitoring and managing of credit exposures

Prior to entering into transactions with new counterparties, Statoil's credit policy requires all counterparties to be formally identified and approved. In addition, all sales, trading and financial counterparties are assigned internal credit ratings as well as exposure limits. Once established, all counterparties are re-assessed regularly and continuously monitored. Counterparty risk assessments are based on a quantitative and qualitative analysis of recent financial statements and other relevant business information like past payment performance, the counterparties' size and business diversification. The internal credit ratings reflect Statoil's assessment of the counterparties' credit risk. Exposure limits are determined based on assigned internal credit ratings combined with other factors, such as expected transaction and industry characteristics. Credit mandates define acceptable credit risk thresholds and are endorsed by management.

Statoil uses risk mitigation tools to reduce or control credit risk both on a counterparty and portfolio level. The main tools include bank and parental guarantees, prepayments and cash collateral.

Statoil has pre-defined limits for the absolute credit risk level allowed at any given time on Statoil's portfolio as well as maximum credit exposures for individual counterparties. Statoil monitors the portfolio on a regular basis and individual exposures against limits on a daily basis. The total credit exposure portfolio of Statoil is geographically diversified among a number of counterparties within the oil and energy sector, as well as larger oil and gas consumers and financial counterparties. The majority of Statoil's credit exposure is with investment grade counterparties.

The following table contains the carrying amount of Statoil's financial receivables and derivative financial instruments split by Statoil's assessment of the counterparty's credit risk. There are no significant receivables that are past due or impaired. Only non-exchange traded instruments are included in derivative financial instruments.

(in NOK billion)	Non-current financial receivables	Trade and other receivables	Non-current derivative financial instruments	Current derivative financial instruments
At 31 December 2015				
Investment grade, rated A or above	0.0	14.6	11.9	2.0
Other investment grade	3.3	27.5	11.9	2.4
Non-investment grade or not rated	2.4	9.3	0.0	0.3
Total financial asset	5.8	51.4	23.8	4.8
At 31 December 2014				
Investment grade, rated A or above	0.0	20.1	15.2	2.4
Other investment grade	0.0	36.5	11.8	2.7
Non-investment grade or not rated	2.7	17.2	2.9	0.2
Total financial asset	2.7	73.7	29.9	5.3

At 31 December 2015, NOK 10.2 billion of cash was held as collateral to mitigate a portion of Statoil's credit exposure. At 31 December 2014 NOK 12.9 billion was held as collateral. The collateral cash is received as a security to mitigate credit exposure related to positive fair values on interest rate swaps, cross currency swaps and foreign exchange swaps. Cash is called as collateral in accordance with the master agreements with the different counterparties when the positive fair values for the different swap agreements are above an agreed threshold.

Under the terms of various master netting agreements for derivative financial instruments as of 31 December 2015, NOK 7.0 billion presented as liabilities do not meet the criteria for offsetting. At 31 December 2014, NOK 5.2 billion was not offset. The collateral received and the amounts not offset from derivative financial instrument liabilities, reduce the credit exposure in the derivative financial instruments presented in the table above as they will offset each other in a potential default situation for the counterparty.

6 Remuneration

(in NOK billion, except average number of employees)	2015	2014	Full year 2013
Salaries[1)]	22.5	23.3	23.5
Pension costs	6.8	3.4	4.6
Payroll tax	3.4	3.5	3.4
Other compensations and social costs	2.5	2.4	2.5
Total payroll costs	35.2	32.5	34.0
Average number of employees[2)]	22,300	23,300	23,600

1) Salaries include bonuses, severance packages and expatriate costs in addition to base pay.
2) Part time employees amount to 3%, 2% and 3% for the years 2015, 2014 and 2013 respectively.

Total payroll expenses are accumulated in cost-pools and partly charged to partners of Statoil operated licences on an hours incurred basis.

For further information on pension costs, see note 19 *Pensions*.

Compensation to the board of directors (BoD) and the corporate executive committee (CEC)
Remuneration to members of the BoD and the CEC during the year was as follows:

(in NOK million)[1]	2015	2014	Full year 2013
Current employee benefits	92.2	73.2	74.5
Post-employment benefits	6.4	13.0	13.0
Other non-current benefits	0.1	0.0	0.1
Share based payment benefits	1.3	1.1	1.1
Total	100.2	87.3	88.7

1) All figures in the table are presented on accrual basis.

At 31 December 2015, 2014 and 2013 there are no loans to the members of the BoD or the CEC.

Share-based compensation
Statoil's share saving plan provides employees with the opportunity to purchase Statoil shares through monthly salary deductions and a contribution by Statoil. If the shares are kept for two full calendar years of continued employment, following the year of purchase, the employees will be allocated one bonus share for each one they have purchased.

Estimated compensation expense including the contribution by Statoil for purchased shares, amounts vested for bonus shares granted and related social security tax was NOK 0.5 billion, NOK 0.6 billion and NOK 0.6 billion related to the 2015, 2014 and 2013 programs, respectively. For the 2016 program (granted in 2015) the estimated compensation expense is NOK 0.5 billion. At 31 December 2015 the amount of compensation cost yet to be expensed throughout the vesting period is NOK 1.2 billion.

7 Other expenses

Auditor's remuneration

(in NOK million, excluding VAT)	2015	2014	Full year 2013
Audit fee	49	45	38
Audit related fee	14	8	8
Tax fee	0	0	0
Other service fee	0	0	0
Total	63	53	46

Of total increase in audit and audit related fees, NOK 3.2 million is due to currency effects, equivalent to 5%.

In addition to the figures in the table above, the audit fees and audit related fees related to Statoil operated licences amount to NOK 7 million, NOK 6 million and NOK 6 million for 2015, 2014 and 2013, respectively.

Research and development expenditures
Research and development (R&D) expenditures were NOK 2.7 billion, NOK 3.0 billion and NOK 3.2 billion in 2015, 2014 and 2013, respectively. R&D expenditures are partly financed by partners of Statoil operated licences. Statoil's share of the expenditures has been recognised as expense in the Consolidated statement of income.

8 Financial items

(in NOK billion)	2015	2014	Full year 2013
Foreign exchange gains (losses) derivative financial instruments	4.4	(1.5)	(4.1)
Other foreign exchange gains (losses)	(6.5)	(0.7)	(4.5)
Net foreign exchange gains (losses)	(2.1)	(2.2)	(8.6)
Dividends received	0.3	0.3	0.1
Gains (losses) financial investments	0.4	1.1	1.9
Interest income financial investments	0.6	0.7	0.6
Interest income non-current financial receivables	0.2	0.1	0.1
Interest income current financial assets and other financial items	1.7	1.8	0.9
Interest income and other financial items	3.2	4.0	3.6
Interest expense bonds and bank loans and net interest on related derivatives	(5.7)	(4.3)	(1.5)
Interest expense finance lease liabilities	(0.2)	(0.3)	(0.2)
Capitalised borrowing costs	3.2	1.6	1.1
Accretion expense asset retirement obligations	(3.9)	(3.7)	(3.2)
Gains (losses) derivative financial instruments	(3.8)	5.8	(7.4)
Interest expense current financial liabilities and other finance expense	(1.2)	(0.8)	(0.8)
Interest and other finance expenses	(11.7)	(1.8)	(12.0)
Net financial items	(10.6)	(0.0)	(17.0)

Statoil's main financial items relate to assets and liabilities categorised in the held for trading category and the amortised cost category. For more information about financial instruments by category see note 25 *Financial instruments: fair value measurement and sensitivity analysis of market risk.*

The line item interest expense bonds and bank loans and net interest on related derivatives primarily includes interest expenses of NOK 8.6 billion, NOK 6.8 billion and NOK 5.4 billion from the financial liabilities at amortised cost category. This was partly offset by net interest on related derivatives from the held for trading category, NOK 2.6 billion, NOK 2.5 billion and NOK 3.9 billion for 2015, 2014 and 2013, respectively.

The line item gains (losses) derivative financial instruments primarily includes fair value loss from the held for trading category of NOK 4.0 billion, a gain of NOK 5.7 billion and a loss of NOK 7.6 billion for 2015, 2014 and 2013, respectively.

Foreign exchange gains (losses) derivative financial instruments include fair value changes of currency derivatives related to liquidity and currency risk. The line item foreign exchange gains (losses) includes a net foreign exchange loss of NOK 9.7 billion, a loss of NOK 13.4 billion and a loss of NOK 4.3 billion from the held for trading category for 2015, 2014 and 2013, respectively.

9 Income taxes

Significant components of income tax expense

(in NOK billion)	2015	2014	Full year 2013
Current income tax expense in respect of current year	52.0	89.6	111.6
Prior period adjustments	0.7	(1.9)	1.3
Current income tax expense	52.7	87.6	112.9
Origination and reversal of temporary differences	(12.3)	(0.6)	(13.4)
Change in tax regulations	0.7	0.1	0.1
Prior period adjustments	0.4	0.3	(0.4)
Deferred tax expense	(11.1)	(0.2)	(13.7)
Income tax expense	41.6	87.4	99.2

During the normal course of its business, Statoil files tax returns in many different tax regimes. There may be differing interpretation of applicable tax laws and regulations regarding some of the matters in the tax returns. It may in certain cases take several years to complete the discussions with the relevant tax authorities or to reach a resolution of the tax positions through litigations. Statoil has provided for probable income tax related assets and liabilities based on best estimates reflecting consistent interpretations of the applicable laws and regulations.

Reconciliation of nominal statutory tax rate to effective tax rate

(in NOK billion)	2015	2014	Full year 2013
Income before tax	4.3	109.4	138.4
Calculated income tax at statutory rate[1)]	(8.5)	31.2	42.4
Calculated Norwegian Petroleum tax[2)]	33.4	62.8	71.7
Tax effect uplift[2)]	(6.8)	(6.4)	(5.2)
Tax effect of permanent differences regarding divestments	(3.7)	(6.2)	(12.0)
Tax effect of permanent differences caused by functional currency different from tax currency	(5.8)	(5.1)	(0.4)
Tax effect of other permanent differences	(0.2)	2.2	(3.7)
Change in unrecognised deferred tax assets	28.2	8.7	3.9
Change in tax regulations[3)]	0.7	0.1	0.1
Prior period adjustments	1.1	(1.7)	0.9
Other items including currency effects	3.2	1.7	1.5
Income tax expense	41.6	87.4	99.2
Effective tax rate	969.3%	79.9%	71.7%

1) The weighted average of statutory tax rates was -198.9% in 2015, 28.5% in 2014 and 30.7% in 2013. The negative weighted average of statutory tax rates for 2015 (198.9%) and the decrease in weighted average tax rates from 2014 to 2015 is mainly caused by losses, impairments and provisions in entities with higher than average statutory tax rates. The decrease from 2013 to 2014 was due to changes in the geographic mix of income, and a decrease in the Norwegian statutory tax rate from 28% to 27%.

2) When computing the petroleum tax of 51% (53% from 2016) on income from the Norwegian continental shelf, an additional tax-free allowance, or uplift, is granted at a rate of 5.5% per year on the basis of the original capitalised cost of offshore production installations. For investments made prior to 5 May 2013, the rate is 7.5% per year. Transitional rules apply to investments from 5 May 2013 covered by among others Plans for development and operation (PDOs) or Plans for installation and operation (PIOs) submitted to the Ministry of Oil and Energy prior to 5 May 2013. The uplift may be deducted from taxable income for a period of four years, starting in the year in which the capital expenditure is incurred. Unused uplift may be carried forward indefinitely. At year end 2015 and 2014, unrecognised uplift credits amounted to NOK 20.6 billion and NOK 21.1 billion, respectively.

3) The increase from 2014 to 2015 is mainly related to change in deferred taxes caused by a reduction in Norwegian statutory tax rate from 27% to 25% effective from 2016.

Deferred tax assets and liabilities comprise

(in NOK billion)	Tax losses carried forward	Property, plant and equipment and Intangible assets	Asset removal obligation	Pensions	Derivatives	Other	Total
Deferred tax at 31 December 2015							
Deferred tax assets	41.8	1.6	61.5	5.1	0.1	7.0	117.1
Deferred tax liabilities	(0.0)	(147.4)	0.0	(0.0)	(8.2)	(9.1)	(164.6)
Net asset (liability) at 31 December 2015	41.8	(145.7)	61.5	5.1	(8.1)	(2.1)	(47.6)
Deferred tax at 31 December 2014							
Deferred tax assets	36.7	4.6	73.3	7.0	0.2	13.4	135.3
Deferred tax liabilities	(0.0)	(172.6)	0.0	0.0	(12.9)	(8.4)	(193.8)
Net asset (liability) at 31 December 2014	36.7	(167.9)	73.3	7.0	(12.7)	4.9	(58.6)

Changes in net deferred tax liability during the year were as follows:

(in NOK billion)	2015	2014	2013
Net deferred tax liability at 1 January	58.6	62.8	77.3
Charged (credited) to the Consolidated statement of income	(11.1)	(0.2)	(13.7)
Other comprehensive income	2.8	(0.9)	(1.5)
Translation differences and other	(2.7)	(3.0)	0.7
Net deferred tax liability at 31 December	47.6	58.6	62.8

Deferred tax assets and liabilities are offset to the extent that the deferred taxes relate to the same fiscal authority, and there is a legally enforceable right to offset current tax assets against current tax liabilities. After netting deferred tax assets and liabilities by fiscal entity, deferred taxes are presented on the balance sheet as follows:

		At 31 December
(in NOK billion)	2015	2014
Deferred tax assets	17.8	12.9
Deferred tax liabilities	65.4	71.5

Deferred tax assets are recognised based on the expectation that sufficient taxable income will be available through reversal of taxable temporary differences or future taxable income. At year end 2015 and 2014 the deferred tax assets of NOK 17.8 billion and NOK 12.9 billion, respectively, were primarily recognised in Norway, Angola and the UK.

Unrecognised deferred tax assets

				At 31 December
		2015		2014
(in NOK billion)	Basis	Tax	Basis	Tax
Deductible temporary differences	21.6	8.9	11.0	3.2
Tax losses carried forward	126.2	46.7	52.5	18.0
Total	147.8	55.6	63.5	21.2

The movement in tax value of unrecognised deferred tax assets in the table above compared to reported change in unrecognised deferred tax assets in the table Reconciliation of nominal statutory tax rate to effective tax rate is mainly caused by currency effects.

Approximately 11% of the unrecognised carry forward tax losses can be carried forward indefinitely. The majority of the remaining part of the unrecognised tax losses expire after 2026. The unrecognised deductible temporary differences do not expire under the current tax legislation. Deferred tax assets have not been recognised in respect of these items because currently there is insufficient evidence to support that future taxable profits will be available to secure utilisation of the benefits.

Total unrecognised deferred tax assets relates to:

(in NOK billion)	2015	At 31 December 2014
US	39.3	12.3
Angola	5.7	0.0
Ireland	2.5	1.8
Canada	2.4	1.9
Netherlands	1.7	1.4
Other	4.0	3.8
Total	55.6	21.2

10 Earnings per share

The weighted average number of ordinary shares is the basis for computing the basic and diluted earnings per share as disclosed in the Consolidated statement of income. The dilutive effect relates to treasury shares.

(in millions)	2015	2014	At 31 December 2013
Weighted average number of ordinary shares	3,179.4	3,180.0	3,180.7
Weighted average number of ordinary shares, diluted	3,188.8	3,188.9	3,188.9
Earnings per share for income attributable to equity holders of the company:			
Basic (NOK)	-11.80	6.89	12.53
Diluted (NOK)	-11.80	6.87	12.50

11 Property, plant and equipment

(in NOK billion)	Machinery, equipment and transportation equipment, including vessels	Production plants and oil and gas assets	Refining and manufacturing plants	Buildings and land	Assets under development	Total
Cost at 31 December 2014	26.1	1,037.5	64.6	10.1	164.7	1,303.0
Additions and transfers	0.4	79.3	5.0	0.6	10.1	95.5

Carrying amount at 31 December 2014	6.0	380.8	16.4	5.3	153.6	562.1
Estimated useful lives (years)	3-20	1)	15 - 20	20 - 33		

1) Depreciation according to unit of production method, see note 2 *Significant accounting policies*.

2) Includes NOK 5.8 billion related to a change in the classification of Statoil's investment in the Sheringham Shoal Windfarm (Scira Offshore Energy Ltd) from joint operation (pro-rata line by line consolidation) to joint venture (equity method) following changes in the joint operating agreements.

The carrying amount of assets transferred to *Property, plant and equipment* from *Intangible assets* in 2015 and 2014 amounted to NOK 2.7 billion and NOK 9.5 billion, respectively.

Impairments

During 2015 and 2014, Statoil recognised total net impairment losses of NOK 63.3 billion and NOK 38.2 billion respectively on *Property, plant and equipment* and *Intangible assets*.

(in NOK billion)	Property, plant and equipment	Intangible assets[3]	Total
At 31 December 2015			
Producing and development assets[1]	43.8	9.8	53.5
Goodwill[1]	0.0	4.2	4.2
Acquisition costs related to oil and gas prospects[2]	0.0	5.6	5.6
Total net impairment losses recognised	43.8	19.6	63.3
At 31 December 2014			
Producing and development assets[1]	22.5	6.0	28.5
Goodwill[1]	0.0	4.2	4.2
Acquisition costs related to oil and gas prospects[2]	0.0	5.5	5.5
Total net impairment losses recognised	22.5	15.7	38.2

1) Producing and development assets and goodwill are subject to impairment assessment under IAS 36. The total net impairment losses recognised under IAS 36 in 2015 and 2014 amount to NOK 57.7 billion and NOK 32.7 billion, respectively, including impairment of acquisition costs - oil and gas prospects (intangible assets).

2) Acquisition costs related to exploration activities, subject to impairment assessment under the successful efforts method.

3) See note 12 *Intangible assets*.

In assessing the need for impairment of the carrying amount of a potentially impaired asset, the asset's carrying amount is compared to its recoverable amount. The recoverable amount is the higher of fair value less cost of disposal (FVLCOD) and estimated value in use (VIU).

The base discount rate for VIU calculations is 6.5% real after tax. The discount rate is derived from Statoil's weighted average cost of capital. A derived pre-tax discount rate would generally be in the range of 8-12%, depending on asset specific characteristics, such as specific tax treatments, cash flow profiles and economic life. The rates are not changed from last year. For certain assets a pre-tax discount rate could be outside this range, mainly due to special tax elements (for example permanent differences) affecting the pre-tax equivalent. See note 2 *Significant accounting policies* for further information regarding impairment on property, plant and equipment.

(in NOK billion)	Impairment method	Carrying amount before impairment	Carrying amount after impairment	Net impairment loss
At 31 December 2015				
Development and Production Norway	VIU	14.5	11.0	3.5
Development and Production International	VIU	219.5	171.2	48.3
Marketing, Midstream and Processing	VIU	5.2	8.7	(3.5)
Development and Production Norway	FVLCOD	22.9	17.7	5.2
Development and Production International	FVLCOD	4.2	0.0	4.2
Marketing, Midstream and Processing	FVLCOD	0.0	0.0	0.0
Total		266.3	208.6	57.7
At 31 December 2014				
Development and Production Norway	VIU	5.2	2.9	2.3
Development and Production International	VIU	187.9	168.4	19.5
Marketing, Midstream and Processing	VIU	8.8	7.9	0.9
Development and Production Norway	FVLCOD	18.3	18.3	0.0
Development and Production International	FVLCOD	25.4	15.4	10.0
Marketing, Midstream and Processing	FVLCOD	0.0	0.0	0.0
Total		245.6	212.9	32.7

During 2015 net impairment losses of NOK 57.7 billion were recognised, on producing and development assets and goodwill, primarily due to declining commodity price forecasts (primarily oil). The recoverable amount of assets tested for impairment was mainly based on VIU estimates on the basis of internal forecasts on costs, production profiles and commodity prices. For short term commodity prices, observed forward oil and gas price curves for the first two to three years have been used. Long term commodity price forecasts are based on internal price forecasts. The FVLCOD have partly been established through comparisons with observed market transactions and bids, and partly through internally prepared net present value estimates using assumed market participant assumptions. During 2014 impairment losses of NOK 32.7 billion were recognised on producing and development assets and goodwill.

Development and Production Norway (DPN)
In the DPN segment net impairment losses of NOK 8.7 billion were recognised in 2015, which were mainly related to conventional offshore assets in the development phase. The net impairment losses were triggered by reduction in commodity price reductions and project delays. In 2014 impairment losses of NOK 2.3 billion were recognised.

Development and Production International (DPI)
In the DPI segment net impairment losses of NOK 52.5 billion were recognised in 2015 of which NOK 28.3 billion related to unconventional onshore assets in USA, including NOK 4.2 billion of goodwill allocated to these assets. NOK 24.1 billion related to other conventional assets which were not considered significant on an individual cash generating unit level. Impairment losses of NOK 42.7 billion were recognised as *Depreciation, amortisation and net impairment losses* and NOK 9.8 billion as *Exploration expenses*, based on the impaired asset's nature. In 2014 impairment losses of NOK 29.5 billion were recognised.

The net impairment losses related to the unconventional onshore assets in North America, were mainly a result from reduced long term commodity price assumptions partly offset by operational performance improvements and cost reductions. The net impairment losses related to other conventional assets were primarily related to reduced commodity price assumptions, but also included an impairment loss related to an asset under development in the Gulf of Mexico due to installation damages and a consequential start-up delay.

Marketing, Midstream and Processing (MMP)
The MMP segment recognised a net impairment reversal of NOK 3.5 in 2015 mainly related to a refinery. The reversal of impairment was triggered by increased refinery margins and operational improvements. In 2014 net impairment losses of NOK 0.9 billion were recognised.

Sensitivities

Throughout 2015 and subsequent to year end, commodity prices have continued to be volatile. Significant downward adjustments of Statoil's commodity price assumptions would result in impairment losses on certain producing and development assets in Statoil's portfolio. The table below presents an estimate of the carrying amount of producing and development assets, that would be subject to impairment assessment if a further decline in commodity price forecasts over the lifetime of the assets were 20%. The sensitivity has been established on the assumption that all other factors would remain unchanged.

Carrying amount of producing and development assets which would be subject to impairment assessment assuming an additional decline in commodity price forecasts of 20%:

(in NOK billion)	Development and Production Norway	Development and Production International	Marketing, Midstream and Processing	Total
Carrying amount subject to impairment assessment in 2015 (after impairment)[1)]	48	230	9	287
Sensitivity: commodity price decline by 20%[2)]	52	253	N/A	305

1) Relates to assets subject to impairment assessment under IAS 36. As a result of these impairment assessments, Statoil recognised a net impairment loss of NOK 57.7 billion and 32.7 billion in 2015 and 2014 respectively, as described above.

2) The sensitivity which is reflected in this line, relates to the carrying amount of assets subject to impairment assessment under IAS 36. Exploration and evaluation assets accounted for under IFRS 6 are not included.

The information in the table above is for indicative purposes only. A significant and prolonged decline in commodity prices would affect other assumptions, e.g. cost level, currency etc. A general decline in commodity price assumptions of 20% would result in mitigating actions by Statoil by optimising the respective business plans in order to reduce the exposure to changes in the macro environment. Considering the substantial uncertainties related to other relevant assumptions that would be triggered by a significant and prolonged decline in commodity price forecasts, Statoil does not disclose the expected impairment amount.

12 Intangible assets

(in NOK billion)	Exploration expenses	Acquisition costs - oil and gas prospects	Goodwill	Other	Total
Cost at 31 December 2014	22.9	53.4	12.1	3.4	91.8

Accumulated depreciation and impairment losses at 31 December 2014			(5.2)	(1.4)	(6.6)
Carrying amount at 31 December 2014	22.9	53.4	6.9	2.0	85.2

The useful lives of intangible assets are assessed to be either finite or indefinite. Intangible assets with finite useful lives are amortised systematically over their estimated economic lives, ranging between 10-20 years.

During 2015, intangible assets were impacted by impairments of acquisition costs related to exploration activities of NOK 5.6 billion primarily as a result from dry wells and uncommercial discoveries in Angola and the Gulf of Mexico. Additionally, Statoil recognised impairments of NOK 9.8 billion primarily related to unconventional onshore assets in USA and goodwill related to US onshore assets of NOK 4.2 billion.

Impairment losses and reversals of impairment losses are presented as *Exploration expenses* and *Depreciation, amortisation and net impairment losses* on the basis of their nature as exploration assets (intangible assets) and other intangible assets, respectively. The impairment losses and reversal of impairment losses are based on recoverable amount estimates triggered by changes in reserve estimates, cost estimates and market conditions. See note 11 *Property, plant and equipment* for more information on the basis for impairment assessments.

The table below shows the aging of capitalised exploration expenditures.

(in NOK billion)	2015	2014
Less than one year	12.8	9.2
Between one and five years	16.9	11.4
More than five years	2.9	2.3
Total	32.6	22.9

The table below shows the components of the exploration expenses.

(in NOK billion)	2015	2014	Full year 2013
Exploration expenditures	23.1	23.9	21.8
Expensed exploration expenditures previously capitalised	17.1	13.7	3.1
Capitalised exploration	(9.2)	(7.3)	(6.9)
Exploration expenses	31.0	30.3	18.0

13 Financial investments and non-current prepayments

Non-current financial investments

(in NOK billion)	2015	At 31 December 2014
Bonds	12.4	11.6
Listed equity securities	6.3	6.6
Non-listed equity securities	1.8	1.4
Financial investments	20.6	19.6

Bonds and listed equity securities relate to investment portfolios which are held by Statoil's captive insurance company and accounted for using the fair value option.

Non-current prepayments and financial receivables

(in NOK billion)	2015	At 31 December 2014
Financial receivables interest bearing	6.7	3.7
Prepayments and other non-interest bearing receivables	1.8	2.0
Prepayments and financial receivables	8.5	5.7

Financial receivables interest bearing primarily relate to project financing of equity accounted company and loans to employees.

Current financial investments

(in NOK billion)	2015	At 31 December 2014
Time deposits	19.1	9.8
Interest bearing securities	67.4	49.4
Financial investments	86.5	59.2

At 31 December 2015 current *Financial investments* include NOK 6.0 billion investment portfolios which are held by Statoil's captive insurance company and accounted for using the fair value option. The corresponding balance at 31 December 2014 was NOK 6.0 billion.

For information about financial instruments by category, see note 25 *Financial instruments: fair value measurement and sensitivity analysis of market risk.*

14 Inventories

(in NOK billion)	2015	At 31 December 2014
Crude oil	10.7	10.1
Petroleum products	5.1	6.0
Other	6.3	7.7
Inventories	22.0	23.7

Other inventory consists of natural gas, spare parts and operational materials, including drilling and well equipment.

The write-down of inventories from cost to net realisable value amounted to an expense of NOK 3.9 billion and NOK 4.0 billion in 2015 and 2014, respectively.

15 Trade and other receivables

(in NOK billion)	2015	At 31 December 2014
Trade receivables	39.3	57.8
Current financial receivables	6.5	6.9
Joint venture receivables	5.1	8.5
Equity accounted investments and other related party receivables	0.5	0.5
Total financial trade and other receivables	51.4	73.7
Non-financial trade and other receivables	7.4	9.6
Trade and other receivables	58.8	83.3

For more information about the credit quality of Statoil's counterparties, see note 5 *Financial risk management*. For currency sensitivities, see note 25 *Financial instruments: fair value measurement and sensitivity analysis of market risk*.

16 Cash and cash equivalents

(in NOK billion)	2015	At 31 December 2014
Cash at bank available	9.2	13.5
Time deposits	13.2	32.5
Money market funds	4.0	3.6
Interest bearing securities	44.8	30.6
Restricted cash, including margin deposits	4.8	2.9
Cash and cash equivalents	76.0	83.1

Restricted cash at 31 December 2015 and 2014 includes collateral deposits related to trading activities of NOK 3.6 billion and NOK 2.0 billion, respectively. Collateral deposits are related to certain requirements set out by exchanges where Statoil is participating. The terms and conditions related to these requirements are determined by the respective exchanges.

17 Shareholders' equity

At 31 December 2015 and 2014, Statoil's share capital of NOK 7,971,617,757.50 comprised 3,188,647,103 shares at a nominal value of NOK 2.50.

Statoil ASA has only one class of shares and all shares have voting rights. The holders of shares are entitled to receive dividends as and when declared and are entitled to one vote per share at general meetings of the company.

Dividends declared and paid per share were NOK 1.80 for each of the first two quarters of 2015. From and including the third quarter of 2015, dividend is declared in USD. Interim dividends of USD 0.2201 per share for the third quarter of 2015 were declared in the fourth quarter of 2015 and have been recognised as a liability in the Consolidated financial statements. This amount will be paid in the first quarter of 2016.

The board of directors will propose to the annual general meeting to maintain a dividend of USD 0.2201 per share for the fourth quarter 2015 and the introduction of a two-year scrip dividend programme starting from the fourth quarter 2015. The scrip programme will give shareholders the option to receive quarterly dividends in cash or in newly issued shares in Statoil, at a 5% discount for the fourth quarter 2015.

In 2014 dividends of NOK 7.20 were paid and NOK 7.00 for 2013.

During 2015 a total of 4,057,902 treasury shares were purchased for NOK 0.6 billion and 3,203,968 treasury shares were allocated to employees participating in the share saving plan. In 2014 a total of 3,381,488 treasury shares were purchased for NOK 0.6 billion and 2,960,972 treasury shares were allocated to employees participating in the share saving plan. At 31 December 2015 Statoil had 11,009,183 treasury shares and at 31 December 2014 10,155,249 treasury shares, all of which are related to Statoil's share saving plan. For further information, see note 6 *Remuneration*.

18 Finance debt

Capital management

The main objectives of Statoil's capital management policy are to maintain a strong financial position and to ensure sufficient financial flexibility. One of the key ratios in the assessment of Statoil's financial robustness is net interest-bearing debt adjusted (ND) to capital employed adjusted (CE).

(in NOK billion)	At 31 December 2015	2014
Net interest-bearing debt adjusted (ND)	129.9	95.6
Capital employed adjusted (CE)	485.0	476.7
Net debt to capital employed adjusted (ND/CE)	26.8%	20.0%

ND is defined as Statoil's interest bearing financial liabilities less cash and cash equivalents and current financial investments, adjusted for collateral deposits and balances held by Statoil's captive insurance company (an increase of NOK 9.6 billion and NOK 8.0 billion for 2015 and 2014, respectively), balances related to the SDFI (a decrease of NOK 1.9 billion and NOK 1.6 billion for 2015 and 2014, respectively) and project financing exposure that does not correlate to the underlying exposure (unchanged and decrease of NOK 0.1 billion for 2015 and 2014, respectively). CE is defined as Statoil's total equity (including non-controlling interests) and ND.

Non-current finance debt

Finance debt measured at amortised cost

	Weighted average interest rates in %[1]		Carrying amount in NOK billion at 31 December		Fair value in NOK billion at 31 December[2]	
	2015	2014	2015	2014	2015	2014
Unsecured bonds						
United States Dollar (USD)	3.51	3.50	182.9	154.4	190.5	165.0
Euro (EUR)	2.28	3.99	63.4	37.6	66.0	43.8
Great Britain Pound (GBP)	6.08	6.08	18.0	15.9	23.8	22.3
Norwegian kroner (NOK)	4.18	4.18	3.0	3.0	3.3	3.5
Total			267.3	210.9	283.7	234.7
Unsecured loans						
Japanese yen (JPY)	4.30	4.30	0.7	0.6	0.8	0.9
Secured bank loans						
United States Dollar (USD)	-	4.20	-	0.1	-	0.1
Norwegian kroner (NOK)	3.11	3.11	0.5	0.3	0.5	0.3
Finance lease liabilities			5.1	5.4	5.0	5.6
Total			6.3	6.5	6.3	6.9
Total finance debt			273.6	217.4	289.9	241.6
Less current portion			9.7	12.3	9.7	12.3
Non-current finance debt			264.0	205.1	280.2	229.3

1) Weighted average interest rates are calculated based on the contractual rates on the loans per currency at 31 December and do not include the effect of swap agreements.
2) The fair value of the non-current financial liabilities is determined using a discounted cash flow model and is classified at level 2 in the fair value hierarchy. Interest rates used in the model are derived from the LIBOR and EURIBOR forward curves and will vary based on the time to maturity for the non-current financial liabilities. The credit premium used is based on indicative pricing from external financial institutions.

Unsecured bonds amounting to NOK 182.9 billion are denominated in USD and unsecured bonds amounting to NOK 70.1 billion are swapped into USD. Two bonds denominated in EUR amounting to NOK 14.3 billion are not swapped. The table does not include the effects of agreements entered into to swap the various currencies into USD. For further information see note 25 *Financial instruments: fair value measurement and sensitivity analysis of market risk*.

Substantially all unsecured bond and unsecured bank loan agreements contain provisions restricting future pledging of assets to secure borrowings without granting a similar secured status to the existing bondholders and lenders.

The secured bank loan in NOK has been secured by real estate and land with a total book value of NOK 0.6 billion.

In 2015 Statoil issued the following bonds:

Issuance date	Amount in EUR billion	Interest rate in %	Maturity date
17 February 2015	1.00	1.625	February 2035
17 February 2015	1.25	1.250	February 2027
17 February 2015	1.00	0.875	February 2023
17 February 2015	0.50	floating	August 2019

Out of Statoil's total outstanding unsecured bond portfolio, 48 bond agreements contain provisions allowing Statoil to call the debt prior to its final redemption at par or at certain specified premiums if there are changes to the Norwegian tax laws. The carrying amount of these agreements is NOK 264 billion at the 31 December 2015 closing exchange rate.

For more information about the revolving credit facility, maturity profile for undiscounted cash flows and interest rate risk management, see note 5 *Financial risk management*.

Non-current finance debt maturity profile

(in NOK billion)	2015	At 31 December 2014
Year 2 and 3	54.9	27.3
Year 4 and 5	43.0	44.2
After 5 years	166.1	133.5
Total repayment of non-current finance debt	264.0	205.1
Weighted average maturity (years)	9	9
Weighted average annual interest rate (%)	3.39	3.78

More information regarding finance lease liabilities is provided in note 22 *Leases*.

Current finance debt

(in NOK billion)	2015	At 31 December 2014
Collateral liabilities	10.2	12.9
Non-current finance debt due within one year	9.7	12.3
Other including bank overdraft	0.6	1.3
Total current finance debt	20.5	26.5
Weighted average interest rate (%)	1.90	2.12

Collateral liabilities relate mainly to cash received as security for a portion of Statoil's credit exposure.

19 Pensions

The Norwegian companies in the group are subject to the requirements of the Mandatory Company Pensions Act, and the company's pension scheme follows the requirements of the Act.

Statoil ASA and a number of its subsidiaries have defined contribution plans. The period's contributions are recognised in the Consolidated statement of income as pension cost for the period.

In 2014 Statoil ASA made a decision to change the company's main pension plan in Norway from a defined benefit plan to a defined contribution plan. The actual transitioning to the defined contribution plan took place in 2015. At the same time paid-up policies for the rights vested in the defined benefit plan were issued. Employees with less than 15 years of future service before their regular retirement age retained the existing defined benefit plans. For onshore employees between 37 and 51 years of age and offshore employees between 35 and 49 years of age a compensation plan has been established. The defined contribution plan in Norway is managed by an insurance company (Storebrand).

The new pension plans in Statoil ASA includes unfunded elements. These notional contribution plans are regulated equal to the return on asset for the main contribution plan and are valued at fair value and recognised as pension liabilities. See note 2 *Significant accounting policies* for more information about the accounting treatment of the notional contribution plans reported in Statoil ASA.

In addition to the closed pension plans in Statoil ASA, some of its subsidiaries have defined benefit plans. The defined benefit plans in Norway are managed and financed through Statoil Pensjon (Statoil's pension fund - hereafter "Statoil Pension"). Statoil Pension is an independent pension fund that covers the employees in Statoil's Norwegian companies. The purpose of Statoil Pension is to provide retirement and disability pension to members and survivor's pension to spouses, registered partners, cohabitants and children. The pension fund's assets are kept separate from the company's and group companies' assets. Statoil Pension is supervised by the Financial Supervisory Authority of Norway ("Finanstilsynet") and is licensed to operate as a pension fund.

The Norwegian National Insurance Scheme ("Folketrygden") provides pension payments (social security) to all retired Norwegian citizens. Such payments are calculated by references to a base amount ("Grunnbeløpet" or "G") annually approved by the Norwegian Parliament. Statoil's plan benefits are generally based on a minimum of 30 years of service and 66% of the final salary level, including an assumed benefit from the Norwegian National Insurance Scheme.

Due to national agreements in Norway, Statoil is a member of both the previous agreement-based early retirement plan ("AFP") and the AFP scheme applicable from 1 January 2011. Statoil paid a premium for both AFP schemes until 31 December 2015. After that date, premiums are only due on the latest AFP scheme. The premium in the latest scheme is calculated on the basis of the employees' income between 1 and 7.1 G. The premium is payable for all employees until age 62. Pension from the latest AFP scheme will be paid from the AFP plan administrator to employees for their full lifetime. Statoil has determined that its obligations under this multi-employer defined benefit plan can be estimated with sufficient reliability for recognition purposes. Accordingly, the estimated proportionate share of the latest AFP plan has been recognised as a defined benefit obligation.

The present values of the defined benefit obligation, except for the notional contribution plan, and the related current service cost and past service cost are measured using the projected unit credit method. The assumptions for salary increases, increases in pension payments and social security base amount are based on agreed regulation in the plans, historical observations, future expectations of the assumptions and the relationship between these assumptions. At 31 December 2015 the discount rate for the defined benefit plans in Norway was established on the basis of seven years' mortgage covered bonds interest rate extrapolated on a yield curve which matches the duration of Statoil's payment portfolio for earned benefits.

Social security tax is calculated based on a pension plan's net funded status and is included in the defined benefit obligation.

Statoil has more than one defined benefit plan, but the disclosure is made in total since the plans are not subject to materially different risks. Pension plans outside Norway are not material and as such not disclosed separately.

Net pension cost

(in NOK billion)	2015	2014	2013
Current service cost	3.0	4.7	4.0
Interest cost	1.5	3.1	2.5
Interest (income) on plan asset	(1.2)	(2.6)	(2.1)
Losses (gains) from curtailment, settlement or plan amendment	2.0	(1.9)	0.0[1)]
Actuarial (gains) losses related to termination benefits	(0.0)	(0.2)	0.0
Notional contributions	0.3	0.0	0.0
Defined benefit plans	5.7	3.2	4.4
Defined contribution plans	1.1	0.2	0.2
Total net pension cost	6.8	3.4	4.6

1) In 2015 and 2014 Statoil ASA offered early retirement (termination benefits) to a defined group of employees above the age of 58 years. The expenses of NOK 1.4 billion and NOK 1.6 billion respectively were recognised in the Consolidated statement of income. In addition, a plan amendment effect related to the changed pension scheme in Norway resulted in a recognition in the Consolidated statement of income of a loss of NOK 0.6 billion in 2015 and a gain of NOK 3.5 billion in 2014. The plan amendment effect was recalculated in 2015 due to actual transitioning from a defined benefit to a defined contribution plan took place in 2015 and all information was not available when calculating the effect in 2014.

Pension cost includes associated social security tax and is partly charged to partners of Statoil operated licences.

(in NOK billion)	2015	2014
Defined benefit obligations (DBO)		
Defined benefit obligations at 1 January	65.0	79.4
Current service cost	3.0	4.7
Interest cost	1.5	3.1
Actuarial (gains) losses - Demographic assumptions	0.0	(0.1)
Actuarial (gains) losses - Financial assumptions	(6.0)	4.8
Actuarial (gains) losses - Experience	(3.1)	(2.1)
Benefits paid	(1.9)	(2.0)
Losses (gains) from curtailment, settlement or plan amendment[1)]	2.2	(2.9)
Paid-up policies	(1.2)	(20.4)
Foreign currency translation	0.3	0.3
Changes in notional contribution liability	0.3	0.0
Defined benefit obligations at 31 December	60.1	65.0
Fair value of plan assets		
Fair value of plan assets at 1 January	45.1	62.3
Interest income	1.2	2.6
Return on plan assets (excluding interest income)	0.6	0.9
Company contributions	0.3	0.1
Benefits paid	(0.6)	(0.7)
Paid-up policies and personal insurance	(1.7)	(20.4)
Foreign currency translation	0.3	0.3
Fair value of plan assets at 31 December	45.2	45.1
Net pension liability at 31 December	(14.9)	(19.9)
Represented by:		
Asset recognised as non-current pension assets (funded plan)	11.3	8.0
Liability recognised as non-current pension liabilities (unfunded plans)	(26.2)	(27.9)
DBO specified by funded and unfunded pension plans	60.1	65.0
Funded	33.9	37.2
Unfunded	26.2	27.9
Actual return on assets	1.8	3.5

1) A loss of NOK 0.1 billion in 2015 and a gain of NOK 0.9 billion in 2014, related to the plan amendment, has been recognised against *Property, plant and equipment*.

As part of the change of Statoil ASA's main pension plan in Norway the estimated assets related to paid-up policies and personal insurance (new disability pension and children pension from 2015) and liabilities related to paid-up policies have been excluded from the amounts in the table above.

Actuarial losses and gains recognised directly in Other comprehensive income (OCI)

(in NOK billion)	2015	2014	2013
Net actuarial (losses) gains recognised in OCI during the year	9.7	0.2	(5.5)
Actuarial (losses) gains related to currency effects on net obligation and foreign exchange translation	0.4	(0.2)	(0.4)
Tax effects of actuarial (losses) gains recognised in OCI	(2.8)	0.9	1.2
Recognised directly in OCI during the year net of tax	7.3	0.9	(4.7)
Cumulative actuarial (losses) gains recognised directly in OCI net of tax	(7.2)	(14.5)	(15.4)

The net actuarial gain in 2015 is mainly related to an updated assessment of the discount rate and expected rate of pension increase to be used for pension obligations in Norway.

The line item net actuarial (losses) gains recognised in OCI during the year in 2014 includes actuarial loss charged to partners of Statoil operated licences.

The line item actuarial (losses) gains related to currency effects on net obligation and foreign exchange translation includes the translation of the net pension obligation in NOK to the functional currency USD for the parent company, Statoil ASA, and the translation of the net pension obligation from the functional currency USD to Statoil's presentation currency NOK.

Actuarial assumptions

	Assumptions used to determine benefit costs in %		Assumptions used to determine benefit obligations in %	
	2015	2014	2015	2014
Discount rate	2.50	4.00	2.75	2.50
Rate of compensation increase	2.25	3.50	2.25	2.25
Expected rate of pension increase	1.50	2.50	1.00	1.50
Expected increase of social security base amount (G-amount)	2.25	3.25	2.25	2.25
Weighted-average duration of the defined benefit obligation			17.1	19.1

The assumptions presented are for the Norwegian companies in Statoil which are members of Statoil's pension fund. The defined benefit plans of other subsidiaries are immaterial to the consolidated pension assets and liabilities.

Expected attrition at 31 December 2015 was 0.4% and 0.1% for employees between 50-59 years and 60-67 years, respectively. Expected attrition at 31 December 2014 was 2.1%, 2.2%, 1.3%, 0.5% and 0.2% for the employees under 30 years, 30-39 years, 40-49 years, 50-59 years and 60-67 years, respectively.

For population in Norway, the mortality table K2013, issued by The Financial Supervisory Authority of Norway, is used as the best mortality estimate.

Disability tables for plans in Norway developed by the actuary were implemented in 2013 and represent the best estimate to use for plans in Norway.

Sensitivity analysis

The table below presents an estimate of the potential effects of changes in the key assumptions for the defined benefit plans. The following estimates are based on facts and circumstances as of 31 December 2015. Actual results may materially deviate from these estimates.

	Discount rate		Expected rate of compensation increase		Expected rate of pension increase		Mortality assumption	
(in NOK billion)	0.50%	-0.50%	0.50%	-0.50%	0.50%	-0.50%	+ 1 year	- 1 year
Changes in:								
Defined benefit obligation at 31 December 2015	(4.3)	5.0	1.1	(1.0)	3.5	(3.1)	2.0	(2.2)
Service cost 2016	(0.2)	0.2	0.1	(0.0)	0.1	(0.1)	0.1	(0.1)

The sensitivity of the financial results to each of the key assumptions has been estimated based on the assumption that all other factors would remain unchanged. The estimated effects on the financial result would differ from those that would actually appear in the Consolidated financial statements because the Consolidated financial statements would also reflect the relationship between these assumptions.

Pension assets
The plan assets related to the defined benefit plans were measured at fair value. Statoil Pension invests in both financial assets and real estate.

Real estate properties owned by Statoil Pension amounted to NOK 3.4 billion and NOK 3.2 billion of total pension assets at 31 December 2015 and 2014, respectively, and are rented to Statoil companies.

The table below presents the portfolio weighting as approved by the board of Statoil Pension for 2015. The portfolio weight during a year will depend on the risk capacity.

(in %)	Pension assets on investments classes 2015	2014	Target portfolio weight
Equity securities	38.3	40.1	31 - 43
Bonds	40.3	38.7	36 - 48
Money market instruments	14.9	13.4	0 - 29
Real estate	5.0	4.8	5 - 10
Other assets	1.5	3.0	
Total	100.0	100.0	

In 2015 100% of the equity securities, 38% of bonds and 100% of money market instruments had quoted market prices in an active market (level 1). In 2014 100% of the equity securities, 38% of bonds and 86% of money market instruments had quoted market prices in an active market. Statoil does not have any equity securities, bonds or money market instruments classified in level 3. Real Estate is classified as level 3. For definition of the various levels, see note 25 *Financial instruments: fair value measurement and sensitivity analysis of market risk*.

No company contribution is expected to be paid to Statoil Pension in 2016.

20 Provisions

(in NOK billion)	Asset retirement obligations	Claims and litigations	Other provisions	Total
Non-current portion at 31 December 2014	107.4	3.5	6.3	117.2
Current portion at 31 December 2014 reported as trade and other payables	1.4	13.6	2.1	17.0
Provisions at 31 December 2014	108.8	17.1	8.4	134.2
New or increased provisions	4.2	6.1	4.4	14.8
Decrease in the estimates	(16.2)	(2.2)	(3.3)	(21.7)
Amounts charged against provisions	(2.2)	(4.6)	(0.9)	(7.7)
Effects of change in the discount rate	(6.8)	0.0	(0.1)	(7.0)
Reduction due to divestments	(1.0)	0.0	(0.1)	(1.1)
Accretion expenses	3.9	0.0	0.0	3.9
Reclassification and transfer	(0.6)	0.0	(0.3)	(0.8)
Currency translation	4.8	2.7	0.9	8.4
Provisions at 31 December 2015	95.0	19.1	9.0	123.0
Current portion at 31 December 2015 reported as trade and other payables	1.3	9.2	2.8	13.4
Long term interest bearing provisions at 31 December 2015 reported as finance debt	0.0	0.0	0.2	0.2
Non-current portion at 31 December 2015	93.7	9.8	6.0	109.4

Expected timing of cash outflows

(in NOK billion)	Asset retirement obligations	Other provisions, including claims and litigations	Total
2016 - 2020	12.2	24.7	36.9
2021 - 2025	16.9	0.8	17.7
2026 - 2030	16.1	0.2	16.3
2031 - 2035	25.5	0.7	26.3
Thereafter	24.2	1.6	25.8
At 31 December 2015	95.0	28.1	123.0

Statoil's estimated asset retirement obligations (ARO) have reduced mainly due to a reduction in cost estimates for plugging and abandonment. Changes in ARO are reflected within *Property, plant and equipment* and *Provisions* in the Consolidated balance sheet. The timing of cash outflows related to ARO primarily depends on when the production ceases at the various facilities.

The claims and litigations category mainly relates to expected payments on unresolved claims. The timing and amounts of potential settlements in respect of these are uncertain and dependent on various factors that are outside management's control.

See also comments on provisions in note 23 *Other commitments, contingent liabilities and contingent assets.*

The other provisions category relates to expected payments on onerous contracts, cancellation fees and other.

For further information of methods applied and estimates required, see note 2 *Significant accounting policies*.

21 Trade and other payables

(in NOK billion)	2015	At 31 December 2014
Trade payables	18.1	21.8
Non-trade payables and accrued expenses	20.8	25.2
Joint venture payables	22.8	28.9
Equity accounted investments and other related party payables	5.5	6.6
Total financial trade and other payables	67.2	82.5
Current portion of provisions and other payables	15.0	18.1
Trade and other payables	82.2	100.7

Included in current portion of provisions and other payables are certain provisions that are further described in note 23 *Other commitments, contingent liabilities and contingent assets.* For information regarding currency sensitivities, see note 25 *Financial instruments: fair value measurement and sensitivity analysis of market risk*. For further information on payables to equity accounted investments and other related parties, see note 24 *Related parties*.

22 Leases

Statoil leases certain assets, notably drilling rigs, vessels and office buildings.

In 2015, net rental expenditures were NOK 27.7 billion (NOK 22.9 billion in 2014 and NOK 17.4 billion in 2013) consisting of minimum lease payments of NOK 32.6 billion (NOK 28.4 billion in 2014 and NOK 21.2 billion in 2013) reduced with sublease payments received of NOK 4.9 billion (NOK 5.5 billion in 2014 and NOK 3.8 billion in 2013). Net rental expenditures in 2015 include rig cancellation payments of NOK 1.6 billion. No material contingent rent payments have been expensed in 2015, 2014 or 2013.

The information in the table below shows future minimum lease payments due and receivable under non-cancellable operating leases at 31 December 2015:

	Operating leases					
(in NOK billion)	Rigs	Vessels	Other	Total	Sublease	Net total
2016	18.2	5.0	2.4	25.6	(2.6)	23.0
2017	11.1	3.8	1.8	16.7	(0.9)	15.8
2018	7.3	3.2	1.6	12.1	(0.7)	11.3
2019	6.1	2.5	1.3	9.9	(0.7)	9.2
2020	4.2	2.2	1.3	7.8	(0.7)	7.0
Thereafter	9.0	6.6	12.2	27.8	(1.4)	26.4
Total future minimum lease payments	55.9	23.3	20.6	99.8	(7.1)	92.7

Statoil had certain operating lease contracts for drilling rigs at 31 December 2015. The remaining significant contracts' terms range from one month to eight years. Certain contracts contain renewal options. Rig lease agreements are for the most part based on fixed day rates. Certain rigs have been subleased in whole or for part of the lease term mainly to Statoil operated licenses on the Norwegian continental shelf. These leases are shown gross as operating leases in the table above.

Statoil has a long-term time charter agreement with Teekay for offshore loading and transportation in the North Sea. The contract covers the lifetime of applicable producing fields and at year end 2015 includes three crude tankers. The contract's estimated nominal amount was approximately NOK 7.0 billion at year end 2015, and it is included in the category vessels in the table above.

The category other includes future minimum lease payments to related parties of NOK 4.3 billion regarding the lease of one office building located in Bergen and owned by Statoil`s pension fund ("Statoil Pension"). These operating lease commitments extend to the year 2034. NOK 3.2 billion of the total is payable after 2020.

Statoil had finance lease liabilities of NOK 4.9 billion at 31 December 2015. The nominal minimum lease payments related to these finance leases amount to NOK 6.5 billion. *Property, plant and equipment* includes NOK 6.8 billion for finance leases that have been capitalised at year end (NOK 5.7 billion in 2014), mainly presented in the category machinery, equipment and transportation equipment, including vessels in note 11 *Property, plant and equipment*.

23 Other commitments, contingent liabilities and contingent assets

Contractual commitments

Statoil had contractual commitments of NOK 62.3 billion at 31 December 2015. The contractual commitments reflect Statoil's share and mainly comprise construction and acquisition of property, plant and equipment.

As a condition for being awarded oil and gas exploration and production licences, participants may be committed to drill a certain number of wells. At the end of 2015, Statoil was committed to participate in 32 offshore wells, with an average ownership interest of approximately 33%. Statoil's share of estimated expenditures to drill these wells amounts to NOK 7.7 billion. Additional wells that Statoil may become committed to participating in depending on future discoveries in certain licences are not included in these numbers.

Other long-term commitments

Statoil has entered into various long-term agreements for pipeline transportation as well as terminal use, processing, storage and entry/exit capacity commitments and commitments related to specific purchase agreements. The agreements ensure the rights to the capacity or volumes in question, but also impose on Statoil the obligation to pay for the agreed-upon service or commodity, irrespective of actual use. The contracts' terms vary, with durations of up to 30 years.

Take-or-pay contracts for the purchase of commodity quantities are only included in the table below if their contractually agreed pricing is of a nature that will or may deviate from the obtainable market prices for the commodity at the time of delivery.

Obligations payable by Statoil to entities accounted for as associates and joint ventures are included gross in the table below. Obligations payable by Statoil to entities accounted for as joint operations (for example pipelines) are included net (i.e. gross commitment less Statoil's ownership share).

Nominal minimum other long-term commitments at 31 December 2015:

(in NOK billion)	
2016	13.5
2017	12.8
2018	11.8
2019	12.2
2020	10.9
Thereafter	77.9
Total	139.1

Of the reported other long-term commitments, NOK 17.5 billion relates to pipeline commitments where the construction of these pipelines is pending governmental approval.

Contingent liabilities and contingent assets

During the annual audits of Statoil's participation in Block 4, Block 15, Block 17 and Block 31 offshore Angola, the Angolan Ministry of Finance has assessed additional profit oil and taxes due on the basis of activities that currently include the years 2002 up to and including 2012. Statoil disputes the assessments and is pursuing these matters in accordance with relevant Angolan legal and administrative procedures. On the basis of the assessments and continued activity on the four blocks up to and including 2015, the exposure for Statoil at year end 2015 is estimated to NOK 11.6 billion (USD 1.3 billion), the most significant part of which relates to profit oil elements. Statoil has provided in the Consolidated financial statements for its best estimate related to the assessments, reflected in the Consolidated statement of income mainly as a revenue reduction, with additional amounts reflected as interest expenses and tax expenses, respectively.

Through its ownership in OML 128 in Nigeria, Statoil is party to an ownership interest redetermination process for the Agbami field. In October 2015, Statoil received the Expert's final ruling which implies a reduction of 5.17 percentage points in Statoil's equity interest in the field. Statoil had previously initiated arbitration proceedings to set aside interim decisions made by the Expert, but this was declined by the arbitration tribunal in its November 2015 judgment. Statoil has initiated proceedings before the Federal High Court in Lagos to set aside the arbitration award and also intends to initiate a new arbitration to set aside the Expert's final ruling. As of 31 December 2015, Statoil has recognised a provision of NOK 9.5 billion (USD 1.1 billion), net of tax, which reflects a reduction of 5.17 percentage points in Statoil's equity interest in the Agbami field. The provision is reflected within *Provisions* in the Consolidated balance sheet.

Some long-term gas sales agreements contain price review clauses. Certain counterparties have requested arbitration in connection with price review claims. The related exposure for Statoil has been estimated to an amount equivalent to approximately NOK 3.6 billion for gas delivered prior to year end 2015. Statoil has provided for its best estimate related to these contractual gas price disputes in the Consolidated financial statements, with the impact to the Consolidated statement of income reflected as revenue adjustments.

There is a dispute between the Nigerian National Petroleum Corporation (NNPC) and the partners (Contractor) in Oil Mining Lease (OML) 128 of the unitised Agbami field concerning interpretation of the terms of the OML 128 Production Sharing Contract (PSC). The dispute relates to the allocation between NNPC and Contractor of cost oil, tax oil and profit oil volumes. NNPC has claimed that since the start of production from Agbami, Contractor has lifted excess volumes compared to the PSC terms, and consequently NNPC has increased its lifting of oil. The Contractor disputed NNPC's position and initiated arbitration in the matter in accordance with the terms of the PSC. In 2015 the Arbitral Tribunal ruled in favour of Contractor's interpretation of the PSC on the main points. The Contractor is currently proceeding to enforce the favourable decision by the means available in the Nigerian legal system, while NNPC on its hand has initiated litigation concerning certain objections to the arbitration award. The Nigerian Federal Inland Revenue Service is also contesting the legality of the arbitration process as far as resolving tax related disputes goes, and is actively pursuing this view through the channels of the Nigerian legal system. Statoil's stake in the dispute at year end 2015 is mainly related to oil volumes previously lifted by NNPC contrary to the PSC terms. NNPC has so far kept on its overlifting contrary to the award. Following the arbitration award, Statoil's previous provision related to NNPC's claim has been reversed with the effect mainly reflected as revenue in the Consolidated statement of income.

In 2014, following a regular review process of Statoil's 2012 Consolidated financial statements, the Financial Supervisory Authority of Norway (the FSA) ordered Statoil to: "*Change its future accounting practices for redetermination of CGUs containing onerous contracts. Correct the described error by establishing a separate onerous contract provision for the Cove Point capacity contract in a financial period prior to Q1 2013. The correction shall be presented in the next periodic financial report. Information about the circumstances shall be given in notes to the accounts*." Statoil appealed the order and has been granted a stay in carrying out the FSA's order pending the final outcome of the appeal. The appeal is currently being assessed by the Norwegian Ministry of Finance and not yet concluded. If the outcome of the appeal would require implementing the FSA's order, a provision would be recognised against *Net operating income* in an earlier reporting period than 2013. As the contracts were fully provided for in 2013, there would be no impact on equity at 31 December 2013 or thereafter. The actual amount to be provided in an earlier period would depend on the period in which the provision would be recorded. The FSA order does not specify which period prior to the first quarter 2013 would be relevant for the provision to be recognised. Statoil's reading is that 2011 would be most relevant. There would be no impact on the 2015 and 2014 financial statements, however, the comparative amounts included therein for 2013 *Net operating income* and *Net income* would be NOK 5.6 billion and NOK 5.0 billion higher, respectively.

During the normal course of its business, Statoil is involved in legal proceedings, and several other unresolved claims are currently outstanding. The ultimate liability or asset, in respect of such litigation and claims cannot be determined at this time. Statoil has provided in its Consolidated financial statements for probable liabilities related to litigation and claims based on its best estimate. Statoil does not expect that its financial position, results of operations or cash flows will be materially affected by the resolution of these legal proceedings.

Statoil is actively pursuing the above disputes through the contractual and legal means available in each case, but the timing of the ultimate resolutions and related cash flows, if any, cannot at present be determined with sufficient reliability.

Provisions related to claims are reflected within note 20 *Provisions*.

24 Related parties

Transactions with the Norwegian State
The Norwegian State is the majority shareholder of Statoil and also holds major investments in other Norwegian companies. As of 31 December 2015 the Norwegian State had an ownership interest in Statoil of 67.0% (excluding Folketrygdfondet, the Norwegian national insurance fund, of 3.2%). This ownership structure means that Statoil participates in transactions with many parties that are under a common ownership structure and therefore meet the definition of a related party. All transactions are considered to be on an arm's length basis.

Total purchases of oil and natural gas liquids from the Norwegian State amounted to NOK 60.0 billion, NOK 86.4 billion and NOK 92.5 billion in 2015, 2014 and 2013, respectively. Total purchases of natural gas regarding the Tjeldbergodden methanol plant from the Norwegian State amounted to NOK 0.6 billion, NOK 0.5 billion and NOK 0.5 billion in 2015, 2014 and 2013, respectively. In addition, Statoil ASA sells in its own name, but for the Norwegian State's account and risk, the Norwegian State's gas production. These transactions are presented net. For further information please see note 2 *Significant accounting policies*. The most significant items included in the line item equity accounted investments and other related party payables in note 21 *Trade and other payables*, are amounts payable to the Norwegian State for these purchases.

Other transactions
In relation to its ordinary business operations Statoil enters into contracts such as pipeline transport, gas storage and processing of petroleum products, with companies in which Statoil has ownership interests. Such transactions are carried out on an arm's length basis and are included within the applicable captions in the Consolidated statement of income. Gassled and certain other infrastructure assets are operated by Gassco AS, which is an entity under common control by the Norwegian Ministry of Petroleum and Energy. Gassco's activities are performed on behalf of and for the risk and reward of pipeline and terminal owners, and capacity payments flow through Gassco to the respective owners. Statoil payments that flowed through Gassco in this respect amounted to NOK 7.2 billion, NOK 7.4 billion and NOK 7.3 billion in 2015, 2014 and 2013, respectively.

For information concerning certain lease arrangements with Statoil Pension, see note 22 *Leases*.

Related party transactions with management are presented in note 6 *Remuneration.* Management remuneration for 2015 is presented in note 5 *Remuneration* in the financial statements of the parent company, Statoil ASA.

25 Financial instruments: fair value measurement and sensitivity analysis of market risk

Financial instruments by category

The following tables present Statoil's classes of financial instruments and their carrying amounts by the categories as they are defined in IAS 39 *Financial Instruments: Recognition and Measurement*. All financial instruments' carrying amounts are measured at fair value or their carrying amounts reasonably approximate fair value except non-current financial liabilities. See note 18 *Finance debt* for fair value information of non-current bonds, bank loans and finance lease liabilities.

See note 2 *Significant accounting policies* for further information regarding measurement of fair values.

				Fair value through profit or loss			
(in NOK billion)	Note	Loans and receivables	Available for sale	Held for trading	Fair value option	Non-financial assets	Total carrying amount
At 31 December 2015

Fair value hierarchy

The following table summarises each class of financial instruments which are recognised in the Consolidated balance sheet at fair value, split by Statoil's basis for fair value measurement.

(in NOK billion)	Non-current financial investments	Non-current derivative financial instruments - assets	Current financial investments	Current derivative financial instruments - assets	Cash equivalents	Non-current derivative financial instruments - liabilities	Current derivative financial instruments - liabilities	Net fair value
At 31 December 2015								
Level 1	10.5	0.0	4.8	0.0	0.0	0.0	0.0	15.3
Level 2	8.2	15.5	62.6	4.3	48.8	(10.8)	(2.3)	126.3
Level 3	1.8	8.3	0.0	0.4	0.0	(0.5)	0.0	10.1
Total fair value	20.6	23.8	67.4	4.8	48.8	(11.3)	(2.3)	151.7
At 31 December 2014								
Level 1	11.1	0.0	4.0	0.0	0.0	0.0	0.0	15.1
Level 2	7.0	17.2	45.5	4.7	34.2	(4.5)	(6.6)	97.4
Level 3	1.4	12.7	0.0	0.6	0.0	0.0	(0.0)	14.7
Total fair value	19.6	29.9	49.4	5.3	34.2	(4.5)	(6.6)	127.3

Level 1, fair value based on prices quoted in an active market for identical assets or liabilities, includes financial instruments actively traded and for which the values recognised in the Consolidated balance sheet are determined based on observable prices on identical instruments. For Statoil this category will, in most cases, only be relevant for investments in listed equity securities and government bonds.

Level 2, fair value based on inputs other than quoted prices included within level 1, which are derived from observable market transactions, includes Statoil's non-standardised contracts for which fair values are determined on the basis of price inputs from observable market transactions. This will typically be when

Statoil uses forward prices on crude oil, natural gas, interest rates and foreign exchange rates as inputs to the valuation models to determining the fair value of its derivative financial instruments.

Level 3, fair value based on unobservable inputs, includes financial instruments for which fair values are determined on the basis of input and assumptions that are not from observable market transactions. The fair values presented in this category are mainly based on internal assumptions. The internal assumptions are only used in the absence of quoted prices from an active market or other observable price inputs for the financial instruments subject to the valuation.

The fair value of certain earn-out agreements and embedded derivative contracts are determined by the use of valuation techniques with price inputs from observable market transactions as well as internally generated price assumptions and volume profiles. The discount rate used in the valuation is a risk-free rate based on the applicable currency and time horizon of the underlying cash flows adjusted for a credit premium to reflect either Statoil's credit premium, if the value is a liability, or an estimated counterparty credit premium if the value is an asset. In addition a risk premium for risk elements not adjusted for in the cash flow may be included when applicable. The fair values of these derivative financial instruments have been classified in their entirety in the third category within current derivative financial instruments and non-current derivative financial instruments - assets in the table above. Another reasonable assumption, that could have been applied when determining the fair value of these contracts, would be to extrapolate the last observed forward prices with inflation. If Statoil had applied this assumption, the fair value of the contracts included would have decreased by approximately NOK 4.6 billion at end of 2015 and decreased by NOK 3.5 billion at end of 2014 and impacted the Consolidated statement of income with corresponding amounts.

The reconciliation of the changes in fair value during 2015 and 2014 for all financial assets classified in the third level in the hierarchy are presented in the following table.

(in NOK billion)	Non-current financial investments	Non-current derivative financial instruments - assets	Current derivative financial instruments - assets	Non-current derivative financial instruments liabilities	Total amount
Full year 2015					
Opening balance	1.4	12.7	0.6	0.0	14.8

Opening balance	0.9	12.0	1.3	0.0	14.2
Total gains and losses recognised					
- in statement of income	(0.0)	0.3	0.6	0.0	0.9
- in other comprehensive income	0.0	0.0	0.0	0.0	0.0
Purchases	0.3	0.0	0.0	0.0	0.3
Sales	0.0	0.4	0.0	0.0	0.4
Settlement	(0.0)	0.0	(1.3)	0.0	(1.3)
Foreign currency translation differences	0.2	0.1	(0.0)	0.0	0.3
Closing balance	1.4	12.7	0.6	0.0	14.8

The assets within level 3 during 2015 have had a net decrease in the fair value of NOK 4.7 billion. Of the NOK 3.1 billion recognised in the Consolidated statement of income during 2015, NOK 2.8 billion is related to changes in fair value of certain earn-out agreements. Related to the same earn-out agreements, NOK 1.5 billion included in the opening balance for 2015 has been fully realised as the underlying volumes have been delivered during 2015 and the amount is presented as settled in the above table.

Substantially all gains and losses recognised in the Consolidated statement of income during 2015 are related to assets held at the end of 2015.

Sensitivity analysis of market risk

Commodity price risk

The table below contains the fair value and related commodity price risk sensitivities of Statoil's commodity based derivatives contracts. For further information related to the type of commodity risks and how Statoil manages these risks, see note 5 *Financial risk management*.

Statoil's assets and liabilities resulting from commodity based derivatives contracts consist of both exchange traded and non-exchange traded instruments, including embedded derivatives that have been bifurcated and recognised at fair value in the Consolidated balance sheet.

Price risk sensitivities at the end of 2015 have been calculated assuming a reasonably possible change of 30% in crude oil, refined products, electricity and natural gas prices. At the end of 2014 an assumption of 40% was used in the calculation and viewed as reasonable possible changes.

Since none of the derivative financial instruments included in the table below are part of hedging relationships, any changes in the fair value would be recognised in the Consolidated statement of income.

(in NOK billion)	- 30% sensitivity	30% sensitivity
At 31 December 2015		
Crude oil and refined products net gains (losses)	1.0	(0.6)
Natural gas and electricity net gains (losses)	3.0	(3.0)

(in NOK billion)	- 40% sensitivity	40% sensitivity
At 31 December 2014		
Crude oil and refined products net gains (losses)	(1.7)	1.8
Natural gas and electricity net gains (losses)	0.7	(0.7)

Currency risk

Currency risk constitutes significant financial risk for Statoil. In accordance with approved strategies and mandates total exposure is managed at a portfolio level on a regular basis. For further information related to the currency risk and how Statoil manages these risks, see note 5 *Financial risk management*.

The following currency risk sensitivity has been calculated by assuming an 11% reasonably possible change in the main foreign exchange rates that Statoil is exposed to. At the end of 2014 a change of 9% in the foreign exchange rates were viewed as reasonably possible changes. An increase in the foreign exchange rates means that the transaction currency has strengthened in value. The estimated gains and the estimated losses following from a change in the foreign exchange rates would impact the Consolidated statement of income.

(in NOK billion)	- 11% sensitivity	11% sensitivity
At 31 December 2015		
USD net gains (losses)	15.4	(15.4)
NOK net gains (losses)	(14.8)	14.8

(in NOK billion)	- 9% sensitivity	9% sensitivity
At 31 December 2014		
USD net gains (losses)	8.1	(8.1)
NOK net gains (losses)	(8.3)	8.3

Interest rate risk

Interest rate risk constitutes significant financial risk for Statoil. In accordance with approved strategies and mandates total exposure is managed at a portfolio level on a regular basis. For further information related to the interest risks and how Statoil manages these risks, see note 5 *Financial risk management*.

The following interest rate risk sensitivity has been calculated by assuming a change of 0.9 percentage points as reasonably possible changes in the interest rates at the end of 2015. At the end of 2014 a change of 0.8 percentage points in the interest rates was viewed as reasonably possible changes. The estimated gains following from a decrease in the interest rates and the estimated losses following from an interest rate increase would impact the Consolidated statement of income.

(in NOK billion)	- 0.9 percentage points sensitivity	0.9 percentage points sensitivity
At 31 December 2015		
Interest rate net gains (losses)	10.7	(10.7)

(in NOK billion)	- 0.8 percentage points sensitivity	0.8 percentage points sensitivity
At 31 December 2014		
Interest rate net gains (losses)	7.1	(7.1)

26 Condensed consolidated financial information related to guaranteed debt securities

Statoil Petroleum AS, a 100% owned subsidiary of Statoil ASA, is the co-obligor of certain existing debt securities of Statoil ASA that are registered under the US Securities Act of 1933 ("US registered debt securities"). As co-obligor, Statoil Petroleum AS fully, unconditionally and irrevocably assumes and agrees to perform, jointly and severally with Statoil ASA, the payment and covenant obligations for these US registered debt securities. In addition, Statoil ASA is also the co-obligor of a US registered debt security of Statoil Petroleum AS. As co-obligor, Statoil ASA fully, unconditionally and irrevocably assumes and agrees to perform, jointly and severally with Statoil Petroleum AS, the payment and covenant obligations of that security. In the future, Statoil ASA may from time to time issue future US registered debt securities for which Statoil Petroleum AS will be the co-obligor or guarantor.

The following financial information on a condensed consolidated basis provides financial information about Statoil ASA, as issuer and co-obligor, Statoil Petroleum AS, as co-obligor and guarantor, and all other subsidiaries as required by SEC Rule 3-10 of Regulation S-X. The condensed consolidated information is prepared in accordance with Statoil's IFRS accounting policies as described in note 2 *Significant accounting policies*, except that investments in subsidiaries and jointly controlled entities are accounted for using the equity method as required by Rule 3-10.

The following is condensed consolidated financial information for the full year 2015, 2014 and 2013, and as of 31 December 2015 and 2014.

27 Supplementary oil and gas information (unaudited)

In accordance with Financial Accounting Standards Board Accounting Standards Codification "Extractive Activities - Oil and Gas" (Topic 932), Statoil is reporting certain supplemental disclosures about oil and gas exploration and production operations. While this information is developed with reasonable care and disclosed in good faith, it is emphasised that some of the data is necessarily imprecise and represents only approximate amounts because of the subjective judgement involved in developing such information. Accordingly, this information may not necessarily represent the present financial condition of Statoil or its expected future results.

For further information regarding the reserves estimation requirement, see note 2 *Significant accounting policies* - Critical accounting judgements and key sources of estimation uncertainty - Proved oil and gas reserves.

No new events have occurred since 31 December 2015 that would result in a significant change in the estimated proved reserves or other figures reported as of that date.

The disputed equity determination at Agbami will potentially alter Statoil's equity share in this field. The effect on the proved reserves will be included once the redetermination is finalised and the effect is known.

Oil and gas reserve quantities
Statoil's oil and gas reserves have been estimated by its qualified professionals in accordance with industry standards under the requirements of the U.S. Securities and Exchange Commission (SEC), Rule 4-10 of Regulation S-X. Statements of reserves are forward-looking statements.

The determination of these reserves is part of an ongoing process subject to continual revision as additional information becomes available. Estimates of proved reserve quantities are imprecise and change over time as new information becomes available. Moreover, identified reserves and contingent resources that may become proved in the future are excluded from the calculations.

Statoil's proved reserves are recognised under various forms of contractual agreements, including production sharing agreements (PSAs) where Statoil's share of reserves can vary due to commodity prices or other factors. Reserves from agreements such as PSAs and buy back agreements are based on the volumes to which Statoil has access (cost oil and profit oil), limited to available market access. At 31 December 2015, 9% of total proved reserves were related to such agreements (15% of total oil, condensate and natural gas liquids (NGL) reserves and 3% of total gas reserves). This compares with 12% and 14% of total proved reserves for 2014 and 2013, respectively. Net entitlement oil and gas production from fields with such agreements was 104 million boe during 2015 (95 million boe for 2014 and 93 million boe for 2013). Statoil participates in such agreements in Algeria, Angola, Azerbaijan, Libya, Nigeria and Russia.

Statoil is recording, as proved reserves, volumes equivalent to our tax liabilities under negotiated fiscal arrangements (PSAs) where the tax is paid on behalf of Statoil. Reserves are net of royalty oil paid in kind and quantities consumed during production.

Rule 4-10 of Regulation S-X requires that the appraisal of reserves is based on existing economic conditions, including a 12-month average price prior to the end of the reporting period, unless prices are defined by contractual arrangements. The proved reserves at year end 2015 have been determined based on a Brent blend price equivalent of USD 54.17/bbl, compared to USD 101.27/bbl and USD 108.02/bbl for 2014 and 2013 respectively. The volume weighted average gas price for proved reserves at year end 2015 was 1.76 NOK/Sm3. The comparable gas price used to determine gas reserves at year end 2014 and 2013 was 1.90 NOK/Sm3 and 2.13 NOK/Sm3. The volume weighted average NGL price for proved reserves at year end 2015 was USD 30.56/boe. The corresponding NGL price used to determine NGL reserves at year end 2014 and 2013 was USD 57.03/boe and USD 62.32/boe. The significant decrease in commodity prices affects the profitable reserves to be recovered from accumulations resulting in reduced reserves. The negative revisions due to price are in general a result of earlier economic cut-off. For fields with a production-sharing type of agreement this is to some degree offset by higher entitlement to the reserves. These changes are all included in the revision category in the tables below, giving a net reduction of Statoil's proved reserves at year end.

From the Norwegian continental shelf (NCS), Statoil is responsible for managing, transporting and selling the Norwegian State's oil and gas on behalf of the Norwegian State's direct financial interest (SDFI). These reserves are sold in conjunction with the Statoil reserves. As part of this arrangement, Statoil delivers and sells gas to customers in accordance with various types of sales contracts on behalf of the SDFI. In order to fulfil the commitments, Statoil utilises a field supply schedule which provides the highest possible total value for the joint portfolio of oil and gas between Statoil and the SDFI.

Statoil and the SDFI receive income from the joint natural gas sales portfolio based upon their respective share in the supplied volumes. For sales of the SDFI natural gas, to Statoil and to third parties, the payment to the Norwegian State is based on achieved prices, a net back formula calculated price or market value. All of the Norwegian State's oil and NGL is acquired by Statoil. The price Statoil pays to the SDFI for the crude oil is based on market reflective prices. The prices for NGL are either based on achieved prices, market value or market reflective prices.

The regulations of the owner's instruction, as described above, may be changed or withdrawn by the Statoil ASA's general meeting. Due to this uncertainty and the Norwegian State's estimate of proved reserves not being available to Statoil, it is not possible to determine the total quantities to be purchased by Statoil under the owner's instruction.

Topic 932 requires the presentation of reserves and certain other supplemental oil and gas disclosures by geographical area, defined as country or continent containing 15% or more of total proved reserves. Norway contains 75% of total proved reserves at 31 December 2015 and no other country contains reserves approaching 15% of total proved reserves. Accordingly, management has determined that the most meaningful presentation of geographical areas would be Norway and the continents of Eurasia (excluding Norway), Africa and Americas.

The following tables reflect the estimated proved reserves of oil and gas at 31 December 2012 through 2015, and the changes therein.

The conversion rates used are 1 standard cubic meter = 35.3 standard cubic feet, 1 standard cubic meter oil equivalent = 6.29 barrels of oil equivalent (boe) and 1,000 standard cubic meter gas = 1 standard cubic meter oil equivalent.

Capitalised cost related to oil and gas producing activities

Consolidated companies

(in NOK billion)	2015	2014	At 31 December 2013
Unproved properties	117.5	97.5	83.8
Proved properties, wells, plants and other equipment	1,327.1	1,178.8	984.1
Total capitalised cost	1,444.6	1,276.3	1,068.0
Accumulated depreciation, impairment and amortisation	(873.1)	(687.2)	(543.7)
Net capitalised cost	571.5	589.1	524.3

Net capitalised cost related to equity accounted investments as of 31 December 2015 was NOK 8.8 billion, NOK 7.2 billion in 2014 and NOK 5.9 billion in 2013. The reported figures are based on capitalised costs within the upstream segments in Statoil, in line with the description below for result of operations for oil and gas producing activities.

Expenditures incurred in oil and gas property acquisition, exploration and development activities

These expenditures include both amounts capitalised and expensed.

Consolidated companies

(in NOK billion)	Norway	Eurasia excluding Norway	Africa	Americas	Total
Full year 2015					
Exploration expenditures	6.4	1.7	3.0	12.0	23.1

Expenditures incurred in development activities related to equity accounted investments was NOK 0.4 billion in 2015, NOK 1.6 billion in 2014 and NOK 0.4 billion in 2013.

Results of operation for oil and gas producing activities
As required by Topic 932, the revenues and expenses included in the following table reflect only those relating to the oil and gas producing operations of Statoil.

The result of operations for oil and gas producing activities contains the two upstream reporting segments Development and Production Norway (DPN) and Development and Production International (DPI) as presented in note 3 *Segments*. Production cost is based on operating expenses related to production of oil and gas. From the operating expenses certain expenses such as; transportation costs, accruals for over/underlift position, royalty payments and diluent costs are excluded. These expenses and mainly upstream business administration are included as other expenses in the tables below. Other revenues mainly consist of gains and losses from sales of oil and gas interests and gains and losses from commodity based derivatives within the upstream segments.

Income tax expense is calculated on the basis of statutory tax rates adjusted for uplift and tax credits. No deductions are made for interest or other elements not included in the table below.

Average production cost in NOK per boe based on entitlement volumes	Norway	Eurasia excluding Norway	Africa	Americas	Total
2015	47	79	61	62	52
2014	53	64	64	52	55
2013	50	53	59	46	51

Production cost per boe is calculated as the production costs in the result of operations table, divided by the produced entitlement volumes (mboe) for the corresponding period.

Standardised measure of discounted future net cash flows relating to proved oil and gas reserves

The table below shows the standardised measure of future net cash flows relating to proved reserves. The analysis is computed in accordance with Topic 932, by applying average market prices as defined by the SEC, year end costs, year end statutory tax rates and a discount factor of 10% to year end quantities of net proved reserves. The standardised measure of discounted future net cash flows is a forward-looking statement.

Future price changes are limited to those provided by existing contractual arrangements at the end of each reporting year. Future development and production costs are those estimated future expenditures necessary to develop and produce year-end estimated proved reserves based on year-end cost indices, assuming continuation of year-end economic conditions. Pre-tax future net cash flow is net of decommissioning and removal costs. Estimated future income taxes are calculated by applying the appropriate year-end statutory tax rates. These rates reflect allowable deductions and tax credits and are applied to estimated future pretax net cash flows, less the tax basis of related assets. Discounted future net cash flows are calculated using a discount rate of 10% per year. Discounting requires a year-by-year estimate of when future expenditures will be incurred and when reserves will be produced. The standardised measure of discounted future net cash flows prescribed under Topic 932 requires assumptions as to the timing and amount of future development and production costs and income from the production of proved reserves. The information does not represent management's estimate or Statoil's expected future cash flows or the value of its proved reserves and therefore should not be relied upon as an indication of Statoil's future cash flow or value of its proved reserves.

(in NOK billion)	Norway	Eurasia excluding Norway	Africa	Americas	Total

Changes in the standardised measure of discounted future net cash flows from proved reserves

(in NOK billion)	2015	2014	2013
Consolidated companies			
Standardised measure at beginning of year	289.8	288.6	252.8
Net change in sales and transfer prices and in production (lifting) costs related to future production	(313.7)	(98.3)	(24.0)
Changes in estimated future development costs	(4.5)	(32.3)	(54.9)
Sales and transfers of oil and gas produced during the period, net of production cost	(168.0)	(232.6)	(243.2)
Net change due to extensions, discoveries, and improved recovery	30.1	23.1	10.6
Net change due to purchases and sales of minerals in place	(7.4)	(25.1)	(33.9)
Net change due to revisions in quantity estimates	76.4	126.1	126.5
Previously estimated development costs incurred during the period	84.6	99.6	95.1
Accretion of discount	71.0	77.3	81.4
Net change in income taxes	145.7	63.3	78.2
Total change in the standardised measure during the year	(85.8)	1.2	35.8
Standardised measure at end of year	203.9	289.8	288.6
Equity accounted investments			
Standardised measure at end of year	1.1	5.1	4.8
Standardised measure at end of year including equity accounted investments	205.1	294.8	293.4

In the table above, each line item presents the sources of changes in the standardised measure value on a discounted basis, with the accretion of discount line item reflecting the increase in the net discounted value of the proved oil and gas reserves due to the fact that the future cash flows are now one year closer in time.

28 Subsequent events

In the first quarter of 2016 Statoil acquired 11.93% of the shares and votes in Lundin Petroleum AB for a total purchase price of SEK 4.6 billion. The shares will be accounted for as a non-current financial investment (available-for-sale) at fair value.

8.2 Report of Independent Registered Public Accounting firm

8.2.1 Report of Independent Registered Public Accounting firm

Report of Independent Registered Public Accounting Firm

To the board of directors and shareholders of Statoil ASA

We have audited the accompanying consolidated balance sheets of Statoil ASA and subsidiaries as of 31 December 2015 and 2014 and the related consolidated statements of income, comprehensive income, changes in equity and cash flows for each of the years in the three-year period ended 31 December 2015. These consolidated financial statements are the responsibility of Statoil ASA's management. Our responsibility is to express an opinion on these consolidated financial statements based on our audits.

We conducted our audits in accordance with the standards of the Public Company Accounting Oversight Board (United States). Those standards require that we plan and perform the audit to obtain reasonable assurance about whether the financial statements are free of material misstatement. An audit includes examining, on a test basis, evidence supporting the amounts and disclosures in the financial statements. An audit also includes assessing the accounting principles used and significant estimates made by management, as well as evaluating the overall financial statement presentation. We believe that our audits provide a reasonable basis for our opinion.

In our opinion, the consolidated financial statements referred to above present fairly, in all material respects, the consolidated financial position of Statoil ASA and subsidiaries as of 31 December 2015 and 2014, and the results of their operations and their cash flows for each of the years in the three-year period ended 31 December 2015, in conformity with International Financial Reporting Standards as issued by the International Accounting Standards Board and International Financial Reporting Standards as adopted by the European Union.

We also have audited, in accordance with the standards of the Public Company Accounting Oversight Board (United States), Statoil ASA's internal control over financial reporting as of 31 December 2015, based on criteria established in Internal Control - Integrated Framework (2013) issued by the Committee of Sponsoring Organizations of the Treadway Commission (COSO), and our report dated 9 March 2016 expressed an unqualified opinion on the effectiveness of Statoil ASA's internal control over financial reporting.

Trondheim, Norway
9 March 2016

8.2.2 Report of KPMG on Statoil's internal control over financial reporting

Report of Independent Registered Public Accounting Firm

To the board of directors and shareholders of Statoil ASA

We have audited Statoil ASA's internal control over financial reporting as of 31 December 2015, based on criteria established in *Internal Control — Integrated Framework (2013)* issued by the Committee of Sponsoring Organizations of the Treadway Commission (COSO). Statoil ASA's management is responsible for maintaining effective internal control over financial reporting and for its assessment of the effectiveness of internal control over financial reporting, included in the accompanying *Management's Report on Internal Control over Financial Reporting*. Our responsibility is to express an opinion on Statoil ASA's internal control over financial reporting based on our audit.

We conducted our audit in accordance with the standards of the Public Company Accounting Oversight Board (United States). Those standards require that we plan and perform the audit to obtain reasonable assurance about whether effective internal control over financial reporting was maintained in all material respects. Our audit included obtaining an understanding of internal control over financial reporting, assessing the risk that a material weakness exists, and testing and evaluating the design and operating effectiveness of internal control based on the assessed risk. Our audit also included performing such other procedures as we considered necessary in the circumstances. We believe that our audit provides a reasonable basis for our opinion.

A company's internal control over financial reporting is a process designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with generally accepted accounting principles. A company's internal control over financial reporting includes those policies and procedures that (1) pertain to the maintenance of records that, in reasonable detail, accurately and fairly reflect the transactions and dispositions of the assets of the company; (2) provide reasonable assurance that transactions are recorded as necessary to permit preparation of financial statements in accordance with generally accepted accounting principles, and that receipts and expenditures of the company are being made only in accordance with authorizations of management and directors of the company; and (3) provide reasonable assurance regarding prevention or timely detection of unauthorized acquisition, use, or disposition of the company's assets that could have a material effect on the financial statements.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements. Also, projections of any evaluation of effectiveness to future periods are subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

In our opinion, Statoil ASA maintained, in all material respects, effective internal control over financial reporting as of 31 December 2015, based on criteria established in *Internal Control — Integrated Framework (2013)* issued by the Committee of Sponsoring Organizations of the Treadway Commission (COSO).

We also have audited, in accordance with the standards of the Public Company Accounting Oversight Board (United States), the consolidated balance sheets of Statoil ASA and subsidiaries as of 31 December 2015 and 2014 and the related consolidated statements of income, comprehensive income, changes in equity and cash flows for each of the years in the three-year period ended 31 December 2015, and our report dated 9 March 2016 expressed an unqualified opinion on those consolidated financial statements.

9 Terms and definitions

Organisational abbreviations

- ACG - Azeri-Chirag-GunashliX
- ACQ - Annual contract quantity
- AFP - Agreement-based early retirement plan
- AGM - Annual general meeting
- ÅTS - Åsgard transport system
- APA - Awards in pre-defined areas
- ARO - Asset retirement obligation
- BTC - Baku-Tbilisi-Ceyhan pipeline
- CCS - Carbon capture and storage
- CH4 - Methane
- CO_2 - Carbon dioxide
- DKK - Danish Krone
- DPI - Development and Production International
- DPN - Development and Production Norway
- DPUSA - Development and Production USA
- DST - Drill Stem Test
- D&W - Drilling and Well
- EEA - European Economic Area
- EFTA - European Free Trade Association
- EMTN - Euro medium-term note
- EU - European Union
- EU ETS - EU Emissions Trading System
- EUR - Euro
- EXP - Exploration
- FPSO - Floating production, storage and offload vessel
- GAAP - Generally Accepted Accounting Principals
- GBP - British Pound
- GBS - Gravity-based structure
- GDP - Gross domestic product
- GHG - Greenhouse gas
- GSB - Global Strategy and Business Development
- HSE - Health, safety and environment
- HTHP - High-temperature/high pressure
- IASB - International Accounting Standards Board
- ICE - Intercontinental Exchange
- IEA - International Energy Agency
- IFRS - International Financial Reporting Standards
- IOR - Improved oil recovery
- LNG - Liquefied natural gas
- LPG - Liquefied petroleum gas
- MMP - Marketing, Midstream and Processing
- MPE - Norwegian Ministry of Petroleum and Energy
- MW - Mega watt
- NCS - Norwegian continental shelf
- NES - New Energy Solutions
- NIOC - National Iranian Oil Company
- NOK - Norwegian kroner
- NOx- Nitrogen oxide
- OECD - Organisation of Economic Co-Operation and Development
- OML - Oil mining lease
- OPEC - Organization of the Petroleum Exporting Countries
- OTC - Over-the-counter
- OTS - Oil trading and supply department
- P5+1 – UN Security Council's five permanent members
- PDO - Plan for development and operation
- PDQ – Production drilling quarters
- PIO - Plan for installation and operation
- PRD - Project Development organisation
- PSA - Production sharing agreement
- PSR - Procurement and Supplier Relations
- RDI - Research, Development and Innovation

- R&D - Research and development
- ROACE - Return on average capital employed
- RRR - Reserve replacement ratio
- SAGD - Steam-assisted gravity drainage
- SCP - South Caucasus Pipeline System
- SDFI - Norwegian State's Direct Financial Interest
- SEC - Securities and Exchange Commission
- SEK - Swedish Krona
- SFR - Statoil Fuel & Retail
- SIF - Serious Incident Frequency
- TAP - Trans Adriatic Pipeline AG
- TEX - Technology Excellence
- TLP - Tension leg platform
- TPD - Technology, projects and drilling
- TRIF - Total recordable injuries per million hours worked
- TSP - Technical service provider
- UKCS - UK continental shelf
- USD - United States dollar
- WTG - Wind Turbine Generators

Metric abbreviations etc.

- bbl - barrel
- mbbl - thousand barrels
- mmbbl - million barrels
- boe - barrels of oil equivalent
- mboe - thousand barrels of oil equivalent
- mmboe - million barrels of oil equivalent
- mmcf - million cubic feet
- MMBtu - million british thermal units
- bcf - billion cubic feet
- tcf - trillion cubic feet
- scm - standard cubic metre
- mcm - thousand cubic metres
- mmcm - million cubic metres
- bcm - billion cubic metres
- mmtpa - million tonnes per annum
- km - kilometre
- ppm - part per million
- one billion - one thousand million

Equivalent measurements are based upon

- 1 barrel equals 0.134 tonnes of oil (33 degrees API)
- 1 barrel equals 42 US gallons
- 1 barrel equals 0.159 standard cubic metres
- 1 barrel of oil equivalent equals 1 barrel of crude oil
- 1 barrel of oil equivalent equals 159 standard cubic metres of natural gas
- 1 barrel of oil equivalent equals 5,612 cubic feet of natural gas
- 1 barrel of oil equivalent equals 0.0837 tonnes of NGLs
- 1 billion standard cubic metres of natural gas equals 1 million standard cubic metres of oil equivalent
- 1 cubic metre equals 35.3 cubic feet
- 1 kilometre equals 0.62 miles
- 1 square kilometre equals 0.39 square miles
- 1 square kilometre equals 247.105 acres
- 1 cubic metre of natural gas equals 1 standard cubic metre of natural gas
- 1,000 standard cubic meter gas equals 1 standard cubic meter oil equivalent
- 1,000 standard cubic metres of natural gas equals 6.29 boe
- 1 standard cubic foot equals 0.0283 standard cubic metres
- 1 standard cubic foot equals 1000 British thermal units (btu)
- 1 tonne of NGLs equals 1.9 standard cubic metres of oil equivalent
- 1 degree Celsius equals minus 32 plus five-ninths of the number of degrees Fahrenheit

Miscellaneous terms

- Appraisal well: A well drilled to establish the extent and the size of a discovery
- Backwardation and contango are terms used in the crude oil market. Contango is a condition where forward prices exceed spot prices, so the forward curve is upward sloping. Backwardation is the opposite condition, where spot prices exceed forward prices, and the forward curve slopes downward
- Biofuel: A solid, liquid or gaseous fuel derived from relatively recently dead biological material and is distinguished from fossil fuels, which are derived from long dead biological material
- BOE (barrels of oil equivalent): A measure to quantify crude oil, natural gas liquids and natural gas amounts using the same basis. Natural gas volumes are converted to barrels on the basis of energy content
- Clastic reservoir systems: The integrated static and dynamic characteristics of a hydrocarbon reservoir formed by clastic rocks of a specific depositional sedimentary succession and its seal
- Condensates: The heavier natural gas components, such as pentane, hexane, iceptane and so forth, which are liquid under atmospheric pressure - also called natural gasoline or naphtha
- Crude oil, or oil: Includes condensate and natural gas liquids
- Development: The drilling, construction, and related activities following discovery that are necessary to begin production of crude oil and natural gas fields
- Downstream: The selling and distribution of products derived from upstream activities
- Equity and entitlement volumes of oil and gas: Equity volumes represent volumes produced under a production sharing agreement (PSA) that correspond to Statoil's percentage ownership in a particular field. Entitlement volumes, on the other hand, represent Statoil's share of the volumes distributed to the partners in the field, which are subject to deductions for, among other things, royalties and the host government's share of profit oil. Under the terms of a PSA, the amount of profit oil deducted from equity volumes will normally increase with the cumulative return on investment to the partners and/or production from the licence. The distinction between equity and entitlement is relevant to most PSA regimes, whereas it is not applicable in most concessionary regimes such as those in Norway, the UK, Canada and Brazil. The overview of equity production provides additional information for readers, as certain costs described in the profit and loss analysis were directly associated with equity volumes produced during the reported years
- Heavy oil: Crude oil with high viscosity (typically above 10 cp), and high specific gravity. The API classifies heavy oil as crudes with a gravity below 22.3° API. In addition to high viscosity and high specific gravity, heavy oils typically have low hydrogen-to-carbon ratios, high asphaltene, sulphur, nitrogen, and heavy-metal content, as well as higher acid numbers
- High grade: Relates to selectively harvesting goods, to cut the best and leave the rest. In reference to exploration and production this entails strict prioritisation and sequencing of drilling targets
- Hydro: A reference to the oil and energy activities of Norsk Hydro ASA, which merged with Statoil ASA
- IOR (improved oil recovery): Actual measures resulting in an increased oil recovery factor from a reservoir as compared with the expected value at a certain reference point in time. IOR comprises both of conventional and emerging technologies
- Liquids: Refers to oil, condensates and NGL
- LNG (liquefied natural gas): Lean gas - primarily methane - converted to liquid form through refrigeration to minus 163 degrees Celsius under atmospheric pressures
- LPG (liquefied petroleum gas): Consists primarily of propane and butane, which turn liquid under a pressure of six to seven atmospheres. LPG is shipped in special vessels
- Midstream: Processing, storage, and transport of crude oil, natural gas, natural gas liquids and sulphur
- Naphtha: inflammable oil obtained by the dry distillation of petroleum
- Natural gas: Petroleum that consists principally of light hydrocarbons. It can be divided into 1) lean gas, primarily methane but often containing some ethane and smaller quantities of heavier hydrocarbons (also called sales gas) and 2) wet gas, primarily ethane, propane and butane as well as smaller amounts of heavier hydrocarbons; partially liquid under atmospheric pressure
- NGL (natural gas liquids): Light hydrocarbons mainly consisting of ethane, propane and butane which are liquid under pressure at normal temperature
- Oil sands: A naturally occurring mixture of bitumen, water, sand, and clay. A heavy viscous form of crude oil
- Oil and gas value chains: Describes the value that is being added at each step from 1) exploring; 2) developing; 3) producing; 4) transportation and refining; and 5) marketing and distribution
- Organic capital expenditures: Capital expenditures excluding acquisitions, capital leases and other investments with significant different cash flow pattern
- Petroleum: A collective term for hydrocarbons, whether solid, liquid or gaseous. Hydrocarbons are compounds formed from the elements hydrogen (H) and carbon (C). The proportion of different compounds, from methane and ethane up to the heaviest components, in a petroleum find varies from discovery to discovery. If a reservoir primarily contains light hydrocarbons, it is described as a gas field. If heavier hydrocarbons predominate, it is described as an oil field. An oil field may feature free gas above the oil and contain a quantity of light hydrocarbons, also called associated gas
- Proved reserves: Reserves claimed to have a reasonable certainty (normally at least 90% confidence) of being recoverable under existing economic and political conditions, and using existing technology. They are the only type the US Securities and Exchange Commission allows oil companies to report
- Refining reference margin: Is a typical average gross margin of our two refineries, Mongstad and Kalundborg. The reference margin will differ from the actual margin, due to variations in type of crude and other feedstock, throughput, product yields, freight cost, inventory etc
- Rig year: A measure of the number of equivalent rigs operating during a given period. It is calculated as the number of days rigs are operating divided by the number of days in the period
- Upstream: Includes the searching for potential underground or underwater oil and gas fields, drilling of exploratory wells, subsequent operating wells which bring the liquids and or natural gas to the surface
- VOC (volatile organic compounds): Organic chemical compounds that have high enough vapour pressures under normal conditions to significantly vaporise and enter the earth's atmosphere (e.g. gasses formed under loading and offloading of crude oil)

10 Forward-looking statements

This Annual Report on Form 20-F contains certain forward-looking statements that involve risks and uncertainties, in particular in the sections "Business overview" and "Strategy and market overview". In some cases, we use words such as "aim", "ambition", "anticipate", "believe", "continue", "could", "estimate", "expect", "intend", "likely", "objective", "outlook", "may", "plan", "schedule", "seek", "should", "strategy", "target", "will", "goal" and similar expressions to identify forward-looking statements. All statements other than statements of historical fact, including, among others, statements regarding future financial position, results of operations and cash flows; future financial ratios and information; future financial or operational portfolio or performance; future market position and conditions; future credit rating; business strategy; growth strategy; sales, trading and market strategies; research and development initiatives and strategy; market outlook and future economic projections and assumptions; competitive position; projected regularity and performance levels; expectations related to our recent transactions and projects, such as the sale of interests in the Shah Deniz project and the South Caucasus Pipeline, interests in the Marcellus onshore play in the US, interests in Trans Adriatic Pipeline, interests in Gudrun and acquisition of interests in Eagle Ford in the US, the UK Mariner project, the Peregrino phase II project in Brazil, in addition to the Johan Sverdrup and Aasta Hansteen projects on the NCS, discoveries on the NCS and internationally; our ownership share in Gassled; completion and results of acquisitions, disposals and other contractual arrangements; reserve information; recovery factors and levels; future margins; projected returns; future levels or development of capacity, reserves or resources; future decline of mature fields; planned turnarounds and other maintenance; plans for cessation and decommissioning; oil and gas production forecasts and reporting; growth, expectations and development of production, projects, pipelines or resources; estimates related to production and development levels and dates; operational expectations, estimates, schedules and costs; exploration and development activities, plans and expectations; projections and expectations for upstream and downstream activities; expectations relating to licences; oil, gas, alternative fuel and energy prices and volatility; oil, gas, alternative fuel and energy supply and demand; renewable energy production, industry outlook and carbon capture and storage; organisational structure and policies; planned responses to climate change; technological innovation, implementation, position and expectations; future energy efficiency; projected operational costs or savings; our ability to create or improve value; future sources of financing; exploration and project development expenditure; our goal of safe and efficient operations; effectiveness of our internal policies and plans; our ability to manage our risk exposure; our liquidity levels and management; estimated or future liabilities, obligations or expenses; expected impact of currency and interest rate fluctuations; expectations related to contractual or financial counterparties; capital expenditure estimates and expectations; projected outcome, impact or timing of HSE regulations; HSE goals and objectives of management for future operations; expectations related to regulatory trends; impact of PSA effects; projected impact or timing of administrative or governmental rules, standards, decisions, standards or laws (including taxation laws); projected impact of legal claims against us; plans for capital distribution and amounts of dividends are forward-looking statements. You should not place undue reliance on these forward-looking statements. Our actual results could differ materially from those anticipated in the forward-looking statements for many reasons, including the risks described above in "Risk review", and in "Operational review", and elsewhere in this Annual Report on Form 20-F.

These forward-looking statements reflect current views about future events and are, by their nature, subject to significant risks and uncertainties because they relate to events and depend on circumstances that will occur in the future. There are a number of factors that could cause actual results and developments to differ materially from those expressed or implied by these forward-looking statements, including levels of industry product supply, demand and pricing; exchange rate and interest rate fluctuations; the political and economic policies of Norway and other oil-producing countries; EU directives; general economic conditions; political and social stability and economic growth in relevant areas of the world; Euro-zone uncertainty; global political events and actions, including war, terrorism and sanctions; security breaches, including breaches of our digital infrastructure (cybersecurity); changes or uncertainty in or non-compliance with laws and governmental regulations; the timing of bringing new fields on stream; an inability to exploit growth opportunities; material differences from reserves estimates; unsuccessful drilling; an inability to find and develop reserves; ineffectiveness of crisis management systems; adverse changes in tax regimes; the development and use of new technology, particularly in the renewable energy sector; geological or technical difficulties; operational problems; operator error; inadequate insurance coverage; the lack of necessary transportation infrastructure when a field is in a remote location and other transportation problems; the actions of competitors; the actions of field partners; the actions of the Norwegian state as majority shareholder; counterparty defaults; natural disasters, adverse weather conditions, climate change, and other changes to business conditions; failure to meet our ethical and social standards; an inability to attract and retain personnel and other factors discussed elsewhere in this report.

Although we believe that the expectations reflected in the forward-looking statements are reasonable, we cannot assure you that our future results, level of activity, performance or achievements will meet these expectations. Moreover, neither we nor any other person assumes responsibility for the accuracy and completeness of the forward-looking statements. Unless we are required by law to update these statements, we will not necessarily update any of these statements after the date of this Annual Report, either to make them conform to actual results or changes in our expectations.

12 Exhibits

The following exhibits are filed as part of this Annual Report:

Exhibit no	Description
Exhibit 1	Articles of Association of Statoil ASA, as amended, effective from 14 May 2013 (English translation).
Exhibit 4(a)(i)	Technical Services Agreement between Gassco AS and Statoil Petroleum AS, dated November 24, 2010.
Exhibit 4(c)	Employment agreement with Eldar Sætre as of 4 February 2015.
Exhibit 7	Calculation of ratio of earnings to fixed charges.
Exhibit 8	Subsidiaries (see section 3.9 Significant subsidiaries included in this Annual Report).
Exhibit 12.1	Rule 13a-14(a) Certification of Chief Executive Officer.
Exhibit 12.2	Rule 13a-14(a) Certification of Chief Financial Officer.
Exhibit 13.1	Rule 13a-14(b) Certification of Chief Executive Officer.[1)]
Exhibit 13.2	Rule 13a-14(b) Certification of Chief Financial Officer.[1)]
Exhibit 15(a)(i)	Consent of KPMG AS.
Exhibit 15(a)(ii)	Consent of DeGolyer and MacNaughton.
Exhibit 15(a)(iii)	Report of DeGoyler and MacNaughton.

1) Furnished only.

The total amount of long-term debt securities of the Registrant and its subsidiaries authorised under any one instrument does not exceed 10% of the total assets of Statoil ASA and its subsidiaries on a consolidated basis. The company agrees to furnish copies of any or all such instruments to the Securities and Exchange Commission upon request.

UNITED STATES DISTRICT COURT
FOR THE DISTRICT OF COLUMBIA

FISHERIES SURVIVAL FUND, *et al.*,	)	
Plaintiffs,	)	
v.	)	Case No. 16-cv-2409 (TSC)
SALLY JEWELL, *et al.*,	)	
Defendants.	)	

MEMORANDUM OPINION

This case concerns a Bureau of Ocean Energy Management ("BOEM") plan to lease a nautical area off the coast of New York to Defendant-Intervenor Statoil Wind US, LLC ("Statoil"), for development of a wind energy facility. Plaintiffs[1], including the Fisheries Survival Fund, claim that in issuing the lease, BOEM violated the National Environmental Policy Act ("NEPA"), the Outer Continental Shelf Lands Act ("OCSLA"), and the Administrative Procedure Act ("APA"). Plaintiffs filed a motion for preliminary injunction, which this court denied. Memorandum Opinion, ECF No. 26. Now before the court are Plaintiffs' Motion for Summary Judgment, ECF No. 39, Defendant-Intervenor's Cross-Motion for Summary Judgment, ECF No. 40, and Defendants' Motion for Summary Judgment, ECF No. 42. For the reasons stated herein, Plaintiffs' motion will be DENIED, Defendants' motion will be GRANTED, and Defendant-Intervenor's motion will be DENIED as moot.

[1] The other Plaintiffs are: Borough of Barnegat Light, NJ; the Town Dock; Seafreeze Shoreside; Sea Fresh USA; Rhode Island Fishermen's Alliance; Garden State Seafood Association; Long Island Commercial Fishing Association; the Town of Narragansett, RI; the Narragansett Chamber of Commerce; the City of New Bedford, MA; and the Fishermen's Dock Co-Operative of Point Pleasant.

I. BACKGROUND

A. Statutory & Regulatory Framework

1. OCSLA

As amended by the Energy Policy Act of 2005, Pub. L. 109-58, 119 Stat. 594 (2005), OCSLA authorizes BOEM to issue leases, easements, or rights-of-way for offshore renewable energy projects. 43 U.S.C. § 1337(p)(1)(C). In exercising this authority, BOEM is required to consult with the U.S. Coast Guard and other relevant federal agencies, and must consider several factors that include, *inter alia*, safety, protection of the environment, prevention of waste, conservation of natural resources, national security interests, and—critically—"the location of . . . a lease. . . for an area of the outer Continental Shelf" and "any other use of the sea or seabed, including use for a fishery, a sealane, a potential site of a deepwater port, or navigation." *Id.* § 1337(p)(4)(A)–(L) & (J)(i)–(ii).

2. NEPA

NEPA was enacted to establish "a national policy [to] encourage productive and enjoyable harmony between man and his environment," to "prevent or eliminate damage to the environment," and "to enrich the understanding of the ecological systems and natural resources important to the Nation." 42 U.S.C. § 4321; *see also Dep't of Transp. v. Pub. Citizen*, 541 U.S. 752, 756–57 (2004). NEPA serves these goals by imposing "procedural requirements on federal agencies with a particular focus on requiring agencies to undertake analyses of the environmental impact of their proposals and actions." *Pub. Citizen*, 541 U.S. at 756–57; *Theodore Roosevelt Conservation P'ship v. Salazar*, 616 F.3d 497, 503 (D.C. Cir. 2010) (noting that "[NEPA] is an 'essentially procedural' statute, meant to ensure 'a fully informed and well-considered decision, not necessarily' the best decision") (quoting *Vermont Yankee Nuclear Power Corp. v. Natural*

Res. Def. Council, Inc., 435 U.S. 519, 558 (1978)). The statute requires that the relevant agency (1) "consider every significant aspect of the environmental impact of a proposed action," *Baltimore Gas & Elec. Co. v. Nat. Res. Def. Council, Inc.*, 462 U.S. 87, 97 (1983) (quoting *Vermont Yankee*, 435 U.S. at 553), and (2) "inform the public that the agency has considered environmental concerns in its decisionmaking process." *Weinberger v. Catholic Action of Hawaii/Peace Educ. Project*, 454 U.S. 139, 143 (1981).

"NEPA requires that when an agency proposes a 'major Federal action[] significantly affecting the quality of the human environment,' the agency must prepare and circulate for public review and comment an environmental impact statement ("EIS") that examines the environmental impact of the proposed action and compares the action to other alternatives." *Theodore Roosevelt Conservation P'ship*, 616 F.3d at 503 (quoting 42 U.S.C. § 4332(2)(C)); *see also Sierra Club v. Van Antwerp*, 661 F.3d 1147, 1153 (D.C. Cir. 2011). Nevertheless, an EIS is not always necessary. *See Public Citizen v. NHTSA*, 848 F.2d 256, 265 (1988) ("NEPA requires the preparation of a complete EIS for 'major federal actions *significantly* affecting the quality of the human environment.'") (emphasis in original). Agencies may "prepare a more limited document"—known as an Environmental Assessment ("EA")—if a proposed action is neither categorically excluded from the EIS requirement nor of the kind that would normally require an EIS. *See* 40 C.F.R. §§ 1501.4(a)–(b); *Pub. Citizen*, 541 U.S. at 757 ("CEQ regulations allow an agency to prepare . . . an [EA] . . . if the agency's proposed action neither is categorically excluded from the requirement to produce an EIS nor would clearly require the production of an EIS."). An EA is a "concise public document" intended to "[b]riefly provide sufficient evidence and analysis for determining whether to prepare an environmental impact statement or a finding of no significant impact." 40 C.F.R. §§ 1508.9(a)(1); *Pub. Citizen*, 541 U.S. at 757–58. Where preparation of an EA leads an agency to decide that an EIS is unnecessary, the agency is required to issue a "finding of no significant impact"—"a document . . . briefly presenting the reasons why an action . . . will not have a significant effect on the human environment and for which an environmental impact statement will therefore not be prepared." 40 C.F. R. §§ 1501.4(e), 1508.13.

B. BOEM's Leasing Process

In accordance with OCSLA, BOEM promulgated a series of regulations governing the leasing and management of offshore renewable energy projects. *See* 30 C.F.R. § 585.200–234. Pursuant to these regulations, the commercial leasing process may be initiated by both solicited and unsolicited applications. A solicited application is one in which BOEM itself identifies the potential development site and initiates the leasing process by publishing a notice of Request for Interest ("RFI") or a Call for Information and Nominations in the Federal Register. *See* 30 C.F.R. §§ 585.210, 585.211(a). An unsolicited application is one in which a potential developer applies for a site not otherwise under consideration by BOEM. *See* 30 C.F.R. § 585.230.

Upon receiving an unsolicited request, BOEM publishes a RFI to seek public comment and determine whether there is competitive interest from other developers. *Id.* § 585.231(b). If there is competitive interest, BOEM proceeds with the competitive process. *Id.* § 585.231(c)(1). Otherwise, it publishes a notice of Determination of No Competitive Interest and follows a separate procedure. *Id.* § 585.231(d)–(i). Regardless of the procedure adopted in any case, BOEM must consult throughout the leasing process with state task forces, other state and local representatives, and with representatives of Indian Tribes whose interests may be affected. *Id.* §§ 585.102(e), 585.211(a)–(d), 585.231(e).

Before issuing a lease, BOEM follows a four-step procedure, issuing a Call for Information and Nominations, completing the Area Identification process, publishing a Proposed Sale Notice, and publishing a Final Sale Notice. *Id.* § 585.211(a)–(d). Once BOEM has issued a lease, the lessee must submit a Site Assessment Plan for review before any assessment activity takes place. *Id.* §§ 585.601, 585.605. Even after completing a site assessment, a lessee may not begin construction until it has submitted, and BOEM has approved, a Construction and Operations Plan. *Id.* § 585.620(c). BOEM can accept, reject, or accept with modifications a lessee's Site Assessment or Construction and Operations Plan, *id.* §§ 585.613, 585.628, and must analyze the potential environmental impacts of the plans. *See id.* §§ 585.613, 585.620(c).

C. Lease OCS–A 0512

In September 2011, a consortium of energy companies consisting of the New York Power Authority, Long Island Power Authority, and Consolidated Edison (collectively, "the Consortium"), proposed developing a wind energy facility covering approximately 81,500 acres of ocean off the coast of New York. NYAR-0074853, 0074854. Due to safety concerns about shipping lanes, the Consortium later amended the request to cover 81,130 acres, or about 127 square miles. NYAR-0074140. The Consortium claims the proposed project has "the potential to be the largest offshore wind energy facility in the United States." NYAR-0074853. Since the Consortium's request was unsolicited, BOEM initiated an RFI on January 4, 2013 to gauge other companies' interest in developing the area. 78 Fed. Reg. 760-02 (Jan. 4, 2013). The RFI also requested that "interested and affected parties comment and provide information about site conditions and multiple uses within the area identified in this notice that would be relevant to the proposed project or its impacts." *Id.* at 760 –61.

After reviewing nominations of interest and acknowledging competitive interest in the area, BOEM initiated the competitive leasing process. Compl. ¶ 54. On May 28, 2014, BOEM published (1) a Notice of Intent to prepare an EA and (2) a Call for Information and Nominations from companies interested in commercial wind energy leases in the proposed wind farm area. 79 Fed. Reg. 30,643–44 (May 28, 2014); 79 Fed. Reg. 30,645. BOEM also began the "Area Identification" process to "identify offshore locations that appear most suitable for wind energy development" and "designat[e] . . . an area with the greatest wind resource potential, minimal environmental and space use conflict, and possible alternatives for environmental analysis." NYAR-0044172; 30 C.F.R. § 585.211(b). BOEM completed this process on March 14, 2016, thereby marking the area as available for lease. *See* NYAR-0045776.

On June 6, 2016, BOEM published a "Proposed Sale Notice for Commercial Leasing for Wind Power on the Outer Continental Shelf Offshore New York" in the Federal Register. 81 Fed. Reg. 36,336 (June 6, 2016) (NYAR-0047230). The Proposed Sale Notice included a sixty-day comment period, which closed on August 6, 2016. *Id.* On June 6, BOEM also published an EA, along with a Notice of Availability for a thirty-day public comment period. 81 Fed. Reg. 36,344 (June 6, 2016) (NYAR-0047238). According to the Notice of Availability, the EA focused on assessing the potential impact of and reasonable alternatives to "commercial wind lease issuance, site characterization activities (geophysical, geotechnical, archaeological, and biological surveys) and site assessment activities (including the installation and operation of a meteorological tower and/or buoys)." *Id.* The Notice also stated that "[s]hould a lessee propose to construct a commercial wind facility through submission of a [Construction and Operations Plan], BOEM would conduct a separate site and project-specific [NEPA] analysis, likely an [EIS], and would provide additional opportunities for public involvement . . . ." *Id.* After requests from Plaintiff Fisheries Survival Fund and other groups, BOEM extended the public comment period to July 13, 2016. Compl. ¶ 62.

On October 31, 2016, BOEM published the Final Sale Notice for the lease sale of the area. 81 Fed. Reg. 75,429 (Oct. 31, 2016) (NYAR-0075588). BOEM determined that fourteen different bidders were "legally, technically, and financially qualified to hold a commercial wind lease" and to bid in the auction. *Id.* at 75,430 (NYAR-0075589). BOEM also published its revised EA, which found no significant impact for commercial wind lease issuance and related activities within the area. 81 Fed. Reg. 75,438 (Oct. 31, 2016). The finding of no significant impact concluded that "the reasonably foreseeable environmental impacts . . . would not significantly impact the quality of the human environment," and "therefore, the preparation of an environmental impact statement [was] not required." *Id.*; *see also* NYAR-0074241. The EA stated that "BOEM reduces its impacts early in the planning process by conducting site identification through public stakeholder meetings to avoid areas that may have significant impacts on the environment, including marine mammals." NYAR-0074521.

On December 15 and 16, BOEM held a lease auction, which Statoil won with a $42,469,725 bid. *See* Commercial Lease of Submerged Lands for Renewable Energy Development on Continental Shelf (NYAR-0046753). BOEM and Statoil executed the lease on March 15, 2017. NYAR-0046759. The lease grants Statoil the exclusive right to conduct site characterization activities and, within one year of lease issuance, to propose a Site Assessment Plan. NYAR-0046753; 30 C.F.R. §§ 585.601, 585.605. If BOEM approves the Plan, Statoil will have five years to engage in site assessment—including conducting surveys and using towers or buoys to evaluate wind resources—and propose a Construction and Operations Plan, 30 C.F.R. §§ 585.235(a)(2), 585.601(b), which must include detailed data and information to support the plan for the wind facility, and proposals for minimizing environmental impact. 30 C.F.R. § 585.626(b). BOEM would then conduct "an appropriate NEPA analysis" based on the information included in the Construction and Operations Plan, before deciding whether to approve the Plan. 30 C.F.R. § 585.628(b).

II. LEGAL STANDARD

The APA requires courts to "set aside any agency action that is 'arbitrary and capricious, an abuse of discretion, or otherwise not in accordance with law." 5 U.S.C. § 706(2)(A). In assessing a summary judgment motion brought under the APA, courts are "not empowered to substitute [their] judgment for that of the agency." *Beyond Nuclear v. U.S Dep't of Energy*, 233 F. Supp. 3d 40, 47 (D.D.C. 2017) (quoting *Citizens to Preserve Overton Park, Inc. v. Volpe*, 401 U.S. 402, 416 (1971)). Rather, the court's role is to "determine whether or not as a matter of law the evidence in the administrative record permitted the agency to make the decision it did." *Coe v. McHugh*, 968 F. Supp. 2d 237, 239–40 (D.D.C. 2013) (quoting *Occidental Eng'g Co. v. INS*, 753 F.2d 766, 769–70 (9th Cir. 1985)).

Generally, an agency action is arbitrary if:

> the agency has relied on factors which Congress has not intended it to consider, entirely failed to consider an important aspect of the problem, offered an explanation for its decision that runs counter to the evidence before the agency, or is so implausible that it could not be ascribed to a difference in view or the product of agency expertise.

Delaware Riverkeeper Network v. FERC, 753 F.3d 1304, 1313 (D.C. Cir. 2014) (quoting *Motor Vehicle Mfrs. Ass'n of the U.S., Inc. v. State Farm Mut. Auto. Ins.*, 463 U.S. 29, 43 (1983)). This standard also applies when assessing compliance with NEPA and the adequacy of an EIS. *City of Olmsted Falls, OH v. FAA*, 292 F.3d 261, 269 (D.C. Cir. 2002) (citing *Marsh v. Oregon Natural Resources Council*, 490 U.S. 360, 376 (1989)). "Courts may not use their review of an agency's environmental analysis to second-guess substantive decisions committed to the discretion of the agency," *Del. Riverkeeper Network*, 753 F.3d at 1313, and must instead "review the EIS to 'ensure that the agency took a "hard look" at the environmental consequences of its decision to go forward with the project.'" *Olmsted Falls*, 292 F.3d at 269 (quoting *City of Grapevine, Tex. v. DOT*, 17 F.3d 1502, 1503–04 (D.C. Cir. 1994)).

III. DISCUSSION

The parties' motions for summary judgment present two broad issues: (1) whether Defendants violated NEPA by improperly segmenting their NEPA analysis, failing to consider a reasonable range of alternatives, and failing to prepare an EIS in deciding the site of the proposed wind farm area; and (2) whether Defendants violated their obligations under OCSLA by failing to consider a number of relevant factors in the site selection process, failing to consider those factors in proceeding with the lease sale, and/or acting in accordance with a regulatory procedure that exceeds the authority granted under OCSLA. Pls. Mot. Summ. J. at 38–47, 47–54, ECF No. 39-1; Def. Intervenors Mot. Summ. J. at 17–24, 24–32, ECF No. 40; Defs. Mot. Summ. J. at 29–44, 45–54, ECF No. 42. The parties also raise issues of standing and constitutional ripeness. *See, e.g.*, ECF No. 42 at 22–28. As these latter issues present jurisdictional questions, this court will address them at the threshold.

A. Standing

Plaintiffs, who bear the burden of establishing standing, *see Kokkonen v. Guardian Life Ins. Co. of Am.*, 511 U.S. 375, 377 (1994), claim a procedural injury relating to BOEM's issuance of the lease. Plaintiffs contend that "the heart of [their] injury" results from BOEM's decision to issue the lease on key fishing grounds "prior to obtaining any public input or considering fishing, environmental, or safety interests with respect to the physical boundaries of that area," in violation of NEPA and OCSLA. ECF No. 39-1 at 37. Plaintiffs further allege that they will be injured by the "exploration and development of a wind farm" in the area that will likely follow from issuance of the lease and "directly damage the natural resources in that area, . . . physically preclude . . . fisheries from operating fishing vessels in that area, . . . [and] pose navigational safety issues." ECF No. 39-1 at 37.

Defendants respond that Plaintiffs' allegations of harm do not establish standing "because they all relate to the possible future approval of the construction of a wind energy facility," rather than "the site characterization and site assessment activities associated with issuance of the lease." Defs. Opp'n Mot. at 23, ECF No. 43. According to Defendants, Plaintiffs' alleged future injuries "fail to demonstrate that the construction of a wind energy facility is *substantially probable*," ECF No. 53 at 3 (emphasis in original), insofar as the construction depends on future events—including the preparation and approval of multiple reports and a development plan—that have not occurred and may not occur for six years, if at all. ECF No. 43 at 24.

Standing is a jurisdictional prerequisite—an "irreducible constitutional minimum" that requires a plaintiff to show: (1) an "injury in fact" that is "concrete and particularized" and "actual or imminent, not conjectural or hypothetical"; (2) that the injury is "fairly traceable to the challenged action of the defendant"; and (3) that it is "likely, as opposed to merely speculative, that the injury will be redressed by a favorable decision." *Chamber of Commerce of U.S. v. E.P.A.*, 642 F.3d 192, 200 (D.C. Cir. 2011) (quoting *Bennett v. Spear*, 520 U.S. 154, 167 (1997)); *Summers v. Earth Island Inst.*, 555 U.S. 488, 492 (2009) (noting that standing doctrine "requires federal courts to satisfy themselves that 'the plaintiff has alleged such a personal stake in the outcome of the controversy' as to warrant his invocation of federal-court jurisdiction.") (quoting *Warth v. Seldin*, 422 U.S. 490, 498 (1975)).

When a party alleges injury to its procedural rights, "courts relax the normal standards of redressability and imminence." *Sierra Club v. Fed. Energy Regulatory Comm'n*, 827 F.3d 59, 65 (D.C. Cir. 2016). In such cases, "the primary focus of the standing inquiry is not the imminence or redressability of the injury to the plaintiff, but whether a plaintiff who has suffered a personal and particularized injury has sued a defendant who has caused that injury." *City of Dania Beach v. FAA*, 485 F.3d 1181, 1185 (D.C. Cir. 2007) (quoting *Fla. Audubon Soc'y v. Bentsen*, 94 F.3d 68, 664 (D.C. Cir. 1996) (en banc)). "To establish injury-in-fact in a 'procedural injury' case, petitioners must show that 'the government act performed without the procedure in question will cause a distinct risk to a particularized interest of the plaintiff.'" *Id.* at 1185 (quoting *Fla. Audubon Soc'y*, 94 F.3d at 663). In other words, "[a] violation of the procedural requirements of a statute is sufficient to grant a plaintiff standing to sue, so long as the procedural requirement was designed to protect some threatened concrete interest of the plaintiff." *City of Dania Beach*, 485 F.3d at 1185 (quoting *City of Waukesha v. EPA*, 320 F.3d 228, 234 (D.C. Cir. 2003)); *see also Sierra Club*, 827 F.3d at 65 ("[A]n adequate causal chain must contain at least two links: one connecting the omitted [NEPA analysis] to some substantive government decision that may have been wrongly decided because of the lack of [proper NEPA analysis] and one connecting that substantive decision to the plaintiff's particularized injury."). A plaintiff alleging a violation of some procedural right "never has to prove that if he had received the procedure the substantive result would have been altered," and need only show "that the procedural step was connected to the substantive result." *Sugar Cane Growers Cooperative v. Veneman*, 289 F.3d 89, 95 (D.C. Cir. 2002).

Plaintiffs are entitled to bring their OCSLA and NEPA claims under a procedural standing theory because they have demonstrated a threat to a sufficiently concrete and particularized interest in the wind farm area, and the alleged procedural deficiencies are connected to a substantive governmental decision—issuing the lease—that is in turn connected to a risk of harm to Plaintiffs' identified interests. *See Dania Beach*, 485 F.3d at 1185 (describing need for distinct risk to particularized interest in procedural injury context); *Sierra Club*, 827 F.3d at 65 (discussing components of an adequate causal chain in procedural injury context). The Plaintiffs in this case include those who use or depend on the use of the wind farm area and the natural resources contained therein for fishing, navigation, and associated economic and recreational benefits. *See* ECF No. 39-1 at 15–17, 21–25. The use or enjoyment of wildlife is a cognizable interest for standing purposes, *see Ctr. for Biological Diversity v. U.S. Department of Interior*, 563 F.3d 466, 479 (D.C. Cir. 2009) ("*CBD*") (citing *Lujan v. Defenders of Wildlife*, 504 U.S. 555, 562–63 (1992)) (affirming the appropriateness of an interest in enjoyment of wildlife), and here, that interest is concrete and particularized insofar as it refers to specific marine species and activities within a distinct, identified area. *See Bentsen*, 94 F.3d at 667–68 (emphasizing need for particularization of alleged environmental interests in form of geographic nexus to claim of particularized injury). Furthermore, Plaintiffs claim—in multiple declarations—that their interest in the use or enjoyment of the area under the lease will be damaged or altogether precluded by development. *See, e.g.*, ECF No. 3-1 at 2–3, 5–9, 133–40, 115–16.

The court notes that the lease only authorizes site characterization and assessment, and that construction—the development phase involving the most transformative activity—has not yet received approval, and depends on multiple contingencies occurring over a six-year period. *See* ECF No. 43 at 24; ECF No. 53 at 11. Nevertheless, this fact does not render Plaintiffs' alleged injury too speculative or hypothetical for purposes of standing. The relevant injury here is the injury that Plaintiffs allege regarding the development process as a whole, including the lease sale phase. While the lease itself may not authorize construction of the wind farm, it is undeniably a milestone in the lessee's plan to transform an area currently used for industrial and recreational fishing into an area that Plaintiffs allege is likely to be rendered unsuitable for such purposes. Although the lease does not dispel all contingencies associated with the project, it does increase the probability that any planned development will occur in the designated area. In other words, Plaintiffs have alleged a particularized threat to their concrete interest in use of the leased area insofar as their stated concern is the progress of a development project affecting that interest.

It also appears that the challenged leasing decision is causally connected to an increased risk of harm to Plaintiffs' particularized interests, insofar as the decision increases the risk to their enjoyment of the marine life in the area likely to be affected by the development. *See CBD*, 563 F.3d at 479 (approving procedural theory of standing because "adoption of an irrationally based Leasing Program could cause a substantial increase in the risk to [Petitioners'] enjoyment of the animals affected by the offshore drilling"); *see also* 827 F.3d at 65 (noting need to connect substantive decision that may have been wrongly decided to a particularized injury). For these reasons, Plaintiffs have successfully articulated a procedural theory of Article III standing.[2]

[2] While the analysis of the standing issue applies directly to the municipal plaintiffs, the associational plaintiffs must satisfy additional requirements. Organizations have standing to sue on behalf of their members if: "(1) at least one of [the organization's] members would have standing to sue in his or her own right; (2) 'the interests it seeks to protect are germane to the organization's purpose'; and (3) 'neither the claim asserted nor the relief requested requires the participation of individual members in the lawsuit.'" *Sierra Club v. FERC*, 827 F.3d 59, 65 (D.C. Cir. 2016) (quoting *WildEarth Guardians v. Jewell*, 738 F.3d 298, 305 (D.C. Cir. 2013)). Here, the associational plaintiffs have standing to sue on behalf of their members, whose declarations demonstrate that they share the interest and injury identified above. *See, e.g.*, ECF No. 3-1 at 1–5, 133–40, 115–16. Moreover, the associational plaintiffs' organizational purposes—broadly, to promote the interests of Atlantic fishermen—plainly relate to the fishing industry and commercial

B. Ripeness of NEPA Claims

Plaintiffs contend that their NEPA[3] claims are ripe because "the Lease precludes any further action for the most critical stage of the leasing process—project siting—and constitutes an irretrievable commitment of resources," the key trigger for an agency's NEPA obligations. Pls. Opp. to Def. & Def. Intervenor Mot. at 23, ECF No. 48. Defendants argue that the NEPA claims are not ripe because they "allege that BOEM failed to properly analyze the environmental impacts of constructing and operating a wind energy facility," even though BOEM has yet to approve the construction or operation of such a facility. ECF No. 43 at 25.

The ripeness doctrine is related to standing, and requires that a litigant's claims be "constitutionally and prudentially ripe," so as to protect (1) "the agency's interest in crystallizing its policy before that policy is subjected to judicial review," (2) "the court's interests in avoiding unnecessary adjudication and in deciding issues in a concrete setting," and (3) "the petitioner's interest in prompt consideration of allegedly unlawful agency action." *Nevada v. Department of Energy*, 457 F.3d 78, 84 (D.C. Cir. 2006) (quoting *Eagle–Picher Indus., Inc. v. EPA*, 759 F.2d 905, 915 (D.C. Cir. 1985)). In "determining whether a dispute is ripe for review, courts consider 'both the fitness of the issues for judicial decision and the hardship to the parties of withholding court consideration.'" *Am. Tort Reform Ass'n v. Occupational Safety & Health Admin.*, 738 F.3d 387, 396 (D.C. Cir. 2013) (quoting *Abbott Laboratories v. Gardner*, 387 U.S. 136, 149 (1967)).

---

or recreational fishing. *See* ECF No. 39 at 2, 34 (describing plaintiffs and organizational purpose); *Ctr. for Sustainable Economy v. Jewell*, 779 F.3d 588, 597 (D.C. Cir. 2015) ("*CSE*") ("The germaneness requirement [of associational standing] mandates 'pertinence between litigation subject and organizational purpose.'") (quoting *Humane Soc. of the United States v. Hodel*, 840 F.2d 45, 58 (D.C. Cir. 1988)).

[3] Plaintiffs' OCSLA claims "concern OCSLA requirements that are implicated at the initial stage of a leasing program," and are therefore ripe. *CBD*, 563 F.3d at 484.

Courts must also consider: "(1) whether delayed review would cause hardship to the plaintiffs; (2) whether judicial intervention would inappropriately interfere with further administrative action; and (3) whether the courts would benefit from further factual development of the issues presented." *Nevada*, 457 F.3d at 84 (quoting *Ohio Forestry Ass'n, Inc. v. Sierra Club*, 523 U.S. 726, 733 (1998)). Typically, "[a] claim is not ripe for adjudication if it rests upon contingent future events that may not occur as anticipated, or indeed may not occur at all." *Nevada*, 457 F.3d at 85 (quoting *Texas v. United States*, 523 U.S. 296, 300 (1998)).

An agency's NEPA obligations mature "only once it reaches a 'critical stage of a decision which will result in irreversible and irretrievable commitments of resources to an action that will affect the environment.'" *CBD*, 563 F.3d at 480 (quoting *Wyoming Outdoor Council v. United States Forest Service*, 165 F.3d 43, 49 (D.C. Cir. 1999) ("*Wyo. Outdoor Council II*")). Cases involving multiple-stage leasing programs—arising in the oil and gas context—indicate that an agency reaches this critical stage when it "no longer retain[s] the authority to preclude all surface disturbing activities subsequent to issuing an oil and gas lease," such that "an EIS assessing the full environmental consequences of leasing must be prepared before commitment to any actions that might affect the quality of the human environment." *Wyo. Outdoor Council II*, 165 F.3d at 49 (alteration in original) (quoting *Sierra Club v. Peterson*, 717 F.2d 1409, 1415 (D.C. Cir. 1983)); *see also Conner v. Burford*, 848 F.2d 1441, 1451 (9th Cir. 1988) ("[U]nless surface-disturbing activities may be absolutely precluded, the government must complete an EIS before it makes an irretrievable commitment of resources . . . ."). In other words, lease issuance triggers

NEPA obligations unless the issuing agency "retain[s] the authority to preclude all surface disturbing activities." *Wyo. Outdoor Council II*, 165 F.3d at 49.[4]

Though the parties agree that the above legal standard is appropriate, they disagree on how it should be applied. Plaintiffs contend that to avoid making an irreversible commitment of resources, the agency making a lease sale must unilaterally retain "the *absolute right* to prevent *all* surface-disturbing activity." ECF No. 48 at 22 (quoting *Conner*, 848 F.2d at 1449) (emphasis in original). They argue that BOEM does not retain the absolute right because its ability to cancel a lease is limited by lease criteria and Statoil's regulatory compliance. ECF No. 48 at 11–12. Defendants respond that the lease language establishes BOEM's absolute authority to preclude activity in the leased area, that Plaintiffs misunderstand the applicable legal standard in contending otherwise, and that "because BOEM retains the authority to deny a [Construction and Operations Plan], the issuance of the lease to Statoil was not an irreversible and irretrievable commitment of resources." ECF No. 53 at 14, 15. In the court's view, the applicable regulations and the terms of the lease preclude Statoil from engaging in any construction activities, and vest complete authority in BOEM to preclude such activity in the leased area before the Construction and Operations Plan is approved. Therefore, issuing the lease does not constitute an irreversible and irretrievable commitment of resources. *See Wyo. Outdoor Council II*, 165 F.3d at 49. Accordingly, Plaintiffs' NEPA claims must be dismissed as unripe at this stage.

---

[4] Plaintiffs do not address ripeness in their memorandum in support of their motion for summary judgment. In their opposition to Defendants' motion, Plaintiffs appear to question in passing whether the standard in cases involving oil and gas leases should apply in the Outer Continental Shelf context or to renewable energy leases. ECF No. 48 at 19. Nevertheless, they do not offer any argument as to why the court should decline to apply that standard, and do not offer any alternative standard, instead opting to argue their position from within the oil and gas lease legal framework, which the court finds analogous and appropriate.

On its own, the lease at issue does no more than grant Statoil the exclusive right to submit a Site Assessment Plan and Construction and Operations Plan to BOEM for approval. NYAR-0046754. No activity is permitted absent the submission and approval of these plans, NYAR-0046754, and the lease provides that (1) "[the] lease does not, by itself, authorize any activity within the leased area," (2) "the Lessor will decide whether to approve a SAP or COP in accordance with the applicable regulations in 30 CFR Part 585," and (3) "the Lessor retains the right to disapprove a SAP or COP based on the Lessor's determination that the proposed activities would have unacceptable environmental consequences . . . ." NYAR-0046754. Moreover, BOEM regulations provide that a lease can be cancelled if, after "notice and opportunity for a hearing," BOEM determines that "continued activity under the lease or grant":

> (i) Would cause serious harm or damage to natural resources; life (including human and wildlife); property; the marine, coastal, or human environment; or sites, structures, or objects of historical or archaeological significance; and
> (ii) That the threat of harm or damage would not disappear or decrease to an acceptable extent within a reasonable period of time; and
> (iii) The advantages of cancellation outweigh the advantages of continuing the lease or grant in force.

30 C.F.R. § 585.437(b)(4)(i)–(iii).

The thrust of Plaintiffs' first argument is that BOEM's authority to preclude activity in the wind farm area cannot be absolute if it is subject to conditions, and that the criteria set forth above are conditions. Thus, Plaintiffs argue, the lease represents a commitment of resources, and therefore their NEPA claims are ripe. *See Conner*, 848 F.2d at 1449–50 (noting that leases permitting surface-disturbing activities subject to conditions do not retain authority to absolutely preclude activities and, therefore, constitute a commitment of resources); *Peterson*, 717 F.2d at 1412, 1414–15 (same).

Though it is true that the criteria may be "conditions" in the sense that BOEM must make certain findings—after notice and an opportunity for a hearing—before disapproving a Construction and Operations Plan and/or cancelling a lease, it does not necessarily follow that "BOEM's own regulations preclude BOEM from changing its mind unilaterally." ECF No. 48 at 20. That is because none of the "conditions" at issue involve or presuppose any transfer of authority to prevent lease activities out of BOEM's hands, which was not the case with the leases in *Peterson* and *Conner*.

Peterson involved an oil and gas leasing program for certain National Forests, administered by the United States Forest Service and Department of the Interior ("Department"). 717 F.2d at 1410. The leasing program divided lands into those designated as "highly environmentally sensitive" and "non-highly environmentally sensitive." *Id.* Leases contained either a "No Surface Occupancy Stipulation (NSO Stipulation)"—preventing any surface activities without departmental approval—or stipulations representing "reasonable," "mitigating" conditions on drilling and other activities, but with no ability to bar those activities entirely. *Id.* at 1412, 1414. The D.C. Circuit concluded that the Department had failed to comply with NEPA by neglecting to conduct a full EIS before issuing leases that relinquished the authority to prevent all development. 717 F.2d at 1414. Critical to the Circuit's reasoning was that under the terms of the leases without NSO Stipulations, "the government could not *deny* an application for a permit to drill, but could only enforce the lease stipulations to control and/or mitigate any environmental damage which result[s] from the drilling." *Id.* at 1414 & n.7 (emphasis in original).

Conner involved the same legal issue in virtually identical factual circumstances. 848 F.2d at 1444–46 (describing NEPA challenge to leasing program that issued NSO or non-NSO oil and gas leases in forest land). Citing *Peterson*, the Ninth Circuit concluded that issuing non-NSO oil and gas leases effectively traded the authority to *preclude* all activity for the authority to *regulate* that activity, and such a trade required an EIS. *See id.* at 1450 (emphasis added).[5]

In this case, the criteria at issue do not contemplate trading preclusion authority for regulatory authority. The criteria do not alter the fact that Statoil must submit Site Assessment and Construction and Operations Plans before starting development, or that BOEM retains the authority to prevent any activity in the wind farm area by rejecting any Site Assessment or Constructions and Operations Plan that Statoil submits. The criteria stem from BOEM's commitment to "NEPA's goal of insuring that federal agencies infuse in project planning a thorough consideration of environmental values," *id.* at 1451, and ensuring that NEPA-related preclusion authority is exercised according to due process and for NEPA-related reasons. Accordingly, the presence of these "conditions" does not transform the lease into an irretrievable commitment of resources.[6]

Plaintiffs also contend that their NEPA claims are ripe because the lease is the final word "for the most critical stage of the leasing process—the siting of development," ECF No. 48 at 14, and therefore constitutes an irretrievable commitment of resources. But this contention

[5] Although these cases do not address ripeness *per se*, their analysis applies here because an agency's irretrievable commitment of resources also triggers the obligation to conduct an EIS. *See* 848 F.2d at 1450; *CBD*, 563 F.3d at 480.

[6] Plaintiffs also contend that 30 C.F.R. § 585.628(f)(2) constitutes a "condition" on BOEM's right to absolutely preclude development activities, because it indicates that BOEM will give reasons for any disapproval of a Construction and Operations Plan and allow the lessee to resubmit without the identified defects. *Id.* However, as with the other criteria described above, Section 585.628(f)(2) does not appear to require BOEM to relinquish authority to preclude all activity within the leased area. Though the provision does grant the lessee an opportunity to cure any defects in the Plan, it does not confer any right to engage in the equivalent of surface disturbing activities, which still require approval from BOEM.

misrepresents the nature of the lease, which makes no promises other than giving the lessee the exclusive right to survey the area and submit a proposal. *See* NYAR-0046754, 0046760. Indeed, at least part of the purpose of conducting site characterization in the leased area is to determine whether the site is suitable for the proposed purpose. NYAR-0074262 ("After lease issuance, a lessee would conduct surveys and, if authorized to do so pursuant to an approved SAP, install meteorological measurement devices to characterize the site's environmental and socioeconomic resources and conditions and to assess the wind resources in the proposed lease area. A lessee would collect this information to determine whether the site is suitable for commercial development . . . ."). Against this background, the lease sale does not represent the final word on anything, nor does it commit any resources, even putting aside the question of whether it does so irretrievably.[7]

[7] Plaintiffs also note in passing that several of the cases addressing ripeness in the context of multi-stage leasing programs identified lease issuance as the point when NEPA claims ripen. ECF No. 48 at 10–11 & n.8; *see also, e.g.*, *CBD*, 563 F.3d at 480 (identifying specific lease sales as point of irreversible and irretrievable commitment). But this interpretation is misleading. *Wyoming Outdoor Council II*—the case upon which more recent cases such as *CBD* and *CSE* relied—described lease issuance as the critical stage for ripeness only as part of an explicit application of the *Peterson* rule. *See Wyoming Outdoor Council II*, 165 F.3d at 49. As this court has already discussed, the heart of the *Peterson* rule is the question of whether the agency retains the authority to preclude all surface disturbing activity. *Peterson*, 717 F.2d at 1414-15; *see also Wyoming Outdoor Council v. Bosworth*, 284 F. Supp. 2d 81, 92–93 (D.D.C. 2003) (noting that *Wyoming II* "based its irreversible commitment finding on the fact that the agency had chosen not to retain its authority to preclude all surface-disturbing activities after lease issuance," that the NEPA claim in the case before it was unripe where lease issuance did not involve relinquishment of preclusive authority or resolution of development contingency, and that ripeness is a "flexible" doctrine, not "a *per se* rule"). In *Wyoming II*, *CBD*, and *CSE*, the agency could not have relinquished its preclusive authority because it had yet to take any specific action under the leasing program. *See CBD*, 563 F.3d at 480 (noting that agency "had only approved the Leasing Program at issue," and that "[n]o lease-sales had yet occurred"); *CSE*, 779 F.3d at 599–600 (same); *Wyo. Outdoor Council II*, 165 F.3d at 49–50 (same). In *Peterson* and *Conner*, ripeness turned on lease issuance because the agency relinquished authority by the terms of the leases. *Peterson*, 717 F.2d at 1414 (noting that since the "decision to allow surface disturbing activities" was made "at the *leasing stage*," NEPA obligations attached at that point) (emphasis in original). But in this case—as in *Bosworth*—the lease does not relinquish preclusive authority. *See* 284 F. Supp. 2d at 93.

For these reasons, Plaintiffs' NEPA claims are not ripe.

C. OCSLA Violations

Plaintiffs allege that Defendants violated OCSLA by (1) failing to properly consider and provide for fishing, safety, conservation of natural resources, and navigation during both the site selection and the lease issuance process; and (2) adopting a set of regulations that on their face exceed the authority granted by OCSLA. ECF No. 39 at 47, 51–52. Statoil responds that (1) the regulations BOEM adopted were a reasonable interpretation of OCSLA's congressional mandate, ECF No. 40 at 17–19; (2) BOEM considered all relevant OCSLA factors at all relevant stages—through stakeholder meetings and public commentary—before reasonably deciding to adopt some changes and defer consideration of certain potential risks, ECF No. 40 at 19–22; and (3) BOEM's analysis of potential alternatives to development of the wind farm area was adequate. ECF No. 40 at 22–28. BOEM echoes these contentions and further argues that Plaintiffs' OCSLA claims are procedurally barred by their failure to observe the statutorily mandated sixty-day waiting period. ECF No. 42 at 28. The court agrees that Plaintiffs' OCSLA claims are barred for noncompliance with the statute.

OCSLA establishes a private right of action for persons "having a valid legal interest which is or may be adversely affected" by an agency's violation of OCSLA or its associated regulations. 43 U.S.C. § 1349(a)(1). OCSLA also provides that "[e]xcept as provided in paragraph (3) of this subsection, no action may be commenced . . . prior to sixty days after the plaintiff has given notice of the alleged violation, in writing, under oath, to the Secretary." 43 U.S.C. § 1349(a)(2)(A). Compliance with the sixty-day notice period is mandatory, although Section 1349(a)(3) provides an exception when "the alleged violation constitutes an imminent threat to the public health or safety or would immediately affect a legal interest of the plaintiff."

Id. § 1349(a)(3). *See Hallstrom v. Tillamook County*, 493 U.S. 20, 23 n.1, 26, 31 (1989) (holding that nearly identical sixty-day notice provision in Resource Conservation and Recovery Act represented a mandatory precondition to suit and expressly noting similarity to 43 U.S.C. § 1349(a)(2)); *Duke Energy Field Servs. Assets, LLC v. Fed. Energy Regulatory Comm'n*, 150 F. Supp. 2d 150, 156 (D.D.C. 2001) ("[T]he citizen suit provision in the instant [OCSLA] case plainly bars *all* cases which do not comply with the provision . . . .") (emphasis in original). Thus, unless they face an imminent threat to public health or safety or some immediate effect on a legal interest, plaintiffs must comply with the sixty-day notice provision. *Hornbeck Offshore Servs., LLC v. Salazar*, 696 F. Supp. 2d 627, 633 (E.D. La. 2010) (citing *Duke Energy*, 150 F. Supp. 2d at 156).

Plaintiffs advance two arguments in support of their compliance with OCSLA's pre-suit requirements: (1) since the lease auction occurred only forty-five days after the Final Sale Notice was published, they did not have sixty days to notify Defendants of their claims before the Final Sale and should therefore be excused from compliance with the sixty-day requirement, ECF No. 48 at 23–24; and (2) their claims fall within Section 1349(a)(3)'s exception because the lease "immediately affect[s] a legal interest of the plaintiff" insofar as it grants Statoil a property interest, along with "attendant rights to condition the access of others," and firmly determines the boundaries of the wind farm area. ECF No. 48 at 24.

Neither of these arguments is persuasive. The fact that there were fewer than sixty days between publication of the Final Sale Notice and the lease sale does not excuse Plaintiffs from compliance with the sixty-day notice period. They have identified no provision of the statute that requires BOEM to schedule its lease sales to accommodate potential claimants, and the plain language of Section 1349(a)(1) contains no ambiguity that is susceptible to such an interpretation. Rather, as in *Hallstrom*, Plaintiffs essentially argue that the statute "should be given a flexible or pragmatic construction" that would accommodate their view of the equities. 493 U.S. at 26. The court declines to engage in such an exercise. Congress has already addressed this situation in Section 1349(a)(1), which contains "explicit and unambiguous" language that "must be given palpable effect." *Duke Energy*, 150 F. Supp. 2d at 155; *see also Hallstrom*, 493 U.S. at 27 (noting in analogous context that "[g]iving full effect to the words of the statute preserves the compromise struck by Congress"). Against this background, the court sees no justification for adopting an interpretation of Section 1349(a)(1) that "flatly contradicts the language of the statute." *Hallstrom*, 493 U.S. at 27.

Moreover, Congress provided for situations in which the rigid sixty-day notice requirement of Section 1349(a)(1) would create unacceptable hardship by carving out an exception for exigent circumstances. *See* 43 U.S.C. § 1349(a)(3). To be eligible for that exception, a plaintiff must (1) provide notice of the alleged violation, and (2) demonstrate an imminent threat to public health or safety or that the alleged violation would immediately affect a plaintiff's legal interests. 43 U.S.C. § 1349(a)(3). While Plaintiffs in this case provided notice, and even signaled their intention to invoke the provision in their notice letter, ECF No. 3-1 at 148, they have failed to demonstrate any imminent threat to public health or safety, or any immediate effect on their legal interests that would authorize their claim under Section 1349(a)(3). As noted earlier, the lease has no immediate effect except to grant Statoil the right to submit an Site Assessment Plan and, potentially, a Construction and Operations Plan. Nothing in the lease authorizes Statoil to exclude others from the leased area or condition access to that area, and to the extent that the lease grants a type of property interest to Statoil, this grant fails to satisfy Section 1349(a)(3), which concerns the effect on a plaintiff's legal interest. *See* 43 U.S.C. § 1349(a)(3).

This case therefore differs from those in which the requirements of Section 1349(a)(3) were met. *See Chevron, U.S.A., Inc. v. FERC*, 193 F. Supp. 2d 54, 64–65 (D.D.C. 2002) (finding Section 1349(a)(3) satisfied where agency intended to "disclose the plaintiffs' commercially sensitive information within five days," which "would detrimentally affect the plaintiffs' legal interest in preserving the confidentiality of the information and in maintaining its suits [challenging disclosure orders]"); *Hornbeck*, 696 F. Supp. 2d at 636 n.8 (noting in alternative that immediate loss of business relationships satisfied requirements of Section 1349(a)(3)). Here, compliance with the sixty-day notice period would not have caused any immediate injury or loss of a legal right. Accordingly, Plaintiffs cannot invoke Section 1349(a)(3), and their OCSLA claims are barred for failure to comply with the terms of Section 1349(a)(1).

IV. CONCLUSION

For the foregoing reasons, the court hereby concludes that Defendants' Motion for Summary Judgment will be GRANTED, Plaintiffs' Motion for Summary Judgment will be DENIED, and Defendant-Intervenor's Motion will be DENIED AS MOOT. An appropriate order accompanies this memorandum opinion.

1. INTRODUCTION

Equinor Wind US LLC has prepared this Site Assessment Plan (SAP) in support of the installation and operation of two floating light detection and ranging buoys (FLiDARs), one metocean buoy, and one subsurface current meter mooring to be located within Official Protraction Diagram New York NK18-12, Blocks 6657 and 6760 (Installation Areas; see Figure 1-1). Equinor Wind US LLC has selected the RPS Group Inc. (RPS) to provide two FLiDAR Buoys, an RPS Wave and Met Buoy, and a subsurface current meter mooring equipped with three CM-04 Acoustic Current Meters and three Seabird SBE37 conductivity and temperature CT loggers (CM/CT Mooring [collectively referred to as the Metocean Facilities]) as the proposed meteorological and metocean data collection technologies, respectively. Although other suppliers and metocean systems are feasible and impacts can be mitigated to within acceptable limits, the selected Metocean Facilities and concept are deemed to have the following mitigating benefits over traditional concepts that include:

- Moored floating systems as opposed to traditional fixed Meteorological Masts, removing the need for percussion pile driving and jack up operations;
- Buoy power systems with 100% renewable charging sources, avoiding backup generators and subsequent emissions and potential for fuel spills;
- Power supply, data storage and mooring integrity that reduces service visit frequency and disturbance to marine life and other users of the marine environment;
- Mooring designs that are fully recoverable, using techniques that reduce the footprint of anchors and remove dynamic heavy chains in contact with the seabed; and
- Subsurface acoustic mooring recovery systems that reduce the risk of entanglement of marine life.

The Installation Areas are contained within the Lease Area[1] as defined under the Commercial Lease of Submerged Lands for Renewable Energy Development on the Outer Continental Shelf (OCS-A 0512) (Lease) taking into consideration the required buffer of 1NM from Traffic Separation Schemes (TSS). The Lease was issued to Statoil Wind US on March 10, 2017, with an effective date of April 1, 2017. On May 16, 2018, Statoil Wind US LLC changed its name to Equinor Wind US LLC, and is in the process of updating the name with BOEM in accordance with the agency's requirements. While this name change is still pending with BOEM, the SAP and associated attachments refer to Equinor Wind US LLC, based upon an expectation that the Lease and associated documentation will be updated.

On October 10, 2017, Statoil Wind US LLC requested a 12-month extension of the Preliminary Term of the Lease from the Bureau of Ocean Energy Management (BOEM), which was approved on November 13, 2017, extending the Preliminary Term from April 1, 2018 to April 1, 2019 (see Appendix A).

This SAP has been prepared in accordance with 30 Code of Federal Regulations (CFR) §§ 585.606, 610, and 611 (see Table 1-1), the Guidelines for Information Requirements for a Renewable Energy SAP issued by BOEM on February 24, 2016, and the stipulations of the Lease (see Table 2-2).

[1] The Lease Area is defined by *Addendum A of BOEM Lease No. OCS-A 0512, Section II. Description of the Lease Area*. The total acreage of the Lease Area is approximately 79,350 acres. The Lease Area is depicted in its entirety on Figure 1-1 of this SAP.

Prior to installation of the Metocean Facilities, Equinor Wind US LLC will obtain all required permits and approvals from various jurisdictional agencies as identified in Table 1-2. Equinor Wind US LLC will include copies of the final agency authorizations as part of the SAP (see Appendix A). Copies of agency authorizations will also be provided to BOEM prior to the initiation of SAP activities to begin no earlier than September 1, 2018. All installation, operation, and decommissioning activities will be conducted in compliance with any additional requirements stipulated in the final permits to be issued by other regulatory agencies.

The Metocean Facilities described in this SAP will collect wind resource and metocean data to support development of the Lease Area.

PUBLIC COPY - CONFIDENTIAL INFORMATION REMOVED

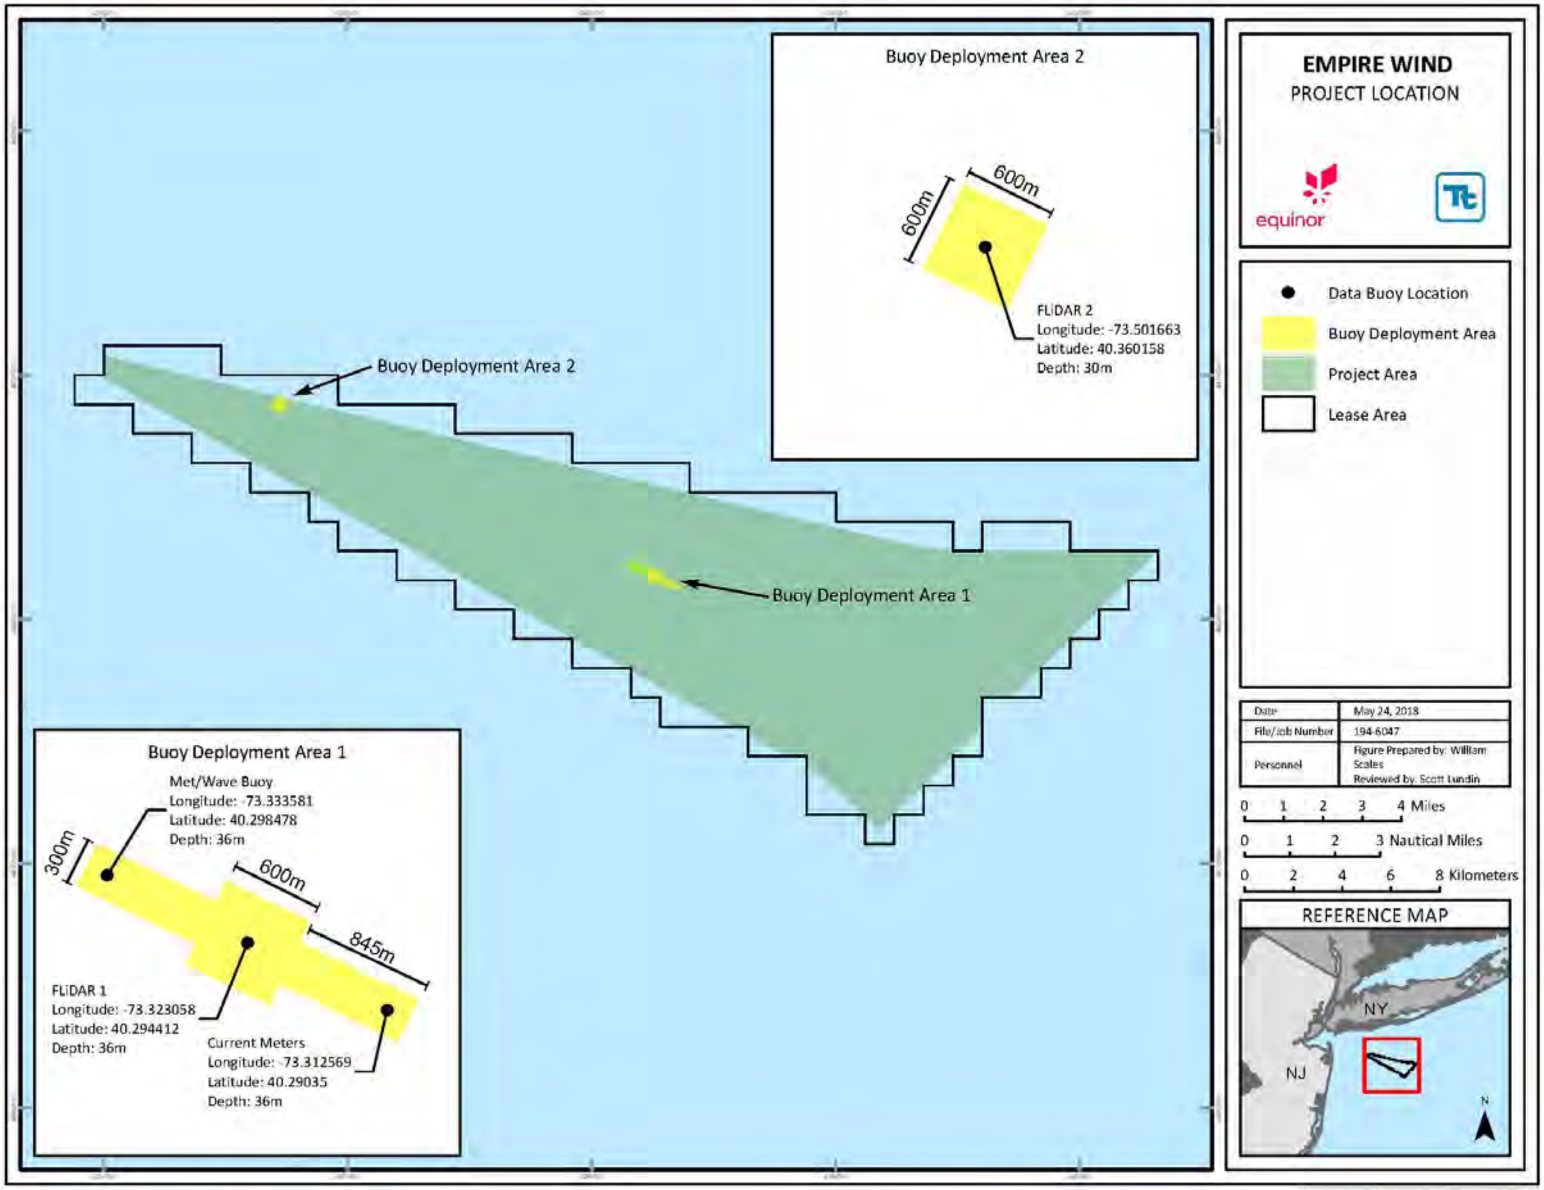

Figure 1-1 Site Assessment Plan Buoy Deployment Areas

1.1 Authorized Representative and Designated Operator

As the lease holder, Equinor Wind US LLC, by default, is also the lease operator. Equinor Wind US LLC proposes to have RPS serve as the contracted operator for the Metocean Facilities. The contact information for RPS's Authorized Representative is as follows:

Name of Authorized Representative	Kevin Redman
Title	Sr. Oceanographer / Regional Manager
Phone Number	+1 206 526 5622 office; +1 206 819 4966 cell
Email	Kevin.Redman@RPSGroup.com
Address	4608 Union Bay Pl. N.E. Seattle, WA 98372

1.2 Certified Verification Agent Waiver Request

Pursuant to 30 CFR § 585.610(a)(9), BOEM may require a Certified Verification Agent (CVA) to certify to BOEM that the Metocean Facilities are designed to withstand the environmental and functional load conditions for the intended life of the Metocean Facilities in the Installation Areas. Equinor Wind US LLC requests a waiver of the CVA requirement per 30 CFR § 585.705(c) because the selected Metocean Facilities are a commercially available technology that have been successfully deployed on many occasions in similar conditions by the selected supplier. Equinor Wind US LLC has had a Measurements Engineer from RPS perform the duties similar to those of a CVA. The Measurements Engineer will also inspect the equipment prior to installation, witness the installation, and prepare an installation report as described in Section 0.

Table 1-1 Site Assessment Plan Requirements for Commercial Leases Pursuant to §585.105(a), 606(a), 610(a) and (b), and 611(a) and (b)

Requirement	Compliance Statement
§ 585.105(a)	
1) The design of the environmental monitoring buoy and conduct of planned activities ensures safety and will not cause undue harm or damage to natural resources and will take measures to prevent unauthorized discharge of pollutants into the offshore environment.	Equinor Wind US LLC will comply with this requirement, as evidenced in this SAP.
§ 585.606(a)	
1) The Project will conform to all applicable laws, regulations, and lease provisions.	Equinor Wind US LLC will comply with this requirement. See Table 1-2, Table 1-3, Table 2-1, Table 2-2, and Appendix A.
2) The Project will be safe.	Equinor Wind US LLC will comply with this requirement. Specifically, see Section 4.8.
3) The Project will not unreasonably interfere with other uses of the Outer Continental Shelf (OCS), including national security or defense.	Equinor Wind US LLC will comply with this requirement. See Table 2-2 for specific activities to ensure compliance.
4) The Project will not cause undue harm or damage to natural resources; life; property; the marine, coastal, or human environment; or historical or archeological resources.	See Section 0 for an analysis of site characteristics and for avoidance and mitigation measures.
5) The Project will use best available and safest technology.	Equinor Wind US LLC will comply with this requirement. See Section 3.1 and Appendix B for a description and technical specifications on the selected Metocean Facilities.
6) The Project will use best management practices.	Equinor Wind US LLC will comply with this requirement. Best management practices are described in Table 1-3, Sections 0, 0, 0, and 0.
7) The Project will use properly trained personnel.	Equinor Wind US LLC will ensure that all personnel meet the company's standard technical as well as health, safety, and environmental (HSE) standards for the work being conducted.

Table 1-1 Site Assessment Plan Requirements for Commercial Leases Pursuant to §585.105(a), 606(a), 610(a) and (b), and 611(a) and (b)

Requirement	Compliance Statement
§ 585.610(a)	
1) Contact Information	Martin Goff Environmental & Permitting Manager +1 202 813 7444 MGOF@equinor.com 120 Long Ridge Road, Suite 3EO1, Stamford, CT 06902
2) Site assessment concept	Meteorological, metocean, and biological data collection using two RPS FLiDAR Buoys, one RPS Wave and Met Buoy, and one RPS Current Meter Mooring consisting of 3 CM-04 Acoustic Current Meters and 3 Seabird SBE37 conductivity and temperature CT loggers.
3) Designation of operator	Not applicable. See Section 1.1
4) Commercial lease stipulations and compliance	See Table 2-2.
5) A location plat	See Figure 1-1.
6) General structural and project design, fabrication and installation information	See Sections 0, 0, and 0.
7) Deployment activities	See Section 0.
8) Measures for avoiding, minimizing, reducing, eliminating, and monitoring environmental impacts	This SAP has been prepared in accordance with the Commercial Wind Lease Issuance and Revised Environmental Assessment for Commercial Wind Lease Issuance and Site Assessment Activities on the Atlantic Outer Continental Shelf Offshore New York, and Stipulations in the Commercial Lease. Specific efforts to avoid, minimize, reduce, eliminate, or monitor environmental impacts can be found in Sections 0 and 0. Conformance with the Offshore New York EA is detailed in Section 2.
9) Certified Verification Agent nomination	Not applicable. See Section 1.2.
10) Reference information	See Section 0.
11) Decommissioning and site clearance procedures	See Section 0.
12) Air quality information	See Section 7.8 and Appendix H.
13) A listing of all federal, state, and local authorizations or approvals required to conduct site assessment activities on your lease	See Table 1-2.
14) A list of agencies and persons with whom you have communicated, or with whom you will communicate, regarding potential impacts associated with your proposed activities	See Appendix A.
15) Financial assurance information	Activities and facilities proposed herein will be covered by an appropriate bond or other approved security.
§585.610(b)	
Geotechnical	
(i) A description of all relevant seabed and engineering data and information to allow for the design of the foundation for that facility	Section 7.1, Appendix C
Shallow Hazards	
(i) Shallow faults;	Section 7.1
(ii) Gas seeps or shallow gas;	Section 7.1
(iii) Slump blocks or slump sediments;	Section 7.1
(iv) Hydrates; or	Section 7.1
(v) Ice scour of seabed sediments.	Section 7.1
Archaeological Resources	
(i) A description of the results and data from the archaeological survey;	Section 7.1, Appendix D

Table 1-1 Site Assessment Plan Requirements for Commercial Leases Pursuant to §585.105(a), 606(a), 610(a) and (b), and 611(a) and (b)

Requirement	Compliance Statement
(ii) A description of the historic and prehistoric archaeological resources, as required by the National Historic Preservation Act of 1966 (NHPA), as amended.	Section 7.1, Appendix D
Geological Survey	
(i) Seismic activity at your proposed site;	Section 7.1
(ii) Fault zones;	Section 7.1
(iii) The possibility and effects of seabed subsidence; and	Section 7.1
(iv) The extent and geometry of faulting attenuation effects of geologic conditions near your site.	Section 7.1
Biological	
(i) Live bottoms	Sections 7.1 and 7.4
(ii) Hard bottoms	Sections 7.1 and 7.4
(iii) Topographic features; and	Sections 7.1 and 7.4
(iv) Surveys of other marine resources such as fish populations (including migratory populations), marine mammals, sea turtles, and sea birds.	Sections 7.1 and 7.4
§ 585.611(a) and (b) Requirements	
Hazard information	Section 7.1
Water quality	Section 7.7
Biological resources	
(i) Benthic communities	Section 7.3

Table 1-2 Permit Matrix

Permitting Agency	Applicable Permit or Approval	Statutory Basis	Regulations	Applicant Requirements
National Oceanic and Atmospheric Administration (NOAA), National Marine Fisheries Service (NMFS)	Endangered Species Act (ESA) Section 7 Consultation	16 United States Code (U.S.C.) 1536	50 CFR 402	These consultations were completed prior to the issuance of the Lease. However, pursuant to its obligations under Section 7 of the ESA, BOEM is required to consult with NMFS prior to approval of any site assessment activities that may affect ESA-listed species that occur within the Lease Area.
	Magnuson-Stevens Fishery Conservation and Management Act Section 305(b) Consultation	16 U.S.C. 1801	50 CFR 600	No action required. BOEM will consult with NMFS to complete the essential fish habitat assessment and determination based on details provided herein.
	Incidental Take Authorization	Marine Mammal Protection Act of 1972 (MMPA)	16 U.S.C. §§ 1361 *et seq.*	No action required. As detailed in Sections 0, 0, and 0, installation, operation, and decommissioning of the Metocean Facilities will not result in the harassment of marine mammals protected under the MMPA. In addition, as demonstrated in Section 2.2, Equinor Wind US LLC will comply with Lease stipulations. The Lease stipulations are based on the Standard Operating Conditions (SOCs) included in Appendix B of the Offshore New York EA which are consistent with Incidental Take Statement of the NMFS Biological Opinion issued in March 10, 2013 (Revised April 10, 2013). Additionally, Equinor Wind US LLC received an Incidental Harassment Authorization to support its geophysical and preliminary geotechnical survey campaign on April 24, 2018.
U.S. Army Corps of Engineers, New York District	Nationwide Permit 5 – Scientific Measurement Devices	Clean Water Act 33 U.S.C. 134	33 CFR 320 *et seq.*	Equinor Wind US LLC confirmed with the United States Army Corps of Engineers on March 15, 2018 that the installation, operation, and decommissioning of the Metocean Facilities are authorized and in conformance with the terms of Nationwide Permit # 5.
United States Coast Guard (USCG)	Approval for Private Aids to Navigation	14 U.S.C. 81	33 CFR Part 66	Equinor Wind US LLC will submit an application to the USCG for a Private Aids to Navigation (PATON) prior to the installation of the Metocean Facilities. Equinor Wind US LLC will submit a copy of the approved PATON to BOEM prior to buoy deployment.
U.S. Department of Interior, BOEM	NHPA Section 106 Consultation	NHPA 16 U.S.C. 470	36 CFR Part 60, Part 800	No action required. BOEM has executed a Programmatic Agreement that establishes procedures for consultations for site assessment activities in the New York Wind Energy Area (WEA) and under NHPA Stipulations for the identification and protection of cultural resources are included in the Lease.
U.S. Fish and Wildlife Service	Endangered Species Act Section 7 Consultation	16 U.S.C. 1536	50 CFR 402	No action required. These consultations were completed prior to the issuance of the Lease.
New York Department of State, Division of Coastal Resources	Coastal Management Program Consistency Certification	Coastal Zone Management Act	15 CFR 930 Subpart C	No action required. A final Coastal Zone Consistency Determination (CD) was issued by BOEM for SAP activities in the New York WEA in June 2016. In August 2016, New Jersey provided conditional concurrence and New York provided concurrence with BOEM's CD. See Appendix A for a copy of the concurrence letters from the New York State Department of State and New Jersey Department of Environmental Protection.

1.3 Best Management Practices

Best management practices (BMPs) are described in Sections 1.3, 0, and 0. Equinor Wind US LLC will use its standard internal project execution structure to manage activities described in the SAP. As stated in Section 4.8, SAP activities will be supported by a detailed HSE Plan, which is included as Appendix F.

In addition, Equinor Wind US LLC will use many of the BMPs identified in the *Guidelines for Information Requirements for a Renewable Energy Site Assessment Plan* (BOEM 2016a) and *Establishment of an OCS Alternative Energy and Alternate Use Program*, Record of Decision, December 2007 (BOEM 2007). See Table 1-3 for a summary of these BMPs (numbering in Table 1-3 corresponds to the format of the noted SAP Guidelines).

Table 1-3 Best Management Practices

Best Management Practices	Location in SAP Document
1. Minimize the area disturbed by installation	Section 3.3
2. Contact and consult with the appropriate affected Federal, state, and local agencies early in the planning process	Table 2-2 and Section 4.1
5. Conduct seafloor surveys to ensure that the project is sighted to avoid or minimize impacts associated with seafloor instability and other hazards	Section 3.3
7. Avoid known sensitive seafloor habitats	Section 7.3
8. Avoid anchoring on sensitive seafloor habitats	Section 7.3
10. Routine inspection of the buoys to monitor scouring and ensure structural integrity	Section 5.2
11. Avoid the use of explosives that may impact fish or benthic organisms	No explosives will be used for activities proposed in the SAP.
14, 15, 16, 17, and 21 related to minimizing/avoiding vessel impacts to marine mammals and sea turtles.	Section 4.4
18. Use existing data to identify important, sensitive, and unique marine habitats in the vicinity of the project and design the deployment to avoid adverse impacts to these habitats	Section 0
19. Minimize construction activities in areas containing anadromous fish during migration periods	Section 7.4
20. Minimize seafloor disturbance during installation of the buoys	Section 4.1
25. Minimize perching opportunities	Section 7.6
27. Comply with USCG lighting and marking requirements while using lighting technology that minimizes impacts to avian species	Table 1-2 and Section 7.6
31 and 32. Minimize potential conflicts with commercial and recreational fishing interests by working with commercial/recreational fishing entities and reviewing planned activities with potentially affected parties	Section 7.4
33. Use practices and operating procedures that reduce the likelihood of vessel accidents and fuel spills	Section 0
34. Avoid impacts to the commercial fishing industry by marking the buoy(s) with USCG-approved marking and lighting to ensure safe vessel operation	Table 1-2 and Section 7.9
36. Avoid hard-bottom habitats, including seagrass communities and kelp beds	Section 7.3
50. Prepare an oil spill response plan	The Metocean Facilities will not require a backup generator or any other fuel dependent equipment. As such, no Oil Spill Response Plan or Oil Spill Response Measures will be required.

2. CONFORMITY WITH PRIOR BOEM ACTIONS REGARDING SAP ACTIVITIES

2.1 Offshore New York Environmental Assessment

On October 21, 2016, BOEM issued a Finding of No Significant Impact based on a comprehensive Environmental Assessment (referred to herein as the "Offshore New York EA") (BOEM 2016b). The Offshore New York EA analyzed the foreseeable consequences associated with issuing commercial leases within the New York WEA, which is inclusive of the Lease Area (Figure 1-1), as well as the site assessment activities including the installation of Metocean Facilities. The Metocean Facilities and proposed activities described herein are consistent with Section 3.2.2.2 of the Offshore New York EA, with the selected concept demonstrating lower impacts than some worst case, but acceptable concepts within the EA. Table 2-1 below provides a comparison of the information assessed in the Offshore New York EA and the relevant detail being proposed by Equinor Wind US LLC herein.

Table 2-1 Comparison of Offshore New York EA and SAP Elements

Project Component	Assessed in EA	Proposed in SAP	Summary
# of Buoys	Max 2 buoys per lease area and an additional small tethered buoy	2 RPS FLiDAR buoys, 1 RPS Wave and Met Buoy, 1 RPS Current Meter Mooring consisting of 3 CM-04 Acoustic Current Meters, and 3 Seabird SBE37 conductivity and temperature CT loggers.	The number of buoys proposed in this SAP are consistent with what was assessed in the EA.
Meteorological Buoy Specifications	Specific to hull type, discus-shaped (33 to 40 ft [10 to 12 m] in diameter), boat-shaped (20 ft (6 m), and spar buoys	RPS FLiDAR Buoy: 15.2 feet (ft, 4.6 meters [m]) diameter, weighing 9480 pounds (4.3 metric tons)	The Metocean Facilities proposed in this SAP are smaller and weigh less that what was assessed in the EA. The direct consequence is a reduction in the anchor requirement and subsequent footprint, and heavy mooring chain in dynamic contact with the seabed.
Meteorological Buoy Hull Type	NOMAD, COLOS	RPS FLiDAR: toroidal shape dodecagon steel hull with aluminum superstructure	Equinor Wind US LLC is proposing to use a hull type that is consistent with what was assessed in the EA.
Meteorological Buoy Height above ocean surface	30-40 ft (9-12 m)	RPS FLiDAR: 10.8 ft (3.3 m)	The Metocean Facilities proposed in this SAP are less than half the height that what was assessed in the EA
Meteorological Buoy Mooring Design	Specific to buoy type, all chain or a combination of chain, nylon, and buoyant polypropylene materials with 6,000- to 8,000-pound (2,721.5 to 3,628.7 kg) anchors, 6 ft^2 footprint, 370,260 ft^2 anchor sweep.	U-shaped mooring, with a combination of chain, polypropylene materials, wire rope, trawl floats, viny floats, amsteel rope dispensers and rubber cords with 2,645.5 lb and 661.4 lb (1,200 kg and 300 kg) steel chain clump weights or steel constructed wagon wheel weights no larger than 6 ft^2 resting on seafloor. Total area of mooring on seafloor, inclusive of both clump weights, chains, and wire ropes, is 67.8 ft^2 (6.3 m^2).	The weight and area of anchor resting on the sea floor is generally consistent with what was assessed in the EA. However, due to the mooring design, there is not expected to be an anchor sweep associated with the mooring proposed by Equinor Wind US LLC. Polypropylene rope will only be used where essential for mooring integrity and safe deployment/recovery operations and will be under tension, removing the risk of entanglement with marine life.
Small Tethered Buoy size	10 ft (3 m) in diameter or less	8.5 ft (2.6 m)	The proposed wave and met buoy is consistent with what was assessed in the EA.

Table 2-1 Comparison of Offshore New York EA and SAP Elements

Project Component	Assessed in EA	Proposed in SAP	Summary
Data Transmission	Transmit operational status and data to receiver on shore	Transmit operational status and data to shore via satellite or cellular telemetry	The data transmission protocols proposed by Equinor Wind US LLC are consistent with what was assessed in the EA.
Maintenance	Monthly or quarterly	Every 6 months	The maintenance schedule proposed in this SAP is less frequent than what was proposed in the EA, which is expected to result in lower impacts through reduced disturbance to marine life and other maritime users.
Installation and decommissioning process	Carried or towed by vessel, lower or place buoy over final location, drop mooring anchor, decommissioning is reverse of installation	Towed by vessel, deploy mooring system, lower anchor over final location, decommissioning is reverse of installation	The installation and decommissioning processes proposed by Equinor Wind US LLC are consistent with what was assessed in the EA.
Installation and decommissioning timeframe	Installation 1 day per buoy, Decommissioning 1 day per buoy	Installation up to seven days for all Metocean Facilities over three separate vessel trips including transit, decommissioning up to seven days for all Metocean Facilities, including transit. Subject to weather.	The installation and decommissioning timeframes proposed by Equinor Wind US LLC are consistent with what was assessed in the EA.
Power supply	Solar, Wind, Backup Diesel Generator	RPS FLiDAR: Solar and Wind RPS Wave and Met Buoy: Solar	The power supply proposed by Equinor Wind US LLC are consistent with what was assessed in the EA. However, unlike similar buoys that have been proposed and deployed on the Atlantic OCS, the RPS FLiDAR and Met/Wave Buoys do not have a backup diesel generator, and, as such, minimizes potential environmental impacts associated with fuel spills and emissions.

2.2 Lease OCS-A 0512

The Bureau of Ocean Energy Management (BOEM) identified mitigation measures or Standard Operating Conditions (SOC) in the Offshore New York EA for buoy installation, operation, and decommissioning. The SOCs were developed by BOEM in consultation with other federal and state agencies to reduce or eliminate the potential environmental risks to, or conflicts with, individual environmental and socioeconomic resources upon issuance of a commercial lease for site assessment and characterization activities. BOEM has issued the mitigation measures for Equinor Wind US LLC's lease-specific site characterization activities and site assessment activities in the Lease based upon these SOCs. Equinor Wind US LLC will implement these Lease specific measures as described in more detail in Table 2-2 and Section 0 of this SAP.

Table 2-2 Conformance with the Commercial Renewable Energy Lease Number OCS-A 0512 Stipulations

Addendum "C" Stipulation	Description	SAP Document
3 National Security and Military Operations		
3.2.4 Lessee Point-of-Contact for Evacuation/Suspension Notifications	The Lessee must inform the Lessor of the persons/offices to be notified to implement the terms of 3.2.2 and 3.2.3.	Martin Goff Environmental & Permitting Manager +1 (202) 813-7444 mgof@equinor.com 120 Long Ridge Road, Suite 3EO1 Stamford, CT 06902
3.2.5 Coordination with Command Headquarters	The Lessee must establish and maintain early contact and coordination with the appropriate command headquarters, in order to avoid or minimize the potential to conflict with and minimize the potential effects of conflicts with military operations.	Equinor Wind US LLC will establish contact with the United States Fleet Forces (USFF) N46 at 1562 Mitscher Avenue, Suite 250, in Norfolk, Virginia ([757]836-6206), as provided in the Commercial Lease.
3.3 Electromagnetic Emissions	Prior to entry into any designated defense operating area, warning area, or water test area for the purpose of commencing survey activities undertaken to support plan submittal, the Lessee must enter into an agreement with the commander of the appropriate command to coordinate the electromagnetic emissions associated with such survey activities. The Lessee must ensure that all electromagnetic emissions associated with such survey activities are controlled as directed by the commander of the appropriate command headquarters.	Equinor Wind US LLC will provide the frequencies the Metocean Facilities will use to transmit data to confirm electromagnetic emissions from the SAP activities will not conflict with military operations.
4 Standard Operating Conditions		
4.1.1 Briefing	Prior to the start of operations, the Lessee must hold a briefing to establish responsibilities of each involved party, define the chains of command, discuss communication procedures, provide an overview of monitoring procedures, and review operational procedures. This briefing must include all relevant personnel, crew members, and Protected Species Observers (PSOs). New personnel must be briefed as they join the work in progress.	See Section 4.3, Pre-Installation Briefing.
4.1.2	The Lessee must ensure that all vessel operators and crew members, including PSO's, are familiar with, and understand, the requirements specified in Addendum C.	See Section 4.3, Pre-Installation Briefing.
4.1.3	The Lessee must ensure that a copy of the standard operating conditions (Addendum C) is made available on every project-related vessel.	See Section 4.3, Pre-Installation Briefing.
4.1.4 Marine Trash and Debris Prevention	The Lessee must ensure that vessel operators, employees and contractors actively engaged in activities in support of plan (i.e., SAP and/or Construction and Operations Plan [COP]) submittal are briefed on marine trash and debris awareness and elimination, as described in the Bureau of Safety and Environmental Enforcement Notice to Lessees (NTL) No. 2015-G03 ("Marine Trash and Debris Awareness and Elimination") or any NTL that supersedes this NTL, except that the Lessor will not require the Lessee, vessel operators, employees and contractors to undergo formal training or post placards. The Lessee must ensure that vessel operator employees, and contractors are made aware of the environmental and socioeconomic impacts associated with marine trash and debris and their responsibilities for ensuring that trash and debris are not intentionally or accidentally discharged into the marine environment. The above-referenced NTL provides information the Lessee may use for this awareness briefing.	Equinor Wind US LLC will comply with this stipulation, except that formal training will not be conducted and placards will not be posted. Vessel Operators, employees, and contractors will be briefed prior to boarding the vessel.

Table 2-2 Conformance with the Commercial Renewable Energy Lease Number OCS-A 0512 Stipulations

Addendum "C" Stipulation	Description	SAP Document
4.1.5 Fisheries Communications Plan (FCP) and Fisheries Liaison	The Lessee must develop a publicly available FCP that describes the strategies that the Lessee intends to use for communicating with fisheries stakeholders prior to and during activities in support of the submission of a plan. The FCP must include the contact information for an individual retained by the Lessee as its primary point of contact with fisheries stakeholders (i.e. Fisheries Liaison). If the Lessee develops a project website, the FCP must be posted on the Lessee's project website. If the Lessee does not develop a project website, the FCP must be made available to the Lessor and the public upon request.	Equinor Wind US LLC will comply with this stipulation. A draft FCP has been posted to the project website, and a Fisheries Liaison has been selected.
4.2.1 Vessel Strike Avoidance Measures	The Lessee must ensure that all vessels conducting activities in support of the plan submittal, including those transiting to and from local ports and the lease area, comply with the vessel-strike avoidance measures specified in stipulations 4.2., except under extraordinary circumstances when complying with these requirements would put the safety of the vessel or crew at risk.	See Section 4.4, Protected Species Avoidance
4.3.6 No Impact without Approval	The Lessee must not knowingly impact a potential archaeological resource without the Lessor's prior approval.	See Section Archaeological Resources Archaeological Resources and Appendix D. Marine Archaeological Resource Assessment Report
4.3.7 Post-Review Discovery Clauses	If the Lessee, while conducting site characterization activities in support of a plan submittal, discovers a potential archaeological resource, such as the presence of a shipwreck (e.g., a sonar image or visual confirmation of an iron, steel, or wooden hull, wooden timbers, anchors, concentrations of historic objects, piles of ballast rock) or pre-contact archaeological site (e.g., stone tools, pottery) within the project area, the Lessee must:	Appendix D. Marine Archaeological Resource Assessment Report
4.3.7.1	Immediately halt seafloor/bottom-disturbing activities within the area of discovery;	Appendix D. Marine Archaeological Resource Assessment Report
4.3.7.2	Notify the Lessor within 24 hours of discovery;	Appendix D. Marine Archaeological Resource Assessment Report
4.3.7.3	Notify the Lessor in writing via report to the Lessor within 72 hours of its discovery;	Appendix D. Marine Archaeological Resource Assessment Report
4.3.7.4	Keep the location of the discovery confidential and take no action that may adversely affect the archaeological resource until the Lessor conducts an evaluation and instructs the applicant on how to proceed; and,	Appendix D. Marine Archaeological Resource Assessment Report
4.3.7.5	Conduct any additional investigations as directed by the Lessor to determine if the resource is eligible for listing in the National Register of Historic Places (30 CFR 585.802(b)). The Lessor will direct the Lessee to conduct such investigations if: (1) the site has been impacted by the Lessee's project activities; or (2) impacts to the site or to the area of potential effect cannot be avoided. If investigations indicate that the resource is potentially eligible for listing in the National Register of Historic Places, the Lessor will tell the Lessee how to protect the resource or how to mitigate adverse effects to the site. If the Lessor incurs costs in protecting the resource, under Section 110(g) of the National Historic Preservation Act, the Lessor may charge the Lessee reasonable costs for carrying out preservation responsibilities under the OCS Lands Act (30 CFR 585.802(c-d)).	Appendix D. Marine Archaeological Resource Assessment Report

Table 2-2 Conformance with the Commercial Renewable Energy Lease Number OCS-A 0512 Stipulations

Addendum "C" Stipulation	Description	SAP Document
4.5.2. Reporting Injured or Dead Protected Species	The Lessee must ensure that sightings of any injured or dead protected species (e.g., marine mammals, sea turtles, or sturgeon) are reported to the NMFS and the NMFS Greater Atlantic (Northeast) Region's Stranding Hotline (866-755-6622 or current) within 24 hours of sighting, regardless of whether the injury or death is caused by a vessel. In addition, if the injury or death was caused by a collision with a project-related vessel, the Lessee must notify the Lessor of the strike within 24 hours. The Lessee must use the form provided in Appendix A to Addendum C to report the sighting or incident. If the Lessee's activity is responsible for the injury or death, the Lessee must ensure that the vessel assist in any salvage effort as requested by NMFS.	See Section 4.4

3. PROJECT DESCRIPTION AND OBJECTIVES

3.1 Project Description and Objectives

Equinor Wind US LLC will collect and analyze meteorological data, inclusive of wind speed and direction at multiple heights, and information on other meteorological and metocean conditions as part of the site assessment activities of the Project within the Lease Area. As stated previously, Equinor Wind US LLC has proposed that the collection of this data will be performed using two RPS FLiDAR Buoys, one RPS Met and Wave Buoy, and one subsea Current Meter mooring. The proposed Metocean Facilities represent state-of-the-art equipment that incorporates the best available technologies, mooring components and mooring designs to ensure reliable, quality data collection, robust mooring integrity, safety and minimal environmental impacts. Design drawings of the technology proposed are provided in Appendix B.

The RPS FLiDAR Buoy will consist of instrumentation and supporting systems atop a floating moored buoy platform (Figure 3-1). Each floating platform consists of the toroidal shaped, dodecagon hull, mooring chain, clump weight anchors, floats and a pendant marker buoy. The hull consists of hot rolled HA1-grade steel with 10-millimeter (mm), 350-grade steel dividing plates. The hull is powder coated and has 12 zinc anodes installed to protect each hull segment from corrosion. The 5005-grade H34 aluminum superstructure is powder coated and measures 15.2 feet (ft) (4.63 meters [m]) in diameter. The vertical profile of RPS FLiDAR including instrumentation, will be approximately 15.8 ft (4.8 m) from the sea surface to the top of the D400 wind generators. The weight of the entire buoy including all electronics and keel is 9,480 pounds (lbs) (4,300kilograms [kg]) (4.3 metric tons).The submerged portion of the hull would measure approximately 13.8 ft (4.2 m) below the sea surface from the water line to the bottom of the buoy. The superstructure has also been designed with consideration for avian species. Landing areas have been minimized and anti-perching devices will be installed on the lights and mast. In addition, consideration has been given to potential icing issues and horizontal surfaces have been minimized to limit the potential ice/snow build up.

Figure 3-1 RPS FLiDAR Buoy

The RPS Wave and Met Buoy is a 8.5 ft (2.6 m) round buoy that measures directional waves, metoerological conditions at sensor height and sea water temperature (Figure 3-2). Similar to the RPS FLiDAR, the buoy hull and superstructure are constructed from hot rolled HA1-grade steel and 5005-grade H34 aluminum, respectively. The Wave and Met Buoy is attached to the seabed using a U-shape mooring design. The vertical profile of the Wave and Met Buoy will be approximately 7.9 ft (2.4 m) from the sea surface to the top of the buoy. The submerged portion of the buoy hull would measure approximately 7.9 ft (2.4 m) below the sea surface from the waterline to the bottom of the buoy. The Wave and Met Buoy weighs 4,409 lbs (2,000 kg).

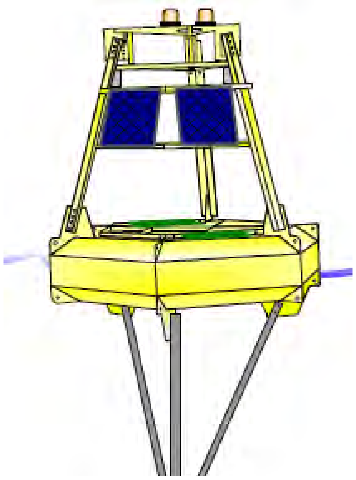

Figure 3-2 RPS Wave and Met Buoy

The CT/CM Mooring will be a subsurface inline mooring consisting of CM-04 Acoustic Current Meters and Seabird SBE37 CT loggers. The CM-04 Acoustic Current Meter, which measures approximately 45 inches (1155 millimeters [mm]) long by 8 inches (195 mm) wide, is a self-contained instrument that can be moored to record ocean currents and water temperature. CM-04 Acoustic Current Meter is constructed from Type 2 Titanium. The CM-04 Acoustic Current Meter will be incorporated into the subsea mooring at 9.8 ft (3 m), 55.8 ft (17 m), and 88.6 ft (27 m) above the seabed. The Seabird SBE37 CT logger, which measures 22.2 inches (563.9 mm) long by 4 in (102.9 mm) wide, is a high-accuracy conductivity and temperature recorder with internal battery and memory. The Seabird SBE37 CT logger is constructed from titanium and other non-corroding materials and has been designed for moorings and other long duration, fixed-site deployments.). The Seabird SBE37 CT loggers will be attached to the subsurface portion of the mooring line via plastic clamps and cables at 4.9 ft (1.5 m), 62.3 ft (19 m), and 95 ft (29 m) above the seafloor.

Figure 3-3 CM-04 Acoustic Current Meter (Left) and Seabird SBE37 CT Logger (Right)

Equinor Wind US LLC plans to deploy the Metocean Facilities no earlier than September 1, 2018, but as soon as all permits are in place thereafter. Equinor Wind US LLC requires a period of wind profile measurements data from the FLiDARs as early as possible to help inform development concepts for bids into upcoming competitive state power offtake solicitations. The two RPS FLiDAR Buoys are scheduled to be decommissioned at the end of their two-year operational life, and the Met and Wave Buoy and the CM/CT mooring will be decommissioned at the end of four years. The Metocean Facilities will be decommissioned at the end of the operational life as described in Section 0.

3.2 Site Location

The location of the proposed Metocean Facilities will fall within two sites that were surveyed and evaluated by Equinor Wind US LLC in spring 2018 (see Section 0 and Appendices C, D, and E). These sites are collectively referred to as the Installation Areas (Figure 1-1). For the purpose of the discussion in this SAP, the two Installation Areas where the Metocean Facilities are proposed to be located have been given unique identifiers. The RPS FLiDAR 1 Buoy, the RPS Wave and Met Buoy, and CM/CT Mooring to be located in the center of the Lease Area are referenced as FLiDAR 1, Wave and Met Buoy, and Current Meters, respectively, and will be deployed within Buoy Deployment Area 1. The RPS FLiDAR 2 Buoy to be installed in the western side of the Lease Area is referenced as FLiDAR 2 and will be deployed within Buoy Deployment Area 2. The coordinates for these locations are provided in Table 3-1 and depicted on Figure 1-1.

The Metocean Facilities will be deployed within the proposed Installation Areas at the coordinates listed in Table 3-1.

Table 3-1 Location of the Metocean Facilities

Platform	Northing (UTM 18N 2011 NAD83)	Easting (UTM 18N 2011 NAD83)	NAVD88 Water Depth	OCS Lease Block	Aliquot
FLiDAR 1	4461784	642530	36 Meters	6760	G
Wave and Met Buoy	4461350	643430	36 Meters	6760	F
Current Meters	4462217	641627	36 Meters	6760	L
FLiDAR 2	4468810	627225	30 Meters	6657	O

3.3 Mooring Designs, Power Supply, and Instrumentation

The location for the Installation Areas of the proposed Metocean Facilities as presented in Table 3-1 was based on a review of existing data, information collected during 2018 high resolution geophysical (HRG) surveys conducted within the Lease Area (See Appendix C), the most likely development scenarios for the lease area and the best available technologies. The following sections provide detailed descriptions of the proposed Metocean Facilities as well as their associated mooring designs, power supply, and instrumentation.

RPS carried out rigorous mooring design and modeling for the FLiDAR, Met and Wave Buoy and the Current Meter CM/CT using their decades of first-hand experience designing and deploying metocean moorings and utilizing the latest mooring technology and modelling software, ORCAFLEX. The FLiDAR, Met and Wave Buoy and the Current Meter CM/CT Mooring designs and testing processes were independent of each other due to differences in surface buoy characteristics and data measurement requirements. Mooring designs went through multiple design iterations and model runs until modelling results returned acceptable and safe values when run at extreme local metocean condition thresholds. Values used in models were 60 knots (30.1meters per second [m/s]) wind speed, 2 knots (1.0m/s) currents, and 27.9 ft (8.5 m) Hs at 13.1 seconds Tp. The

FLiDAR, Met and Wave Buoy, and Current Meter CM/CT moorings were designed with the following objectives:

- the surface FLiDAR buoy and Met and Wave Buoy remain secure on the sea surface without risk of detachment, submersions, significant overtopping from waves and within satisfactory limits of tilt for sensors;
- the mooring components are rated to a good level of safety factor when under tension to minimize risk of mooring failure during operational life and lifting operations;
- the mooring components can survive benign conditions without the risk of tangling or rubbing and causing self-wear;
- mooring components are of a material and length with 'stopping off points' that allow for safe deployment and recovery on a range of vessels; and
- where feasible, mooring designs use components and materials that minimize risk to marine life and other marine users.

The mooring designs have been selected to be consistent with other similar moorings deployed in the lease area including 25 BOEM funded Atlantic Sturgeon acoustic detection moorings made up of a combination of anchor weights, chain and rope with floats. The recovery section of the moorings are deemed to avoid the risk of entanglement for the following reasons:

- Unlike static fishing gear with rope recovery lines that extend to surface marker buoys that can go slack and have the ability to loop, the 32.8 ft (10m) of polypropylene rope on the FLiDAR and Met and Wave Buoy recovery section is under constant tension, provided by the 198 lbs (90kg) of positive buoyancy. This removes the risk of looping sections of rope and available slack.
- The upper 9.8 ft (3m) of polypropylene rope on the recovery sections are fed through the three viny floats, exposing approximately 5 ft (1.5m) of rope, which is not considered to be long enough to cause an entanglement risk. This section of rope is also under constant tension from the 198 lbs (90kg) of positive buoyancy produced by the viny floats.
- Unlike long, loose sections of rope on fishing gear, the combination of three subsurface viny floats, a rope dispenser and an acoustic release would provide an adequate target to produce a return signal from marine mammals using echo location, therefore it is expected that there is an ability to detect and avoid this section of mooring.

The final FLiDAR and Met and Wave Buoy mooring designs utilize a combination of rubber cords and chain from the buoy to the primary anchor weight to allow the buoy to ride the waves, with the rubber cords acting to absorb the tension and reduce a tugging/snatching action on the buoy and mooring. The lower section of rubber cord is held clear of the seabed by a float with 110 lb (50kg) buoyancy to remove the risk of the non-buoyant rubber cord wearing on the seabed or anchor. Modelling results demonstrated that the FLiDAR buoy and mooring system responds better to wave motion when the mooring line is secured to the side of the buoy hull as opposed to the underside of the buoy hull. The Met and Wave buoy mooring system is attached to the bottom of the buoy. The upper section of rubber cord is attached to the buoys via a section of heavy chain to ensure the upper section of rubber cord cannot rub and wear against the side of the FLiDAR or the underside of the Met and Wave Buoy hull. Extensive modelling demonstrated that the most effective means of ensuring mooring integrity through strength and an ability to respond to wave and current action was a section of mooring line between the upper and lower rubber cord sections, also acting as a means to separate the two sections of rubber cord and to give sufficient mooring line length. The use of chain or wire rope was not deemed to be feasible in this section as it introduces non-buoyant material that would act to pull the two rubber cord sections towards each other. These materials also introduce the risk of wear to and therefore failure of the rubber cords should they come into regular contact.

A section of wire rope ground line extends from the primary anchor weight with a length and material strength to allow for safe recovery of the primary anchor weight to the vessel during mooring recovery operations. The ground line is attached to a smaller secondary anchor weight, which serves both to secure the ground line to the seabed and to anchor the mooring recovery system.

For the mooring recovery system, a rope dispenser concept on an acoustic release positioned inline above the secondary anchor weight on a combination of polypropylene rope, chain and floatation has been selected. When the acoustic release is activated, the amsteel rope dispensers release high strength Spectra rope that floats to the surface on the three viny floats. The U-mooring design facilitates recovery of the Wave and Met Buoy in higher sea state conditions by allowing the mooring to be recovered and the Wave and Met Buoy to be towed without the need for lifting the buoy at sea.

The available rope dispensers house 131 ft (40m) of recovery line. To ensure there is adequate slack on the recovery line when activated during recovery operations, the rope dispenser needs to be raised off the seabed. This slack is required to ensure personnel on the recovery vessel have sufficient rope to secure on to with a recovery boat hook or grappling line and to have enough rope section to get onboard the vessel to secure it to a winch to then haul in the mooring. In addition to the slack required, the 32.8 ft (10m) section of mooring line from the secondary anchor weight to the acoustic release and rope dispenser is required to allow for safe deployment, as it allows the floats, acoustic release and rope dispenser to float clear of the vessel stern before the anchor weight is released to the seabed. Polypropylene rope has been used in this section of the mooring to allow for a semi-buoyant material during deployment, as alternative materials such as chain and wire rope introduce non-buoyant sections that would restrict the ability of the floats, acoustic release and rope dispenser to float clear of the vessel stern prior to releasing the anchor weight. In addition, this section of mooring is planned to be deployed by hand and therefore polypropylene rope is deemed the safest material to handle as opposed to chain or wire rope.

3.3.1 RPS FLiDAR Buoy

3.3.1.1 Mooring Design

The RPS FLiDAR Buoy will be attached to the seafloor by means of a U-shaped mooring design which is comprised of chain, polypropylene rope, wire rope, trawl floats, an amsteel rope dispenser with acoustic release and rubber cords that connect the RPS FLiDAR Buoy to both a primary and secondary clump anchor on the sea floor as well as three underwater viny floats that sit approximately 55.8 ft (17 m) above the seabed as part of the mooring recovery system. (Figure 3-4).

The primary and secondary clump weights would weigh approximately 4,409 lbs (2,000 kg) and 660 lbs (300 kg), respectively and sit on the seabed for a total area of up to 21.5 ft^2 (2 m^2) per clump weight. The chain would be attached to the side of the FLiDAR hull via the 12T bow shackle. Due to the use of rubber cords in the mooring design, there will be no anchor chain sweep associated with the long-term operation of the RPS FLiDAR Buoy. Total area of mooring resting on the seafloor, inclusive of both clump weights, chains and wire ropes, would be approximately 67.8 ft^2 (6.3 m^2). Vertical penetration of the primary and secondary clump weights into the seabed is anticipated to be approximately 1.6 ft and 0.7 ft (0.5 m to 0.2 m), respectively. All clump weights will be fully recovered.

3.3.1.2 Power Supply

The RPS FLiDAR Buoy instrumentation will be powered by 30 x 110 Amp-hour Victron Gel batteries, charged by 12 x 335-Watt solar panels and 4 x D200 wind generators. Five regulators protect the batteries from being damaged by possible overcharging. Equinor has selected a concept that has avoided the use of backup generators using traditional fuels in an attempt to mitigate the risk of oil spills and reduce emissions. The acoustic release is powered by an alkaline or lithium battery pack.

In the event of failure of the key power supply systems, the RPS FLiDAR Buoy instrumentation would be capable of operating at full capacity on battery power alone for up to ten days. The life of the acoustic release battery pack is over a year.

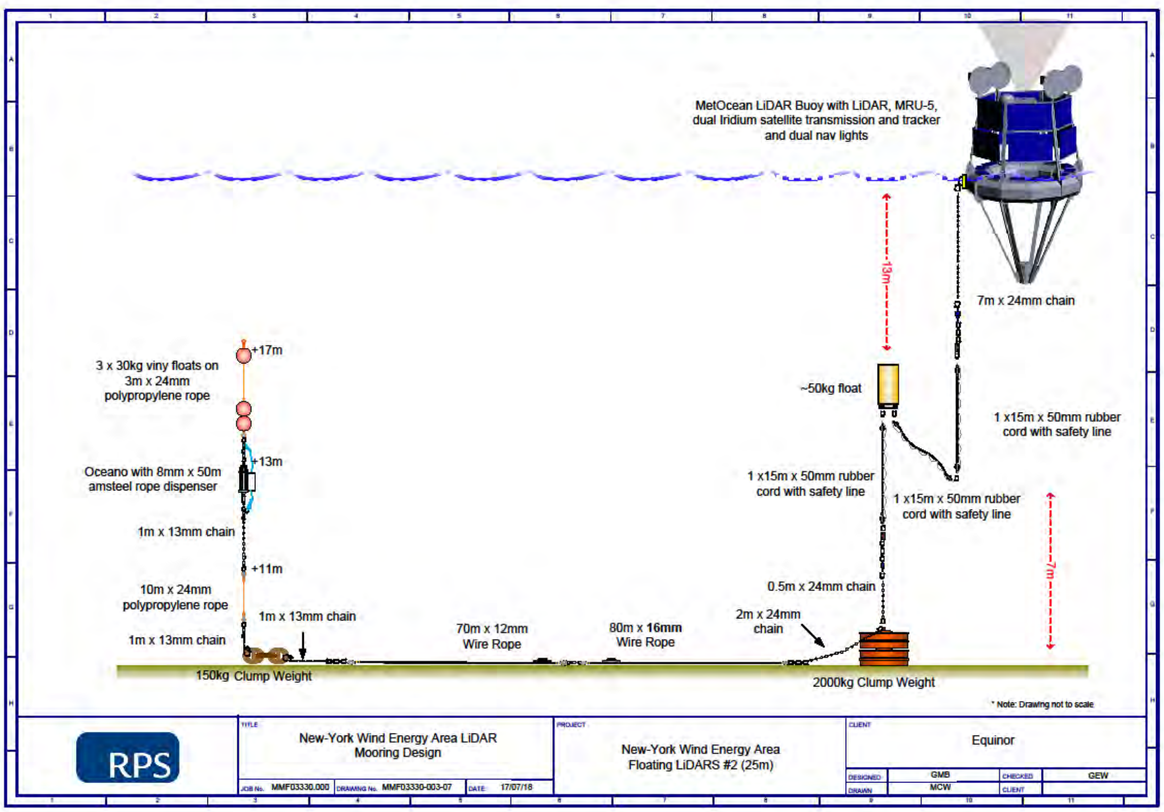

Figure 3-4 RPS FLiDAR Buoy U-Mooring Design

3.3.1.3 Instrumentation Equipment

A ZephIR300M light detection and ranging (LiDAR) and KONGSBERG MRU-5 motion reference unit, will be installed atop the RPS FLiDAR Buoy. The ZephIR300M unit is a wind profiling device capable of remotely measuring and collecting wind speeds and directions up 656 ft (200 m). The KONGSBERG MRU-5 motion reference unit collects high accuracy roll, pitch and heave measurements. The RPS FLiDAR Buoy would also contain the following equipment:

Table 3-2 provides a list of the parameters measured by the RPS FLiDAR Buoy, the associated instrumentation, as well as the range and accuracy of the measurements.

Table 3-2 Parameters Measured and Recorded by the RPS FLiDAR Buoys

Parameter	Instrumentation	Range	Accuracy
Wind Speed	ZephIR 300 LiDAR	<1 m/s to 70 m/s	0.1 m/s
Wind Direction		0 to 360°	<0.5°
Temperature		-40 + 50° C	
Orientation	KONGSBERG MRU-5	+180°	0.02° RMS
Gyro		+149°/s	0.08% RMS
Acceleration		+30 m/s^2	0.1 m/s^2 RMS
Heave		+50m	0.01 m/s RMS

The RPS FLiDAR Buoys will store data using a combination of the M200 data loggers and the Zephir LiDAR 300m instrument.

The M200 data logger is latest version of data loggers constructed by RPS. Custom firmware is written for the M200, thus allowing maximum control of communication options and data transmission protocols. The M200 logger has the ability to integrate various sensors via analogue, digital, serial and Ethernet inputs. Each RPS FLiDAR Buoy has two M200 data loggers installed to allow redundancy in data logging and transmission. The M200 Data Logger has a 64-gigabyte flashcard installed, which allows for years of data logging without the need for erasing.

Both M200s (System A and B) on the buoy will be connected to the LiDAR via Ethernet. The LiDAR 10 minute data will be retrieved via Modbus polling of the LiDAR, logged and transmitted by each M200 in an Iridium Short Burst Data message.

The M200 Data Logger will also receive 1 Hertz continuous data from the GPS compass, KVH compass and MRU. All of this data will be stored in daily files which will be retrieved once per day via 4G or Iridium Broadband (should 4G coverage not be available). The GPS compass is used to correct the M200 clock to GPS time once per day at midnight UTC.

The Zephir LiDAR 300M will log the 10 minute averaged LiDAR data as well as the raw data in daily files. The raw LiDAR data will be retrieved once per day via 4G or Iridium Broadband (should 4G coverage not be available).

The following supporting systems for navigational aids, position tracking, and remote monitoring will also be installed on the RPS FLiDAR Buoy:

- Buoy tracking system;
- V104S GNSS Compass;
- Two KVH Compass;
- Two M200 Logger units; and
- Two self-contained Global Star tracker units.

Using the maintenance plan described in Section 5.2, equipment on the RPS FLiDAR Buoy will have a minimum two-year operational lifespan.

3.3.2 Wave and Met Buoy

3.3.2.1 Mooring Design

The Wave and Met Buoy mooring design will also consist of the U-shaped mooring design. The Wave and Met Buoy will be attached to the seafloor by means of a U-mooring design which is comprised of a chain, polypropylene rope, wire rope trawl floats, and amsteel rope dispenser with acoustic release and rubber cord that connects the RPS Wave and Met Buoy to both a primary and secondary clump anchor on the sea floor as well as 3 underwater viny floats that sit approximately 55.8 ft (17 m) above the seabed (Figure 3-45).

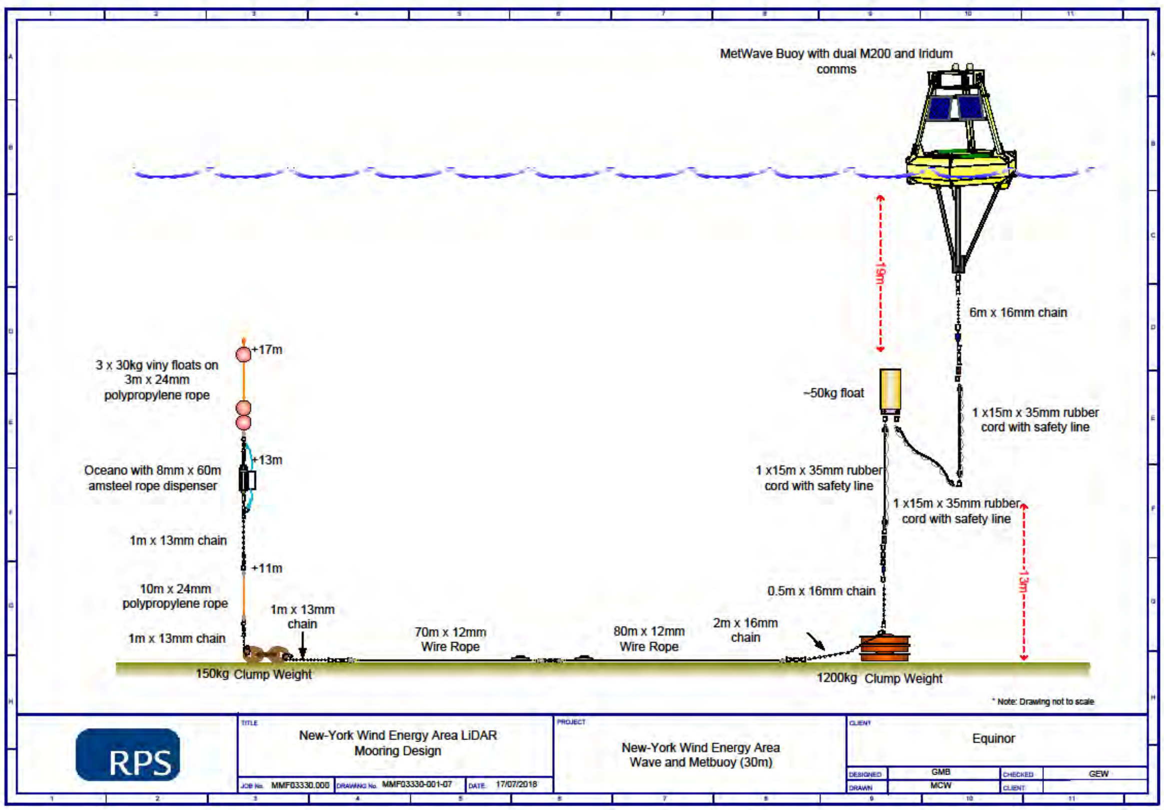

Figure 3-5 Wave and Met Buoy U-Mooring Design

The primary and secondary clump weights would weigh approximately 2646 lbs (1,200 kg) and 661 lbs (300 kg), respectively, and will rest on the seafloor for an area of approximately 21.5 ft² (2 m²) per clump weight. The chain would be attached to the underside of the hull. Due to the mooring design, which includes a rubber cord section, there will be no anchor chain sweep associated with the long-term operation of the Wave and Met Buoy. Total area of mooring resting on the seafloor, inclusive of both clump weights, chains and wire ropes, would be approximately 62.4 ft² (5.8 m²). Vertical penetration of the primary and secondary anchor chain for the Wave and Met Buoy into the seabed is anticipated to be approximately 1.5 ft and 0.5 ft (0.5 m to 0.2 m), respectively. The discrepancy between water depths reported in Table 3-1 and those presented on Figure 3-5 is negligible in light of the mooring design configuration. All clump weights will be fully recovered.

3.3.2.2 Power Supply

The Wave and Met Buoy instrumentation will be powered by 6 x 110 Amp-hour Victron Gel batteries, charged by 6 x 100 Watt solar panels. A regulator in the Power Management Unit protects the batteries from being damaged by overcharging. When fully charged the batteries have enough reserve capacity to power the buoy in a standard sampling routine for up to two months without being charged. The acoustic release is powered by an alkaline or lithium battery pack that has a life of at least a year.

3.3.2.3 Instrumentation Equipment

The Wave and Met Buoy is instrumented with the following sensors to provide in-situ monitoring and analysis of wave and meteorological activity:

- Datawell MOSE-G Waves Sensor;
- WindSonic Wind Sensor;
- A Gill WindObservor II Wind Sensor;
- Pyrosales RTD Air Temperature Sensor;
- A Vaisala HMP 155 Relative Humidity Sensor; and
- A Vaisala PTB110 Barometric Pressure Sensor.

Table 3-3 provides a list of the parameters measured by the Wave and Met Buoy, as well as the resolution and accuracy of the measurements.

Table 3-3 Parameters Measured and Recorded by the Wave and Met Buoy

Parameter	Instrumentation	Range	Resolution	Accuracy
Wind Speed	WindSonic	0 to 60 m s^{-1}	0.01 m s^{-1}	±4%
Wind Direction	WindSonic	0 to 360˚	1˚	±3˚
Wind Speed	WindObserver II	0 to 65 m s^{-1}	0.01 m s^{-1}	±2%
Wind Direction	WindObserver II	0 to 360˚	1˚	±2˚
Air Temperature	Pyrosales RTD	-200 to 600 ˚C	0.1 ˚C	±0.05 ˚C
Relative Humidity	Vaisala HMP-155	0 to 100%	0.025 % RH	±1.0% at 20 ˚C
Barometric Pressure	Vaisala PTB-110A	800 to 1060 hPa	0.1 hPa	±0.3 hPa at 20 ˚C
Waves	Datawell MOSE-G	1 – 100s period	1mm	2cm

The data acquisition system will acquire and store data using the dual M200 loggers with 64 Gigabyte flashcards. Wave and met parameters, including 30 minute wave spectrum and 3 x 10 minute met parameter data, will be transmitted from both M200 units via Iridium/Short Burst Data every 30 minutes.

The following supporting systems for navigational aids, position tracking, and remote monitoring will also be installed on the Wave and Met Buoy:

- Two Global Star Tracking Beacons;
- Iridium moderns; and
- MOSE-G sensor.

Using the maintenance plan described in Section 5.2, equipment on the Wave and Met Buoy will have a minimum four-year operational lifespan.

3.3.3 Current Meter CM/CT Mooring

3.3.3.1 Mooring Design

The CM/CT mooring design will consist of a subsurface mooring design. The CM-04 Acoustic Current Meters/Seabird SBE37 CT loggers will be deployed as part of the subsea mooring. The CM-04 Acoustic Current Meters will be incorporated into the subsurface portion of the mooring line at 9.8 ft (3 m), 55.8 ft (17 m), and 88.6 ft (27 m) above the seafloor via chain and 10 mm galv wire segments on the top and bottom of the meters that connect to the mooring line (Figure 3-6). The CT loggers will be attached to the subsurface portion of the mooring line via plastic clamps at 4.9 ft (1.5 m), 62.3 ft (19m), and 95.1 ft (29 m) above the seafloor. The remainder of the mooring is comprised of chain, wire rope, two amsteel rope dispensers with acoustic release and shackles and load rings that connects the subsurface portion of the mooring to a clump anchor on the sea floor as well as a pendant buoy that will sit approximately 16.4 ft (5 m) below the sea surface (Figure 3-6). When the acoustic release is activated, the amsteel rope dispensers release high strength Spectra rope that floats to the surface on the viny floats. The mooring has been designed to withstand the prevailing conditions and facilitates safe recovery of the CM/CT mooring.

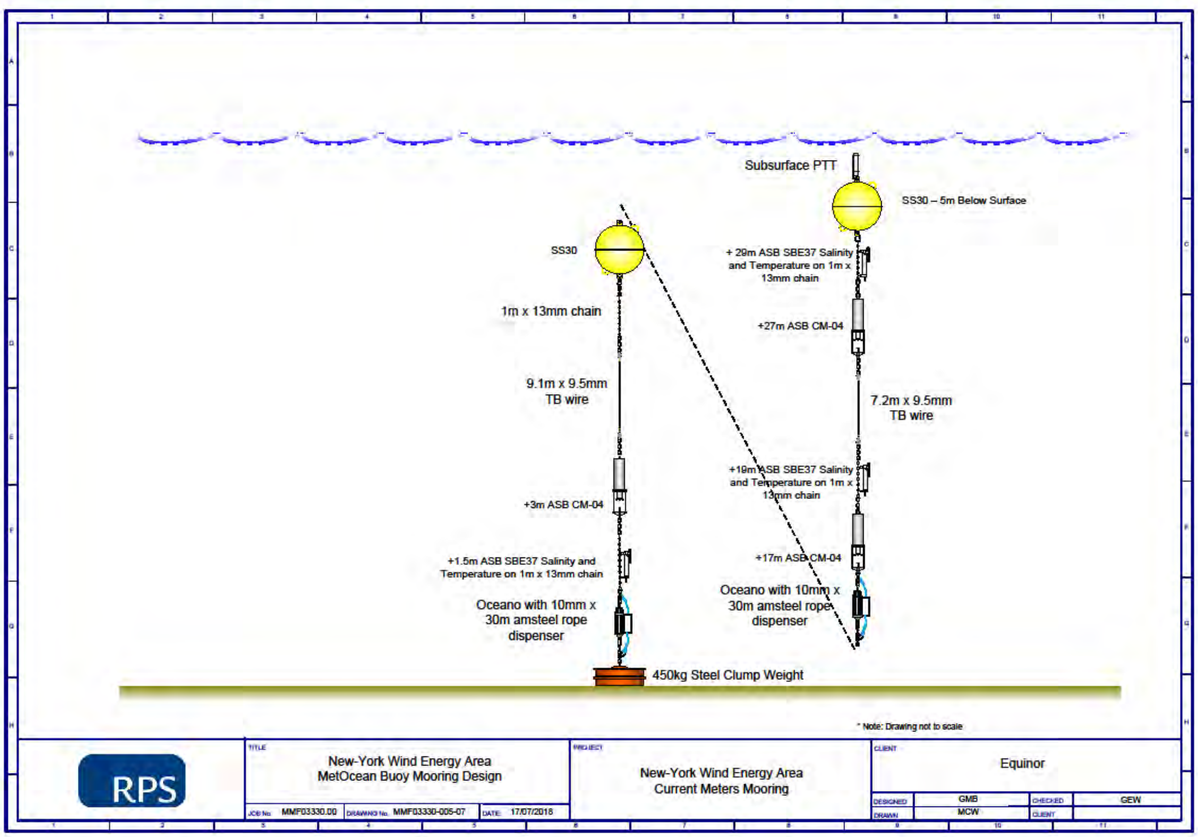

Figure 3-6 CM/CT Mooring Design

The clump weight would weigh approximately 992 lbs (450 kg), and will rest on the seafloor for an area of approximately 21.5 ft^2 (2 m^2). Vertical penetration of the anchor chain for the Current Meter mooring into the seabed is anticipated to be approximately 0.5 ft to 1.5 ft (0.2 m to 0.5 m). The discrepancy between water depths reported in Table 3-1 and those presented on Figure 3-6 is negligible in light of the mooring design configuration. All clump weights will be fully recovered.

3.3.3.2 Power Supply

Each CM-04 Acoustic Current Meter and Seabird SBE37 CT logger is powered by 28 Amp-hour alkaline battery packs and 12 AA lithium batteries, respectively. The current meter batteries can last over a year, but would be replaced during the 6-month maintenance trip (Section 5.2). The acoustic release is powered by an alkaline or lithium battery pack that has a life of at least a year.

3.3.3.3 Instrumentation Equipment

The CM-04 Acoustic Current Meter is a self-contained instrument that can be moored to record ocean currents and water temperature. The CM-04 Acoustic Current Meter consists of four piezoelectric transducers, an acoustic mirror positioned to measure velocities in two axes, a flux-gate compass unit, and a temperature sensor. Recording intervals range from 0.5 second to 10 minutes. On this project, the data will be measured in 1-minute averages of the continuous 30 Hertz current data. Data is stored on an internal flash card and will be downloaded during 6-month maintenance trips.

The Seabird SBE37 CT logger is a high-accuracy conductivity and temperature recorder with internal battery and memory. The Seabird SBE37 CT logger's internal field conductivity cell, which measures conductivity, is unaffected by external fouling which ensures stability. The aged and pressure protected thermistor, used to measure temperature, has a long history of accuracy and stability. There are several user selectable sampling rates that range from 5-second to 9.1-hour intervals, polled sampling, or serial line sync. On this project, the conductivity and temperature sampling data will be measured at 5-minute intervals. Data is stored on an internal non-volatile FLASH memory card and will be downloaded during 6-month maintenance trips.

Table 3-4 Parameters Measured and Recorded by the CM-04 Meter and CT Recorder

Parameter	Instrumentation	Range	Resolution	Accuracy
Current Speed	CM-04	0 to ±400 cms^{-1}	0.01 mms^{-1}	±1 cms^{-1} or ±1%
Current Direction	CM-04	0 to 360˚	1˚	±1˚
Water Temperature	CM-04	-3˚C to +37˚C	±0.01˚C	±0.2˚C
Water Conductivity	CT Logger	0 – 7 S/m	0.00001 S/m	0.0003 S/m
Water Temperature	CT Logger	-5˚C to +38˚C	0.0001 ˚C	0.002 ˚C

The CM-04 Acoustic Current Meter and Seabird SBE37 CT Logger will store data internally. Data will be downloaded every 6 months during maintenance of the equipment.

The CM/CT Mooring would also be equipped with a subsurface satellite transmitter PTT which would activate and send an alarm in the event that the subsea mooring has surfaced.

Using the maintenance plan described in Section 5.2, equipment on the CM/CT Mooring will have a minimum four-year operational lifespan.

4. DEPLOYMENT/INSTALLATION

Installation of the Metocean Facilities may take up to seven days over three separate vessel trips including transit, barring weather delays. It is anticipated that the deployment activities will be staged out of Millers Launch, Pier 7 ½, in Staten Island, New York.

4.1 Overview of Installation and Deployment Activities

Equinor Wind US LLC will notify BOEM, United States Fleet Forces (USFF) N46, the United States Army Corps of Engineers, and the United States Coast Guard (USCG) prior to mobilization to deploy the Metocean Facilities. Written notice via email will be provided to the appropriate contact at Fleet Forces Command prior to mobilization in order to avoid potential conflicts with military operations. Equinor Wind US LLC will update Fleet Forces Command on the installation schedule following approval of the SAP and detailed planning.

Equinor Wind US LLC will notify mariners, fisherman, and other users of the area by submitting a request to the USCG for publication of a Local Notice to Mariners at least two weeks prior to the start of the in-water work. This notice will include the contact names for the installation vessels, local fisheries liaison officer, channels of communication, and the duration of the work. Copies of all USCG communications will be provided to BOEM as required. Additionally, in accordance with standard maritime practices, the vessel captain(s) will broadcast via VHF radio on Marine Channel 16 notification to mariners of their position and limited mobility during installation activities and submit an application to the USCG for a Private Aids To Navigation (PATON) for the Metocean Facilities (see Table 1-2). Equinor Wind US LLC will submit a copy of the approved PATON to BOEM prior to buoy deployment.

Within 30 days of completing the installation of the Metocean Facilities, Equinor Wind US LLC will prepare an Installation Report and provide a copy to BOEM to fulfill the requirements of 30 CFR 585.615(a). This report will include a description of the equipment and the installation, including final coordinates of the installation site and photo documentation of the equipment deployed, the results of all commissioning tests, the plans and schedule for upcoming inspections and maintenance, and any noted problems or issues to be addressed.

Equinor Wind US LLC will provide written notification to BOEM and the DoD of any proposal to add new sensors to the data collection buoy(s). Equinor Wind US LLC will include the technical specifications (manufacturer, model, spectrum requirements, etc.) for any proposed new sensors, specifically seismometers and hydrophones, in the notification. The notification will be provided to the contacts listed in the Lease, or updated contact information as provided by BOEM.

4.1.1 RPS FLiDAR, Wave and Met Buoy, and CM/CT Mooring Deployment

One workboat, up to approximately 150 ft (46 m) in length, will be used for installation of the Metocean Facilities. The Installation of the Metocean Facilities will require three separate round trips over a 6-to 7-day period. FLiDAR 1 will be deployed following SAP approval. FLiDAR 2 will be deployed either concurrently with deployment of FLiDAR 1 or during the first 6-month service visit.

Installation of FLiDAR 1 will happen over a two-day period. The first day, the vessel will be loaded and prepared for deployment, and FLiDAR 1 will be secured for towing. The mooring system for FLiDAR 1 will also be loaded and stored on the deck of the vessel for transit. The vessel will transit out to the deployment location overnight. On arrival at the FLiDAR 1 deployment location the following day (day 2), the chain will be laid out on the deck of the vessel in a manner that will prevent tangling or twisting while it is let out into the water. The mooring system will then be prepared for connection on the deck of the vessel. The tow rope would then be pulled in so that the rubber cords on the mooring can be shackled to the mooring chain that is connected to FLiDAR 1. A quick release would be attached to the mooring chain, which would then be secured on deck, and the tow rope will be removed. The mooring chain for FLiDAR 1 will then be deployed. The mooring systems for the Metocean Facilities, inclusive of clump weights, chains, ropes, rope dispenser, acoustic release and lines, will be deployed from the work vessel by a crane.

Following deployment of FLiDAR 1, the vessel will return to shore, and the Wave and Met Buoy, the CM/CT Mooring, and the Wave and Met Buoy mooring system will be secured to the deck. The vessel will then transit to the Wave and Met Buoy deployment location, which will be located 3,279 ft (1,000 m) northwest from FLiDAR 1. The Wave and Met Buoy mooring chain will be laid out on the deck of the vessel in a manner that will prevent tangling or twisting while it is let out into the water. The Wave and Met Buoy will then be connected to the mooring system, the mooring will be streamed out, and the clump weight anchor will be released. Following deployment of the Wave and Met Buoy, the vessel will transit back to port.

Finally, the vessel will transit to the CM/CT Mooring deployment location, which will be located approximately 3,280 ft (1,000 m) southeast from FLiDAR 1. The CM/CT mooring chain will be laid out on the deck of the vessel in a manner that will prevent tangling or twisting while it is let out into the water. The CM/CT Mooring system, inclusive of clump weights, chains, ropes and lines, will be deployed from the work vessel by a crane. Following deployment of the CM/CT Mooring, the vessel will transit back to port. (NOTE: Final deployment procedures may be modified depending on the deployment vessel configuration). No vessel anchoring will take place during installation.

FLiDAR 2 will be deployed either concurrently with deployment of FLiDAR 1 or during the first 6-month service visit. Once secured for towing the FLiDAR 2 mooring will be secured to deck for transport to the deployment location overnight. On arrival at the FLiDAR 2 deployment location the following day (day 2) FLiDAR 2 will be deployed in the same manner as FLiDAR 1 described above. Following deployment of the FLiDAR 2, the vessel will transit to the CM/CT Mooring deployment location, and begin the scheduled service visit.

All personnel participating in the installation will attend a pre-installation briefing prior to mobilization (See Section 4.3).

4.2 Vessels

Equinor Wind US LLC will employ RPS to transport and deploy the Metocean Facilities.

It is anticipated that the deployment of the Metocean Facilities will require the support of a single work boat. Equinor Wind US LLC is currently proposing to use the Rana Miller or a similar vessel as the work boat. The Rana Miller is a multi-purpose offshore utility vessel with two Cummins KTA-38 main engines rated at 850 horsepower each. The Rana Miller measures 150 ft (46 m) in length with a 36 ft (11 m) beam and 11.5 ft (4 m) draft. See Appendix G for vessel specifications.

4.3 Pre-Installation Briefing

All personnel will attend a pre-installation briefing as required by Lease stipulation 4.1.1. The pre-installation briefing will be performed prior to departure from the RPS office in Perth Australia, and again, on the vessel prior to the installation of the Metocean Facilities. The pre-installation briefing will include a Tool-Box Talk (Appendix E) as well as HSE and hazard identification presentations. The briefing will occur prior to commissioning and again prior to boarding the vessel. The purpose of this briefing will be to review the HSE requirements and associated emergency response requirements for the proposed work, identify the responsibilities of each person, define the chains of command, discuss communication procedures, and provide an overview of planned installation activities. Additional topics for the briefing will include protected species avoidance, marine trash and debris awareness, and oil spill response procedures.

The Equinor Wind US LLC onsite representative will have the authority to stop or delay any of the installation activities, if deemed necessary. If change in personnel is required during installation activities, the new personnel will be briefed as they join the work in progress.

4.4 Protected Species Avoidance

All whales, dolphins, and porpoises in the northeast region are federally protected by the Marine Mammal Protection Act of 1972. In addition, many large whales in the area, as well as sea turtles, are further protected under the Endangered Species Act of 1973 (ESA).

The Lease contains specific stipulations to minimize risk to marine species that must be followed. Installation of the Metocean Facilities will not require pile-driving; accordingly, mitigations to reduce adverse impacts on protected species from pile driving do not apply to this installation. The Lease stipulations summarized in Table 4-1 apply to activities associated with installation, operation and decommissioning of the Metocean Facilities and must be adhered to.

Table 4-1 Standard Operating Conditions in the Lease Area

Addendum "C" Stipulation	Vessel Operations Conditions
4.2 Vessel Strike Avoidance Measures	
4.2.1	The Lessee must ensure that vessels conducting activity in support of a plan submittal, including those transiting to and from local ports and the lease area, comply with the vessel-strike avoidance measures specified in stipulations 4.2, except under extraordinary circumstances where complying with these requirements would put the safety of the vessel or crew at risk.
4.2.2	The Lessee must ensure that vessel operators and crews maintain a vigilant watch for cetaceans, pinnipeds, and sea turtles and slow down or stop their vessels to avoid striking these protected species.
4.2.3	The Lessee must ensure that all vessel operators comply with 10 nautical miles per hour (knot, <18. kilometers per hour [km/hr]) speed restrictions in any Dynamic Management Area[1].
4.2.4	The Lessee must ensure that vessels 65 ft (19.8 m) in length or greater, operating from November 1 through April 30, operate at speeds of 10 knots (<18.5 km/hr) or less.
4.2.5	The Lessee must ensure that all vessel operators reduce speed to 10 knots or less when mother/calf pairs, pods, or large assemblages of non-delphinoid cetaceans are observer near an underway vessel.
4.2.6 North Atlantic Right Whales	
4.2.6.1	The Lessee must ensure all survey vessels maintain a separation distance of 1,640 ft (500 m) or greater from any sighted North Atlantic right whale.
4.2.6.2	The Lessee must ensure that the following avoidance measures are taken if a vessel comes within 1,640 ft (500 m) of any North Atlantic right whale:
4.2.6.2.1	If underway, vessels must steer a course away from any sighted North Atlantic right whale at 10 knots (18.5 km/h) or less until the 1,640 ft (500 m) minimum separation distance has been established (except as provided in stipulation 4.2.6.2.2).
4.2.6.2.2	If a North Atlantic right whale is sighted within 328 ft (100 m) of an underway vessel, the vessel operator must immediately reduce speed and promptly shift the engine to neutral. The vessel operator must not engage engines until the North Atlantic right whale has moved outside of the vessel's path and beyond 328 ft (100 m), at which point the Lessee must comply with 4.2.6.2.1.
4.2.6.2.3	If a vessel is stationary, the vessel must not engage engines until the North Atlantic right whale has moved beyond 328 ft (100 m), at which point the Lessee must comply with stipulation 4.2.6.2.1.
4.2.7 Non-Delphinoid Cetaceans other than the North Atlantic Right Whale.	
4.2.7.1	The Lessee must ensure all vessels maintain a separation distance of 328 ft (100 m) or greater from any sighted non-delphinoid cetacean.

Table 4-1 Standard Operating Conditions in the Lease Area

Addendum "C" Stipulation	Vessel Operations Conditions
4.2.7.2	The Lessee must ensure that the following avoidance measures are taken if a vessel comes within 328 ft (100 m) of any non-delphinoid cetacean:
4.2.7.2.1	If any non-delphinoid cetacean is sighted, the vessel underway must reduce speed and shift the engine to neutral, and must not engage the engines until the non-delphinoid cetacean has moved beyond 328 ft (100 m).
4.2.7.2.2	If a vessel is stationary, the vessel will not engage engines until the sighted non-delphinoid cetacean has moved beyond 328 ft (100 m).
4.2.8 Delphinoid Cetaceans and Pinnipeds	
4.2.8.1	The Lessee must ensure that all vessels underway do not divert to approach any delphinoid cetacean and/or pinniped.
4.2.8.2	The Lessee must ensure that if a delphinoid cetacean and/or pinniped approaches any vessel underway, the vessel underway must avoid excessive speed or abrupt changes in direction to avoid injury to the delphinoid cetacean and/or pinniped.
4.2.9 Sea Turtles	
4.1.1.6.1	The Lessee must ensure all vessels maintain a separation distance of 164 ft (50 m) or greater from any sighted sea turtle.
Note: 1. A Dynamic Management Area is defined in Section 1.2 of the Lease. Vessel operators may send a blank email to ne.rw.sightings@noaa.gov for an automatic response listing all current Dynamic Management Areas.	

In addition to the Lease stipulations, between November 1 and July 1, vessel operators will monitor National Marine Fisheries Service (NMFS) North Atlantic Right Whale reporting systems (e.g., the Early Warning System, Sighting Advisory System, and Mandatory Ship Reporting System) for the presence of North Atlantic Right Whales.

4.4.1 Reporting of Injured or Dead Protected Species

During all phases of marine activities, sightings of any injured or dead protected species (sea turtles and marine mammals) will be reported within 24 hours, regardless of whether the injury or death was caused by a vessel as specified in Stipulation 4.5.2 of the Lease. All marine activities will be suspended immediately and the circumstances reported as specified below if a dead or injured right whale is found in any of the Installation Areas. The Lease stipulations summarized in Table 4-2 below apply and must also be adhered to.

Table 4-2 Protected Species Reporting Requirements in the Lease Area

Addendum "C" Stipulation	Lease Requirement
4.5.2 Reporting Injured or Dead Protected Species	The Lessee must ensure that sightings of any injured or dead protected species (e.g., marine mammals, sea turtles or sturgeon) are reported to the Lessor, NMFS and the NMFS Greater Atlantic (Northeast) Region's Stranding Hotline (866-755-6622 or current) within 24 hours of sighting, regardless of whether the injury or death is caused by a vessel. In addition, if the injury or death was caused by a collision with a project-related vessel, the Lessee must notify the Lessor of the strike within 24 hours. The Lessee must use the form provided in Appendix A to Addendum "C" to report the sighting or incident. If the Lessee's activity is responsible for the injury or death, the Lessee must ensure that the vessel assist in any salvage effort as requested by NMFS.
4.5.3 Reporting Observed Impacts to Protected Species	
4.5.3.1	The Lessee must report any observed takes (as defined in 1.13) of listed marine mammals, sea turtles or sturgeon resulting in injury or mortality within 24 hours to the Lessor and NMFS.
4.5.3.2	The Lessee must report any observations concerning any impacts to Endangered Species listed marine mammals, sea turtles, or sturgeon to the Lessor and NMFS Northeast Region's Stranding Hotline within 48 hours.
4.5.3.3	The Lessee must record injuries or mortalities using the form included as Appendix A to Addendum "C".

Table 4-2 Protected Species Reporting Requirements in the Lease Area

Addendum "C" Stipulation	Lease Requirement
4.5.4 Protected Species Observer Reports	The Lessee must ensure that the PSO record all observations of protected species using standard marine mammal PSO data collection protocols. The list of required data elements for these reports is provided in Appendix B to Addendum "C."

4.5 Avian and Bat Protection

Equinor Wind US LLC will provide an annual report to the to BOEM and U.S. Fish and Wildlife Service using the contact information listed in the Lease, or updated contact information as provided by BOEM, by January 31 of each year of the site assessment term. This report will document dead or injured birds or bats found on vessels and the meteorological buoy during construction, operations, and decommissioning of the meteorological buoy. Each report will contain the following information: the name of species, date found, location, a picture to confirm species identity (if possible) and any other relevant information. In addition to submitting the annual report, Equinor Wind US LLC will report carcasses with Federal or research bands to the United States Geological Survey Bird Band Laboratory within 30 calendar days of discovery using the following website: https://www.pwrc.usgs.gov/bbl/, or updated contact information as provided by BOEM.

4.6 Marine Trash and Debris Awareness and Elimination

Equinor Wind US LLC will comply with and ensure that all employees and contractors are briefed on marine trash and debris awareness elimination, as required in Addendum C, Section 4.1.4 of the Lease and as described in the Bureau of Safety and Environmental Enforcement NTL No. 2015-G03 or any NTL that supersedes NTL 2015-G03.

4.7 Oil Spill Response

The RPS FLiDAR Buoys, Wave and Met Buoy and CM/CT Mooring will not require a backup generator or any other fuel dependent equipment. As such, no Oil Spill Response Plan or Oil Spill Response Measures will be required.

4.8 Health and Safety

Equinor Wind US LLC will implement a project-specific HSE Plan to ensure the health and safety of all personnel involved in the installation, operation, and maintenance, and decommissioning of the Metocean Facilities. The project-specific plan will be prepared in accordance with Equinor's standard corporate HSE policies and procedures. The HSE Plan will also address emergency response and reporting requirements. The HSE plan is included as Appendix F to this SAP.

5. OPERATIONS AND MAINTENANCE

5.1 Data Collection and Operations for Wind and Metocean Data

As stated in Sections 0 and 0 the Metocean Facilities will remain moored in position and transmit wind data and metocean measurements autonomously via Iridium Broadband, or 4G, if available. The RPS FLiDAR Buoys will transmit motion reference data, heading data and charge/discharge once a day, and 10-minute average wind speed and direction profiles, as well as system voltage information and charge discharge rates will be transmitted every 10 minutes The Wave and Met Buoy will transmit wave and met parameters, including 30-minute wave spectrum and 3 x 10-minute met parameter data, every 30 minutes. Equipment on the CM/CT Mooring will store data internally to be downloaded every six months during maintenance trips.

5.2 Maintenance Activities

5.2.1 RPS FLiDAR Buoy

Planned on-site maintenance for the RPS FLiDAR Buoys is scheduled at 6-month intervals and will be completed by a vessel comparable to the work boat used for installation (see Section 4.2). Planned maintenance activities will include service of sensors, data retrieval, inspection of mooring components and replacement where appropriate, and cleaning of solar panels and wind turbines. A detailed service, which will include all 6-month activities, as well as replacement of the mooring system, will be performed at 12-month intervals.

5.2.2 Wave and Met Buoy

Planned on-site maintenance for the Wave and Met Buoy is scheduled every 6 months and will be completed by a vessel comparable to the work boat used for installation (see Section 4.2). Planned maintenance activities at the first 6-month interval would include cleaning of the buoy dome and hull if necessary, as well as visual inspection of the mooring system and replacement of parts where appropriate. At 12 months the mooring will be recovered to deck and replaced.

5.2.3 CM/CT Mooring

Planned on-site maintenance for the CM/CT Mooring is scheduled every 6 months and will be completed by a vessel comparable to the work boat used for installation (see Section 4.2). Planned maintenance activities include changing out batteries, downloading data, and visual inspection of the mooring system. At 12 months the mooring will be replaced. Equinor Wind US LLC will incorporate planned maintenance activities into a comprehensive annual Self-Inspection Plan pursuant to 30 CFR 585.824(a).

5.2.4 Unscheduled Visits

In addition to the planned 6-month maintenance activities, in exceptional circumstances an unscheduled visit to a deployment location may be required if there is evidence of damage (such as partial or total loss of data transmissions), or if transmitted GPS data indicated that a buoy had drifted significantly outside the “watch circle,” which allows for buoy movement inside a roughly 100-meter radius from the recorded deployment coordinates. Examples of events that could cause such damage or buoy displacement include, but are not limited to, hurricane-strength tropical or "nor'easter" storms, heavy snow accumulation, or heavy icing in the event of extremely low temperatures. It has been assumed that up to one unscheduled round trip per year may be needed to visit a buoy site, and potential emissions for unscheduled visits have been based on the round-trip distance to the farthest deployment location from Miller’s Launch, which is FLiDAR 1.

5.3 Reporting

Per Lease stipulation 2.2.1, Equinor Wind US LLC will submit a semi-annual progress report to BOEM every six months for the duration of the site assessment term. The semi-annual progress report will provide a brief narrative of overall progress since the previous semi-annual progress report (or since the effective date for the first semi-annual progress report). The progress report will include updated survey plans to account for modifications in schedule, as necessary. In addition to the semi-annual progress reports, Equinor Wind US LLC will prepare and submit a Self-Inspection Report, an Annual Report, and a Certification of Compliance to BOEM no later than November 1 of each year for the duration of the site assessment term. See Table 5-1 for a description of the content of each report and the associated regulatory citation.

Table 5-1 Reporting Requirements

Report Name	Content	Regulatory Citation
Self-Inspection Report	The Self-Inspection Report will be based on the comprehensive Self-Inspection Plan that Equinor Wind US LLC will develop pursuant to 30 CFR 585.824(a).	30 CFR 585.824(b)
Annual Report	The Annual Report will provide a summary of site assessment activities and the results of those activities.	30 CFR 585.615(b)
Certification of Compliance	Together with the certification, Equinor Wind US LLC will submit: • Summary reports that demonstrate compliance with the terms and conditions that require certification; and • A statement identifying and describing any mitigation measures and monitoring methods that have been taken, as well as their effectiveness. If Equinor Wind US LLC identifies measures that are not effective, we will make recommendations for substitute mitigations measures and monitoring methods, and explain why we believe they would be effective.	30 CFR 585.615(c)

5.4 Potential Faults or Failures

The Metocean Facilities will be remotely monitored for the duration of operations. This monitoring will include a range of key indicators such as power level, buoy location, and data quality to provide an insight to the 'health' of the buoy and payload. Unplanned maintenance activities may be required in the event of a power supply failure, buoy drift outside of designated area, mooring component failure, or other such event. If any of these problems are suspected, a technical service crew would be promptly dispatched to investigate and repair the issue. The RPS FLiDAR Buoys are capable of operating at full capacity without renewable power supply to the batteries for up to seven days. The RPS Wave and Met Buoy has enough reserve power to operate in a standard sampling routine for up to three months without being recharged.

6. DECOMMISSIONING

BOEM requires decommissioning of facilities described in the SAP in accordance with § 585.901. Equinor Wind US LLC will submit a decommissioning application to BOEM as required by § 585.902(b) prior to decommissioning of the Metocean Facilities. Following BOEM approval of the decommissioning application, Equinor Wind US LLC will submit a decommissioning notice to BOEM at least 60 days prior to vessel deployment as required by § 585.90(a).

6.1 Overview of Decommissioning Activities

Upon completion of SAP activities, the Metocean Facilities will be decommissioned. The decommissioning process will be similar to the installation process but in reverse. Similar types and numbers of vessels used for the installation of the Metocean Facilities would be used for decommissioning. The work vessel would position itself on-site to attach the chain to the crane or A-frame of the work vessel and the mooring would be recovered to deck. The Buoys would then be detached from the mooring and attached to the work vessel. The Metocean Facilities would then be towed off site.

6.2 Site Clearance

The operation of the Metocean Facilities is not expected to result in any trash or bottom debris. However, Equinor Wind US LLC will ensure that the seafloor has been cleared of all obstructions created by activities on the Lease as required in § 585.902(a)(2). This will be accomplished via photo documentation of all deployed and retrieved equipment. As stated in Section 4.1, Equinor Wind US LLC will provide an Installation Report that will contain the final coordinates and photo documentation of the equipment that was deployed. At the completion of decommissioning, similar documentation will be provided to BOEM to confirm that all equipment was retrieved from the site.

6.3 Reporting

As specified in the Lease, Addendum C, Section 2.2, Equinor Wind US LLC will submit semi-annual progress reports to BOEM throughout the duration of activities covered by the SAP. At the conclusion of the site assessment activities a Decommissioning Report will be prepared in accordance with §§ 585.900-913 and provided to BOEM with the semi-annual progress reports, or upon request. This report will include a description of the process and equipment used for decommissioning the Metocean Facilities and confirmation of site clearance.

7. AFFECTED ENVIRONMENT, POTENTIAL IMPACTS, AND MITIGATION MEASURES

The following sections describe the affected environment, impacts and proposed mitigation measures for benthic resources, archaeological resources, and geophysical conditions which have been developed through site surveys and analysis that were conducted in March and April 2018 in support of the SAP. Site surveys and analysis followed a detailed SAP Survey Plan which included protocols, methods, and/or used data that represented the state of industry techniques and knowledge at the time of the study. The SAP Survey Plan, detailing the SAP survey approach, timing, identified surveys, and reporting, was accepted by BOEM on February 27, 2018.

The analysis focuses on the maximum area of potential disturbance associated with the installation, operation, and decommissioning of the Metocean Facilities (site assessment activities): approximately 151.8 ft^2 (14.1 m^2) for Buoy Deployment Area 1 and 67.8 ft^2 (6.3 m^2) for Buoy Deployment Area 2.

As stated in Section 3.2, the two Buoy Deployment Areas where the Metocean Facilities are proposed to be located have been given unique identifiers. The Buoy Deployment Area 1 will have a RPS FLiDAR Buoy, a RPS Wave and Met Buoy, and a CM/CT Mooring, located at positions FLiDAR 1, Wave and Met Buoy, and Current Meters, as indicated in Table 3-1. The Buoy Deployment Area 2 will have a RPS FLiDAR Buoy at location FLiDAR 2, per Table 3-1. The coordinates for these locations are provided in Table 3-1 and depicted on Figure 1-1.

7.1 Geological Conditions

The following section summarizes results of the HRG survey that was conducted in March to April of 2018. The survey was conducted in accordance with the SAP Survey Plan, as approved by BOEM on February 27, 2018. The full site characterization report is provided in Appendix C.

The HRG survey and sampling program involved acquisition of the following data:

- **Multibeam echosounder bathymetry**– acoustic swath mapping to determine water depths and topographic features on the seabed and initial review of surficial sediment;
- **Side scan sonar imagery** – acoustic seabed imagery used to map surficial sediment distributions and bedforms, as well as detect possible natural and anthropogenic hazards on the seabed such as boulders, debris, and shipwrecks;
- **Sub-bottom profiler** – acoustic reflection profiling subsurface investigation using a shallow and a medium penetration sub-bottom profiler (high-frequency CHIRP and single channel sparker) to investigate shallow (up to 66 ft [20 m]) sediment stratigraphy;
- **Gradiometer** –magnetic field anomaly mapping to detect ferrous items on the seabed that could be potential hazards or cultural deposits, included debris and shipwrecks;
- **Sediment grab samples** – acquisition of physical samples of the surficial seabed to ground-truth interpretation of the geophysical data; and
- **Underwater video imagery** – visual imagery of the seabed collected using a remotely operated camera to identify natural and human-caused obstructions, as well as aid in benthic habitat assessment.

Data from the HRG and sampling program, along with information from publicly-available databases, were compiled and reviewed to describe the surface and subsurface geologic conditions in the Buoy Deployment Areas. Table 7-1 summarizes the water depth, surficial seafloor sediment, and side scan features or magnetometer contacts related to seafloor hazards identified within the Buoy Deployment Areas.

Table 7-1 Seafloor and Sub-Seafloor Hazards

Hazard	Definition	Identification and Description
Seafloor		
Scarp	An exposed face of soil above the head of a landslide.	None identified on bathymetry or side scan sonar data.
Channels	The deepest portion of a body of water through which the main volume or current of water flows.	None identified on bathymetry or side scan sonar data.
Ridges	A relatively narrow elevation which is prominent on account of steep angle at which it rises.	None identified on bathymetry or side scan sonar data.
Bedforms	Features that develop due to the movement of sediment by the interaction of flowing water; critical angle and forces required for movement are dependent upon many factors.	Low-relief bedforms are noted, which suggesting minor continuous or episodic seabed currents, but are not anticipated to present a hazard.
Exposed Rocky Area	Surface expression of bedrock outcropping on seafloor.	None identified on bathymetry, side scan sonar, or sub-bottom profiler datasets.
Boulders	Glacial erratics (boulders) greater than 12 inches in diameter; outcropping coarse till/drift or lag deposit.	Occasionally identified at seabed on bathymetry or side scan sonar data, often correlating to areas of coarser seabed sediments. Sizes and distances to installation locations indicate that the boulders will not be a hazard to mooring deployment, operation, or recovery.
Buried Boulders	Glacial erratics (boulders) greater than 12 inches in diameter; subsurface coarse till/drift or lag deposits.	None identified on the sub-bottom profiler datasets.
Pock Marks / Depressions	Craters in the seabed caused by fluids (gas and liquids) erupting /streaming through the seabed sediments.	None identified on bathymetry, side scan sonar, or sub-bottom profiler datasets.
Seabed Scars / Ice Scour / Drag Marks	Incisions or cuts into the seafloor may be associated with glacial advances/retreats or bottom fishing activity.	None identified on bathymetry or side scan sonar data.
Buried Channels	Former fluvial drainage pathways during sea level low stands, usually only deepest portion of the waterway in-filled and preserved. Mark ancestral patterns of glacier meltwater runoff.	Channeling events are interpreted within the Pleistocene sediments, but as these features occur deeper than 65.6 ft (20 m) below the seabed, there is no hazard posed to the mooring systems.
Submarine Canyons	Steep-sided valley cut into the seafloor of the continental slope, sometimes extending well onto the continental shelf.	None identified on bathymetry data.
River Channel	Outline of a path of relatively shallow and narrow body of fluid	None identified on bathymetry or side scan sonar data.
Exposed Hardbottom Surfaces	Any semi-lithified to solid rock strata exposed at the seafloor; in this area, may include bedrock or a nearly continuous pavement of fragmented rock or boulders.	None identified on bathymetry, side scan sonar, or sub-bottom profiler datasets.
Shallow Gas	Subsurface concentration of material in gaseous form that has accumulated by the process of decomposition of carbon-based materials (former living organisms).	None identified on the sub-bottom profiler datasets.
Gas Hydrates	Subsurface gas deposits that were formed at or near the seafloor in association with hydrocarbon seeps.	None identified on the sub-bottom profiler datasets.
Gas/Fluid Expulsion Features	Upward movement of gas/fluid via low resistance pathways through sediments onto the seafloor; may be related to other hazards diapirs, faults, shallow water flows).	None identified on bathymetry, side scan sonar, or sub-bottom profiler datasets.
Diapiric Structure Expressions	The extrusion of more mobile and ductile-deformable material forced onto the seafloor from pressure below.	None identified on the sub-bottom profiler datasets.
Karst Areas	Landscape formed from the dissolution of soluble rocks.	None identified on the sub-bottom profiler datasets.
Faults, Faulting Expression, Fault Activity	Physiographic feature (surface expression) related to a fracture, fault, or fracture zone along which there has been displacement of the sides relative to one another.	None identified on bathymetry, side scan sonar, or sub-bottom profiler datasets.
Slumping, Sliding Seafloor Features	Large scale structures that result from the downslope movement of sediments due to instability and gravity. In the	None identified on bathymetry, side scan sonar, or sub-bottom profiler datasets.

Table 7-1 Seafloor and Sub-Seafloor Hazards

Hazard	Definition	Identification and Description
	submarine environment these structures are often found in slope environments along coastal margins.	
Steep/Unstable Seafloor Slopes	Large scale feature/stretch of ground forming a natural or artificial incline, with a slope that approaches the angle of repose (maximum angle at which the material remains stable).	None identified on bathymetry, side scan sonar, or sub-bottom profiler datasets.
Scour/Erosion Features	Erosion of material due to water flow. Often associated with erosion adjacent to larger natural and man-made structures.	No significant scour-related features are identified on the seabed or near interpreted boulder features.
Sensitive Benthic Habitats (chemosynthetic communities, submerged aquatic vegetation)	Shallow water habitats of submerged aquatic vegetation including macroalgae and sea grasses	None identified on bathymetry, side scan sonar, or sub-bottom profiler datasets.

7.1.1 Buoy Deployment Area 1

Water depths across Buoy Deployment Area 1 range between 110 ft (33.6 m) and 124 ft (37.8 m) NAVD88. Water depth at the proposed FLiDAR 1, Wave and Met Buoy, and Current Meters Locations is 118 ft (36.0 m), 118 ft (35.9 m), and 119 ft (36.3 m) NAVD88 respectively. The seafloor is generally flat across the entire area, with slight shoaling in the west, displaying gradients of less than 1°. In Buoy Deployment Area 1 ripples are noted across much of the area, orientated from west-southwest to east-northeast with 0.3 ft (0.1 m) height and 20-33 ft (6-10 m) wavelength. Chart 11179.102 in Appendix C presents bathymetry contours for Buoy Deployment Area 1.

The seabed throughout Buoy Deployment Area 1 is characterized as predominantly sand with occasional shell fragments. Areas of higher reflectivity in the side scan sonar dataset map across the area and correlate to bathymetric lows. Environmental sampling and bottom photos show these areas to contain a higher proportion of coarser gravels. The seabed interpretation identifies three seabed types: sand with occasional shell fragments, slightly gravelly sand, and sandy gravel.

Seabed features and the side scan sonar mosaic for the Buoy Deployment Area 1 are presented as Chart 11179.103 and Chart 11179.104, respectively, in Appendix C. Two sonar contacts are present in the side scan sonar data within Buoy Deployment Area 1, with one target interpreted as a boulder with a height of 0.3 ft (0.1 m) and the other interpreted as linear debris with a length of 103 ft (31.5 m).

The residual (anomalous) magnetic field contours for Buoy Deployment Area 1 are presented as Chart 11179.107 in Appendix C. Thirteen (13) magnetic anomalies occur within Buoy Deployment Area 1 (see Appendix C). None of these anomalies are associated with either of the identified side scan sonar targets.

Shallow soils interpretation was based on both the shallow seismic chirp system as well as the medium penetration sparker seismic data. Horizons were predominantly digitized from the sparker data due to the limited penetration of the chirp system into the sandy sediments within the survey area. The elevation of the base of the Holocene Marine Deposits is mapped and presented on Chart 11179.106. The thickness of this unit is contoured as isopachs on Chart 11179.105. The base of these sediments below seabed at the FLiDAR 1, Wave and Met Buoy, and Current Meters Locations are 13.4 ft (4.1 m), 8.9 ft (2.7 m), and 13.1 ft (4.0 m), respectively. The Holocene deposits generally thicken slightly towards the East. Pleistocene sediments underlie the Holocene sediments, with unconformities present. The base of these deposits reaches a maximum depth below seabed of 128 ft (39 m) in a north-south trending channel feature in the east of the survey area.

7.1.2 Buoy Deployment Area 2

Water depths across Buoy Deployment Area 2 range between 92 ft (28.1 m) and 101 ft (30.8 m) NAVD88. Water depth at the proposed FLiDAR 2 location is 29.6 m NAVD88. The seafloor is characterized as generally flat lying, with low relief bedforms noted across much of the area. Seafloor gradients across the site are generally less than 1°. Bathymetry contours for the Buoy Deployment Area 2 are presented as Chart 11179.202 in Appendix C.

Environmental sampling show seabed sediments across the FLiDAR 2 survey area to predominantly comprise sand with occasional shell fragments. Areas of higher reflectivity side scan sonar data are noted across the site; which generally correlate with bathymetric lows. Environmental sampling and imagery show these areas to contain a higher proportion of gravels.

Seabed features and a side scan sonar mosaic for the Buoy Deployment Area 2 are presented as Chart 11179.203 and Chart 11179.204 in Appendix C respectively. Fifteen side scan sonar contacts are present within Buoy Deployment Area 2. Fourteen of these contacts are interpreted as boulders and occur within the locations of the gravelly sediments. One contact is interpreted as an item of debris. The boulders range in interpreted size from 0.3 ft (0.1 m) to 1.6 ft (0.5 m) in height.

Chart 11179.207 in Appendix C presents the residual (anomalous) magnetic field contours for Buoy Deployment Area 2. Twenty-one (21) magnetic anomalies occur within Buoy Deployment Area 2 (see Appendix C). None of these anomalies are associated with side scan sonar targets. Two larger magnetic anomalies of 23 nanotesla and 20 nanotesla were identified 1351.7 ft (412 m) and 662.7 ft (202 m) from the FLiDAR 2 location respectively. The other anomalies are not interpreted a hazard to mooring due to their distance from the location and small magnitude, as well as the absence of any features at or below seabed to confirm the presence of a hazard.

Shallow soils interpretation was based on both the shallow seismic chirp system as well as the medium penetration sparker seismic data. Horizons were predominantly digitized from the sparker data due to the limited penetration of the chirp system into the sandy sediments within Buoy Deployment Area 2. The base of the Holocene Marine Deposits is mapped and presented on Chart 11179.206. The base of these sediments below seabed at the FLiDAR 2 location is 6.2 ft (1.9 m). The thickness of this unit is contoured as isopachs on Chart 11179.205. The Holocene deposits generally thicken slightly towards the west. Pleistocene sediments underlie the Holocene sediments, with a number of unconformities present.

7.1.3 Natural Seafloor and Sub-Seafloor Hazards

The HRG datasets were analyzed for seafloor and sub-seafloor hazards, which could pose a potential risk to the installation, operation, and maintenance of the Metocean facilities.

The HRG datasets were used to determine the presence or absence of additional geological hazards (see Table 7-1). The side scan sonar, multibeam bathymetry, and sub-bottom profiler datasets were reviewed and do not provide any evidence of seismic activity, such as extensive or regional faulting or slump and mass wasting features. Additionally, no fault zones, nor any other faulting activity, are identified either from seabed data or from the sub-bottom profiler records, as would typically be indicated by offset sedimentary bedding planes in the sub-bottom profiles or linear fault-related features on the seabed. No faults or other sedimentary features indicative of differential compaction or localized seabed subsidence have been identified. As there has been no faulting identified, there has also been no evidence of faulting attenuation effects observed in the geophysical datasets. These results are consistent with the expected nature of the passive continental margin of the New York Bight.

No areas of acoustic whiteouts or other significant amplitude anomalies were observed in the sub-bottom profiler data, as would be anticipated for any significant accumulation of shallow gas. The sub-bottom profiler records do not contain any bottom simulating reflectors, which are a typical indication of the presence of hydrates. The interpretation of the side-scan sonar, multibeam bathymetry, and sub-bottom profile datasets provide no evidence of ice scour, such as seabed gouging by either icebergs or sea ice pressure ridges. Additionally, no craters or other seabed evidence of strudel scours were noted in any of the datasets.

Based on the Geophysical Site Investigation Site Characterization Reports for Site Acquisition Plan (Appendix C), the site conditions are suitable for the installation of the Metocean Facilities and associated mooring equipment in each of the two Buoy Deployment Areas. No notable hazards are identified which would preclude installation at these locations. The low-relief bedforms on areas of the seabed may indicate minor seabed currents, but no larger scour-related features, such as deep moats, nor evidence of large-scale migrating bedforms are present in the seabed and shallow subsurface datasets. Due to the absence of these more significant features, seabed currents are inferred to be modest and seabed scour due to bottom currents is not anticipated to be an issue for the mooring systems. The boulders identified within the Deployment Areas are generally small, with lower relief (1.6 ft [0.5 m] or less) and do not represent a significant hazard to the installation, operations, maintenance, or recovery of the mooring systems. While buried channels are identified within the Pleistocene sediments, these sub-seafloor features do not represent a hazard to the mooring systems.

7.2 Archaeological Resources

The following section summarizes the analysis and findings described in the Marine Archaeological Resource Assessment Report (Appendix D).

7.2.1 Affected Environment

Installation of the Metocean Facilities has the potential to affect submerged archaeological resources.

The New York Lease Area is located roughly 25 miles (40 km) from the mouth of New York Harbor at its closest point, which suggests a high potential for both historic and prehistoric archaeological sites. This high potential designation is based on the historic maritime activity of the area and prehistoric occupation on the once exposed continental shelf. The preservation potential for archaeological resources within the New York Lease Area, however is low. The low preservation potential results from two related factors: marine transgression and seafloor sedimentation. Sedimentation rates have been low along the continental margin within the last 10,000 years, and the seafloor has been exposed to erosional forces associated with both marine transgression and seabed currents. Consequently, relict channels of major rivers have the potential to be recognized in marine remote sensing datasets, but the identification of small-scale sites and landforms is limited.

SEARCH, Inc. conducted an archaeological assessment of the HRG survey data acquired in 2018 for the Project (described in Section 7.1). To support this effort, SEARCH maritime archaeologists, submerged paleoarchaeologists, and historians created a prehistoric and historic context for the region, assembled a geologic and environmental background, reviewed previous archaeological investigations conducted in the vicinity, and identified submerged cultural resources reported in the vicinity of the New York Lease Area to supplement and guide data analysis. This information, a discussion of survey and data processing technologies and methodologies, and the archaeological findings and recommendations are presented as the Marine Archaeological Resource Assessment Report for the Empire Wind SAP survey (Appendix D).

The HRG survey utilized numerous remote survey methods including: marine gradiometer, side scan sonar, subbottom profiler, and multibeam echosounder. Archaeological review of the survey data focused on the entire Buoy Deployment Areas, although bottom disturbing activity will be limited to the footprint of the clump weight anchors and mooring chain resting on the seafloor. The Area of Potential Effect (APE) is defined as the area of seabed disturbance associated with the metocean facilities.

The qualified marine archaeologist from SEARCH identified no magnetic anomalies and no side scan sonar contacts representing submerged cultural resources within the two Buoy Deployment Areas. Sub-bottom profiler data was collected and analyzed to identify paleolandscape features. This data indicated that no prominent seismic reflectors indicative of paleo-landforms are present that may preserve inundated archaeological sites.

7.2.1.1 Buoy Deployment Area 1

SEARCH identified twenty-two magnetic anomalies (meeting the 5-gamma threshold), five acoustic contacts, and forty unique acoustic reflectors (representing eleven total reflective features) in Buoy Deployment Area 1 (Appendix D, Appendix A-1 to A-4). These reflectors do not exhibit characteristics of a submerged paleolandscape potentially used for occupation but instead likely represent a geographically wide-spread, natural, geologic feature.

7.2.1.2 Buoy Deployment Area 2

SEARCH identified six magnetic anomalies, ten acoustic contacts, and six unique buried reflectors (representing six total reflective features) in the Buoy Deployment Area 2 APE (Appendix D, Appendix A-5 to A-8). These targets do not exhibit characteristics of verified shipwrecks.

The anomalies, contacts, and reflectors observed in the data records for the Buoy Deployment Area 1 and Buoy Deployment Area 2 likely relate to modern debris and non-cultural geological features. Given that no remote-sensing targets exhibit characteristics of verified shipwrecks or paleolandscapes, no features of cultural significance have been identified for both Buoy Deployment Area 1 and Buoy Deployment Area 2.

7.2.2 Potential Impacts and Proposed Mitigation Measures

Based upon the results of the 2018 marine archaeological assessment (Appendix D), no potential submerged cultural or archaeological resources were identified within Buoy Deployment Areas, and as such, the installation and operation of the proposed Metocean Facilities would result in no impacts to marine archaeological resources. Due to the height of the FLiDAR (13.5 ft [4.1 m]) from the sea surface to the top of the hull mast) and the distance from shore, the installation and operation of the Metocean Facilities will not result in any visual impacts.

7.3 Benthic Resources

The following section summarizes results of the benthic habitat assessment that was conducted in March to April 2018. The survey was conducted in accordance with the plan, approved by BOEM on February 27, 2018. The full benthic habitat assessment report is provided in Appendix E.

Benthic samples were collected at five locations using a stainless-steel 0.1-m^2 Day grab (Figure 7-1). The grab carried extra weights where appropriate to induce better penetration on impact and an extended bucket lip to reduce sediment washout. Storm feet and elastic straps were used to reduce the likelihood of the instrument pre-triggering in the water column during deployment. An attached, protective enclosure held a SubSea 1Cam HD digital camera with a dedicated video lamp. Pre-grab still photographs were taken at each station. Sediment grab samples were in general concordance with the remote imagery, confirming a predominance of sand occasionally mixed with gravel.

PUBLIC COPY - CONFIDENTIAL INFORMATION REMOVED

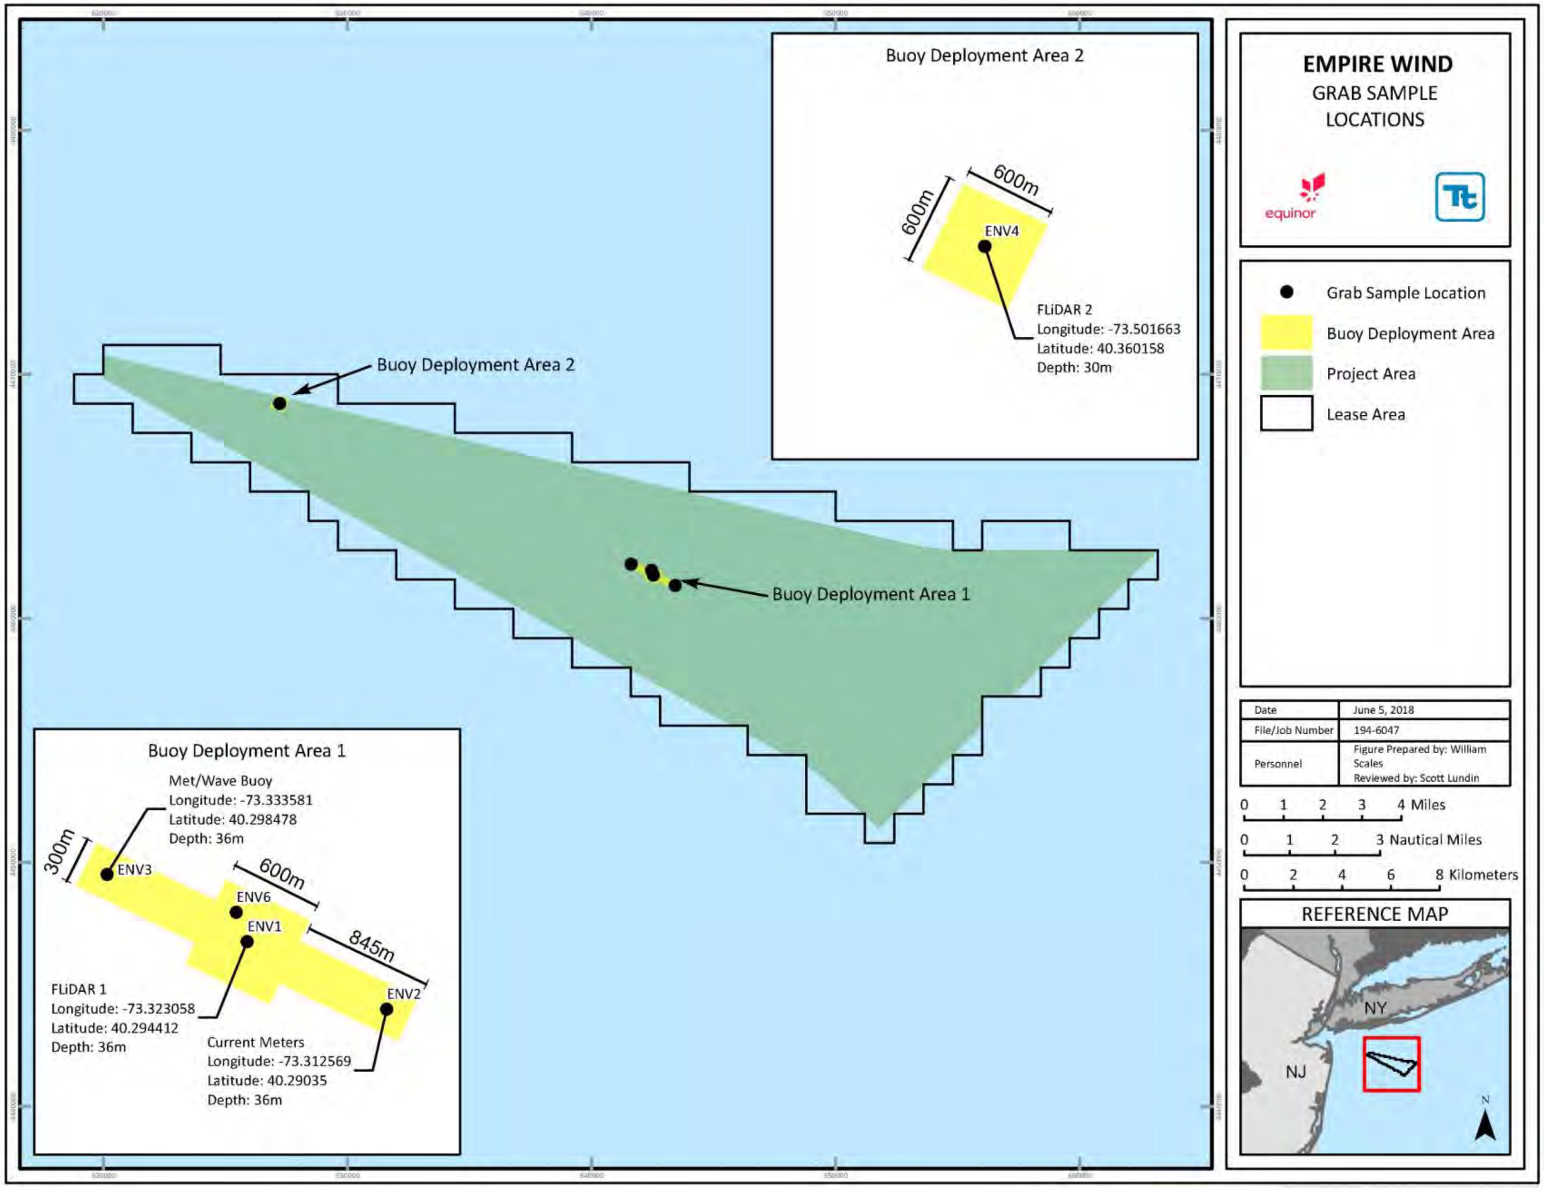

Figure 7-1 Grab Sample Locations

No evidence of protected or unique habitats was indicated by the seabed imagery or grab sampling in either Buoy Deployment Area. No benthic species listed under the ESA occur in the Lease Area. No protected fish species were observed during the survey.

7.3.1 Buoy Deployment Area 1

The side scan sonar imagery in the Buoy Deployment Area 1 indicated a generally flat bottom with a range of reflectivities. The substrate was dominated by slightly gravelly fine to medium sand with occasional shell fragments at Stations ENV1, ENV2, and ENV3. Station ENV6, which was added to represent an area of medium reflectivity near the FLiDAR 1 location, had larger grain sizes, identified as coarse sand. Total organic content was low at all stations, ranging from 0.2 to 0.4 percent. Water depths ranged between 108.3 ft (33.0 m) and 124.0 ft (37.8 m) NAVD88.

Infaunal organisms in grab samples from the four stations associated with Buoy Deployment Area 1 varied in taxonomic diversity and overall abundance of organisms. Station ENV2, which was farthest offshore and in the deepest water, had the fewest individuals (44 of 529) and the smallest number of distinct taxa (8 of 60). Species distribution was patchy among the four stations, as shown by the Coastal and Marine Ecological Classification Standard (CMECS). All four stations were classified as Benthic Biota: Faunal Bed: Soft Sediment Fauna, then diverged as shown in Table 7-2. Stations are presented in order of distance from shore.

Table 7-2 Buoy Deployment Area 1 Grab Samples

Station	Biotic Group	Biotic Community
ST18904-ENV3	Sand Dollar Bed	*Echinarachnius parma* Bed
ST18904-ENV6	Small Surface- Burrowing Fauna	Lumbrinerid Bed
ST18904-ENV1	Diverse Soft Sediment Epifauna	Sand Dollar/ Sea Pansy/ Mobile Mollusk Bed (Large Megafauna)
ST18904-ENV2	Sand Dollar Bed	*Echinarachnius parma* Bed

7.3.2 Buoy Deployment Area 2

The Buoy Deployment Area 2 was characterized as generally flat but traversed by a broad depression about 6.6 ft (2 m) deep running northwest to southeast. Thirteen boulders and one debris item were identified in the side scan sonar imagery. Only one station (ENV4) was sampled in this area.

Seabed imagery indicated that the low reflectivity seabed consisted of medium sand with occasional shell fragments. The grab was described as slightly gravelly silty sand with a very slight anoxic odor.

The single FLiDAR 2 location (ENV4) had notably higher species diversity and abundance than the four sampling locations associated with FLiDAR 1. Forty-five percent of the individuals and 42 percent of the taxa collected from grab samples were from this station. The Buoy Deployment Area 2 location also had relatively higher percent TOC (0.07) and finer grain size than the stations to the east. Water depths ranged between 92.2 ft (28.1 m) and 101.1 ft (30.8 m) NAVD88 in the Buoy Deployment Area 2.

The benthic community at ENV4 was characterized as Larger Tube-Building Fauna: Robust Ampelisca Bed; the infauna was dominated by polychaetes and amphipods. Epibenthic organisms observed in the imagery included cariid shrimp, bivalves, and gastropod snails. A solitary tube-dwelling anemone (Ceriantharia) was the only anthozoan observed in grab samples. Hydractinia symbiolongicarpu was observed in benthic imagery. Neither of these species form biogenic reefs. These species are not considered indicative of sensitive benthic habitat.

7.4 Fisheries

As demonstrated in Section 2, the equipment and methodologies proposed herein by Equinor Wind US LLC are consistent with the activity considered by BOEM in the Offshore New York EA (BOEM 2016b). Section 4.4.2.7 of the revised EA describes the affected environment and potential impacts to fisheries that may result from site assessment activity. The information in BOEM (2016) is incorporated by reference and not repeated.

Equinor Wind US LLC has reviewed currently available literature and data (see Section 8.2) regarding fisheries in and near the project area and has determined that no new substantive information has become available that warrants revision of the analysis in BOEM (2016). While stock assessments for the Mid-Atlantic fisheries resources are regularly updated, the description of species assemblages in the Revised Offshore New York EA are considered representative of current conditions.

Critical habitat for the Atlantic sturgeon was designated in August 2017, after the Revised Offshore New York EA was released. However, no critical habitat was designated within the Lease Area (NOAA 2017a), (82 FR 39160). BOEM's analysis is applicable and the determination that the proposed site assessment activity would not likely to adversely affect Atlantic sturgeon is appropriate. The oceanic whitetip shark (*Carcharhinus longimanus*) and the manta ray (*Manta birostris*) were proposed for listing as threatened under the ESA after the Revised Offshore New York EA was released (NMFS 2017 and 2018). These large mobile elasmobranchs will be assumed present in the Lease Area; they are expected to behave much like other more common sharks, skates, and rays by avoiding areas of human activity and noise. BMPs implemented for other fish, including Atlantic and shortnose sturgeon, would be protective of the whitetip shark and manta ray. The proposed site assessment activity would not adversely affect these proposed threatened species.

Equinor Wind US LLC has committed to implementing all applicable lease conditions, which include implementing BMPs during installation, operation, and decommissioning of the Metocean Facilities to minimize impacts on fisheries, including species protected under the ESA. Lease Stipulation 4.1.5 requires that Equinor Wind US LLC develop a publicly available Fisheries Communications Plan that describes the strategies that Equinor Wind US LLC intends to use for communicating with fisheries stakeholders prior to and during activities in support of the submission of a plan. The Fisheries Communications Plan presents Equinor Wind US LLC's proposed approach to outreach with the fishing industry in relation to the development of the Project. The draft Fisheries Liaison & Outline Coexistence Plan for survey activities is available online at https://www.equinor.com/en/what-we-do/empirewind.html. Additionally, Equinor Wind US LLC has contracted with Sea Risk Solutions LLC to provide Fisheries Liaison Officer(s) to the Project. Sea Risk Solutions leverages experience, technology, innovation, and people skills to mitigate risks and serve as a bridge among marine sectors. The lead Fisheries Liaison Officer for the Project will be:

Stephen Drew
Sea Risk Solutions LLC
sdrew@searisksolutions.com
Tel +1 908 339 7439

Equinor Wind US LLC will comply with any additional stipulations as set forth in permits or approvals in support of the proposed site assessment activity.

7.5 Marine Mammals and Sea Turtles

As demonstrated in Section 2, the equipment and methodologies proposed herein by Equinor Wind US LLC are consistent with the activity considered by BOEM in the Offshore New York EA (BOEM 2016b). Sections 4.4.2.5 and 4.4.2.6 of the EA provide details on the species and seasonal occurrence of marine mammals and sea turtles that may be present during the proposed site assessment activity and is incorporated by reference and not repeated.

Equinor Wind US LLC has reviewed publicly available literature and data published since the Offshore New York EA and Finding of No Significant Impact were issued (see Section 8.3). There is no substantive new information that would change BOEM's analysis and conclusion that the proposed activity is not anticipated to result in any significant or population-level effects to marine mammals or sea turtles.

BOEM's EA references NMFS biological opinion on assessment activities in the [Empire Wind Lease Area] (NMFS, 2013a), and states that, 'The potential for marine mammals to interact with the buoy and become entangled in the buoy or mooring system is extremely unlikely given the low probability of a marine mammal encountering one buoy or mooring system within the [Empire Wind Lease Area], and the high tension of the chain which further reduces risk of entanglement". Appreciating the biological opinion relates to an all chain mooring, the key points to note are the extremely unlikely possibility of that contact occurring, in addition to the reduced risk from a line under tension, which would be applicable to the polypropylene line under tension.

As stated above, the use of polypropylene rope in a taught and vertical section of the moorings is not deemed to be a significant entanglement risk, and alternative material such as chain or wire rope add risk to the safe and effective deployment and recovery procedures, while not necessarily adding any proportional value to mitigating extremely unlikely events. Other mitigation such as coating the rope section in plastic tubing have been explored, but have also been deemed to add risk through potential wear and failure of the rope section, again at little or no proportional mitigating value.

Equinor Wind US LLC has committed to implementing all applicable lease conditions, which include BMPs for the installation, operation, and decommissioning of the Metocean Facilities in order to further reduce the potential for interactions with or impacts on marine wildlife. Equinor Wind US LLC will comply with any additional stipulations as set forth in permits or approvals in support of the proposed site assessment activity.

Pile driving activity is not required for met buoy installation and therefore there will be no acoustic harassment associated with met buoy installation and mitigation measures are not applicable.

7.6 Avian and Bat Resources

As demonstrated in Section 2, the equipment and methodologies proposed herein by Equinor Wind US LLC are consistent with the activity considered by BOEM in the Offshore New York EA (BOEM 2016b). Sections 4.4.2.1 and 4.4.2.2 of the EA provide details on the species and seasonal occurrence of avian and bat resources that may be present during the proposed site assessment activity and is incorporated by reference and not repeated.

Equinor Wind US LLC has reviewed currently available literature and data (see Section 8.4) regarding avian and bat resources in the Mid-Atlantic off the coast of New York and has determined that there is no substantive new information that would change BOEM's analysis. The results of the EA and BOEM's analysis and conclusion that the proposed activity is not anticipated to result in any significant or population-level effects to avian and bat resources is applicable.

Equinor Wind US LLC has committed to implementing all applicable lease conditions, which include BMPs for the installation, operation, and decommissioning of the Metocean Facilities in order to further reduce the potential for interactions with or impacts on avian and bat resources. Equinor Wind US LLC will comply with any additional stipulations as set forth in permits or approvals in support of the proposed site assessment activity.

7.7 Water Quality

As demonstrated in Section 2, the equipment and methodologies proposed herein by Equinor Wind US LLC are consistent with the activity considered by BOEM in the Offshore New York EA (BOEM 2016b). Section 4.4.1.2 of the EA provide details on the potential impacts to water quality that result from the proposed site assessment activity and is incorporated by reference and not repeated.

Equinor Wind US LLC has reviewed currently available literature and data (see Section 8.5) regarding water quality in the Mid-Atlantic off the coast of New York and has determined that there is no substantive new information that would change BOEM's analysis. The results of the EA and BOEM's analysis and conclusion that the proposed activity is not anticipated to result in any significant impact to water quality is applicable.

Equinor Wind US LLC has committed to implementing all applicable lease conditions, which include BMPs for the installation, operation, and decommissioning of the Metocean Facilities in order to further reduce the potential for impacts on water quality. Equinor Wind US LLC will comply with any additional stipulations as set forth in permits or approvals in support of the proposed site assessment activity.

7.8 Air Quality

The closest points of land to the proposed site assessment activity are located in Nassau County, New York. In addition, vessels traveling from Miller's Launch to service the Project will transit through waters located in Richmond County, NY (Staten Island) and potentially also in Kings County, NY (Brooklyn). All three of these counties have been designated as moderate nonattainment for the 1997 8-hour ozone (O_3) standard in the revised National Ambient Air Quality Standards (NAAQS); as marginal nonattainment for the 2008 8-hour O_3 standard; as maintenance areas for the 1971 8-hour and 1-hour carbon monoxide [CO] standards; and as maintenance areas for the 1997 annual and 2006 24-hour $PM_{2.5}$ standards. In addition, the U.S. Environmental Protection Agency (EPA) has designated New York as an unclassifiable/attainment area for the new one-hour NO_2 NAAQS, which was promulgated in 2010, pending the collection of additional monitoring data. A similar designation is expected for the one-hour sulfur dioxide (SO_2) NAAQS. New York is designated as unclassifiable or attainment for all other NAAQS. Finally, all of New York is within the Northeast Ozone Transport Region as designated by the Clean Air Act.

7.8.1 Potential Impacts and Proposed Mitigation Measures

The proposed site assessment activity has the potential to impact local air quality. Potential emission sources would however be limited to a single work boat and a support vessel. The vessel associated with these activities would emit criteria air pollutants (NO_x, CO, SO_2, particulate matter less than 10 microns in diameter [PM_{10}], particulate matter less than 2.5 microns in diameter [$PM_{2.5}$]), and volatile organic compounds [VOCs]), hazardous air pollutants (HAPs) and greenhouse gasses [GHGs]). The vessel would emit pollutants both in state and federal waters while traveling to and from the Installation Areas throughout the operational lifecycle of the proposed buoys. Impacts from pollutant emissions associated with this vessel would likely be localized within the immediate vicinity of the site assessment activity.

It is anticipated that the installation and decommissioning of the buoys would each be completed over a period of up to seven over three separate vessel trips. During the operations phase, Equinor Wind US LLC has assumed one separate round trip every six months to each of the four deployment sites (FLiDAR 1, FLiDAR 2, wave and met buoy, and CM/CT mooring) for a single work boat during the operational period. After accounting for the 2-year operational life of the FLiDAR buoys and the 4-year operational life of the wave and met buoy and the CM/CT mooring, this results in a total of 20 round trips during the operations phase. A summary of the air emission estimates is presented in Table 7-3, and the detailed emission calculations and assumptions are presented in Appendix H.

Table 7-3 Equinor Metocean Facilities Air Emissions Summary

Metocean Facilities Activity	VOC tons	NO_X tons	CO tons	PM/PM_{10} tons	$PM_{2.5}$ tons	SO_2 tons	HAPs tons	GHG tons CO_2e
Deployment Activities (Yr. 1)	0.015	0.53	0.27	0.014	0.014	7.08E-05	0.003	38.0
Maintenance Activities (Yrs. 1-2)	0.034	1.25	0.64	0.033	0.032	1.66E-04	0.007	89.0
Maintenance Activities (Yrs. 3-4)	0.018	0.64	0.32	0.017	0.016	8.45E-05	0.004	45.4
Unscheduled Visits (up to 1 per yr.)	0.002	0.08	0.04	0.002	0.002	1.06E-05	0.000	5.7
Decommissioning Activities (end of Yr. 2)	0.010	0.35	0.18	0.009	0.009	4.92E-05	0.002	26.4
Decommissioning Activities (end of Yr. 4)	0.005	0.18	0.09	0.005	0.005	2.44E-05	0.001	13.0
Maximum Annual Emissions (tons) [1]	**0.051**	**1.86**	**0.95**	**0.049**	**0.048**	**2.47E-04**	**0.011**	**132.7**
Total Project Lifetime Emissions (tons)	**0.12**	**4.53**	**2.31**	**0.12**	**0.12**	**6.04E-04**	**0.026**	**324.3**

Note:
1. The maximum annual emissions occur for Year 1 of the project, and include the initial deployment activities, two rounds of 6-month inspections, and up to one unscheduled visit.

Emissions associated with the site assessment activity would be minor based on the estimate of less than 50 tons per year of NO_X and VOCs, 100 tons per year of the other criteria air pollutants, and 25 tons per year of HAPs or 10 tons per year of any individual HAP. The majority of these emissions would occur within Installation Areas and therefore would not affect local onshore air quality in New York. Additionally, since the buoys would not be considered an OCS source and the project emissions are associated with mobile sources, an OCS air permit for these activities will not be required.

7.9 Socioeconomic Resources

As demonstrated in Section 2, the equipment and methodologies proposed herein by Equinor Wind US LLC are consistent with the activity considered by BOEM in the Offshore New York EA (BOEM 2016b). Section 4.4.3 of the EA provide details on the affected environment and potential impacts to socioeconomic resources that may result from the proposed site assessment activity and is incorporated by reference and not repeated.

Equinor Wind US LLC has reviewed currently available literature and data (see Section 8.7) regarding socioeconomic resources in the Mid-Atlantic off the coast of New York and has determined that there is no substantive new information that would change BOEM's analysis. The results of the EA and BOEM's analysis and conclusion that the proposed activity is not anticipated to result in any significant impact to socioeconomic resources is applicable.

Equinor Wind US LLC has committed to implementing all applicable lease conditions, which include BMPs for the installation, operation, and decommissioning of the Metocean Facilities in order to further reduce the potential for impacts on social and economic resources. Equinor Wind US LLC will comply with any additional stipulations as set forth in permits or approvals in support of the proposed site assessment activity.

7.10 Coastal and Marine Uses

As demonstrated in Section 2, the equipment and methodologies proposed herein by Equinor Wind US LLC are consistent with the activity considered by BOEM in the Offshore New York EA (BOEM 2016b). Sections 4.3.3, 4.4.2., and 4.4.3 of the EA provide details on the affected environment and potential impacts to coastal and marine uses that may result from the proposed site assessment activity and is incorporated by reference and not repeated.

Equinor Wind US LLC has reviewed currently available literature and data (see Section 8.8) regarding coastal and marine uses off the coast of New York and determined that there is no substantive new information that would change BOEM's analysis. The results of the EA and BOEM's analysis and conclusion that the proposed activity is not anticipated to result in any significant impact to coastal and marine uses is applicable.

Equinor Wind US LLC has committed to implementing all applicable lease conditions, which include BMPs for the installation, operation, and decommissioning of the Metocean Facilities in order to further reduce the potential for impacts on coastal and marine uses. Equinor Wind US LLC will comply with any additional stipulations as set forth in permits or approvals in support of the proposed site assessment activity.

7.11 Meteorological and Oceanographic Hazards

As demonstrated in Section 2, the equipment and methodologies proposed herein by Equinor Wind US LLC are consistent with the activity considered by BOEM in the Offshore New York EA (BOEM 2016b). Sections 4.3.2 of the EA provide details on the affected environment and potential impacts to meteorological and oceanographic hazards that may result from the proposed site assessment activity and is incorporated by reference and not repeated.

Equinor Wind US LLC has reviewed currently available literature and data (see Section 8.9) regarding coastal and marine uses off the coast of New York and has determined that there is no substantive new information that would change BOEM's analysis. The results of the EA and BOEM's analysis and conclusion that the proposed activity is not anticipated to result in any significant impact to meteorological and oceanographic hazards is applicable.

Equinor Wind US LLC has committed to implementing all applicable lease conditions, which include BMPs for the installation, operation, and decommissioning of the Metocean Facilities in order to further reduce the potential for impacts on meteorological and oceanographic hazards. Equinor Wind US LLC will comply with any additional stipulations as set forth in permits or approvals in support of the proposed site assessment activity.

United States Department of the Interior

BUREAU OF OCEAN ENERGY MANAGEMENT
WASHINGTON, DC 20240-0001

JUN 1 5 2016

Mr. Matthew P. Maraglio
New York Department of State
Consistency Review Unit
Office of Planning & Development
One Commerce Plaza
99 Washington Avenue, Suite 1010
Albany, New York 12231

Dear Mr. Maraglio:

This document provides the State of New York with the Bureau of Ocean Energy Management's (BOEM) Consistency Determination (CD) for the Wind Energy Area offshore of New York under the Coastal Zone Management Act Section 307(c)(1) and 15 CFR Part 930 Subpart C. The information in this CD is provided pursuant to 15 CFR 930.36(a) and 930.39. The CD takes into consideration the reasonably foreseeable coastal effects of the proposed action and its consistency with the enforceable policies identified by New York's Coastal Zone Management Program. The proposed action includes:

- Lease issuance (including reasonably foreseeable consequences associated with shallow hazards, geological, geotechnical, archaeological resources, and biological surveys); and

- Site assessment activities (including reasonably foreseeable consequences associated with the installation and operation of a meteorological tower and/or meteorological buoys) as indicated in the *Commercial Wind Lease Issuance and Site Assessment Activities on the Atlantic Outer Continental Shelf Offshore New York Environmental Assessment* (EA).

BOEM's analysis of the effects of the proposed action on land and water uses and/or natural resources can be found in the enclosed EA. The New York Coastal Zone Management Program's applicable enforceable policies and reasonably foreseeable coastal effects are included in Table 6 (enclosed) for your review.

Based upon the above referenced information, data and analysis, BOEM finds the proposed action consistent to the maximum extent practicable with the enforceable policies of the New York Coastal Zone Management Program.

Pursuant to 15 CFR 930.41, the New York Coastal Zone Management Program has sixty (60) days from the receipt of this letter in which to concur with or object to this CD, or request an extension under 15 CFR 930.41(b). New York's concurrence will be presumed if its response is not received by BOEM within sixty (60) days of receipt of this determination.

The state's response should be sent to:

Bureau of Ocean Energy Management
Office of Renewable Energy Programs
45600 Woodland Road, VAM-OREP
Sterling, Virginia 20166

We appreciate having a cooperative working relationship with the State of New York as we move forward with our review of potential offshore renewable energy activities.

Sincerely,

James F. Bennett
Program Manager
Office of Renewable Energy Programs

Enclosures

U.S. Department of the Interior
Bureau of Ocean Energy Management

Coastal Zone Management Act, Consistency Determination
(15 CFR 930.36(a))

Wind Energy Area Offshore the States of New York and New Jersey

The purpose of this Consistency Determination (CD) is to determine whether issuing a commercial wind energy lease and approving site assessment activities (including the installation, operation, and decommissioning of a meteorological tower and/or buoys) within the Wind Energy Area (WEA) offshore New York and New Jersey (*see* Figure 1) is consistent to the maximum extent practicable with the enforceable policies of the New York and New Jersey Coastal Management Programs (CMPs). This document is provided pursuant to the requirements of 15 CFR 930.39(a) of the Coastal Zone Management Act (CZMA) federal consistency regulations.

Section 307(c)(1) of the CZMA, as amended, requires that Federal agency activities affecting any land or water use or natural resource of the coastal zone shall be carried out in a manner which is consistent to the maximum extent practicable with the enforceable policies of federally-approved state management programs.

The States of New York and New Jersey share common coastal management issues and have similar enforceable policies as identified by their respective CMPs. Due to the proximity of the WEA to both states (*see* Figure 1), and their shared impacts on environmental and socioeconomic resources and uses, the Bureau of Ocean Energy Management (BOEM) has prepared a single CD for the WEA.

BOEM is proposing to issue a commercial wind energy lease within the WEA (as illustrated in Figure 1 and described below) and approve site assessment activities that would determine whether the lease is suitable for, and would support, commercial-scale wind energy production. The lease, by itself, would not authorize the lessee to construct or operate any wind energy project on the Outer Continental Shelf (OCS).

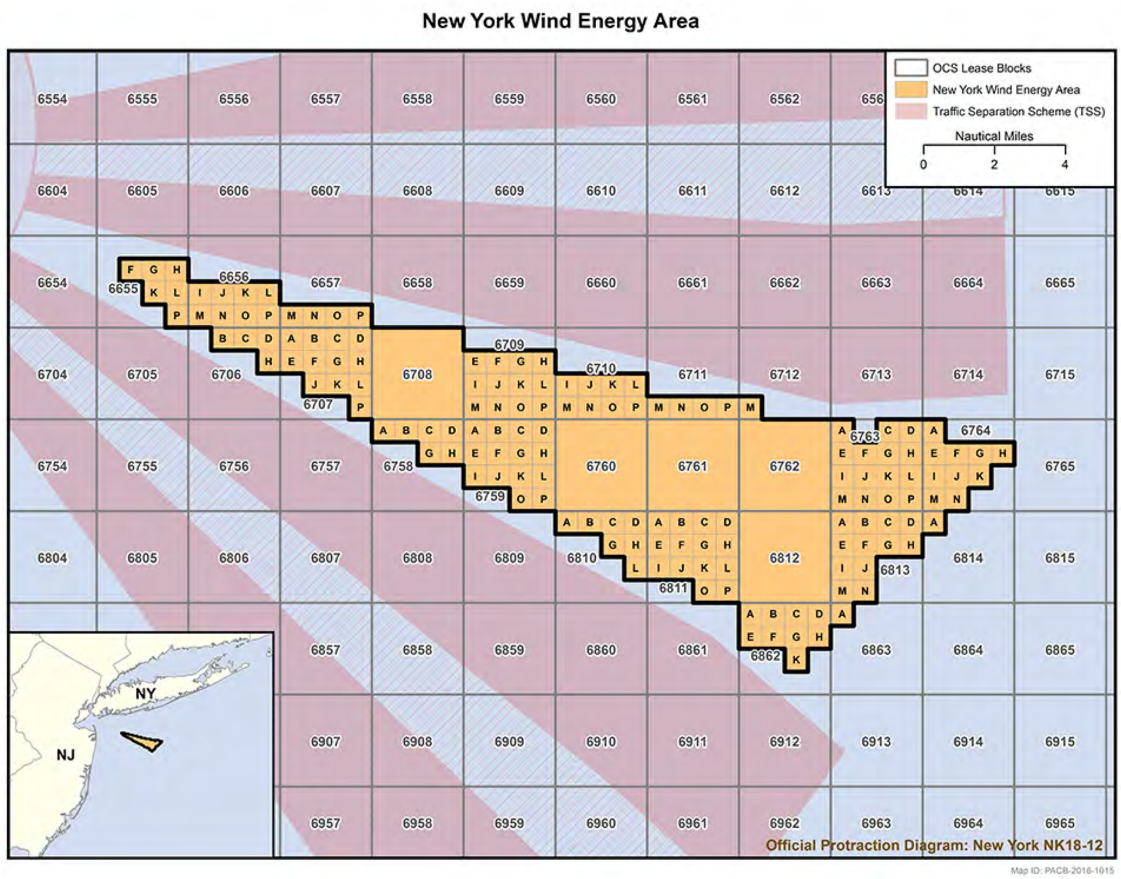

Figure 1: Wind Energy Area

In September 2011, BOEM received an unsolicited request for a commercial lease offshore New York from the New York Power Authority (NYPA). NYPA worked together with the Long Island Power Authority and Consolidated Edison to propose a 350-700 megawatts offshore wind power project south of Long Island, New York, approximately 13 miles (mi) (21 kilometers [km]) off Rockaway Peninsula.

On January 4, 2013, BOEM published a Request for Interest (RFI) in the *Federal Register* (Docket ID: BOEM-2012-0083; 78 FR 760-764) to assess whether there were other parties interested in developing commercial wind facilities in the same area proposed by NYPA. In addition to inquiring about competitive interest, BOEM also sought public comment on the NYPA proposal, its potential environmental consequences, and the use of the area in which the proposed project would be located. BOEM received indications of interest from Fishermen's Energy, LLC, and Energy Management, Inc. BOEM reviewed the nominations received in response to the RFI and determined that competitive interest in the area proposed by NYPA exists. Therefore, BOEM stopped processing NYPA's unsolicited lease application and initiated the competitive leasing process pursuant to 30 CFR 585.211.

On May 28, 2014, BOEM published in the *Federal Register* (Docket ID: BOEM-2013-0087; 79 FR 30645-30651) a Call for Information and Nominations offshore New York to seek additional nominations from companies interested in obtaining commercial wind energy leases within the Call Area.

On March 16, 2016, BOEM released the Announcement of Area Identification (*see* http://www.boem.gov/NY-Area-ID-Announcement/). The WEA begins about 11 nautical miles (nm) (20 km) south of Long Beach, New York and extends approximately 26 nm (48 km) southeast along its longest portion. The WEA contains five whole OCS blocks and 148 sub-blocks (127 square miles [mi^2] [329 square kilometers (km^2)] or 81,130 acres (ac) [32,830 hectares (ha)]). The WEA is shown in Figure 1 and described in Table 1 below.

Table 1
Wind Energy Area

Wind Energy Area (WEA)	Official Protraction Diagram	Size (sq nautical miles (nm^2))	Distance to Shore (nm)	Minimum Water Depth (feet [ft])	Maximum Water Depth (ft)
New York	New York NK18-12	96	11	61	137

Activities that may occur over the site assessment period of the lease (i.e., up to five years) include site characterization survey activities and site assessment activities involving the construction, operation, maintenance, and decommissioning of a meteorological tower and/or buoys. Site characterization surveys would inform a lessee about the site specifics of the lease area in order to prepare for submission of a site assessment plan (SAP) and, potentially, a construction and operations plan (COP). The projected site characterization and site assessment activities within the WEA are discussed in detail in Section 2 and summarized in Table 2 (below).

Table 2
Projected Site Characterization & Assessment Activities in the WEA

1. BACKGROUND

BOEM is authorized to issue leases on the OCS for the purposes of wind energy development pursuant to Section 388 of the Energy Policy Act of 2005 (EPAct). On April 22, 2009, BOEM promulgated regulations implementing this authority at 30 CFR Part 585. The regulations establish a program to grant leases, easements, and rights-of-way for orderly, safe, and environmentally responsible renewable energy development activities, such as the siting and construction of offshore wind facilities on the OCS, as well as other forms of renewable energy such as marine hydrokinetic (i.e., wave and current). The Minerals Management Service (MMS) prepared a programmatic Environmental Impact Statement (EIS) to evaluate the impact of establishing of a comprehensive, nationwide MMS Alternative Energy Program on the OCS (*Programmatic Environmental Impact Statement for Alternative Energy Development and Production and Alternate Use of Facilities on the Outer Continental Shelf, Final Programmatic Environmental Impact Statement*, October, 2007) (Programmatic EIS.) The final rule and the Programmatic EIS can be reviewed for reference on the BOEM website at: http://www.boem.gov/Renewable-Energy-Program/Regulatory-Information/Index.aspx and http://www.boem.gov/Renewable-Energy-Program/Regulatory-Information/Guide-To-EIS.aspx. In addition, BOEM published the *Atlantic Geological and Geophysical Activities Programmatic Final Environmental Impact Statement* (G&G Final PEIS). The G&G PEIS can be viewed at: http://www.boem.gov/Atlantic-G-G-PEIS/.

On June 2, 2016, BOEM released the *Commercial Wind Lease Issuance and Site Assessment Activities on the Atlantic Outer Continental Shelf Offshore New York Environmental Assessment* (EA), which is available online at: http://www.boem.gov/New-York/. The EA analyzes the reasonably foreseeable consequences associated with two distinct BOEM actions in the WEA:

(1) Lease issuance (including reasonably foreseeable consequences associated with shallow hazards, geological, geotechnical, archaeological resources, and biological surveys); and

(2) SAP approval (including reasonably foreseeable consequences associated with the installation and operation of a meteorological tower and/or meteorological buoys).

BOEM does not issue permits for shallow hazards, geological, geotechnical, archaeological resource, or biological surveys. However, since BOEM regulations require that a lessee include the results of these surveys in its application for SAP and COP approval, the EA treats the environmental consequences of these surveys as reasonably foreseeable consequences of issuing a lease.

2. PROPOSED ACTION DESCRIPTION

Offshore Site Characterization Surveys

BOEM regulations require that a lessee provide the results of a number of surveys with both a SAP and a COP, including: a shallow hazards survey, a geological survey, biological surveys, a geotechnical survey, and an archaeological resource survey (30 CFR 585.626(a)(1) to (a)(5), respectively). BOEM refers to these surveys as “site characterization” activities. Site characterization activities (e.g., locating shallow hazards, cultural resources, and hard-bottom areas; evaluating installation feasibility; assisting in the selection of appropriate foundation system designs; and determining the variability of subsurface sediments) would necessitate using high-resolution geophysical (HRG) surveys and geotechnical exploration. The purpose of the HRG survey would be to acquire geophysical shallow hazards data and information pertaining to the presence or absence of archaeological resources and to conduct bathymetric charting. The purpose of geotechnical exploration would be to assess the suitability of shallow foundation soils for supporting a structure or transmission cable under any operational and environmental conditions that might be encountered (including extreme events), and to document soil characteristics necessary for the design and installation of all structures and cables. The results of geotechnical exploration allow for a thorough investigation of the stratigraphic and geo-engineering properties of the sediment that may affect the foundations or anchoring systems of a meteorological tower or buoy, which would be necessary for BOEM to consider in a SAP, or later a COP, for a given lease.

Site characterization activities would also necessitate vessel and/or aerial surveys to characterize three primary biological resource categories: (1) benthic habitats; (2) avian resources; and (3) marine fauna. BOEM does not anticipate the lessee needing to conduct separate surveys to characterize the benthic habitats which could be affected by their potential future leasehold activities because the geological and geotechnical surveys would provide enough detailed information for BOEM to adequately assess potential impacts on benthic habitats in the area. For the lessee to describe the state of the avian and marine fauna resources, resource surveys would generally involve simple visual observation, either from a vessel or aircraft. For avian and marine fauna surveys, multi-year assessment periods may be necessary to capture natural seasonal and inter-annual variability of marine fauna within the WEA and immediate surroundings if current data available is not sufficient to determine spatial and temporal distribution of species. It is generally envisioned that the fish, marine mammal, sea turtle, and bird aerial and shipboard surveys could be conducted simultaneously.

It is assumed that the site of a meteorological tower and/or buoys would be surveyed first, to meet the similar data requirements for a lessee's SAP (30 CFR 585.610 and 585.611), and the site of a meteorological tower or buoy would not be resurveyed when the remainder of the leasehold is surveyed to meet the data requirements for a lessee's COP (30 CFR 585.626(a)). However, a lessee could conduct all of their surveys at the same time (to support both a SAP and a COP).

Meteorological Tower and Buoys

A typical meteorological tower consists of a mast mounted on a foundation, anchored to the seafloor. The mast may be either a monopole or a lattice (similar to a radio tower). The mast and data collection devices would likely be mounted on a fixed or pile-supported platform (monopile, jackets, or gravity bases) or floating platform (spar, semi-submersible, or tension-leg). Total installation time for one meteorological tower would be eight days to ten weeks, depending on the type of structure installed and the weather and ocean conditions.

Different types of foundations include tripod, monopile, or steel jacket. Characteristics of these foundation types are summarized in Table 3 below. The final foundation selection would be included in a detailed SAP submitted to BOEM for its review and approval, along with the results of SAP-related site characterization surveys.

Table 3
Meteorological Tower Foundations

	Number of Foundation Piles	Diameter of Foundation Piles (ft)	Area of Bottom Covered[1] (square feet [ft^2])	Depth Driven below Seafloor (ft)	Height above Mean Sea Level (ft)
Tripod	3	10	1,500	25 to 100	295 to 393
Monopile	1	10	200	25 to 100	295 to 393
Steel Jacket	3 to 4	3	2,000	25 to 100	295 to 393

[1]Foundations may be surrounded by a scour system placed at the base of the structure that would cover up to 2 acres (0.81 hectares) of ocean bottom

While a meteorological tower has been the traditional device for characterizing wind conditions, several companies have expressed their interest in installing one or two meteorological buoys instead. Meteorological buoys can be used as an alternative to or in combination with a meteorological tower for collecting wind, wave, and current data in the offshore environment. The EA assumes that, should a lessee choose to employ buoys instead of meteorological towers, it would install a maximum of two buoys. These meteorological buoys would be anchored at fixed locations and would regularly collect observations from many different atmospheric and oceanographic sensors. There are three primary types of buoys BOEM anticipates could be used for meteorological resource data collection on the lease: discus-shaped hull buoys; boat-shaped hull buoys; and spar-type buoys. Discus-shaped and boat-shaped buoys are typically towed or carried aboard a vessel to the installation location. A discus-type buoy would use a combination of chain, nylon, and buoyant polypropylene materials, while a boat-shaped buoy would be moored using an all-chain mooring. Once at the installation site, the buoy would be either lowered to the surface from the deck of the transport vessel and the mooring anchor dropped. Transport and installation vessel anchoring would typically require one day for these types of buoys. The total area of bottom disturbance for boat-shaped and discus shaped buoys would be approximately 6 ft^2 (.55 square meters [m^2]) for the actual footprint and 370,260 ft^2 (34,398 m^2) for the anchor sweep. A spar-type buoy would require two distinct phases for installation, with typically a total of 2 to 3 days for installation. The total area of bottom disturbance associated with a spar-type buoy and installation vessel anchors would be roughly 784 ft^2 (73 m^2). See Section 3.2.2.2 of the EA for more information on meteorological buoys and their anchor systems.

To obtain meteorological data, scientific measurement devices consisting of anemometers, vanes, barometers, and temperature transmitters would be mounted either directly on a tower, buoy, or on instrument support arms. A meteorological tower or buoy also could accommodate environmental monitoring equipment, such as avian monitoring equipment (e.g., radar units or thermal imaging cameras), acoustic monitoring for marine mammals, data-logging computers, power supplies, visibility sensors, water measurements (e.g., temperature or salinity), communications equipment, material hoist, and storage containers.

To measure the speed and direction of ocean currents, Acoustic Doppler Current Profilers (ADCPs) would likely be installed on or near a meteorological tower or buoy. An ADCP is a remote-sensing technology which transmits sound waves at a constant frequency and measures the ricochet of the sound wave off fine particles or zooplanktons suspended in the water column. The ADCPs may be mounted independently on the seafloor, to the legs of the platform, or attached to a buoy. A typical ADCP is about 1 to 2 ft tall (approximately 0.3 to 0.6 meters) and 1 to 2 ft wide (approximately 0.3 to 0.6 meters).

A SAP describes the activities (e.g., installation of meteorological towers and/or buoys) a lessee plans to perform for the assessment of the wind resources and ocean conditions at its commercial lease (30 CFR 585.605). No site assessment activities may take place on a lease until BOEM has approved a lessee's SAP (30 CFR 585.600(a)). Once approved, the site assessment term for a commercial lease is five years from the date of SAP approval (30 CFR 585.235(a)(2)). It is assumed that the lessee would install a data-collection device (e.g., meteorological tower, buoy, or both) on its lease area to assess the wind resources and ocean conditions of the leasehold. This information would allow the lessee to determine whether the lease is suitable for wind energy development, where on the lease it would propose development, and what form of development to propose in a COP.

A lessee must submit a COP at least six months before the end of the site assessment term if the lessee intends to continue to the lease's operations term (30 CFR 585.601(c)). If the COP describes continued use of existing facilities, such as a meteorological tower or buoy approved in the SAP, a lessee may keep such facilities in place on their lease during BOEM's review of the COP (30 CFR 585.618(a)), which may take up to two years. If, after the technical and environmental review of a submitted COP, BOEM determines that such facilities may not remain in place throughout the operations term, a lessee must initiate the decommissioning process (30 CFR 585.618(c)). BOEM anticipates that a meteorological tower could be present for up to five years before the agency decides whether to allow the tower to remain in place for the lease's operations term, or whether the tower must be decommissioned immediately.

Coastal Activity

A lessee will likely determine specific ports used for site assessment and survey activities based primarily on proximity to the lease blocks, capacity to handle the proposed activities, and/or established business relationships between port facilities and the lessee. Existing ports or industrial areas in New York and New Jersey are adequate to support proposed action activities. BOEM therefore does not anticipate expansion of port facilities to meet lessee needs, and considers only existing facilities which can currently accommodate proposed site characterization and site assessment activities.

Installation of a meteorological tower and/or two buoys would require port facilities with the following requirements:

- Deep-water vessel access (greater than 15 ft [4.6 m]) to accommodate large vessels;
- Landing and unloading facilities in close proximity to fabrication yards for staging, assembly, and temporary materials storage; and
- Located within a reasonable travel distance to the WEA, which BOEM assumes to be 40

miles from the WEA boundary to the port.

BOEM has identified the following ports as potential staging ports for the WEA:

- Staten Island, NY
- Erie Basin, NY
- Brooklyn, NY
- Bayonne, NJ
- Newark, NJ
- Elizabeth, NJ
- Perth Amboy, NJ

Surveying and operations and maintenance activities could be supported by smaller ports because these types of activities can use smaller vessels and don't need access to fabrication and storage yards for large infrastructure that would be required for installation of a meteorological tower and/or buoys. Vessels used for these activities are anticipated to be approximately 65 to 100 ft (20 to 30 meters) in length. These smaller ports would serve as staging areas and crew/cargo launch sites for the survey, and operations and maintenance vessels. While a variety of ports could be used for the survey, operations and maintenance activities, including some of the staging ports listed above, BOEM has identified the following ports as likely to support these activities associated with the WEA:

- Staten Island, NY;
- Kismet Harbor, NY;
- Ocean Beach Harbor, NY;
- Perth Amboy, NJ;
- Shark River, NJ; and
- Manasquan, NJ.

Vessel Traffic

Approximately 574 to 1010 total vessel round trips are anticipated to occur as a result of the proposed action over a five-year period (*see* Table 4). Approximately 530 to 542 of these vessel trips (round trips) would be associated with all site characterization surveys as a result of the proposed action over five years, from 2017 to 2022. The total vessel traffic estimated as a result of the installation, decommissioning, and routine maintenance of the meteorological towers and/or meteorological buoys that could be reasonably anticipated in connection with the proposed action would range from 44 to 468 round trips over a five-year period.

Table 4
Total Vessel Round Trips

HRG Surveys	Cable surveys	Geotechnical Sampling Surveys	Avian Surveys	Fish Surveys	Met Buoys	Met Tower	Total
157	10	247	24-36	92	44-128	100-340	574-1010

The total vessel traffic estimated as a result of the HRG surveys and geotechnical exploration work that could be reasonably anticipated in connection with the proposed action would be approximately 167 round trips over five years, and spread over existing and available port facilities in New York and New Jersey. In addition, BOEM presumes 116 to 128 extra independent surveys conducted to characterize avian and fish resources under the proposed action.

Should the lessee decide to install a meteorological tower on its leasehold, a total of 40 round trips are estimated for construction (*see* Table 5). These vessel trips may be spread over multiple construction seasons as a result of weather and sea state conditions, the time to assess suitable site(s), the time to acquire the necessary permits, and the availability of vessels, workers, and tower components. Because the decommissioning process would basically be the reverse of construction, vessel usage during decommissioning would be similar to vessel usage during construction, so another 40 round trips are estimated for decommissioning of the tower. Meteorological buoys would typically take 1 to 2 days to install by one vessel, and 1 to 2 days to decommission by one vessel. Maintenance trips to each meteorological tower may occur weekly to quarterly, and monthly to quarterly for each buoy. However, to provide for a conservative scenario, total maintenance vessel trip calculations are based on weekly trips for towers and monthly trips for buoys over the entire 5-year period (*see* Table 5).

Table 5
Vessel Traffic for Meteorological Buoys and Tower Construction, Maintenance, and Decommissioning

Site Assessment Activity	Round Trips	Formula
Meteorological Buoys		
Meteorological Buoy Installation	2-4	1-2 round trips x 2 buoys
Meteorological Buoy Maintenance – Quarterly/Monthly	40-120	4 quarters x 2 buoys x 5 years 12 months x 2 buoys x 5 years
Meteorological Buoy Decommissioning	2-4	1-2 round trips x 2 buoys
Total Buoy Trips Over 5-year period	**44-128**	
Meteorological Tower		
Meteorological Tower Construction	40	40 round trips x 1 tower
Meteorological Tower Maintenance – Quarterly/Weekly	20-260	4 quarters x 1 tower x 5 years 52 weeks x 1 towers x 5 years
Meteorological Tower Decommissioning	40	40 round trips x 1 tower
Total Tower Trips Over 5-year Period	**100-340**	
Total Trips for a Tower and Two Buoys	**144-468**	

3. STATE ENFORCEABLE POLICIES

As part of this CD, BOEM has evaluated and documented in the enclosed table (*see* Table 6), policies identified by New York and New Jersey as enforceable, applicable offshore and coastal resources or uses, and CZMA "reasonably foreseeable coastal effects" that might be expected for activities conducted under the proposed action. While reviewing and making these determinations on the policies the states have identified as enforceable in this CD, BOEM has considered the common enforceable policies identified by each of the two states as enforceable in their CMP, as listed in Table 6.

4. CONSISTENCY DETERMINATION

BOEM has evaluated all applicable enforceable policies of New York and New Jersey, and the potential activities resulting from the proposed action. This CD has examined whether the proposed action described in Section 1 is consistent to the maximum extent practicable with the policies and provisions identified as enforceable by the CMPs of New York and New Jersey (*see* Table 6). Based on the preceding information and analyses, and the incorporated-by-reference Programmatic EIS, G&G Final PEIS, and EA, BOEM has determined the proposed action will be consistent to the maximum extent practicable with the policies that New York and New Jersey have identified as enforceable.

Table 6: Applicable Enforceable Policies for the Coastal Management Programs of New York and New Jersey

CATEGORY	ENFORCEABLE POLICIES: APPLICABLE COASTAL ZONE MANAGEMENT RULES	REASONABLY FORESEEABLE COASTAL EFFECTS (CZMA COASTAL EFFECTS)
Coastal Habitats and Wetlands	Policy 44 (NY) 7:7E-3.6 Submerged vegetation habitat (NJ) 7:7E-3.16 Dunes (NJ) 7:7E-3.18 Coastal high hazard areas (NJ) 7:7E-3.22 Beaches (NJ) 7:7E-3.27 Wetlands (NJ)	No dunes, beaches, submerged vegetation habitat, or wetlands will be altered as a result of the proposed action. No direct impacts on wetlands or other coastal habitats would occur from routine activities in the Wind Energy Area (WEA) due to the distance of the WEA from shore. No cables would be installed to shore to support the meteorological tower or buoys. Additionally, existing ports or industrial areas in New York and New Jersey are expected to be used in support of the proposed activities. No expansion of existing facilities is expected to occur as a result of the proposed action. Indirect impacts from routine activities may occur from wake erosion and associated added sediment caused by increased traffic in support of the proposed action. Given the volume and nature of existing vessel traffic in the area, a negligible increase of wake-induced erosion may occur. Existing channels could accommodate the vessels anticipated to be used, and no additional dredging would be required to accommodate different vessel size(s). For more information on ports and navigation, see the Ports, Navigation, and Waterfront section below. Should an incidental diesel fuel spill occur as a result of the proposed action, the impacts on coastal habitats, including dunes, beaches, and wetlands, are expected to be negligible. See Section 4.4.2.4 of the *Environmental Assessment for Commercial Wind Lease Issuance and Site Assessment Activities on the Atlantic Outer Continental Shelf Offshore New York* (EA) for additional information on potential impacts to coastal habitats.
Ports, Navigation, and Waterfront	Policy 2 (NY) Policy 3 (NY)	Ports that could serve as potential staging areas include: Staten Island, NY; Erie Basin, NY; Brooklyn, NY; Bayonne, NJ; Newark, NJ; Elizabeth, NJ; and Perth Amboy, NJ. While a variety of ports could be used for the survey, operations, and maintenance activities, including some of the staging ports listed above, the Bureau of Ocean Energy Management (BOEM) has identified the following ports as likely to support these

	Policy 4 (NY) Policy 5 (NY) Policy 24 (NY) Policy 25 (NY) Policy 35 (NY) 7:7E-3.7 Navigation channels (NJ) 7:7E-3.11 Ports (NJ) 7:7E-3.41 Special hazard areas (NJ) 7:7E-7.5 Transportation use rule (NJ) 7:7E-7.7 Industry use rule (NJ) 7:7E-7.9 Port use rule (NJ) 7:7E-7.10 Commercial facility use rule (NJ) 7:7E-8.14 Traffic (NJ)	activities associated with the WEA: Staten Island, NY; Kismet Harbor, NY; Ocean Beach Harbor, NY; Perth Amboy, NJ; Shark River, NJ; and Manasquan, NJ. Wake erosion and sedimentation effects would be limited to approach channels and the coastal areas near ports and bays used to conduct activities. Given the existing amount and nature of vessel traffic, there would be a negligible, if any, increase to wake-induced erosion of associated channels based on the relatively small size and number of vessels associated with the proposed action. Moreover, all approach channels to these ports are armored, and speed limits would be enforced, which also helps to prevent most erosion. Several existing fabrication sites, staging areas, and ports in New York and New Jersey could support site characterization surveys and the construction, operation, and decommissioning of the meteorological tower and buoys. No expansion of these existing onshore areas is anticipated. Existing channels could accommodate the vessels anticipated to be used, and no additional dredging would be required to accommodate different vessel size(s). In addition, no cables would be installed to shore to support the meteorological tower or buoys. The meteorological tower platform would likely be constructed onshore at an existing fabrication yard near one of the ports. The meteorological tower could also be fabricated at various facilities, or at inland facilities in sections, and then shipped by truck or rail to the port staging area. Project related vessels traveling to or from the ports for survey activities, installation, maintenance, and decommissioning of the meteorological tower and buoys could experience spills within a channel or bay that could potentially reach shoreline areas. The impacts on coastal habitats would depend on the type of material spilled, the size and location of the spill, the meteorological conditions at the time, and the speed with which cleanup plans and equipment could be employed. These impacts are expected to be minimal because vessels are expected to comply with the United States Coast Guard regulations at 33 CFR Part 151, relating to the prevention and control of oil spills. Based on the distance from shore where proposed action activities would occur, and the rapid evaporation and dissipation of diesel fuel, a spill occurring in the WEA would likely not contact shore. Collisions between vessels and allisions between vessels and the meteorological tower and buoys are unlikely. However, if a vessel collision or allision was to occur, and in the unlikely event that a spill would result, the most likely pollutant to be discharged into the environment would be diesel fuel. Diesel dissipates very rapidly in the

		water column, then evaporates and biodegrades within a few days, resulting in negligible, if detectable, impacts on the area of the spill. For the proposed action, approximately 574-1,010 vessel trips from site characterization and assessment activities are projected to occur over a 5-year period if the entire WEA was leased and the maximum number of site characterization surveys were conducted in the lease area (*see* Table 4 for vessel traffic calculations). For more information on ports, see Section 3.2.3 of the EA. For more information on vessel traffic and navigation see Sections 3.2.4 and 4.4.2.10 of the EA.
Energy Facilities	Policy 12 (NY) Policy 14 (NY) Policy 17 (NY) Policy 27 (NY) Policy 29 (NY) 7:7E-7.4 Energy facility use rule (NJ)	This analysis is limited to the effects of lease issuance, conducting site characterization activities (i.e., surveys of the lease area), and approval of site assessment activities (i.e., construction and operation of a meteorological tower and/or two buoys) within the WEA. This analysis does not consider construction and operation of any commercial wind power facilities, which would be evaluated later in the process during the review of a construction and operations plan (COP). BOEM takes this approach based on several factors. First, BOEM does not consider the issuance of a lease to constitute an irreversible and irretrievable commitment of agency resources toward the authorization of a commercial wind power facility. Section 1.1.1 of the EA describes BOEM's phased planning and authorization process for offshore wind development. Under this process, the issuance of a lease only grants the lessee the exclusive right to use the leasehold to (1) gather resource and site characterization information, (2) develop its plans, and (3) subsequently seek BOEM approval of its plans for the development of the leasehold. The purpose of conducting the surveys and installing meteorological measurement devices is to assess the wind resources in the lease area and to characterize the environmental and socioeconomic resources and conditions. A lessee must collect this information to determine whether the site is suitable for commercial development and, if so, submit a COP with its project-specific design parameters, for BOEM's review. Should a lessee submit a COP, BOEM would consider its merits; perform the necessary consultations with the appropriate state, federal, local, and tribal entities; solicit input from the public and the Task Force; and perform an independent, comprehensive, site- and project specific National Environmental Protection Act (NEPA) analysis. This separate

		site- and project-specific NEPA analysis may take the form of an environmental impact statement (EIS) and would provide additional opportunities for public involvement pursuant to NEPA and the CEQ regulations at 40 CFR Parts 1500–1508. BOEM would use this information to evaluate the potential environmental and socioeconomic consequences associated with the lessee-proposed project, when considering whether to approve, approve with modification, or disapprove a lessee's COP pursuant to 30 CFR 585.628. After lease issuance, but prior to COP approval, BOEM retains the authority to prevent the environmental impacts of a commercial wind power facility from occurring. Secondly, BOEM does not consider development of a commercial wind power facility within the WEA, and its attendant environmental impacts, to be reasonably foreseeable at this time. Based on the experiences of the offshore wind industry in northern Europe, the project design and the resulting environmental impacts are often geographically and design specific, and it would, therefore, be premature to analyze environmental impacts related to the potential approval of any future COP at this time. There are a number of design parameters that would be identified in a project proposal, including foundation type, project layout, installation methods, and associated onshore facilities. However, the development of these parameters would be determined by information collected during site characterization and assessment activities conducted by the lessee after lease issuance. Each design parameter, or combination of parameters, would have varying environmental effects. Therefore, additional analyses under NEPA would be required before any future decision is made regarding construction of wind energy facilities on the OCS. Additionally, while BOEM has issued 11 commercial wind energy leases offshore, only one lessee has submitted a COP to date. Construction of a commercial wind power facility on the Outer Continental Shelf (OCS) has yet to commence. Given the nascent nature of the offshore wind industry and market uncertainties, it is speculative at this time whether projects will actually be proposed within these areas.
Protected Species	Policy 7 (NY) Policy 8 (NY) 7:7E-3.38 Endangered or	<u>Marine Mammals</u> More information on potential impacts to marine mammals can be found in Section 4.4.2.5 of the EA. There are 31 species of marine mammals that occur in the New York Bight. These 31 species include the following:

	threatened wildlife or plant species habitats (NJ) 7:7E-3.39 Critical wildlife habitats (NJ)	• six mysticetes (baleen whales; five federally endangered); • 21 odontocetes (toothed whales, including: dolphins, a porpoise, beaked whales, dwarf and pygmy sperm whales, and federally endangered sperm whales); and • four pinnipeds (seals). The Endangered Species Act (ESA)-listed marine mammal species that occur in the New York Bight include six large whale species (fin, sei, humpback, North Atlantic right, blue, and sperm whales) (*see* Table 4-6 of the EA). Sperm, blue, and sei whales that are sighted in the New York Bight are generally found farther offshore and/or near the shelf edge. Thus, these species are not expected to occur in the action area. Three listed species, all endangered, are likely to occur in the action area: fin, humpback, and North Atlantic right whales. However, National Marine Fisheries Service (NMFS) is currently proposing to establish 14 distinct population segments (DPS) for humpback whales, two of which will be listed as endangered and two will be listed and threatened. The West Indies DPS covers all humpbacks along the Atlantic, and this DPS will be de-listed (80 FR 22303). Sightings per unit effort (SPUE) results for the three species combined indicate that while these species are not particularly common (*see* Figure 4-11 of the EA), they could occur in the action area at any time during the year (*see* Table 4-6 of the EA). Marine mammals listed as federally endangered or threatened under the ESA (i.e., listed) and marine mammals protected under the Marine Mammal Protection Act (i.e., non-listed) are discussed together because the potential impact mechanisms are the same for all marine mammals. **Site Characterization** Impacts on marine mammals from site characterization were analyzed in the *Atlantic Geological and Geophysical Activities Final Programmatic Environmental Impact Statement* (G&G Final PEIS) and are incorporated herein by reference and summarized below. Although the geographic boundary in the G&G Final PEIS was outside of the WEA (it included BOEM's Mid-Atlantic and South Atlantic planning areas: Delaware to Florida), many of the same species occur in the New York Bight area, and the conclusions

		on impact levels are applicable. The following conclusions for site characterization that were made in the G&G Final PEIS for BOEM's Mid-Atlantic and South Atlantic planning areas are expected to be the same in the WEA: • Impacts from High Resolution Geophysical (HRG) survey sound sources are expected to be minor because acoustic signals from electromechanical survey equipment are within the hearing range for marine mammals, and may cause Level B harassment. However, standard operating conditions (SOCs) implemented to minimize acoustic impacts would include monitoring by a protected species observer (PSO) of a 1,640 ft (500 m) exclusion zone for North Atlantic right whales and a 656 ft (200 m) exclusion zone for all other marine mammals, clearance of the exclusion zone 60 minutes prior to equipment start-up, "ramp up" of equipment, and immediate shut down if a non-delphinoid cetacean (large whale) is sighted at or within the exclusion zone (*see* Appendix B of the EA). If a delphinoid cetacean (dolphin or porpoise) or pinniped (seal) is sighted at or within the exclusion zone, the survey equipment must be powered down to the lowest power output feasible until the exclusion zone is clear; • Impacts from vessel and equipment noise, including geotechnical sampling (e.g., coring) are expected to be negligible to minor. BOEM based this finding on our conclusion that vessel and equipment source levels can be high enough to exceed threshold criteria for behavioral disturbance and undetected marine mammals may occur in the ensonified area during sampling activities. The following SOCs would minimize acoustic impacts: monitoring of the 656 ft (200 m) exclusion zone by a PSO, clearance of the 656 ft (200 m) exclusion zone 60 minutes prior to activity, and immediate shut down if a non-delphinoid cetacean is sighted at or within the exclusion zone. Subsequent restart of geotechnical survey equipment may only follow clearance of exclusion zone for at least 60 minutes for all marine mammals (*see* Appendix B of the EA); and • Impacts from project-related vessel traffic are expected to be negligible because SOCs require that all vessel operators and crew maintain a vigilant watch for marine mammals, separation of 1,640 ft (500 m) from a sighted North Atlantic right whale, and 328 ft (100 m) from all other non-delphinoid cetaceans (*see* Appendix B of the EA). Additional vessel strike avoidance measures for North

		Atlantic right whales apply from November 1 to July 31. SOCs also require that all vessels underway do not divert to approach a delphinoid cetacean or pinniped. **Site Assessment** Impacts on marine mammals from site assessment activities are divided into two categories: underwater noise impacts and non-acoustic impacts. Impacts are assessed by relative potential of overlap, both spatially and temporally, between marine mammal species and impact-producing factor. **Underwater Noise Impacts** Marine mammals use sound for vital biological functions, including socialization, foraging, responding to predators, and orientation. It has been documented that some anthropogenic noise can negatively impact the biological activities of marine mammals in some instances. The response of marine mammals to sound depends on a range of factors, including (1) the sound presser level; frequency, duration, and novelty of the sound; (2) the physical and behavioral state of the animal at the time of perception; and (3) the ambient acoustic features of the environment. Noise can cause behavioral disturbance, including changes in feeding, vocalization, and dive patterns, or avoidance of the ensonified area (i.e., the area filled with sound). Auditory masking, defined as the obscuring of sounds of interest by interfering sounds, generally at the same or similar frequency, may also cause important behavioral changes to marine mammals exposed to sound. In addition to behavioral disturbance, underwater noise can result in two levels of potential injury to marine mammal hearing: (1) Temporary Threshold Shift (TTS), a non-permanent decrease in hearing sensitivity, and (2) Permanent Threshold Shift (PTS), a physical injury that results in a permanent decrease in hearing sensitivity. Detailed discussions on underwater sound and its importance to marine mammals and their hearing capabilities can be found in the G&G Final PEIS and the *Commercial Wind Lease Issuance and Site Assessment Activities on the Atlantic Outer Continental Shelf Offshore Massachusetts Revised Environmental Assessment*. NMFS interim threshold criteria, based on received levels of sound for marine mammals during acoustic activities, are defined as follows:

		• 120 decibels (dB) re 1 µPa root mean square (RMS) for the potential onset of behavioral disturbance or harassment (Level B) from a *continuous* source of sound (e.g., vessel noise, geotechnical drilling, or vibratory pile driving); • 160 dB re 1 µPa RMS for the potential onset of behavioral disturbance (Level B) from a *non-continuous* source (e.g., impact pile driving, HRG surveys); and • Potential injury (Level A) from received levels of 180 dB re 1 µPa RMS for cetaceans, and 190 dB re 1 µPa RMS for pinnipeds. Although distinct exposure thresholds can be determined for injury, behavioral reactions follow a wider spectrum of variable responses, some which may be negligible, while others can have more severe consequences. The traditional threshold level to predict behavioral reactions are 160 dB RMS for impulsive noise and 120 dB (RMS) for continuous noise where only animals exposed to levels above the threshold have the potential to be disturbed. An increasing number of studies indicate that the effect of underwater sound on marine mammal behavior is quite variable between species, individuals, life history stage, and behavioral state. Additionally, some species (e.g., beaked whales and porpoises, or migrating baleen whales) or animals in certain behavioral states may be more sensitive to disturbance, while other species may be more tolerant to environmental noise. **Pile Driving** Among all acoustic activities during site assessment, pile driving has the potential to produce the highest noise levels. Sound levels from pile driving are highly variable depending on site location, type of pile, type and size of hammer, water depth, and bottom type. There are two methods of pile driving that may be used in the WEA, vibratory pile driving and impact pile driving, and each has different potential impacts. BOEM anticipates that pile driving would occur for 3 to 8 hours per day for up to 3 consecutive days, and that pile diameters would be approximately 3 ft (1 m) to 10 ft (3 m) depending on the structural design of the meteorological tower. Under BOEM's SOCs (*see* Appendix B, Section B.4 of the EA), which require that pile driving be conducted from May 1 to October 31, a monitoring zone of 3,280 feet (ft) (1,000 meters [m]), and implementation of "soft start", no marine mammals are expected to experience Level A noise (>180 dB re 1 µPa). However, measurements from

		Illingworth and Rodkin, Inc. (2013) indicate that source levels above Level B harassment (120 dB RMS) could occur from 6,824 to 31,053 ft (2,080 to 9,465 m) from the source at a 33 ft (10 m) water depth, and from 10,745 to 37,730 ft (3,275 to 11,500 m) at a 66 to 98 ft (20 to 30 m) water depth. Therefore, because marine mammals may occur in or near the WEA during times of the year when pile driving may take place, behavioral impacts may occur. The requirements under BOEM's SOCs are expected to reduce the potential impacts to marine mammals from vibratory pile driving activities. Nonetheless, the potential for behavioral impacts remains. Overall, impacts from vibratory pile driving activities are expected to be minor to moderate for both non-ESA-listed marine mammals and for ESA-listed fin, humpback, and North Atlantic right whales that could occur in the WEA. The three ESA-listed threatened and endangered mysticete species that are most likely to occur in the WEA are fin, humpback, and North Atlantic right whales. The only other non-listed mysticete that may occur in the New York Bight area, and thus the action area, is the minke whale. Pile-driving activities are expected to be minor for minke whales because SPUE data suggest that these whales do not typically occur within 25 nautical miles (nm) (40 kilometers [km]) of the WEA. BOEM's SOCs (*see* Appendix B, Section B.4 of the EA), which require a lessee to limit pile driving between May 1 and October 31, a monitoring zone of 3,281 ft (1,000 m), and the implementation of "soft start", are expected to minimize Level A noise (>180 dB re 1 μPa) exposures to ESA-listed marine mammals. However, it is possible that some endangered whales may experience Level A or Level B harassment. For example, recent acoustic data indicate the possible presence of North Atlantic right whales in the New York Bight at any time during the year (Whitt et al., 2013). Large whales engaged in migration are known to be more sensitive to relatively low levels of noise (lower than Level B harassment threshold levels), and this sensitivity may cause them to avoid the area. Considering the short duration of impact pile driving activities (anticipated to be approximately 3 to 8 hours per day for up to 3 consecutive days), impacts from impact pile driving on fin, humpback, and North Atlantic right whales are expected to be minor to moderate.

		Considering the short duration of impact pile driving activities (anticipated to be approximately 3 to 8 hours per day for up to 3 consecutive days), impacts from impact pile-driving activities are expected to be minor for harbor, harp, hooded, and gray seals, and negligible for ringed seals. **Vessel Strike** Potential impacts to marine mammals include strikes from vessels used during the construction, operation, and decommissioning phases of the tower and/or buoy installation. BOEM anticipates that between approximately 44 to 468 round trips of various vessel types may occur during site assessment activities (*see* Table 5). While the number of vessel trips anticipated is relatively low compared to the existing level of vessel traffic in the area, it is possible that underwater noise (e.g., pile driving) may cause behavioral changes for some whale species that could increase the chances for a collision between a marine mammal and a vessel. This is especially important for endangered whales (North Atlantic right, fin, and humpback whales) due to vessel strikes being a major cause of mortality, which indicate that the behavioral response of some whale species to noise may secondarily increase the risk of vessel strike to large whales (e.g., changes in ascent behavior and rapid acceleration away from the source). Recent studies have also indicated that some whale species are more sensitive to sound during migration than during feeding and may show avoidance responses at greater distances if the noise can be heard by the animal. These studies suggest that North Atlantic right whales, known to migrate through the New York Bight could be susceptible to such behavioral reactions from project-related noise. However, considering the existing levels of vessel traffic noise generated in the general area of the WEA (between the two traffic separation schemes surrounding the WEA), it is unlikely that noise related to the construction, operation, or decommissioning phases of a meteorological tower or buoy would be detected at levels or durations that might result in an increase in risk of vessel strike to North Atlantic right whales. BOEM's SOCs were designed to minimize potential vessel strikes to marine mammals (*see* Appendix B, Section B.1.1 of the EA). NMFS concluded that during site assessment activities, the potential for construction- and maintenance-related vessel strike to marine mammals is extremely low. Potential impacts to marine mammals from vessel strikes

		during site assessment activities are, therefore, expected to be negligible because of the low probability of such an event. Nonetheless, if vessel strikes did occur they could result in minor to moderate impacts to ESA-listed marine mammal species. Impacts from trash and debris are expected to be negligible. Potential impacts on marine mammals from fuel spills are expected to range from negligible (if the fuel does not contact individual marine mammals) to minor (if individual marine mammals encounter the slick). Overall, impacts to marine mammals are expected to be moderate due to potential acoustic impacts during site assessment activities that involve pile driving; however, potential impacts covering site characterization and other site assessment activities would range from negligible to minor**,** depending on the activity being conducted. Vessel strike and noise are two of the most important factors that may affect marine mammals. Implementing the vessel strike avoidance measures in the SOCs (*see* Appendix B, Section B.1.1 of the EA) would minimize the potential for vessel strikes. BOEM's SOCs related to site characterization surveys (*see* Appendix B, Section B.3 of the EA) and site assessment (*see* Appendix B, Section B.4 of the EA) would minimize the potential for noise impacts to marine mammals. <u>Sea Turtles</u> More information on potential impacts to sea turtles can be found in Section 4.4.2.6 of the EA. Four species of sea turtles occur in the New York Bight: loggerhead, green, Kemp's ridley, and leatherback. All four species are listed as threatened or endangered under the ESA. Of the four species, loggerhead turtles are sighted more frequently than any other sea turtle species in the vicinity of the WEA (*see* Appendix E of the EA). Impact-producing factors associated with the proposed action that could have potential impacts on Kemp's ridley, loggerhead, leatherback, and green sea turtles include vessel traffic, vessel noise, HRG active acoustic sources, equipment noise, seafloor disturbance, pile driving noise, dynamic positioning thruster use during vessel positioning, release of

		trash and debris, and accidental fuel spill. BOEM has developed SOCs for sea turtles that are designed to prevent or reduce any possible impacts during both site characterization and site assessment activities. These SOCs are described in detail in Appendix B of the EA. Potential impacts to sea turtles would range from negligible to moderate depending on the activity being conducted during site characterization and site assessment. Vessel strike and noise are two of the most important factors that may affect sea turtles. However, implementing the vessel strike avoidance measures in the SOCs (*see* Appendix B, Section B.1.1 of the EA) would minimize the potential for vessel strikes and adverse impacts on sea turtles. There are large data gaps regarding behavioral and physiological responses of sea turtles to sound, and recommendations for future studies include the potential physiological (critical ratios, TTS, and PTS) and behavioral effects of exposure to sound sources. Although implementation of the SOCs is expected to minimize the potential of hearing injury impacts and disruption the behavior of sea turtles, pile driving from May 1 to October 31 (*see* Appendix B, Section B.4 of the EA) coincides with the time of year that sea turtles are known to occur in the WEA. However, pile driving of one meteorological tower would take a relatively short time (approximately 3 to 8 hours per day for up to 3 days), which would limit the turtles' exposure to the sound to periodic disruptions over a 1-day to 3-day period. Sea turtles that avoid the area are expected to successfully forage in nearby habitats with similar prey availability. There are no critical or otherwise important foraging habitats known to occur in the area of the WEA. <u>Protected Fish Species</u> For information on protected fish species, see the Fisheries Management section below.

Fisheries Management	Policy 9 (NY) Policy 10 (NY) 7:7E-3.2 Shellfish habitat (NJ) 7:7E-3.3 Surf clam areas (NJ) 7:7E-3.4 Prime fishing areas (NJ) 7:7E-3.5 Finfish migratory pathways (NJ) 7:7E-8.2 Marine fish and fisheries (NJ)	<u>Commercial and Recreational Fisheries</u> In 2012, BOEM contracted with NMFS to characterize the commercial fishing industry in the New York Call Area (the WEA is identical to the New York Call Area). NMFS developed a statistical model to predict the spatial footprint of a fishing trip by merging vessel trip reports with data collected by at-sea fisheries observers. NMFS then linked these locations to seafood dealer reports to create revenue-intensity maps as a visual representation of the fishing harvest. According to the NMFS fishing revenue study *Socio-Economic Impact on Outer Continental Shelf Wind Energy Development on Fishing in the U.S. Atlantic. Draft* (Kirkpatrick et al. 2015*)*, commercial fishermen sourced an average of $3.59 million annually from the New York Call Area from 2007 to 2012. Based on analysis of NMFS data, input derived from outreach efforts with the fishing industry, and public comments, BOEM determined that the fisheries that use the area the most, based on a percentage of total revenue, are the Atlantic sea scallop, and the squid, mackerel, and butterfish (SMB) fisheries. Other species of commercial importance with distributions that overlap the WEA include monkfish, Atlantic herring, black sea bass, summer flounder, and scup. The average annual scallop revenue represents more than 90 percent of the total fishing revenue sourced from the New York Call Area (*see* Figure 4-1 in the EA). During the six-year study period, the scallop revenue from the New York Call Area ranged from $494,326 to $6 million. The average annual scallop revenue from the New York Call Area was $3.26 million, which represents 0.8 percent of the total Atlantic sea scallop revenue from the Atlantic seaboard. Much of the total scallop revenue is from regulated access areas farther offshore, such as on Georges Bank, Hudson Canyon, and the Delmarva access areas. The New York Call Area's annual SMB fishery revenue ranged from $71,673 to $319,686. These values equate to 0.2 and 0.7 percent of the total squid value landed from the Atlantic in those low and high years, respectively (Kirkpatrick et al., 2015). The squid fishery operates in and around the New York Call Area primarily between June and September. The fishery is highly variable regarding where the squid will occur and where they will be caught. Although the entire New York Call Area is used as a squid fishery, the primary

		area fished by the squid fleet is in waters less than 16 fathoms (30 m) closer to Cholera Banks Waters off New York and New Jersey are home to substantial recreational fishing activities. The WEA is adjacent to, and overlaps with, some reported recreational fishing ground. The major recreational fishing areas along the south coast of Long Island are roughly 10 to 25 nm (19 to 46 km) from the WEA. NMFS described the recreational fishery as lightly overlapping the New York Call Area (Kirkpatrick et al., 2015). Site characterization and site assessment activities would result in underwater noise from survey activity and the installation of piles to support the meteorological tower. The direct impact of these noise sources on fish is analyzed in Section 4.4.2.7 of the EA. The analysis in that section concludes that impacts of low frequency sound on fish and fish populations, including SOCs such as the "soft-start" provision for pile driving, is anticipated to be negligible. BOEM does not anticipate adverse impacts from noise associated with installation of piles on fish populations that are targeted by commercial and recreational fishing groups. However, noise generated from low frequency sound, like pile driving and some survey equipment, may result in decreased catch rates of fish while the noise producing activity is occurring. Decreased catch rates may be most acute in hook and line fisheries, since behavioral changes may reduce the availability of the fish to be captured in the fishery. The increase in vessel traffic associated with installation, maintenance, and decommissioning of a meteorological tower and/or buoys could potentially deter commercial and recreational fishermen from using the area around the tower or buoys while work-related vessels are in the area. To avoid collisions and gear entanglement with vessels, commercial and recreational fishermen may temporarily move to other locations. The tower and buoys could provide previously unavailable habitat for species that prefer structured and hardbottom habitats, creating a temporary increase in these types of fish in the area of the tower or buoy while the structure is in place. This could have a temporary beneficial effect to commercial and recreational fisheries, depending on the species of interest and the fishing gear used. Commercial fisheries in areas adjacent to the WEA are more productive than the commercial fisheries in the WEA (Kirkpatrick et al., 2015), so the temporary increased vessel traffic associated with site assessment is expected to be minor. Similarly, most coastal recreational fishing for New York and New Jersey takes

		place away from the WEA, and impacts of increased vessel traffic are anticipated to be negligible. Mollusks, such as scallops, would likely be adversely affected in the immediate area of the tower foundations and/or buoy moorings, and suffer from suspended sediment during the construction process. Exclusion zones are typically established around large and/or slow work-related vessels (referred to as "source vessels"; e.g., barges and tow vessels) to maintain safe passage of the source vessel, and by keeping it clear of other vessel traffic. Temporary adverse impacts expected to result from vessel traffic and/or vessel exclusion zones could be avoided by recreational anglers because these user groups tend to use smaller boats that are more maneuverable; therefore, avoidance of survey vessels could be achieved as needed. Impacts would be limited geographically to the vessel exclusion zone and would be temporary at any given location since the exclusion area would move along with the movement of the vessel. Temporary exclusion zones would also be established around the meteorological tower during construction and decommissioning. During construction/ decommissioning, BOEM anticipates that the typical temporary vessel exclusion zone around a 377 ft- (115 m-) meteorological tower would be approximately 162 acres (ac) (66 hectares [ha]). Impacts on recreational fishing could be greater if the exclusion zone is established over a popular and/or critical sport fishing location, such as one that may coincide with the migration route of a target fishing species. Impacts on recreational boating and fishing from temporary vessel exclusion zones are expected to be negligible, and impacts on recreational boating and fishing from temporary exclusion zones are expected to be minor. Accidental oil spills from damaged gear or machinery (e.g., vessels, generators, or pile-driving hammers) associated with site assessment could directly affect commercial and recreational fisheries by contaminating fish and gear, and interfering during cleanup and recovery operations, or indirectly affect fisheries by temporarily degrading fishing habitat. Spills could result from severe weather damage to vessels or the tower/buoys, from vessel collisions/allisions, or during generator refueling. However, the impact of a spill on commercial and recreational fishing activity would largely depend on the size of the spill. The effects would be detrimental to commercial and recreational fisheries if they led to

		declines in target species. While such spills are hard to predict, based on the structures and vessels associated with the activities, the potential for oil spills, the size of these spills, and the impact to commercial recreational fisheries from non-routine events is expected to be negligible. Overall, impacts to commercial and recreational fisheries under the proposed action would be minor. Impacts would range from negligible to minor depending on the fishery and proposed action activity. Minor impacts are expected based on the low level of vessel traffic activity associated with site characterization and site assessment activities, the fact that one meteorological tower and/or two buoys would be installed over a relatively large geographic area, the level and duration of sound produced from routine activities and events, and the low likelihood of potential impacts from disturbances and pollution. See Section 4.4.4.5 of the EA for more information on potential impacts to commercial and recreational fisheries. <u>Finfish, Shellfish, and Essential Fish Habitat</u> Essential Fish Habitat (EFH) has been designated for 37 species in the WEA. No Habitat Areas of Potential Concern (HAPCs) have been designated in the WEA. EFH descriptions for several of the designated species in the WEA are provided in the G&G Final PEIS. EFH descriptions for species and lifestages that were not discussed in the G&G Final PEIS are summarized in Table 4-14 of the EA. Surf clam concentrations in the WEA appear to be moderate or secondary (<1 bushel) concentrations. The NEFSC 2011 clam dredge survey data showed low catch rates (0 and 1 to 50 clams per tow) of total surf clams and prerecruits in the WEA. The *PEIS for Alternative Energy Development and Production and Alternate Use of Facilities on the Outer Continental Shelf, Final Environmental Impact Statement* identified potential impacts to fish resources and EFH that could occur in OCS WEAs in the Atlantic region during site characterization, including: G&G surveys; vessel and equipment noise; and meteorological tower/buoy installation, operation, and decommissioning.

		The potential impacts of renewable energy site characterization on finfish resources and EFH have been analyzed in the G&G Final PEIS and were incorporated into the EA by reference. Although the geographic boundary in the G&G Final PEIS is outside of this WEA (it included BOEM's Mid-Atlantic and South Atlantic planning areas: Delaware to Florida), many species occur in both areas, and the conclusions on impact levels are applicable. The following conclusions for site characterization that were made in the G&G Final PEIS are expected to be the same in the WEA: • Impacts from acoustic sound sources from HRG surveys and geotechnical exploration are expected to be negligible. A boomer sub-bottom profiler is the only sound source expected to produce sounds within finfish and invertebrate hearing ranges; • Impacts from vessel and equipment noise are expected to be negligible**;** and • Impacts from seafloor disturbances are expected to be negligible**.** The G&G Final PEIS assessment of impacts on fish and EFH from acoustic sound sources, vessel and equipment noise, seafloor disturbance, and discharge of waste materials and accidental fuel releases was for G&G-related site characterization activities only. While the number of vessel trips and area of seafloor disturbance for activities covered in the EA differ from those in the G&G Final PEIS, the overall types of impacts to finfish, shellfish, and EFH —and the impact levels and conclusions—are anticipated to be the same. The SOCs required by BOEM (*see* Appendix B, Section B.4 of the EA) to reduce the potential for adverse impacts to marine mammals and sea turtles are expected to also benefit fish. With the "soft start" procedure for pile driving, it is anticipated that the majority of fish would flee the area during the tower installation period and return to the area and resume normal activity after construction. Fish that do not flee the area during pile driving could be exposed to noise levels that result in temporary hearing threshold shifts, injuries, or mortality. Thus, the noise associated with pile driving would cause avoidance or other adverse effects resulting in minor impacts to adult finfish. Demersal eggs and larvae may also be vulnerable to pile driving-generated vibrations, and could experience some adverse effects near pile installation resulting in minor impacts on finfish

		populations. Underwater noise impacts (from all sources) to finfish and shellfish populations, and EFH, are expected to be negligible to minor. Installation of piles or anchor systems associated with a tower and/or buoys may cause an increase in local suspended sediments. These impacts would be limited to the immediate area surrounding the piles or anchors, and of short duration. Depending on the currents, the suspended sediment is expected to disperse and settle on the surrounding seafloor, potentially coating or burying some benthic organisms. Effects on finfish and shellfish populations, and EFH, from suspended sediments would be negligible because these activities would be localized and of short duration. The installation of a meteorological tower foundation and/or buoy anchor systems and associated scour control systems may result in the direct mortality of benthic invertebrates, the loss of benthic habitat, and the displacement of water column (pelagic) habitat. Sessile marine invertebrates, including molluscan shellfish (including surf clams), would be lost (buried or crushed) in the footprint (200 square ft to two ac [19 square m to 0.8 ha]) of the tower foundations/moorings and scour control systems. Although sea scallops are mobile molluscan shellfish, it is a conservative assumption that they would not be able to avoid sudden deployment of an anchor or foundation/mooring system, and for these analyses are considered to be sessile. The amount of habitat temporarily displaced or lost in the area is small compared to the amount of habitat available in the surrounding area. Overall, impacts from site characterization and site assessment activities to finfish and shellfish populations, and EFH, in the WEA would be minor. However, impacts would range from negligible to minor depending on the activity. A meteorological tower foundation and/or buoy anchor systems installation and decommissioning would produce noise that could disturb normal fish behaviors. Fish are expected to avoid or flee from the noise source. Fish that do not flee the immediate action area during pile driving could be exposed to injurious or lethal noise levels that may result in adverse effects. The short duration (3 to 8 hours per day over 3 days) and the use of mitigation measures required by the SOCs (Appendix B of the EA) would minimize the possible exposure to injurious and lethal noise levels, resulting in minor effects to finfish and shellfish populations, and EFH. The increases in suspended sediments, loss of benthic

		habitat, and displacement or alteration of water column habitat due to meteorological tower installation, operation, and decommissioning, and/or installation and operation of buoy anchor systems are expected to be small compared to the available habitat in the surrounding areas, and would, therefore, result in negligible effects to finfish and shellfish populations, and EFH. The potential increase in vessel collisions and allisions that could result in accidental fuel spills due to a meteorological tower and/or buoys is expected to be minimal. The overall impact on finfish and shellfish populations and EFH from a fuel spill that could result from such an occurrence is expected to be minimal and temporary, and would; therefore, be considered minor. See Section 4.4.2.7 of the EA for more information on potential impacts to finfish, shellfish, and essential fish habitat.
Public Access	Policy 19 (NY) 7:7E-8.11 Public Access (NJ)	Short-term limitations on public access within the WEA may occur during certain activities under the proposed action. Exclusion zones are typically established around large and/or slow work-related vessels (referred to as “source vessels”; e.g., barges and tow vessels) to maintain safe passage of the source vessel and keep it clear of other vessel traffic. Recreational anglers can avoid temporary adverse impacts expected to result from vessel traffic and/or vessel exclusion zones because they tend to use smaller boats that are more maneuverable; therefore, avoidance of survey vessels could be achieved as needed. Impacts would be limited geographically to the vessel exclusion zone, and would be temporary at any given location since the exclusion area would move along with the movement of the vessel. Temporary exclusion zones would also be established around the meteorological tower during construction and decommissioning. During construction/ decommissioning, BOEM anticipates that the typical temporary vessel exclusion zone around a 377 ft- (115 m-) meteorological tower would be approximately 162 ac (66 ha). Impacts on recreational fishing could be greater if the exclusion zone is established over a popular and/or critical sport fishing location, such as one that may coincide with the migration route of a target fishing species. Although recreational fishing and boating access may be limited by temporary exclusion zones, impacts on recreational boating and fishing from temporary vessel exclusion zones are expected to be negligible. In addition, impacts on recreational boating and fishing from temporary construction or decommissioning exclusion zones are expected to be minor.

		See Section 4.4.3.4 of the EA for more information on potential impacts to recreational fishing. Impacts to recreation and tourism resulting from routine and non-routine activities would be minor. Impacts would result primarily from vessel traffic restrictions in exclusion zones, potential for small scale spills, and from vessel traffic associated with installation of a meteorological tower and/or buoys. For more information on recreation and tourism, see the Recreation and Tourism section below.
Water Quality	Policy 30 (NY) Policy 33 (NY) Policy 34 (NY) Policy 36 (NY) Policy 37 (NY) 7:7E-8.4 Water Quality (NJ)	The routine activities associated with the proposed action, which would impact coastal and marine water quality, include mechanical disturbance of the seafloor and discharge of bilge water, ballast water, or sanitary/domestic wastewater, as well as non-routine events such as accidental spills of fuel and maintenance materials, such as lubricants and solid debris. Additional information on water quality and impacts to coastal and marine water quality can be found in Section 4.4.1.2 of the EA. Routine activities that have the potential to adversely affect water quality include discharges from survey vessels and vessels servicing the tower and/or buoys (i.e., bilge water, ballast water, sanitary waste, and debris). Bilge and ballast water discharges may contain small amounts of petroleum-based products and metals, and as such, are prohibited within 13 nm (24 km) of the shore. Any vessels conducting surveys or servicing a tower and/or buoys are likely to be equipped with holding tanks for sanitary waste and would not discharge untreated sanitary waste within state or federal waters. The regulations governing the relevant discharges are discussed in the EA, Section 3.2.1.5, *Operational Waste Associated with Site Characterization*. The instrumentation used for site characterization is self-contained, so there should be no discharges from instruments aboard the survey vessels that would impact water quality. Impacts to water quality would occur during construction and decommissioning, with water quality returning to its original state both during operation of the tower and/or buoys and after decommissioning. The seabed would be disturbed locally during construction of a meteorological tower and/or buoys as a byproduct of anchoring, pile driving, and placement of scour protection devices. The resulting mobilization of sediments would

		produce minor, transient impacts to water quality in the immediate vicinity of the disturbance in the form of increased turbidity. Releases/spills (oils, lubricants, trash, debris, fuel) due to non-routine events are likely to be small and result in minor, transient impacts on water quality over a localized area in the immediate vicinity of the release/spill. Overall, activities associated with proposed action would have a minor impact on water quality, with any changes being small in magnitude, highly localized, and transient. Any operational discharges from vessels during surveying or servicing of buoys and a tower would be small and have a minor adverse effect. Seabed disturbances during construction, deployment, and decommissioning of buoys or a tower would result in minor, localized impacts on water quality in the area immediately adjacent to the structure or disturbance.
Air Quality	Policy 41 (NY) Policy 42 (NY) Policy 43 (NY) 7:7E-8.10 Air Quality (NJ)	Air quality impacts that could result from site characterization activities under the proposed action were evaluated in the G&G Final PEIS and found to be negligible. Section 4.4.1.1 of the EA includes an area-specific evaluation of air quality impacts associated with G&G activities, along with an evaluation of air quality impacts associated with site assessment activities. Increased vessel traffic associated with site characterization surveys would add to current vessel traffic levels associated with the ports used by the vessel operators. The additional vessel activity associated with the proposed action is anticipated to be relatively small when compared with existing and future vessel traffic levels in the area. Impacts from pollutant emissions associated with these vessels would likely be localized within the WEA and in the vicinity of vessel activity. Appendix C of the EA provides further information on the anticipated numbers of project-related vessel trips and associated emission calculations. The onshore areas that are closest to the WEA are classified as nonattainment areas for O_3. Hudson, Queens, Kings, Nassau, and Richmond Counties are classified as maintenance areas for CO (*see* Table 4-1 of the EA). Nonattainment and maintenance areas are subject to the EPA General Conformity Rule (40 CFR 93, Subpart B). The rule establishes emissions thresholds, or *de minimis* levels, for use in evaluating a project's conformity with the applicable State Implementation Plan. If the net air pollutant emissions exceed

		these thresholds, a formal conformity determination may be required. If a submitted site assessment plan (SAP) indicates that project-related activities in the non-attainment and maintenance areas would emit more than the thresholds, then a General Conformity analysis would be performed. The *de minimis* levels for consideration in the project's conformity analysis are: • 100 tons/year (90.7 metric tons/year) of NO_x (O_3 precursor); • 50 tons/year (45.5 metric tons/year) VOCs (O_3 precursor); and • 100 tons/year (90.7 metric tons/year) CO. If the net increases in emissions due to a project are lower than the *de minimis* levels, the project is presumed to conform, and no further conformity evaluation is necessary. Based on the emissions sources and assumptions listed above, estimated annual emissions associated with the proposed action for NO_x, VOCs, and CO were below *de minimis* levels; therefore, no further conformity evaluation is needed. Emissions associated with buoy deployment would be less than those associated with tower installation because buoys would be towed or carried aboard a vessel and then anchored to the seafloor. No drilling equipment would be required to install meteorological buoys. Although unlikely, a spill could occur in the event of vessel collision while in route to and from the WEA, or during surveys. Spills occurring in these areas, including harbor and coastal areas, are not anticipated to have significant impacts on onshore air quality due to the small estimated size and short duration of the spill. A diesel spill in the WEA would not be expected to have impacts on onshore air quality because of the estimated size of the spill, prevailing atmospheric conditions over the WEA, and distance from shore. Although the emissions estimates from site characterization and site assessment activities are measurable, they would not be distinguishable from other air emissions onshore or offshore; therefore, emissions associated with the proposed action would be negligible. As shown in Table 4-1 of the EA, air pollutant concentrations due to emissions from the

		proposed action are not expected to lead to any violation of the National Ambient Air Quality Standards.
Recreation and Tourism	Policy 21 (NY) Policy 22 (NY) 7:7E-7.3 Resort/Recreational Use (NJ)	More information on recreation and tourism can be found in Section 4.4.3.4 of the EA. The coastal areas of New York and New Jersey are characterized by an abundance of coastal recreation and tourism opportunities. Coastal counties that may depend on their coastal setting for tourism and recreation include Monmouth and Kings Counties in New Jersey, and Nassau, Suffolk, and Queens Counties in New York. The following impact-producing factors from both site characterization and assessment have the potential to impact recreation and tourism opportunities: • Vessel traffic during site characterization and site assessment; • Vessel exclusion zones surrounding the meteorological tower and/or buoys during deployment (no exclusion zones once a tower and/or buoys are operational); • Trash and debris from vessels; • Viewshed-related impacts associated with site characterization and site assessment from additional vessels, and nighttime lighting on the vessels that could be seen both from shore and from recreational boaters; • Viewshed-related impacts from the meteorological tower, including nighttime lighting; and • Fuel spills. Information on potential exclusion zones can be found in the Public Access section above. The primary impact-producing factor for recreation and tourism associated with vessels used in support of the proposed action would be the potential for generation of trash and debris. Trash and debris, if accidentally released, could wash up on beaches and into harbors, bays, and coastal marshes, and other recreation and tourism destinations. Presence of trash/debris could adversely affect the aesthetic quality of the setting and alter the perception of affected areas, particularly for those areas valued for beach and near

		shore recreation (e.g., Gateway National Recreation Area, and Jones Beach State Park), or those considered pristine wilderness. However, because of restrictions that prohibit the release of trash and debris provided by existing regulations (MARPOL 73/78 Annex V) impacts to recreation and tourism resulting from trash and debris are expected to be negligible. Potential impacts to recreation and tourism settings resulting from the visual contrast of the meteorological tower and/or buoys and associated nighttime lighting would be minor, as described in Section 4.4.4.6 of the EA. As noted in the G&G Final PEIS, potential impacts to recreation and tourism from a fuel spill would depend on the location of a spill, meteorological conditions at the time of the spill, and the speed with which cleanup occurred. Should a spill occur, access to recreation and tourism destinations could be temporarily limited by cleanup and response vessel activity. However, a spill would likely be relatively small in size (88 gallons [333 liters]) so a large-scale spill response involving multiple cleanup vessels is not expected. Therefore, impacts on recreational resources from a small diesel fuel spill are expected to be minor. Impacts to recreation and tourism resulting from routine and non-routine activities would be minor**.** Impacts would result primarily from vessel traffic restrictions in exclusion zones, potential for small scale spills, and from vessel traffic associated with installation of a meteorological tower and/or buoys.
Historic, Cultural, and Subaqueous Areas Management	Policy 23 (NY) Policy 26 (NY) 7:7E-3.36 Historic and archaeological resources (NJ) 7:7E-3.6 Submerged vegetation habitat (NJ)	Historic properties are defined as any pre-contact or historic period districts, sites, buildings, structures, or objects included in, or eligible for inclusion in, the National Register of Historic Places (NRHP). Historic properties that could experience impacts from site characterization (i.e., HRG surveys and geotechnical sampling) and/or site assessment activities (i.e., installation of a meteorological tower and/or buoys) include: • Offshore historic properties on or below the seafloor within portions of the WEA or cable routes to shore that could be affected by seafloor disturbing activities; and • Onshore historic properties within the viewshed of survey activities, construction activities, or a meteorological tower and/or buoys.

	7:7E-3.12 Submerged infrastructure (NJ) 7:7E-4.14 Submerged pipelines (NJ) 7:7E-4.20 Submerged cables (NJ) 7:7E-4.21 Artificial reefs (NJ) 7:7E-4.22 Miscellaneous Water Area uses (NJ) 7:7E-8.12 Scenic Resources and Design (NJ)	For more information on cultural, historical, and archaeological resources in the effected environment, see Section 4.4.3.1 of the EA. <u>Offshore Historic Properties</u> Due to historic sea level rise, the WEA has a high potential for the presence of submerged archaeological sites dating from the Paleoindian through Early Archaic periods, but very low to no potential for the presence of submerged archaeological sites more recent than the end of the Early Archaic (*see* Table 4-18 of the EA). There are nine shipwrecks reported for the WEA, two of which have dates for sinking; the remaining seven do not have dates associated with them (*see* Table 4-21 of the EA). One of the nine is simply identified as an unknown vessel and has no further data to suggest construction, rig, or purpose. Additionally, the precision of the hull locations of the nine vessels is medium to low, and the hulls may be up to 3 mi (4.8 km) from the plotted positions. These vessels potentially meet several of the criteria for eligibility on the NRHP. The types of historic properties expected within the onshore affected environment include districts, sites, buildings, structures, or objects within the viewshed of site characterization and site assessment activities. There are 40 known NRHP-listed and potentially eligible properties within the analysis area that are considered in the EA (*see* Figure 4-19 of the EA). Site characterization activities include both HRG survey (e.g., shallow hazard, geological, and archaeological surveys) and geotechnical sampling techniques. Geophysical surveys do not come in contact with the seafloor and, therefore, have no ability to impact offshore historic properties, submerged infrastructure, pipelines, or cables. Geotechnical sampling activities, when conducted to inform the design and installation of renewable energy structures or cables, disturb the seafloor and, therefore, have the potential to impact historic properties located on or below the seafloor. Coring, sediment grab sampling, and other direct sampling techniques (e.g., cone penetrometer tests and deep borings), in addition to anchoring, anchor chain sweep from moored or anchored support vessels, use of jack-up barges, or other equipment used in conducting geotechnical sampling, all have the

		potential for damaging or destroying historic properties, submerged infrastructure, pipelines, or cables located on or under the seafloor. These potential impacts can be reduced to negligible through the completion of geophysical surveys in the WEA consistent with BOEM's *Guidelines for Providing Archaeological and Historic Property Information Pursuant to 30 CFR Part 585*. Geophysical surveys, in part, serve to identify offshore historic properties. If geophysical surveys are completed by a lessee prior to conducting geotechnical/sediment sampling, historic properties (and other obstructions) can be identified and bottom disturbing activities can be located in areas where historic properties are not present. Therefore, BOEM would require a lessee to conduct geophysical surveys consistent with the *Guidelines for Providing Archaeological and Historic Property Information Pursuant to 30 CFR Part 585* prior to conducting geotechnical sampling, and if a potential offshore historic property is identified, the lessee would be required to avoid it. The following elements, designed to avoid impacts to offshore historic properties from site characterization activities, would be included in a commercial lease issued for the WEA: • The lessee may only conduct geotechnical exploration activities, including geotechnical sampling or other direct sampling or investigation techniques, which are performed in support of plan (i.e., SAP and/or COP) submittal, in areas in which an archaeological analysis of the results of geophysical surveys has been completed for that area; • The analysis must be completed by a qualified marine archaeologist who both meets the Secretary of the Interior's Professional Qualifications Standards (48 FR 44738–44739) and has experience analyzing marine geophysical data; • The qualified marine archaeologist's analysis of the geophysical data must include a determination of whether any potential archaeological resources are present in the area of geotechnical sampling, including consideration of both pre-contact and historic period archaeological resources; • If present in the area, the lessee's geotechnical sampling activities must avoid any potential archaeological resources by a minimum of 164 ft (50 m). The avoidance

		distance must be calculated by the qualified marine archaeologist from the maximum discernible extent of the archaeological resource; • The qualified marine archaeologist must certify in the lessee's archaeological reports, included with a SAP or COP, that geotechnical exploration activities did not affect potential historic properties identified as a result of the HRG surveys; and • In no case may the lessee's actions affect a potential archaeological resource without BOEM's prior approval. In addition, BOEM would require that the lessee observe the unanticipated finds requirements at 30 CFR 585.802. The following requirements would also be included in a commercial lease issued within the WEA: • If the lessee, while conducting site characterization activities in support of plan (i.e., SAP and/or COP) submittal, discovers a potential archaeological resource such as the presence of a shipwreck or pre-contact archaeological site within the project area, the lessee must: o Immediate halt of seafloor-disturbing activities in the area of discovery; o Notify the lessor within 24 hours of discovery; o Notify the lessor in writing by report within 72 hours of its discovery; o Keep the location of the discovery confidential and take no action that may adversely affect the archaeological resource until the lessor has made an evaluation and instructs the applicant on how to proceed; and o Conduct any additional investigations as directed by the lessor to determine if the resource is eligible for listing in the NRHP (30 CFR 585.802(b)). The lessor will direct the lessee to conduct such investigations if: (1) the site has been affected by the lessee's project activities; or (2) impacts on the site or on the area of potential effect cannot be avoided. If investigations indicate that the resource is potentially eligible for listing in the NRHP, the lessor will tell the lessee how to protect the resource or how to mitigate adverse effects on the site. If the lessor incurs costs in protecting the resource, under Section 110(g) of the National Historic Preservation Act (NHPA), the lessor may charge the lessee

		reasonable costs for carrying out preservation responsibilities under the OCS Lands Act (30 CFR 585.802(c-d)). Because a lessee would be required to conduct geophysical surveys prior to conducting geotechnical sampling, and would be required to follow the lease stipulations regarding avoidance and unanticipated discovery protocols for submerged historic properties, impacts from site characterization on offshore historic properties, submerged infrastructure, pipelines, and cables are expected to be negligible. In some cases, geotechnical testing methods may also provide a useful strategy of confirming the presence or absence of features of archaeological interest and for gathering information that informs the archaeological interpretation of HRG data. If a lessee intends to impact a potential offshore historic property for the purpose of historic property identification or National Register testing and evaluation, the lessee would be required to provide written notification describing these activities to BOEM for approval under the elements of lease issuance outlined above. BOEM would review this information under Section 106 of the NHPA and the stipulations of the Programmatic Agreement, discussed below. Impacts to submerged historic properties from vibracores or other direct samples collected, by or under the supervision of a Qualified Marine Archaeologist, for the purposes—at least in part—of historic property identification or National Register eligibility testing and evaluation, are expected to be negligible. Although installation of a meteorological tower and/or buoys would affect the seafloor, the lessee's SAP must be approved by BOEM prior to installation. To assist BOEM in complying with the NHPA and other relevant laws (30 CFR 585.611(a) and 30 CFR 585.611(b)(6)), the SAP must contain a description of the historic properties that could be affected by the activities proposed in the plan. Under its Programmatic Agreement, BOEM will consult with the New York and New Jersey State Historic Preservation Officers and other appropriate parties prior to approval of a SAP to ensure potential effects on historic properties are avoided, minimized, or mitigated under Section 106 of the NHPA. The seafloor impacts associated with installation of a meteorological tower and/or buoys include: disturbance resulting from foundation installation; dropping and dragging anchors from construction vessels; and mooring chain sweeping.

		Impacts on archaeological resources in these activity areas could result in destruction of all or part of the historic properties, or loss of their archaeological context. Should the archaeological surveys reveal the possible presence of an archaeological site in an area that may be affected by activities proposed in a SAP, BOEM would likely require the lessee to avoid the potential site or to demonstrate through additional investigations that an archaeological resource either does not exist, or would not be adversely affected by the seafloor/bottom-disturbing activities. If avoidance of the historic property is not possible, BOEM would continue Section 106 consultation under the Programmatic Agreement to resolve adverse effects. Although site assessment activities have the potential to affect historic properties either on or below the seabed, existing regulatory measures, coupled with the information generated for a lessee's initial site characterization activities and presented in the lessee's SAP, make the potential for bottom-disturbing activities to damage historic properties low. Therefore, impacts on offshore historic properties from site assessment activities are expected to be negligible. In addition, installation of a meteorological tower and/or buoys would affect the seafloor and could impact submerged infrastructure, pipelines, cables, and artificial reefs. Should survey results reveal the presence of submerged infrastructure, pipelines, cables, or artificial reefs, BOEM would likely require the lessee to avoid impacting the existing submerged infrastructure. Therefore, impacts on submerged infrastructure, pipelines, cables, and artificial reefs from site assessment activities are expected to be negligible. <u>Onshore Historic Properties</u> Vessel traffic from site characterization activities could be visible from onshore historic properties and scenic resources. As noted in Section 4.4.3.2 of the EA, BOEM anticipates that there would be one to three vessels at any given time in the WEA and between the shore and the WEA associated with the proposed action. Survey vessels in the WEA would appear small in scale or would fall below the horizon, thereby reducing the likelihood that vessels are seen from onshore locations. Similarly, lighting associated with survey vessels operating under night conditions would appear small in scale and isolated, consistent with existing nautical lighting visible on the horizon. However, the increased ocean vessel traffic from these survey activities would be indistinguishable from existing ocean vessel traffic, and these impacts would be temporary and minimal. Based on the distance of survey activities from any onshore historic properties, the impacts to the

		characteristics of these properties that contributed to their eligibility for listing in the NRHP are expected to be negligible. Additionally the distance of survey activities from scenic resources would make any impacts to these resources negligible. Because of the distance of the WEA from shore, it is anticipated that meteorological buoys would not be visible from onshore areas and would have no impact on onshore historic properties or scenic resources. Under daytime conditions, if a lessee installed a meteorological tower at the closest point of the WEA that is available for structure placement to the shoreline (at the western tip of the 1 nm [1.9 km] buffer), approximately 13.5 nm (25 km) from the shoreline, the tower may be visible, although it would be difficult to detect by the casual observer when viewed from onshore historic properties or scenic resources. Assuming no daytime avoidance lighting on the meteorological tower (*see* discussion of avoidance lighting per FAA [2015] in Section 4.4.4.6 of the EA), if the tower was detected by an observer on the shore, it would appear small in scale relative to the broad horizon of the seascape, and visual contrast would be weak. During nighttime conditions, avoidance lighting on the tower could be visible from onshore historic properties and scenic resources; however, lighting would be discrete and isolated and appear consistent with existing nautical lighting on the horizon. Lighting would appear similar to lights visible from existing vessel traffic. Visibility of the meteorological tower, and related viewshed impacts, would attenuate with distance due to the influence of atmospheric haze and the reduction in scale of the tower relative to the surrounding seascape. No portion of the structure or lighting would be visible if the tower was placed beyond 23.5 nm (44 km), because the entire tower would fall below the horizon when viewed from the shore. Consequently, visual impacts to onshore historic properties and scenic resources resulting from the proposed action would be minor. <u>Conclusion</u> Overall, impacts to cultural, historical, archaeological, and scenic resources would be minor.

		Impacts to submerged historic properties, infrastructure, pipelines, cables, and artificial reefs from site characterization activities are expected to be negligible given the geophysical surveying requirements and lease conditions discussed above. Impacts to submerged historic properties, infrastructure, pipelines, cables, and artificial reefs, from installation of a meteorological tower and/or buoys are expected to be negligible as avoidance would likely be required by BOEM. If avoidance of potential historic properties is not feasible, BOEM will continue its Section 106 consultation to resolve adverse effects. Vessel traffic associated with survey activities would be indistinguishable from existing vessel traffic and short-term. Therefore, impacts to onshore historic properties and scenic resources from site characterization activities are expected to be negligible. A meteorological tower is not expected to be detected by the casual observer when viewed from onshore historic properties under daytime conditions. Nighttime lighting would be discrete and isolated and appear consistent with existing nautical lighting on the horizon and is not expected to adversely impact the character of onshore historic properties or scenic resources. Therefore, overall impacts on onshore historic properties and scenic resources from installation of a meteorological tower are expected to be minor. For more information on visual resources, see Section 4.4.3.6 of the EA. For more information on BOEM's compliance with the NHPA, see Section 5.3.4 of the EA.

Sterling, VA 20166

RE: Federal Consistency Determination
DLUR File No. 0000-13-0021.1CDT160001
Bureau of Ocean Energy Management (BOEM)
Proposed Lease Issuance and Site Assessment Activities
New York Wind Energy Area (WEA)
Atlantic Continental Shelf Offshore New York

Dear Mr. Bennett:

The New Jersey Department of Environmental Protection, Division of Land Use Regulation, acting under Section 307 of the Federal Coastal Zone Management Act (P.L. 92-583) as amended, agrees with the certification that the above referenced project is consistent with the approved New Jersey Coastal Management Program. The Division has determined that the project is conditionally consistent with New Jersey's Rules on Coastal Zone Management N.J.A.C. 7:7-1.1 et seq., as amended on July 6, 2015, with the implementation of the below.

The proposed activities include:

- Lease issuance for the New York Wind Energy Area (including reasonably foreseeable consequences associated with shallow hazards, geological, geotechnical, archaeological resources, and biological surveys). The Wind Energy Area is approximately 11 nautical miles south of Long Beach, NY and extends 26 nautical miles southeast. The lease issuance grants the lessee the right to use the leasehold to 1) gather resource and site characterization information, 2) develop its plan, 3) subsequently seek BOEM approval of its plans for the development of the leasehold. This analysis does not consider construction and operation of any commercial wind power facilities, which would be evaluated later in the process during the review of a construction and operations plan.

- Site Assessment Plan approval (including reasonably foreseeable consequences associated with the installation of a meteorological tower and meteorological buoys).

The purpose of conducting the surveys and installing meteorological measurement devices is to assess the wind resources in the lease area and to characterize the environmental and socioeconomic resources and conditions. A lessee must collect this information to determine whether the site is suitable for a commercial wind development. In the event that it is determined that the lease area is suitable for development, the lessee will submit for BOEM's review, a construction and operations plan with its project-specific design parameters.

The Division has determined that the project is consistent with New Jersey's Rules on Coastal Zone Management N.J.A.C. 7:7-1.1 et seq., as amended on July 6, 2015.

Conditional Compliance:

To ensure consistency with the New Jersey Coastal Management Program, the following conditions must be met:

1. The Bureau of Ocean Energy Management (BOEM) and the New Jersey Department of Environmental Protection's Historic Preservation Office have executed a Programmatic Agreement to cover all cultural resource issues as they are related to Outer Continental Shelf Renewable Energy Activities Offshore New Jersey and New York. The BOEM and any lessee to the WEA, shall adhere to said Programmatic Agreement.

2. This Federal Consistency Determination shall not affect any future review by the NJ Department of Environmental Protection of any commercial wind power facility nor should this Federal Consistency Determination be construed as an endorsement of any future facility.

This Federal Consistency is authorized pursuant to all parties following the guidelines set forth, and agreed upon, for the construction of the proposed structures.

Pursuant to 15 CFR 930.44, the Division reserves the right to object and request remedial action if the proposal is conducted in a manner, or is having an effect on, the coastal zone that is substantially different than originally proposed.

Thank you for your attention to and cooperation with New Jersey's Coastal Zone Management Program. If you have any questions regarding this determination, please do not hesitate to call Cathryn Schaffer of our staff at (609) 633-2289.

Sincerely,

Christopher Jones

RE: F-2016-0510 (DA)
Lease Issuance and Site Assessment Activities for the Wind Energy Area offshore of NY.
New York Bight
Concurrence with Consistency Determination

Dear Mr. Bennett:

The Department of State (DOS) received the Bureau of Ocean Energy Management's (BOEM) consistency determination (CD) on June 17, 2016 prepared in accordance with the Coastal Zone Management Act (16 U.S.C. § 1451 et seq.) and pursuant to 15 CFR part 930 subpart C, for the above referenced project.

BOEM's proposed actions include a lease issuance for a delineated wind lease area (WEA), and subsequent site assessment activities to be conducted by the lessee post lease issuance, as indicated in the *Draft Commercial Wind Lease Issuance and Site Assessment Activities on the Atlantic Outer Continental Shelf Offshore New York Environmental Assessment (EA)*, which was appended to the CD. The site assessment activities would determine whether the lease is suitable for, and would support, commercial-scale wind energy production. BOEM's identification and evaluation of the impacts of site assessment activities on New York's coastal resources and uses are included in the EA. DOS concurs with BOEM's CD for lease issuance and site assessment activities as they are evaluated and assessed in the EA. We note that the lease, by itself, does not authorize a lessee to construct or operate any wind energy project on the Outer Continental Shelf.

As described in BOEM's CZMA consistency determination analysis accompanying its June 17, 2016 letter to DOS, following the award of a lease issuance for the WEA, the lessee will be required to prepare a Site Assessment Plan (SAP) enumerating the site assessment activities that it will be conducting within the WEA. Prior to BOEM approval of the lessee's SAP, DOS will make a determination as to whether the SAP contains site activities which will cause an effect on any New York State coastal use or resource substantially different that those addressed within the CD. If effects on the state's coastal uses and resources are found to be substantially different, then the lessee will be required to submit a consistency certification in accordance with 15 CFR part 930 subpart D. To facilitate this review, DOS will make itself available to consult with the lessee while the SAP is developed.

E

Please feel free to discuss any additional comments or concerns with Jeffrey Zappieri (Jeffrey.Zappieri@dos.ny.gov) or Matthew Maraglio (Matthew.Maraglio@dos.ny.gov) of my staff.

Sincerely,

Gregory Capobianco

RE: Commercial Lease of Submerged Lands for Renewable Energy Development on the Outer Continental Shelf, OCS-A 512 – Request for Extension of Preliminary Term

Dear Mr. Bennett,

In accordance with 30 CFR Part 585.235(a), Statoil Wind US LLC (Statoil) is required to submit a Site Assessment Plan (SAP) within 12 months of executing the Commercial Lease of Submerged Lands for Renewable Energy Development on the Outer Continental Shelf: Lease No. OCS-A 0512 (the Lease). This preliminary term is currently scheduled to expire on April 1, 2018. Pursuant to 30 CFR 585.235(b), Statoil is requesting a 12-month extension of the preliminary term to April 1, 2019.

In preparation for site investigations (SAP pre-surveys) of the Lease area, and the subsequent submittal of a SAP, Statoil has engaged with the Bureau of Ocean Energy Management (BOEM) regarding the SAP, survey plans, requirements and expectations, in a workshop on May 30, 2017. Statoil has also begun discussions with relevant organizations and stakeholders, which will be an ongoing process.

Statoil has been actively maturing the project survey plans and technical scope towards SAP submission. A geological desktop study was commissioned and completed, providing the information necessary to effectively plan SAP survey activities. Work has been carried out in consultation with the supply chain, regarding the appropriate concept to use for site characterization (wind resource and metocean), which in turn informs the SAP survey requirements and plan. As a result, Statoil has decided on a buoy based 'Floating Light Detection and Ranging' (FLiDAR) approach for wind resource measurements, and metocean buoys for oceanographic and meteorological measurements. The procurement process for selecting a supplier and final concept is underway, with the intention to award a contract by the end of calendar year (CY) 2017. There are currently no plans for traditional fixed bottom meteorological masts.

SAP survey plans are currently being drafted, with the intended submission in Q4 2017. Consultation on the survey plans with BOEM and Tribes and other relevant stakeholders will take place in Q1 2018.

A draft Fisheries Liaison Plan and Coexistence Plan have been developed, which will feed into the Fisheries Communications Plan. This will be published on the Statoil project webpage in Q1 2018.

During the requested preliminary term extension, and subject to BOEM's approval of the survey plan(s), Statoil intends to undertake site investigations, including geophysical and geotechnical surveys. The relevant data collected from these surveys will be included in the SAP and the COP as appropriate. Once the SAP is approved and other necessary permits are issued, Statoil intends to deploy FLiDAR buoy(s) / meteorological buoy(s) in the Lease area. A preliminary calendar year schedule for SAP activities is:

- Submission of survey plans Q4 2017;
- Procurement of survey contractors Q4 2017;
- Survey plan consultation meetings with BOEM, Tribes and relevant stakeholders Q1 2018;
- Initiate surveys Q2 2018;
- SAP submission Q3 2018; and
- FLiDAR and metocean buoy deployment Q4 2018.

An extension to the preliminary term will increase the time available to allow for full and effective stakeholder engagement, survey planning and project related technical decisions. It is also important for the project to aim for a survey window in spring 2018 that provides an opportunity for maximizing synergies with the wider COP survey and consultation activities.

We appreciate your review of our request for a 12-month extension of the preliminary term. If you have any questions or comments, please contact the Permitting Manager, Martin Goff, at mgof@statoil.com or +1 (202) 813-7444.

Sincerely,

Meagan Keiser

Secretary, Statoil Wind US LLC

United States Department of the Interior

BUREAU OF OCEAN ENERGY MANAGEMENT
WASHINGTON, DC 20240-0001

NOV 13 2017

Ms. Meagan Keiser
Statoil Wind US LLC
120 Long Ridge Road, Suite 3E01
Stamford, Connecticut 06902

Dear Ms. Keiser:

The Bureau of Ocean Energy Management (BOEM) has received Statoil Wind US LLC's (Statoil) October 10, 2017, letter requesting a 12-month extension of the preliminary term for commercial lease OCS-A 0512, from April 1, 2018, to April 1, 2019, pursuant to 30 C.F.R. § 585.235(b). BOEM is approving your request for the reasons described below.

Your letter indicates that Statoil has been actively maturing the project survey plans and technical scope towards submission of a Site Assessment Plan (SAP) as required by lease OCS-A 0512, by conducting the following activities:

1. Hosting a workshop with BOEM on May 30, 2017.
2. Completion of a geological desktop study.
3. Consultation with wind resource and metocean supply chain representatives resulting in a decision to pursue deployment of a buoy based Floating Light Detection and Ranging (FLiDAR) as a wind resource solution.
4. Drafting of SAP survey plans and consultation with BOEM, Tribes, and other relevant stakeholders.

Your letter also states that while Statoil has made significant progress to date, more time is necessary to complete several activities to collect information required to submit a SAP. These include:

1. Advancing full and effective stakeholder engagement;
2. Survey planning and project related technical decisions, and;
3. Seasonal considerations in relation to undertaking offshore site characterization work as well as planning to maximize synergies with wider construction and operations plan survey and consultation efforts.

Your letter provides a plan for conducting geophysical and geotechnical surveys during the requested preliminary extension term. The results from these surveys will be included in the SAP planned for filing in Q3 (calendar year) 2018. Assuming the SAP is approved by BOEM; Statoil would deploy the FLiDAR(s) and wave buoy(s) in the lease area in Q4 2018.

BOEM has reviewed your request and has determined an extension of the preliminary term is justified. We base our decision on the fact that Statoil has identified their previous and planned activities over the next year to support SAP submission and development of commercial lease OCS-A 0512.

Therefore, pursuant to 30 C.F.R. § 585.235(b) and in consideration of the information provided in your October 10, 2017 letter, your request to extend the preliminary term of commercial lease OCS-A 0512 to April 1, 2019, is approved.

If you have any questions please contact Mr. Luke Feinberg at 703-787-1705 or luke.feinberg@boem.gov.

Sincerely,

James F. Bennett

Notes:
1. Three separate round trips will be required for equipment deployment: one for FLIDAR 1; one for FLIDAR 2; and one for both the met buoy and subsea mooring.
2. Three separate round trips will be required for equipment decommissioning: one for FLIDAR 1; one for FLIDAR 2; and one for both the met buoy and subsea mooring.
3. Four separate round trips will be required for each 6-month maintenance period: one for FLIDAR 1; one for FLIDAR 2; one for the met buoy; and one for the subsea mooring.
4. 6-month maintenance activities will be performed at 6 months, 12 months, and 18 months after the initial deployment of equipment.
5. It is also assumed that up to one unscheduled round trip per year may be needed to visit a buoy site if there is evidence of damage (such as partial or total loss of data transmissions), or if transmitted GPS data indicated that a buoy had drifted significantly outside the "watch circle," which allows for buoy movement inside a roughly 100-meter radius from the recorded deployment coordinates.
Examples of events that could cause such damage or buoy displacement include, but are not limited to, hurricane-strength tropical or "nor'easter" storms, heavy snow accumulation, or heavy icing in the event of extremely low temperatures. Trip time is based on travel to the farthest away buoy location (FLIDAR 1).
6. Trip time constitutes the round trip transit time to and from the project site. The number of hours per trip were estimated based on an assumed transit speed of 4 knots when towing a buoy, and 8 knots when not towing a buoy. Round trip distances are estimated to be: 82 nm to the deployment location for FLIDAR 1, the met buoy, and the subsea mooring; and 66 nm to the deployment location for FLIDAR 2.
7. Operating hours/day is the estimated time each vessel is at the deployment site performing its associated activities.
8. The auxiliary engine on the work boat powers the winch, crane, and A-frame, and will only operate in the immediate vicinity of each deployment site.
9. Emission calculations based on vessels traveling from Miller's Launch in Staten Island.
10. The engines utilized on each of the vessels are assumed to be Category 1 engines based on engine horsepower rating (<1,000 kW) and cylinder displacement (1-5 liters per cylinder).
11. Emission factors for marine vessel engines are from Table 3-8 in the ICF International report to the US EPA "Current Methodologies in Preparing Mobile Source Port-Related Emissions Inventories", April 2009. (See emission factors summary page) Assumed all engines to be used are certified to meet EPA Tier 1 engine standards; therefore, the Tier 1 emission factors in Table 3-8 from the ICF International report was used to provide conservative estimate.
12. HAP emission factors for commercial marine vessels were determined using the methodology identified by US EPA for the 2011 National Emissions Inventory (NEI); i.e., they are calculated as percentages of the PM_{10}, $PM_{2.5}$, or VOC emissions from the CMVs. The HAP emisson for nonroad engines were based on EPA's AP-42 Volume 1, Chapters 3.3 and 3.4 for small and large diesel engines. (see HAP emission factor summary pages)
13. Average load factors were estimated based on load factors presented in Table 3-4 of the ICF International report.

EMPIRE WIND OFFSHORE WIND FARM
Emission Factor Summary

Commercial Marine Vessels (CMVs)

		Commercial Marine Vessel Emission Factors (g/hp-hr) /a									Fuel Cons.
	Engine Type	VOC	NO_x	CO	PM/ PM_{10} /b, /c	$PM_{2.5}$ /b	SO_2 /c	CO_2	CH_4	N_2O	(gal/hp-hr) /d
1	Category 2 engines	0.37	7.3	3.73	0.46	0.45	0.0010	515	0.067	0.015	0.050
2	Category 1 engines ≤ 1000 kW	0.20	7.3	3.73	0.19	0.19	0.0010	515	0.067	0.015	0.050
3	Category 3 engines (MSD using MDO) (>30L/cyl.)	0.37	9.8	0.82	0.14	0.13	0.296	482	0.003	0.023	0.046
4	All Categories aux. engines (MSD using MDO)	0.30	10.4	0.82	0.14	0.13	0.316	515	0.003	0.023	0.049

/a Emission factors for Category 1 and 2 engines are from Table 3-8 from ICF International report to the US EPA "Current Methodologies in Preparing Mobile Source Port-Related Emissions Inventories", April 2009 (converted from g/kW-hr to g/hp-hr by multiplying by 0.746 kW/hp). Assumed all Category 1 and 2 engines to be used are certified to meet EPA Tier 1 and 2 marine engine standards respectively (providing conservative estimate for Category 1 engines); therefore the Tier 1 and 2 emission factors in Table 3-8 from the ICF International report was used. Note, the CO emission factor for Category 1 Tier 2 engines is higher than what is provided for Tier 1 engines, thus the Tier 2 emission factor for CO was used to provide a conservative estimate.

/b All PM is assumed to less than 10 µm in diameter; therefore, PM emission factor is equivalent to PM_{10} emission factor. $PM_{2.5}$ is estimated to be 97 % of PM_{10} per EPA guidance in "Exhaust and Crankcase Emission Factors for Nonroad Engine Modeling - Compression-Ignition," EPA420-R-10-018/NR-009d, July 2010.

/c Emission factors for Category 1 and 2 engines for SO_2 and PM_{10} presented in Table 3-8 of the ICF report (ICF International 2009) are based on a fuel sulfur content of 1.5 percent. These factors were adjusted for the 15 ppmw sulfur content in ultra-low sulfur diesel fuel, by multiplying the emission factors by 0.001 and 0.86 for SO_2 and PM_{10}, respectively, following the approach used in Section 3.4.2 of the ICF Report.

/d Fuel consuption rate for Category 1 and 2 marine engines was estimated based on CO_2 emission factor (g/hp-hr) and the emission factor for the mass of CO_2 generated per gallon of fuel (10.21 kg CO_2/gal fuel) as presented in the Table 13.1 of the “2014 Climate Registry Default Emission Factors.” Fuel consumption for Category 3 marine engines was based on the BSFC (g/kW-hr) in the ICF International report.

EMPIRE WIND OFFSHORE WIND FARM
EPA NEI HAP emission factors for Commercial Marine Vessels

HAP emission factors for commercial marine vessels were determined using the methodology identified by US EPA for the 2011 National Emissions Inventory (NEI); i.e., they are calculated as percentages of the PM10, PM2.5, or VOC emissions from the CMVs.

Site Assessment Plan Approval

United States Department of the Interior
BUREAU OF OCEAN ENERGY MANAGEMENT
WASHINGTON, DC 20240-0001

NOV 21 2018

Mr. Martin Goff
Leader - Permitting
Equinor Wind US LLC
120 Long Ridge Road, Suite 3E01
Stamford, Connecticut 06902

Dear Mr. Goff:

This letter serves to inform you that the Bureau of Ocean Energy Management (BOEM) has approved the Site Assessment Plan (SAP) submitted on June 18, 2018, by Equinor Wind US LLC, subject to the enclosed conditions of approval pursuant to 30 CFR 585.613(e)(1). Your five-year site assessment term commences on the date of this letter, pursuant to 30 CFR 585.235(a)(2).

To help maintain compliance with the approved SAP, please take note of the following requirements, among others, that must be implemented:

1. Adhere to the enclosed Conditions of SAP Approval.
2. Notify BOEM in writing within 30 days of completing installation activities approved in your SAP, pursuant to 30 CFR 585.615(a).
3. Prepare and submit to BOEM a report annually each November 1 of your site assessment term that summarizes your site assessment activities and the results of those activities, pursuant to 30 CFR 585.615(b).
4. Submit a certification of compliance annually, pursuant to 30 CFR 585.615(c), with certain terms and conditions of your SAP that BOEM identifies under 30 CFR 585.613(e)(1). Together with your certification, you must submit:
    a. Summary reports that demonstrate compliance with the terms and conditions that require certification; and
    b. A statement identifying and describing any mitigation measures and monitoring methods that you have taken, as well as their effectiveness. If you identify measures that are not effective, you must make recommendations for substitute mitigation measures or monitoring methods and explain why you believe they would be effective.

    These reports are due annually starting on November 1, 2019.
5. Develop a comprehensive annual Self-Inspection Plan, pursuant to 30 CFR 585.824(a), and submit an annual Self-Inspection Report no later than November 1 of each year that your site assessment facility is in operation, pursuant to 30 CFR 585.824(b).

This letter constitutes a final BOEM decision that may be appealed pursuant to 30 CFR 585.118, 30 CFR Part 590, and 43 CFR Part 4, Subpart E.

Please do not hesitate to contact Mr. Luke Feinberg at (703) 787-1705 if you have any questions.

Sincerely,

James F. Bennett
Program Manager
Office of Renewable Energy Programs

Enclosure

U.S. DEPARTMENT OF THE INTERIOR
BUREAU OF OCEAN ENERGY MANAGEMENT

Conditions of Site Assessment Plan Approval

Lease Number OCS-A 0512

The Lessee's rights to conduct activities under the approved Site Assessment Plan (SAP) are subject to the following conditions. The Lessor reserves the right to impose additional conditions incident to any future approval of any modifications to the SAP.

Table of Contents

Section:

Attachments:

1. Conditions for Cultural Resource Protection

1.1. No Impact without Approval. The Lessee must not knowingly impact a potential archaeological resource without the Lessor's prior approval.

1.2. Post-Review Discovery Clauses. If, while conducting SAP activities, the Lessee discovers a potential archaeological resource, such as the presence of a shipwreck (e.g., a sonar image or visual confirmation of an iron, steel, or wooden hull; wooden timbers; anchors; concentrations of historic objects; or piles of ballast rock), or pre-contact archaeological site (e.g., stone tools; pottery) within the project area, the Lessee must:

1.2.1. Immediately halt seafloor/bottom-disturbing activities within the area of discovery;

1.2.2. Notify the Lessor within 24 hours of discovery;

1.2.3. Notify the Lessor in writing via report to the Lessor within 72 hours of discovery;

1.2.4. Keep the location of the discovery confidential and take no action that may adversely affect the archaeological resource until the Lessor has made an evaluation and instructs the applicant on how to proceed; and

1.2.5. Conduct any additional investigations as directed by the Lessor to determine if the resource is eligible for listing in the National Register of Historic Places (NRHP) (30 CFR §585.802(b)). The Lessor will direct the Lessee to conduct such investigations if: (1) the site has been impacted by the Lessee's project activities; or (2) impacts to the site or to the area of potential effect cannot be avoided. If investigations indicate that the resource is potentially eligible for listing in the NRHP, the Lessor will instruct the Lessee as to how to protect the resource, or how to mitigate adverse effects to the site. If the Lessor incurs costs in protecting the resource, under Section 110(g) of the National Historic Preservation Act, the Lessor may charge the Lessee reasonable costs for carrying out preservation responsibilities under the Outer Continental Shelf Lands Act (30 CFR 585.802(c & d)).

2. Conditions Relating to Protected Marine Mammals, Sea Turtles, and Fish

2.1. Project Meetings and Protected Species Briefings. Prior to conducting at-sea activities pursuant to the SAP, the Lessee must hold a briefing on protected species (all marine mammals, sea turtles, and fish listed under the Endangered Species Act and Marine Mammal Protected Act) that occur in the project area, the conditions and reporting requirements specified herein, and establish the responsibilities of each party involved in at-sea operations. During this briefing, the parties involved must define the chains of command, discuss communication procedures, provide an overview of mitigation and monitoring requirements, and review operational procedures. This briefing must include all relevant personnel, crew members, and any Protected Species Observers (PSOs). New personnel must be briefed as they join the work in progress.

2.1.1. The Lessee must ensure that all vessel operators and crew members, including any PSOs, are familiar with, and understand, the requirements specified in Sections 2 and 4 of these conditions.

2.1.2. The Lessee must ensure that a copy of Section 2 and Section 4 of these conditions are made available on every project-related vessel.

2.2. Minimum Separation Distance for Protected Species. The Lessee must ensure all vessel operators and crews maintain a vigilant watch for protected species. All vessels must maintain the following minimum separation distances from any sighted protected species to avoid potential harm or harassment, except when the safety of the vessel or crew is at risk:

2.2.1. 500 meters (m) (547 yards [yds]) or greater from any sighted North Atlantic right whale or any other unidentified large marine mammal;

2.2.2. 100 m (109 yd) or greater from any sighted Endangered Species Act (ESA)-listed whales other than a North Atlantic right whale; and

2.2.3. 50 m (55 yd) or greater from any sighted small cetaceans (dolphins and porpoises), seals, sea turtles, and giant manta rays.

2.3. Requirements for Vessel Strike Avoidance. The Lessee must ensure that all vessels conducting activities pursuant to the SAP, including those transiting to and from local ports and the lease area, comply with the vessel-strike avoidance measures specified below, except when the safety of the vessel or crew is at risk.

2.3.1. The Lessee must ensure that vessel operators and crews maintain a vigilant watch for marine mammals, sea turtles, and giant manta rays, and take appropriate measures to avoid striking sighted protected species. Vessels must route around the animals and maintain minimum separation distances (per Section 2.2 above) from protected species whenever possible.

2.3.2. The Lessee must ensure that vessel operators reduce vessel speed to 10 knots (18.5 kilometer [km]/hour [hr]) or less in the following circumstances:

2.3.2.1. When operating a vessel in any Dynamic Management Area (DMA) established for North Atlantic right whales including those established in transit routes to and from local ports, and within the lease area.

2.3.2.2. When mother/calf pairs, pods, or large assemblages of marine mammals are observed near an underway vessel.

2.3.3. The Lessee must ensure that underway vessels do not divert their course to approach protected species.

2.3.4. When marine mammals approach an underway vessel (e.g., bow-riding by small cetaceans), the Lessee must ensure that vessel operators make best efforts to remain parallel to the animal's course and avoid excessive speed or abrupt changes in direction until the animal has left the area.

2.3.5. When an animal is sighted in the vessel's path or in close proximity to a moving vessel, the Lessee must ensure that vessel operators reduce speed and shift the engine to neutral. Vessel operators must not engage the engines until the animals are clear of the area.

2.3.6. The Lessee must ensure all vessel operators check communication media for general information regarding avoiding ship strikes and daily information regarding North Atlantic right whale sighting locations. These media may include, but are not limited to, National Oceanic and Atmospheric Administration (NOAA weather radio, U.S. Coast Guard NAVTEX broadcasts, Notices to Mariners, and the Whale Alert app.

2.4. North Atlantic Right Whales

2.4.1. The Lessee must ensure that all vessels greater than or equal to 19.8 m (65 feet [ft]) in length must operate at 10 knots (11.5 miles per hour [mph]) or less when operating within any current Seasonal Management Area (SMA) designated for the North Atlantic right whale, including those established in transit routes to and from local ports and within the lease area (see the current SMA maps and coordinates at https://www.fisheries.noaa.gov/national/endangered-species-conservation/reducing-ship-strikes-north-atlantic-right-whales).

Seasonal Management Area	**Effective Dates**
Northeast Feeding Areas	
Cape Cod Bay SMA	Jan 1 – May 15
Off Race Point SMA	Mar 1 – Apr 30
Great South Channel SMA	Apr 1 – Jul 31
Mid-Atlantic Migratory Route	
Port and vessel route areas from Block Island, RI to Savannah, GA	Nov 1 – Apr 30

2.4.2. The Lessee must ensure that the following avoidance measures are taken if a vessel comes within 500 m (547 yd) of any North Atlantic right whale:

2.4.2.1. If underway, any vessel must steer a course away from any North Atlantic right whale at 10 knots (18.5 km/h) or less until the 500 m (547 yd) minimum separation distance has been established.

2.4.2.2. If a North Atlantic right whale is sighted within 100 m (109 yd) of an underway vessel, the vessel operator must immediately reduce speed and promptly shift the engine to neutral. The vessel operator must not engage the engines until the North Atlantic right whale has moved beyond 100 m (109 yd) and steer a course away from the whale.

2.4.3. <u>If a vessel is stationary, the vessel must not engage engines until the North Atlantic right whale has moved beyond 100 m (109 yd) and steer a course away from the whale.</u> The Lessee must ensure that any sighted injured, dead or entangled North Atlantic right whale is immediately reported to the U.S. Coast Guard via VHF Channel 16, in addition to the reporting requirements set forth in Section 2.6 below.

2.5. Entanglement Avoidance.

2.5.1. The Lessee must ensure that any structures or devices attached to the seafloor for continuous periods greater than 24-hours use the best available mooring systems. Buoy lines (chains, cables, or coated rope systems), swivels, shackles, and anchor designs must prevent any potential entanglement or entrainment of marine mammals, sea turtles, and giant manta rays while ensuring the safety and integrity of the structure or device.

2.5.2. All mooring lines and ancillary attachment lines must use one or more of the following measures to reduce entanglement risk: shortest practicable line length, rubber sleeves, weak-links, chains, cables or similar equipment types that prevent lines from looping, wrapping, or entrapping protected species.

2.5.3. Any equipment utilized for activities conducted pursuant to the SAP must be attached by a line within a rubber sleeve for rigidity. The length of the line must be as short as necessary to meet its intended purpose.

2.5.4. If a live or dead marine protected species becomes entangled, the Lessee must immediately contact the marine mammal or sea turtle stranding network coordinator per Section 2.6 below, and provide any on-water assistance requested by the coordinator.

2.6. <u>Reporting</u>. The Lessee must ensure compliance with the following reporting requirements for activities conducted pursuant the SAP, and must use the contact information provided in Attachment 1, or updated contact information as provided by the Lessor, to fulfill these requirements.

2.6.1. The Lessee must ensure that sightings of any injured or dead protected species (e.g., listed marine mammals, sea turtles, giant manta rays, or sturgeon) are immediately reported within 24 hours to the Lessor, NMFS, and the appropriate stranding network.

2.6.2. The Lessee must record all sighting data reported per Section 2.6.1, including observed injuries or mortalities, using the form provided in Attachment 2 below.

2.6.3. The Lessee must additionally ensure that any sighted injured, dead, or entangled North Atlantic right whale is immediately reported to the U.S. Coast Guard via VHF Channel 16,

2.6.4. If the Lessee's activity is responsible for the injury or death, the Lessee must ensure that the vessel assist in any salvage effort as requested by NMFS.

3. Conditions for Avian and Bat Protection

3.1. <u>Anti-perching Devices</u>. The Lessee must install anti-perching devices on the meteorological buoy to the extent practicable.

3.2. <u>Lighting</u>. Any lights used by the lessee to aid marine navigation during SAP activities must meet U.S. Coast Guard requirements for private aids to navigation, available at: https://www.navcen.uscg.gov/pdf/AIS/CG_2554_Paton.pdf. The Lessee must use any additional lighting only when necessary, and such lighting must be hooded downward and directed when possible, to reduce upward illumination and illumination of adjacent waters.

3.3. <u>Reporting Requirement for Avian and Bat Species</u>. The Lessee must provide BOEM and the United States Fish and Wildlife Service (USFWS) an annual report documenting any dead or injured birds or bats found on structures, as well as during installation, operation, and decommissioning of the meteorological buoy. The reports are due each November 1 after the date of the SAP approval and required for every year that the buoy is deployed. Each report must be sent to the USFWS contact provided in Attachment 1 below, and must contain the following information: the name of species; date found; location; a picture to confirm species identity (if possible); and any other relevant information. The Lessee must report carcasses with Federal or research bands to the United States Geological Survey Bird Band Laboratory (https://www.pwrc.usgs.gov/bbL/bblretrv).

4. **Marine Trash and Debris Prevention**

The Lessee must ensure that vessel operators, employees, and contractors engaged in activities pursuant to the SAP are briefed on marine trash, debris awareness and elimination, as described in the Bureau of Safety and Environmental Enforcement (BSEE) Notice to Lessees (NTL) No. 2015-G03 ("Marine Trash and Debris Awareness and Elimination") or any NTL that supersedes this NTL. The Lessee must ensure that its vessel operators, employees and contractors participating in activities pursuant to the SAP, receive training on the environmental and socioeconomic impacts associated with marine trash and debris, as well as their responsibilities for ensuring that trash and debris are not intentionally or accidentally discharged into coastal and marine environment. Briefing materials on marine debris awareness, elimination, and protected species are available at http://oocmain.theooc.us/page41.html.

5. **Conditions Related to Private Aids to Maritime Navigation**

5.1. The Lessee must file an application (form CG-2554), either in paper form or electronically, with the Commander of the United States Coast Guard (USCG) First District to establish a private aid to maritime navigation (PATON) for all facilities deployed pursuant to the SAP, per 33 CFR part 66.

5.2. The Lessee must submit a copy of the USCG-approved PATON to BOEM prior to deployment of any facilities covered by 5.1.

6. **Conditions Related to the Avoidance of Magnetic Anomalies**

The Lessee must ensure that all anchor points for vessels and SAP facilities are placed at least 30 m from any identified magnetic anomalies on the sea floor.

7. **Modifications**

The Lessee, by itself or through its designated operator, may request a modification of a term in the SAP or these conditions of approval. The Lessor will review this request and determine whether the modification requires a revision to the SAP under 30 CFR 585.617. If the Lessor determines that the requested modification does not require a revision to the SAP, the Lessor will provide a written response to the Lessee and its designated operator approving, approving with conditions, or disapproving the modification. This written response will become a part of the approved SAP.

Attachment 1

Contact Information for Reporting Requirements

The following contact information must be used for the reporting requirements in Section 2.6 of the Conditions for Site Assessment Plan approval (Attachment 2):

Dead and/or Injured Protected Species
National Marine Fisheries Service
Northeast Region's Stranding Hotline
866-755-6622

All other reporting requirements in Section 2.6
Bureau of Ocean Energy Management
Environment Branch for Renewable Energy
Phone: 703-787-1340
Email: renewable_reporting@boem.gov

National Marine Fisheries Service
Northeast Regional Office, Protected Resources Division
Section 7 Coordinator
Phone: 978-281-9328
Email: incidental.take@noaa.gov

Vessel operators may send a blank email to ne.rw.sightings@noaa.gov for an automatic response listing all current Dynamic Management Areas.

The following contact information must be used for the reporting and coordination requirements specified in Section 3.3 of the Conditions for Site Assessment Plan approval:

Field Supervisor
U.S. Fish and Wildlife Service
New York Field Office
3817 Luker Road
Cortland, New York 13045

Sample Supplier Declaration

equinor

Supplier Declaration

Compliance with Laws
As a supplier to Equinor we will comply with all applicable laws and regulations.

Improper Payments
As a supplier to Equinor we will not, in order to obtain or retain business or any advantage in the conduct of business, offer, promise or give any improper advantage to a public official (or a third party) to make the official act or refrain from acting in relation to the performance of her/his official duties. This applies regardless whether the advantage is offered directly or through an intermediary.

Gifts, Hospitality and Expenses
As a supplier to Equinor we will not offer, directly or indirectly, to Equinor employees or representatives or anyone closely related to them gifts except for promotional items of minimal value normally bearing a company logo.

Hospitality such as social events, meals or entertainment may be offered if there is a clear business reason, but the cost must be kept within reasonable limits. Travel, accommodation and other expenses for the individual representing Equinor will always be paid by Equinor.

Hospitality, expenses, gifts or other favours shall not be offered or received in situations of contract bidding, evaluation or award.

Conflict of Interest
As a supplier to Equinor we, and our employees, will not take part in or seek to influence any decision under circumstances that can give rise to an actual or perceived conflict of interest. Such circumstances may be a business interest or a personal interest in the subject matter – economically or otherwise – directly or through someone closely related. If we become aware of a potential conflict of interest we will, without delay, notify Equinor.

Minimum Age of Labour
As a supplier to Equinor we shall not employ children below the age of 15. If the child is secured the right for education, play, rest and family life, limited exceptions may be made if this is clearly in the best interests of the child.

Forced Labour
As a supplier to Equinor we will not engage or employ people against their own free will, nor will personnel be required to lodge ‘deposits’ or identity papers upon commencing employment.

Freedom of Association & Right to collective Bargaining
As a supplier to Equinor we recognise that our employees are entitled to be – or refrain from being – union members and to be represented in collective bargaining agreements. In countries where these rights are restricted our employees will anyway have the right to influence their work situation.

Working Hours
As a supplier to Equinor we will comply with local law or agreements regarding working hours.

Wages
As a supplier to Equinor we will ensure that wages paid to employees and hired labour are considered fair.

Employment Practices
As a supplier to Equinor we will treat our employees equally and fairly. We will not accept any form of harassment or discrimination.

Minority Rights

As a supplier to Equinor, we recognize and shall respect the special importance of the social, cultural, religious and spiritual values and practises of the indigenous and tribal peoples and their relationship with the land or territories. To the extent our work may affect indigenous peoples, a process to minimize and manage such impacts will be undertaken.

Security Resources

As a supplier to Equinor, we will observe strict requirements for the selection of security contractors to avoid human rights risks in countries where security firms are not properly regulated.

Environment

As a supplier to Equinor we will work according to internationally recognized environmental management principles and aim for continuous improvement. We will comply with national environmental legislation and discharge permits. We will work to achieve energy efficiency and minimize harmful discharge, emissions, and waste production in a lifecycle perspective.

Health and Safety

As a supplier to Equinor we will work ambitiously, through continuous improvement, for a healthy work environment and safe and secure conduct according to internationally recognized health and safety management principles and practices and applicable law.

Selection of Business Partners, Agents and other Intermediaries

As a supplier to Equinor we will promote that potential business partners, agents and intermediaries adopt the principles set forth in this Supplier Declaration.

Standards towards own Suppliers

As a supplier to Equinor we will promote the implementation of the principles set forth in this Supplier Declaration towards own suppliers.

1 Introduction

1.1 About this document

This document is the first draft Fisheries Liaison Plan (FLP) (Document ref. RE-PM710-00001, Version 01) developed to present Statoil's proposed approach to liaison and consultation with the fishing industry in relation to the development of offshore wind farm projects, cable corridors and landfall sites in the New York Lease OCS-A 0512 Wind Energy Area (WEA). This document will continue to be updated and evolve in consultation with the fishing industry as the project(s) moves through the various stages of development, and will conclude with a 'Final' Fisheries Liaison and Communications Plan and Fisheries Coexistence Plan for implementation.

The FLP has been produced for stakeholders from the fishing industry and is intended to provide clarity on Statoil's delivery objectives, as well as the approach to liaison and co-existence.

1.2 Background

In 2014, Governor Andrew M. Cuomo launched New York's energy policy, 'Reforming the Energy Vision'. The associated State Energy Plan (SEP) set a goal for 50% of electricity consumed in the state of New York to come from renewable sources by 2030. Offshore wind has the potential to be the most significant renewable energy resource available in the southeast portion of the state where currently only a small proportion of renewable energy is being generated and consumed. In January of 2017, Governor Andrew M. Cuomo committed to develop up to 2.4 gigawatts of offshore wind by 2030. The development of the New York Lease OCS-A 0512 WEA is expected to make a significant contribution towards achieving this objective.

The New York OCS-A 0512 WEA was originally proposed September 2011, as the result of an unsolicited request to the Bureau of Ocean Energy Management (BOEM) from the New York Power Authority (NYPA), Long Island Power Authority (LIPA) and ConEd, for a commercial lease. In June 2012 the WEA was modified to expand the buffer between shipping lanes and proposed wind turbines from one-quarter nautical mile to one nautical mile. In January 2013, BOEM issued a 'Request for Interest' seeking public comments on the proposal, followed by a 'Call for Information and Nominations' in May 2014 seeking public comments on the development authorization process.

In December 15 – 16, 2016, BOEM conducted an auction for the New York WEA, which concluded with Statoil as the successful bidder. Statoil signed the commercial wind energy lease OCS-A 0512 on March 15, 2017.

Statoil has the objective of developing the New York OCS-A 0512 WEA, with the first stage of development involving site characterization surveys, stakeholder engagement and securing the necessary permits and licenses required to construct and operate a utility scale offshore wind farm.

The first step in Statoil's permitting process is to develop and submit to BOEM a Site Assessment Plan (SAP). BOEM requires the SAP to describe the initial activities necessary to characterize a lease site. This includes for example, wind resource measurements using meteorological masts or buoys, and/or meteorological and oceanographic (metocean) data collection, as well as any requirements for testing new technology that comes into contact with the seabed.

The next phase is the development of the Construction and Operations Plan (COP). The COP describes all the activities necessary for the construction, operation, and decommissioning of proposed offshore wind farm(s) on the lease. It also outlines the environmental, social and technical information needed for BOEM to undertake Environmental and Social Impact Assessments (ESIA) as part of its review under the National Environmental Policy Act (NEPA).

As part of the ESIA, a wide range of potentially affected receptors, identified through stakeholder engagement and scoping, will form part of the detailed process of information gathering, site investigations, site specific environmental surveys, stakeholder engagement and impact assessments that will inform the federal and state environmental review processes.

In addition to the BOEM SAP and COP submittals, Statoil will seek and obtain authorizations from Federal and State regulatory agencies for the deployment of a metocean data measuring system and construction of the wind energy facility. The SAP and COP phases of the Project are anticipated to occur over the coming years.

1.3 Empire Wind OCS-A 0512 Lease

The New York OCS-A 0512 WEA site extends 14-30 miles southeast of Long Island, spanning 79,350 acres, in water depths between 65 and 131 feet (see map). Subject to environmental and technical constraints, which will be explored as part of the development phase, it is believed that the site has a potential generating capacity of over 1 GW.

The WEA has water depths suitable for conventional, bottom-fixed foundations, such as monopiles or jackets. The exact details of the wind farm design and installation techniques will be determined during the survey and design phase, and will be influenced by consultation with affected parties, for example the fishing community.

The exact location of the electricity grid connection points and associated landfall and electrical export cable routes have yet to be determined, but will be identified during the development phase in consultation with the relevant affected parties.

The offshore wind farm(s) may be developed and constructed in phases, subject to technical, grid and commercial constraints that are yet to be determined.

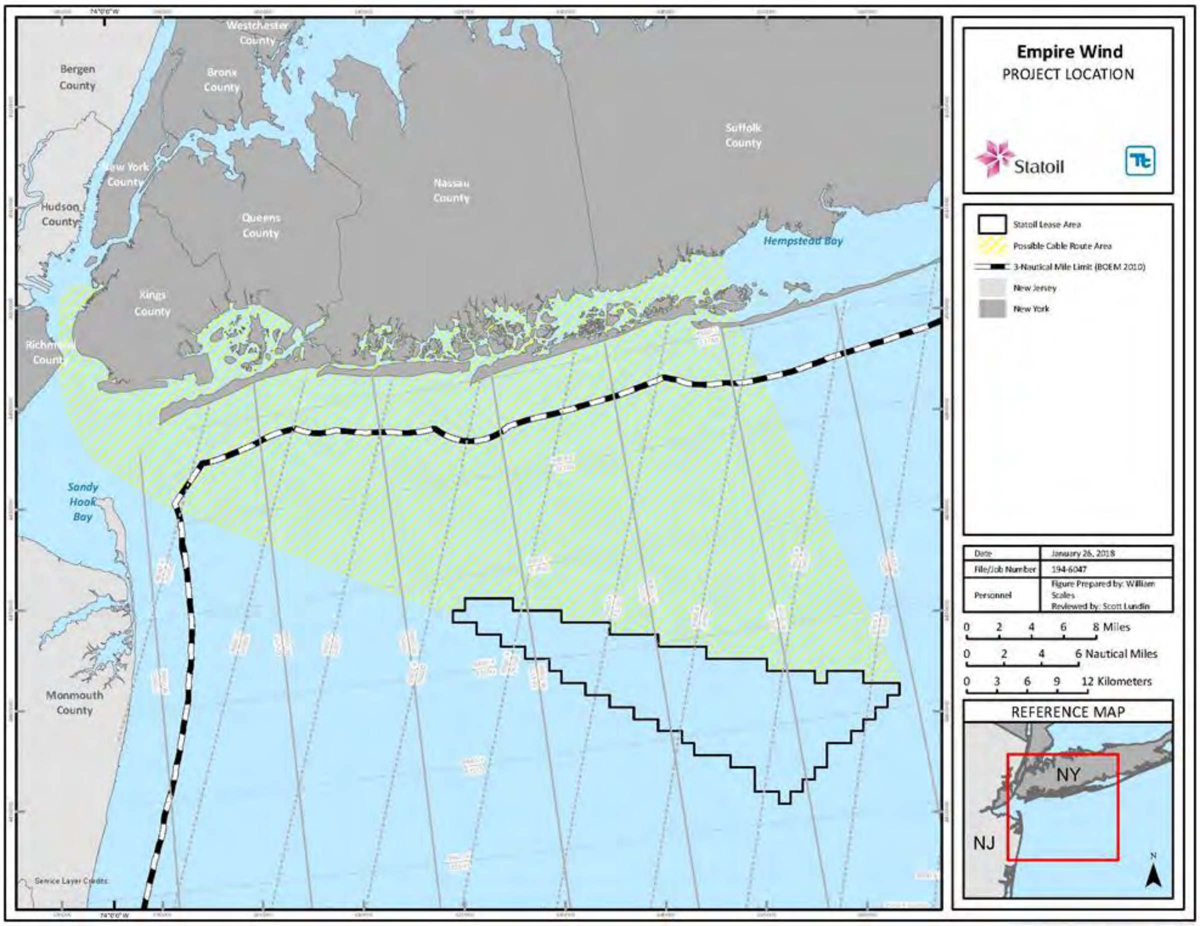

FIGURE 1 NEW YORK EMPIRE WIND OFFSHORE WIND FARM OCS-A 0512 LEASE AREA

2 Outline Co-existence Strategy

2.1 Co-existence

Statoil believes that the fishing industry and offshore wind farm developments can co-exist and, as such, sets out with the objective to co-exist with the fishing industry in and around the New York OCS-A 0512 WEA. Statoil has no intentions to restrict or apply for restrictions on fishing activities of any sort within the wind farm area(s), or electrical export cable area(s) post construction. Restrictions, if applicable, will likely be limited to the application for standard safety zones during the construction phase, and operational safety zones around manned or sensitive offshore platforms or in some cases access points to turbines. Co-existence can be achieved through the objective to avoid impacts where feasible and, where this is not feasible, to reduce impacts through mitigation. A successful co-existence strategy will require open and regular communication between Statoil and the fishing industry starting with the development phase leading up to permitting and construction, through construction, operation, and decommissioning of the wind farm.

A Co-existence Plan will be finalized in consultation with the fishing industry at the time of COP submission. This will be at a time when detailed wind farm designs and construction and operation practices will be better understood, as well as a better understanding of the interaction between the fishing industry and the proposed offshore wind farms.

The co-existence plan will present:

- A commitment to continuing consultation and liaison with the aim of assisting fishermen to safely resume their fishing activities within the operational site and along the export cable corridor;
- The sharing of wind turbine and cable locations in a format appropriate to the fishing industry to use in chart plotters and/or the provision of charts with key facility locations appropriately called out;
- A distribution system for ongoing liaison plans and dissemination of information, including construction schedules, survey schedules and planned operations and maintenance activities using a variety of media;
- Mitigation measures (where feasible) to minimize potential impacts on the fishing industry and an execution plan for each measure;
- Details of the main project contacts, including the Fisheries Liaison Officer as the primary point of contact;
- Codes of conduct for vessels undertaking project related activities within the wind farm area and ports;
- Safe operations procedures;
- Emergency response procedures;
- Fishing gear snagging and loss procedures and any required claim procedures thereafter;

3 Fisheries Liaison

3.1 Fisheries Liaison Strategy

Openness is one of Statoil’s core values and will form the basis of the fisheries liaison philosophy. Regular, open consultation will be key to ensuring all parties are well informed, are able to contribute to the discussions and can work towards the joint objective of co-existence.

The FLP will be an evolving plan throughout the project development process. The identification of potential impacts on the fishing industry may change as the wind farm design and installation methodology change or become more detailed during the various phases of development. The FLP will be designed to describe the liaison and coordination of activities appropriate to the life cycle of the wind farm, through the permitting phase, construction, operation and decommissioning phases, where there the requirements and potential impacts may vary in each of these phases.

Liaison activities will be primarily based on best practice guidance and feedback from the fishing industry through consultation. It will also draw on consultation from fisheries bodies, regulators, ports and harbors and legislation, as well as previous experiences of the Statoil team with fisheries liaison work in the offshore wind industry. The best practice guidance will include, but not be limited to:

- Development of Mitigation Measures to Address Potential Use Conflicts between Commercial Wind Energy Lessees/Grantees and Commercial Fishermen on the Atlantic Outer Continental Shelf, BOEM 2014-654;
- Best Practice Guidance for Offshore Renewables Developments: Recommendations for Fisheries Liaison - Fishing Liaison with Offshore Wind and Wet Renewables Group (FLOWW), UK;
- Fishing and Submarine Cables Working Together – published by the International Cable Protection Committee

3.2 Fishing Industry Contacts & Affected Parties

Effective dialogue and consultation will be facilitated with the establishment of a comprehensive contact database for local and regional fisheries associations, societies, groups, individual fishermen and the different industry organizations. This database will be maintained and regularly updated by the FLO in conjunction with Statoil’s key project team members. It should be noted that the fishing industry ‘database’ will be used solely for the purposes of Statoil’s fisheries liaison activities and will not be made available to any individual or group, outside of Statoil’s specific requirements. It is acknowledged and appreciated that some fisheries information, such as fishing sites, can be commercially sensitive. In these circumstances Statoil will work with the individual fishing organization / fisherman to establish confidentiality agreements for the purpose of sharing information with the objective of using it to work towards the objective of coexistence.

3.3 Fisheries Liaison Officers

Statoil will contract a Fisheries Liaison Officer(s) (FLO) with the appropriate level of knowledge of or first-hand experience in the fishing industry of the region to aid in communication with, and the dissemination and gathering of information between, Statoil and the fishing industry. The FLO will also support Statoil in the identification of potential impacts, potential mitigation measures, and support with data gathering to inform the environmental and social impact assessments related to commercial and recreational fishing. A FLO will be acting on Statoil's behalf throughout all development stages, including during the operation and decommissioning phases. The primary roles and responsibilities of the FLO are:

- To serve as the primary point of contact between the project and the fleets

- To log all interactions between the project team and fisheries representatives accurately and in a way that can be shared by the project team

- To maintain a fisheries stakeholder database and contacts list for all identified fisheries operating within the vicinity of the offshore wind lease area and export cable throughout all stages the project, covering the following details:
  - Vessel names, owners, registrations and base ports
  - Vessel radio call sign
  - Dominant method(s) of fishing and any new technology developing within the fisheries
  - Static gear surface marker details where applicable
  - Target species as well as key by-catch species
  - Fishing grounds relevant to the project
  - Fishing periods and operating practices of each key fishery
  - Feedback, comments and concerns voiced within consultations

- To arrange meetings with the fishing industry throughout all stages of project development, with frequency, timings and method of communication appropriate to the level of activity at the time.

- To consult the relevant Fishing Industry Representatives (see section 3.4 below).

- To maintain regular liaison with relevant fishermen's associations, individual skippers and vessel owners, the Mid-Atlantic Fishery Management Council, and any relevant fisheries regulatory bodies as appropriate.

- To disseminate project related activities which could potentially interact with fisheries stakeholders. This will include:
  - A description of the survey activity or other works to be undertaken;
  - The location and timing of survey activities;
  - The coordinates of partially and/or fully installed infrastructure;
  - A look ahead of the schedule of works where available;
  - Details of the vessels involved in the works including the vessels contact details;
  - Survey and installation vessels transit routes to and from site;
  - The locations and timings of safety exclusion zones that may be required during installation or maintenance activities;

- Health & Safety standards and COLREGS obligations;
- Contractor obligations towards fisheries stakeholders;
- Conflict avoidance response procedures and reporting procedures.

- Be available to receive and relay back to Statoil all relevant concerns from the fisheries stakeholders in respect of the various activities associated with the project;
- To keep fisheries stakeholders updated of any changes in project design, or scheduling;
- To assess and advise Statoil on the need for, and subsequently support Statoil in organizing, guard vessels and offshore Fisheries Liaison Representatives (see section 3.4 below);
- Monitor fishing activity within the wind farm site and export cable route during all phases of the project;
- Support Statoil in making wind farm survey, installation and operations and maintenance contractors aware of relevant fishing activities, including any relevant fishermen's sensitivities, and procedures for communicating with fishing vessels at sea;
- Advising and supporting Statoil on the procurement of offshore Fishing Liaison Representatives (OFLRs);

3.4 Fishing Industry Representatives (FIRs)

Fishing Industry Representatives (FIRs) will be established as the main point of contact within a fishing industry organization. These representatives should represent the views of the fishermen within his or her remit. The FIRs should have the backing and support of the fisheries stakeholders they represent. The FIRs should be able and willing to disseminate information from the FLO or Statoil to the fishing community and vice versa on a timely and all-inclusive basis. The FIR is normally an individual who has worked extensively within the industry. The primary responsibilities of the FIR are:

To be the main focal point for liaison with fisheries stakeholders;

- To liaise and cooperate with the FLO to ensure the objectives of the FLP and co-existence strategy are achievable;
- To feed back to the FLO any fishermen's concerns, data, or requests for meetings; and
- To assist in the distribution of notices and relevant project information to fisheries stakeholders and to follow up that all relevant parties received such notices.

3.5 Offshore Fisheries Liaison Representatives (OFLRs)

Where required and appropriate, Fisheries Liaison Representatives (FLRs) will be present on vessels that are working on behalf of Statoil in the wind farm related activities, for example survey vessels and installation vessels. The main purpose is to ensure good communications with fishing vessels encountered on site. This may be for the purpose of disseminating information, responding to queries from fishing vessels and acting as a conduit for information offshore between the FLO, FIR and fisheries stakeholders within or near the site. The primary responsibilities of the OFLR are:

- To maintain daily contact with, and keep records of, fishing vessels observed to be within the vicinity of the work areas of wind farm related vessels;
- To keep the masters and watch officers of wind farm related vessels informed of fishing vessels in the vicinity of their working area and the gears and modes of operation of such fishing vessels;
- To keep fishing vessels advised of the wind farm vessels locations, operations, schedules, safety zones and Health & Safety restrictions; and
- To provide on-site adhoc assistance and advice to wind farm related vessel officers with the objective of minimizing hindrance to fishing activities, avoid conflicts and ensuring the commitments in the co-existence plan are adhered to.

3.6 Communication Channels

Notices and Information for fishermen will be distributed via the following options:

- Via the FIRs where relevant;
- Fishermen's associations;
- Directly from the FLO to individual fishermen not represented by an FIR, but identified on the FLO's database;
- USCG Notice to Mariners;
- Electronic email distribution to commercial fishing permit holders (NOAA or state agencies)
- Statoil's relevant website page;
- Local harbor masters;
- Newsletters;
- Fishing news publications.

3.7 Communications Plan & Scheduling

Prior to the onset of site surveys and installation activities, a survey specific fisheries communications and emergency response plan will be drafted specifically for the identified fisheries stakeholders. This will include:

- Primary points of contact;
- Points of contact in an emergency situation offshore;
- Follow up / incident reporting procedures.

A scheduling plan will be drafted in consultation with fisheries stakeholders on the appropriate amount of notice required prior to the onset of surveys, installation or operations and maintenance activities. The plan will also detail the agreed effective frequency of general project and project development updates, and how these updates are conducted (e.g. meetings, email, via FIRs etc).

Offshore Survey Activities 2018 Update

Attention Fishermen and Other Mariners: Survey Activities for the Empire Wind Offshore Lease, New York Bight - Ongoing 2018

Equinor Wind US, formerly known as Statoil Wind US, is the lease holder of the New York offshore wind energy area OCS-A 0512 known as the 'Empire Wind' project. As part of the site development process, Equinor has been conducting geophysical & geotechnical surveys over the project area since spring 2018.

Details of the survey activities were covered in the Survey Newsletter issued in February 2018. The purpose of this newsletter is to provide an update on active survey activities, planned surveys and metocean mooring deployments.

Survey vessel RV Ocean Researcher has been engaged in surveys in the wind lease area since April 2018 and is finishing surveys as of December 2, 2018.

Following the approval of Equinor's Site Assessment Plan (SAP) by BOEM on November 21, 2018, contractor RPS will deploy two meteorological & oceanographic (metocean) buoys and one subsurface metocean mooring in the lease area as of December 2018 for a period of up to 2-years.

Details of the metocean buoy positions and relevant contact details are covered on the next page.

NEWSLETTER

Notice of Surveys

28 November 2018

Indicative Offshore Wind Farm: Dudgeon, UK

Empire Wind OCS-A 0512

The Empire Wind site extends 14-30 miles south of Long Island, spanning 79,350 acres, in water depths between 65 and 131 feet (see map). Subject to environmental and technical constraints, which will be explored as part of the development phase, it is believed that the site has a potential generating capacity of over 1 GW. The exact details of the wind farm design and installation techniques will be influenced by consultation with the maritime and fishing community. Equinor intends to consult on draft layouts this winter 2018/2019.

RPS Metocean Moorings

RPS has been contracted to supply and deploy surface and subsurface metocean moorings on Equinor's offshore wind lease in order to measure wind, meteorological and oceanographic conditions to help inform the design and development of the proposed wind farm. This consists of 1 x Floating LiDAR (FLiDAR) buoy, 1 x surface Metocean buoy and 1 x subsurface current meter mooring.

FLiDAR Buoy - the FliDAR buoy is made up of a surface buoy of approx. 15 ft diameter and 16 ft overall height, moored to the seabed via a combination of mooring chains, rubber cords and anchor weights. The FLiDAR measures wind speed and direction.

Metocean Buoy – the Metocean buoy, measuring waves and meteorological conditions, is made up of a surface buoy of approx. 9 ft diameter and 8 ft in height, moored to the seabed via a combination of mooring chains, rubber cords and anchor weights.

Current Meter Mooring – The current meter mooring is an inline subsurface mooring made up of subsurface floats, chain, wire rope and oceanographic sensors measuring current speed and direction and seawater properties. The upper most float is approx. 15 ft below sea surface.

Issue Five

Spring 2015

Fisheries Update 5

Dogger Bank Creyke Beck consented

The first consent order for offshore wind energy at Dogger Bank was granted in February making it the largest renewable energy development ever to receive planning consent in the UK.

The consent approval is the result of more than four years of comprehensive assessments, stakeholder consultation and planning by Forewind, which included the most extensive study of an offshore area by a wind energy developer ever undertaken with more than £60 million spent on surveys, the vast majority going to UK-based contractors.

The fish ecology surveys were undertaken by Suffolk-based Brown & May Marine and Hull-based Precision Marine Services Limited. Local UK fishing vessels including the *Jubilee Spirit* were used to carry out a number of surveys employing scientific and traditional fishing sampling methods.

Energy and Climate Change Secretary Ed Davey approved the application for the Dogger Bank Creyke Beck development, which was submitted to the Planning Inspectorate by the Forewind consortium in August last year. He said:

"This is another great boost for Yorkshire and Humberside. This development has the potential to create hundreds of green jobs and power up to two million homes.

"Making the most of Britain's home grown energy is supporting jobs and businesses in the UK, getting the best deal for consumers and reducing our reliance on foreign imports. Wind power is vital to this plan, with £14.5 billion invested since 2010 into an industry which supports 35,400 jobs."

Fishing survey vessel, *Jubilee Spirit* used during the environmental impact assessment

Dogger Bank Creyke Beck, which has a total generating capacity of 2.4GW, comprises two separate 1.2GW offshore wind farms, each with up to 200 turbines installed across an area of around 500km^2.

The wind farms will be located 131 kilometres from the UK coast and will connect into the existing Creyke Beck substation near Cottingham, in the East Riding of Yorkshire.

When constructed, Dogger Bank Creyke Beck will be one of UK's largest power generators, second only to the 3.9GW Drax coal-fired station in North Yorkshire.

In total it will be capable of generating 8 terrawatt hours (TWh) of green energy per annum, equal to the amount used annually by approximately two million British homes.*

* Homes powered equivalent: This is calculated using the most recent statistics from the Department of Energy and Climate Change showing that annual UK average domestic household consumption is 4,192kWh.

Dogger Bank Teesside A&B decision due August

The Planning Inspectorate's six-month examination of the Dogger Bank Teesside A&B development consent order application concluded in February, with a recommendation due to be submitted to the Secretary of State for Energy and Climate Change in May and a decision anticipated in August.

As per Dogger Bank Creyke Beck, Dogger Bank Teesside A&B also comprises two 1.2 gigawatt wind farms, however they are located further from the UK coast at their closest point (165 kilometres) and are planned to connect to the national grid at the existing Lackenby substation near Eston, in Redcar & Cleveland.

If consent is granted, fisheries stakeholders, and particularly those directly impacted, will continue to be engaged and involved by operators in planning for the construction and operation and maintenance phases of the wind farms.

Issue highlights

This is the fifth edition of Fisheries Update – Forewind's newsletter for the commercial fishing industry. It gives the latest news on the Dogger Bank development and consenting progress.

If you would like to receive copies electronically please email your request and contact details to info@forewind.co.uk.

forewind.co.uk

DOGGER BANK
CREYKE BECK

Dogger Bank Creyke Beck comprises two up to 1.2GW wind farms subject to a single development consent order application. Consent was granted for the 2.4GW development in February 2015.

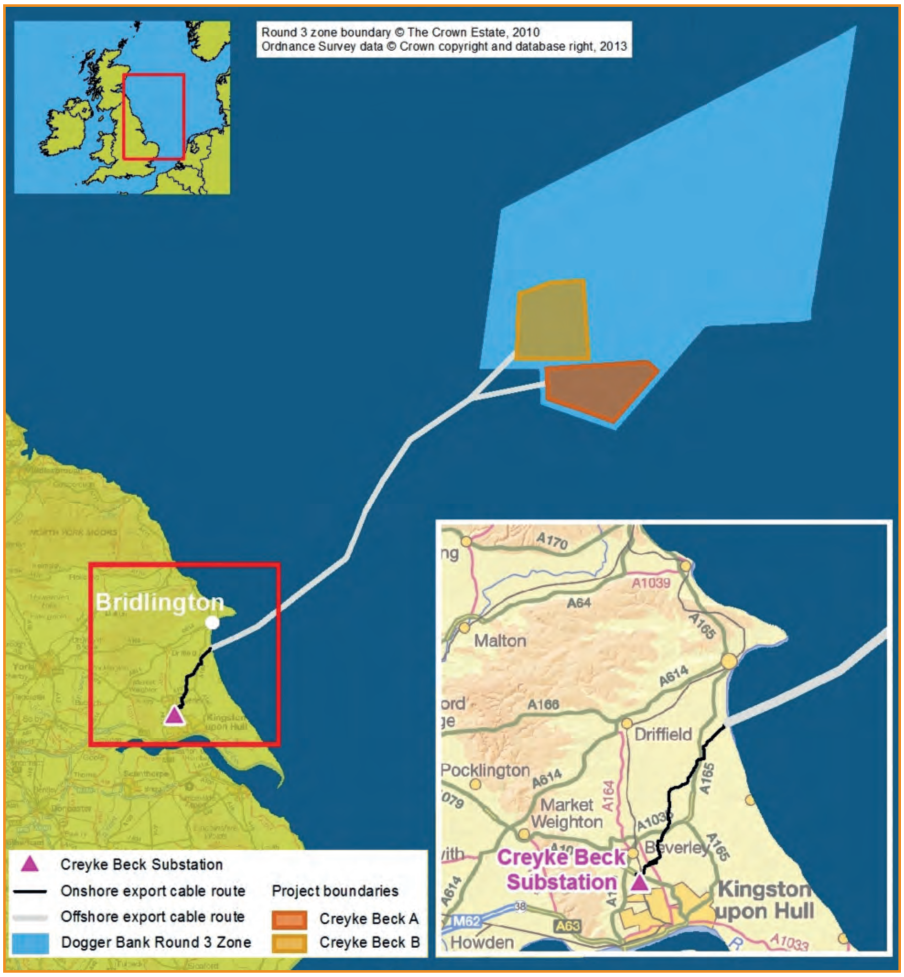
Next steps post-consent

The Forewind consortium is a joint venture formed specifically with the remit to gain the consents for the Dogger Bank projects, and now that the consent for Dogger Bank Creyke Beck has been granted, the work to further the development will be transferred to operators for the next phase.

General Manager, Tarald Gjerde said the organisation and its four owners were thrilled when the first consent for the Dogger Bank Zone was granted, taking the flagship development a step closer to supplying the UK with a significant amount of renewable energy, and to realising the many potential economic opportunities, particularly on the east coast.

Dogger Bank Creyke Beck could create up to 4,750 new direct and indirect full time equivalent jobs** and generate more than £1.5 billion for the UK economy, with the majority of opportunities in the North East and Yorkshire and the Humber regions.

This is particularly due to the regions proximity to the development as well as their historic strengths, existing skills in large-scale production activities and a marine support legacy.



Operators will take over the further development of the two Dogger Bank Creyke Beck projects.

Operators to take over

The operators of the two Dogger Bank Creyke Beck projects should be in place this year. The operators look set to come from within the four Forewind owner companies, and they are now carrying out the complex work to finalise the administrative and governance arrangements for the handover.

Once in place, the operators will begin the postconsent work which will include the technical and commercial design of the wind farms, developing links with supply chain and stakeholders and carrying out all the pre-construction activity needed to reach the stage of financial investment decision.

Fisheries stakeholders will be informed about the operators and provided with relevant contact details as soon as practicable after they are appointed.

Maintaining good working relationships with the fisheries industry will be one of their priorities and Forewind will be closely involved to facilitate a smooth handover.

Offshore Environmental Impact Assessment Manager Martin Goff will be responsible for the process to personally introduce the fisheries contacts from the Dogger Bank Creyke Beck operators to the fishing industry. A key task will be to coordinate workshops that will be forums to ensure there is mutual understanding of the fishing related requirements in the development consent order as well as the commitments within the Statements of Common Ground.

While the responsibility for fisheries liaison for the Dogger Bank Creyke Beck projects will transfer to the operators once they are in place, Forewind will continue to manage fisheries liaison for the Dogger Bank Zone and, for a period, for Dogger Bank Teesside A&B.

The responsibility for fisheries liaison for the Dogger Bank Teesside projects is expected to transfer to operators following the consent award, however there will be emphasis amongst all the operators on maintaining a coordinated approach for the Dogger Bank Zone.

Until the operators take responsibility, the fisheries liaison contacts named on the back page will remain in place for any relevant enquiries or concerns.

** Full time equivalent (FTE) employment is equivalent to 10 annual job years (filled by either one employee or multiple employees).

DOGGER BANK
TEESSIDE A&B

Dogger Bank Teesside A&B comprises two up to 1.2GW wind farms subject to a single development consent order application. A decision on the development consent application is expected in August 2015.

Examination brings revisions

Input from fisheries industry representatives during the Dogger Bank Teesside A&B examination process resulted in an updated Fisheries Liaison Plan (FLP) and other relevant commitments.

The examination started in Redcar in August last year and included both open floor and issue-specific hearings plus five site visits to the proposed landfall, along the onshore cable route, and to the sites for the two proposed converter stations and connection works into the national grid.

The examination involved approximately 40 stakeholder organisations and individuals with an interest in the project proposals. Around 55 statements of common ground were agreed with key groups as part of the process, including with 11 with fisheries groups and four with shipping and navigation organisations. More than 550 documents were submitted over the period.

The FLP was discussed specifically during the examination and updated following feedback from examiners, Hartlepool Fishermen's Society, National Federation of Fishermen's Organisations and Anglo-Dutch fisheries body, VisNed.

The plan covers Forewind's approach to coexistence and includes a consultation strategy with objectives to ensure early, effective, meaningful and transparent engagement with stakeholders. The necessary future roles are defined and it also includes an overall strategy covering mitigation or compensation for those within the commercial fisheries industry likely to be subject to residual significant impacts.

Specifically, the main updates to the draft FLP included:

- A commitment to early engagement from the start of the design phase to enable operators to benefit from previous lessons learned by the fishing industry and existing knowledge of ground conditions, as well as to give a platform for concerns

- A commitment to sharing post-installation survey results with fishermen

Teesside fishing boats – local fisheries organisations helped shape the new Fisheries Liaison Plan.

- Consideration of the use of guard vessels outside of safety zones

- Collaborative use of the Dogger Bank 3D computer generated simulation.

The updated plan is now available for download on the Forewind website (www.forewind.co.uk).

Fisheries related commitments

The revisions to the FLP were not the only change resulting from fisheries involvement during the examination process.

Its iterative approach enabled fisheries groups to attend and highlight their main issues, resulting in a number of conditions to be committed to within Deemed Marine Licenses as part of the Dogger Bank Teesside A&B draft Development Consent Order.

These commitments relate to: securing the Fisheries Liaison Plan, the appointment of Fisheries Liaison Officers; the cable specification and installation plan, post-installation cable surveys, and the search and rescue emergency response plan (ERCOP).

A position to alleviate key concerns was agreed with the Hartlepool Fishermen's Society during the examination. The concerns related to a potential loss of habitat and safety issues over cable protection and it was agreed these would be best dealt with post consent through early engagement in the early design phase and the sharing of information.

Forewind's Offshore Environmental Impact Assessment Manager, Martin Goff said that the cornerstone for Forewind has always been the belief that the fishing industry and the Dogger Bank offshore wind farm development will be able to co-exist peacefully.

"The operators will be keen to also ensure good cooperation and a close working relationship once they take over the projects," he said. "Key to this will be adhering to the commitments made by Forewind and secured within the Development Consent Order and Fisheries Liaison Plan."

What's in a name?

The Dogger Bank projects were early on given names that linked the offshore wind farm location with the onshore substation site.

The names were intentionally functional for the development consent process and it was understood they would most likely be later changed in line with the longer-term needs of the operators and to meet the practical needs of key offshore stakeholders.

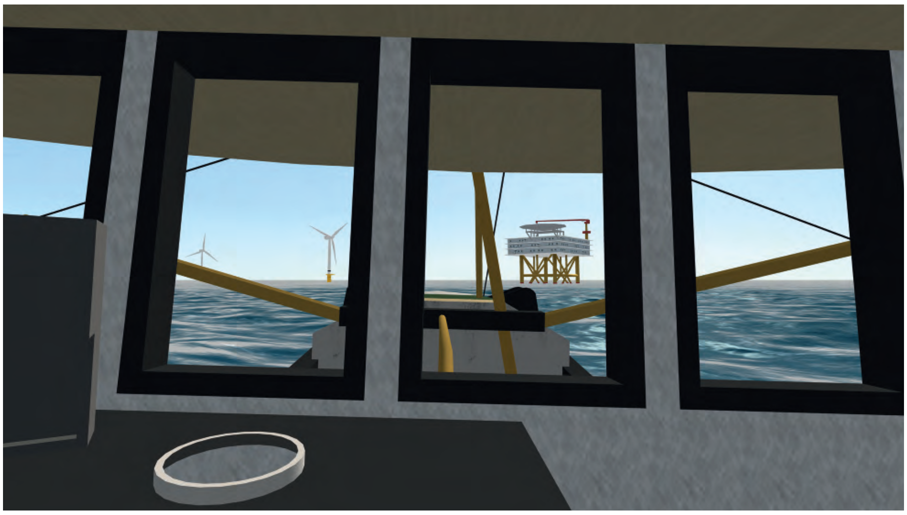
The re-naming will be the responsibility of the operators and will be changed and publicised when the timing is appropriate.

Trawler view added to 3D programme

Forewind's 3D computer generated simulation of the proposed Dogger Bank offshore development has been updated to include the view from the bridge of a trawler which is of particular relevance to fisheries.

The model was developed to enable fishermen and offshore authorities to better understand and visualise how the development will look once constructed and can now downloaded from the organisation's website.

Anyone wanting to download a copy of the model should email info@forewind.co.uk to request a username and password. They can then visit the Downloads section of www.forewind.co.uk to install the 2GB .exe file and find instructions and a user guide.



The view from a trawler has now been incorporated into the Dogger Bank 3D computer simulation, which has proved popular with offshore and other stakeholders.

Dealing with subsea cable risks

The potential risk to fishing trawlers from subsea cables will be the focus of a new subgroup of the Fisheries Liaison with Offshore Wind and Wet Renewables (FLOWW) group, which Forewind supports and will actively participate in.

The risk to trawlers from subsea cables from the Dogger Bank offshore wind farms was a topic which emerged during the examination of Dogger Bank Teesside A&B, however it is recognised as a wider issue extending to the whole offshore wind industry as well as oil and gas, telecommunications and other sectors.

The newly formed FLOWW subsea cables subgroup has the remit to develop best practice guidance on this important issue as well as guiding principles for the fisheries liaison related to offshore renewables cables, from planning through to operation, and dealing with emerging concerns.

Forewind will be represented on the subgroup to contribute to the discussions and assist with the development of guidance on this issue.

Danish fishermen assist in porpoise research

Danish fishermen have been assisting a group of offshore wind developers, which have joined forces to better assess the impact of offshore wind farm construction on the harbour porpoise population of the North Sea.

Harbour porpoise in the North Sea.
Photo courtesy of Malcolm Barradell.

The fishermen have contacted the researchers at Aarhus University, who are carrying out the research known as Disturbance Effects on the Harbour Porpoise Population in the North Sea (DEPONS), when harbour porpoise have been found in their pound nets. The researchers have then been able to tag the harbour porpoise for monitoring.

The research will continue this year with the final results published in peer-reviewed scientific publications in 2016.

NYS Energy Research and Development Authority
17 Columbia Circle
Albany, NY 12203-6399

To Whom It May Concern,

I am writing to express my strong support of the proposed Empire Wind Project by Equinor Wind US. This offshore wind project proposal is currently under consideration by the New York State Energy Research and Development Authority ("NYSERDA") and is the only proposal that would be located off the coast of Long Island.

With the effects of climate change becoming ever-more apparent, and the impacts from superstorm Sandy still reverberating throughout communities on Long Island, the need for strong investments in renewable resources should be readily apparent. With this project, New York has the opportunity to become an economic hub for the emerging offshore wind industry. Additionally, situating an offshore wind project off the New York coast, rather than selecting a project from Massachusetts, Rhode Island or New Jersey, will create thousands of good green jobs for New Yorkers.

Choosing the Empire Wind Project will greatly assist in enabling New York to accomplish its goal of 100% renewable energy by 2040, while creating quality jobs for the local community. I am pleased to be able to offer a recommendation on the behalf of this project. Thank you for your consideration and please do not hesitate to contact me if you have any questions.

Sincerely,

Todd Kaminsky
Senator, 9th District

February 12, 2019

President and CEO Alicia Barton
New York State Energy Research and Development Authority
17 Columbia Circle - Albany NY 12203

Dear Alicia Barton,

I write in support of Equinor Wind US and their offshore wind project proposal under consideration by NYSERDA. As a champion for the transition to a clean and renewable energy economy, I was especially excited with Governor Cuomo's recent proposal to increase the state's offshore wind target from 2,400 MWs by 2030 to 9,000 MWs by 2035.

With the effects of climate change becoming ever-more apparent, and the impacts from Hurricane Sandy still reverberating throughout communities in New York City and on Long Island years later, I am encouraged by the opportunity for New Yorkers to seize this moment and lead the nation as an economic hub for the emerging offshore wind industry. I believe siting an offshore wind project off the New York coast, rather than selecting a project from Massachusetts, Rhode Island, or New Jersey, will further the intent of the state to create thousands of good paying jobs for New Yorkers for decades to come.

As New York procures Offshore Wind Renewable Energy Certificates (ORECs) to achieve the Clean Energy Standard, I urge you to give strong consideration to the economic benefits for New Yorkers and the application by Equinor Wind.

Thank you for your consideration. Please contact my office with any questions.

Sincerely,

Michael J. Cusick
Member of Assembly

Re: Empire Wind Project

To Whom it May Concern:

I write to express my support of the Empire Wind Project proposed by Equinor Wind LLC ("Equinor") in response to NYSERDA's request for proposals.

Renewable energy, particularly offshore wind, is critically important to Nassau County and the State of New York as a whole. My Administration has been following the developments of the State's Offshore Wind Program with great interest, given the exciting potential it offers for meeting the State's ambitious clean energy goals, as well as the tremendous economic development opportunities for our region.

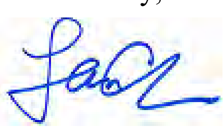
Throughout this process we have made the case that the local communities expected to "host" wind generation activities, like Nassau County, should be able to participate in the economic opportunities created by these projects.

We are pleased that Equinor has engaged in an on-going dialogue with Nassau County to ensure that jobs and facilities created as a result of this new industry be located here. We appreciate the company's commitment to Nassau regarding such investments, particularly in the area of potential land-based operations and maintenance activities.

We believe the Equinor Wind project holds great promise for a partnership with Nassau County and look forward to the associated economic benefits for our residents.

Thank you for the opportunity to offer our views on this matter.

Sincerely,



Laura Curran

COUNTY OF SUFFOLK

OFFICE OF THE COUNTY EXECUTIVE

Steven Bellone
SUFFOLK COUNTY EXECUTIVE

Re: Empire Wind Project

To whom it may concern,

I am pleased to have an opportunity to express our support for Equinor Wind US LLC ("Equinor Wind"), as it works towards development of the Empire Wind Project. I particularly appreciate Equinor Wind's willingness to engage in an open dialogue with my office and keep Suffolk County updated about the progress of the project. It is especially important to Suffolk County that Equinor continue to engage stakeholders from throughout the region, including our heritage commercial fisheries, in order to balance the needs of all constituencies as the offshore industry develops in the region.

I am optimistic about the potential impact that the Empire Wind Project will have on establishing New York as a hub for offshore wind development. We look forward to collaborating with Equinor on potential synergies with Suffolk County companies that can play a role in the project.

We wish continued success as it pursues development of the Empire Wind Project and look forward to the project's completion.

Sincerely,

STEVEN BELLONE
County Executive

SCVOA Suffolk County Village Officials Association
FIGHTING FOR VILLAGE RESIDENTS SINCE 1934

February 7, 2019

RE: Empire Wind Project

To Whom It May Concern,

We would like to express our support of Equinor Wind US LLC ("Equinor Wind") and the Empire Wind Project. Renewable energy, particularly offshore wind, is critically important to Suffolk County and New York State as a whole. We appreciate Equinor Wind's continued dialogue with local municipalities as it works to develop this project.

The villages of Suffolk County are excited about the Empire Wind Project and the benefits it could bring to the area, if selected. We particularly appreciate the significant effort Equinor Wind has made in reaching out to interested stakeholder groups and communities. If selected, development of the Empire Wind Project has the potential to establish New York as a national leader in the offshore wind industry and result in a range of environmental and economic benefits for local municipalities.

Sincerely,

Richard B. Smith

ROYAL NORWEGIAN
CONSULATE GENERAL

Consul General

New York, 31.01.2019

To Whom It May Concern

Equinor is a reputable, prosperous company, known for its high ambitions for sustainable solutions and shaping the future of energy – ambitions which it is already following through on, among other things by entering the market for offshore wind.

Equinor is the largest company noted on the Norwegian stock exchange, and has been instrumental to the economic development of the country since its inception in 1972. It is a highly profitable company, with a total revenue of $61 billion in 2017. It is present in over 30 markets, including several of the world's most important oil and gas markets. Its products include crude oil and natural gas, as well as processed products such as petrochemicals – and now it aims to seize the new business opportunities that are opening up in clean energy. It already powers 650 000 British homes through its offshore wind projects, and has several new projects in Germany, Norway and the US on the horizon.

In the past year, The Royal Consulate General has had the pleasure of hosting two events relating to clean energy policy in New York with Equinor as a valued partner on both, showing their dedication to collaborate with stakeholders to work together toward a clean energy future. We follow the developments of Equinor with great interest, and appreciate our close dialogue with the company on offshore wind developments.

Yours sincerely

Harriet E. Berg

WCS

February 12, 2019

To whom it may concern,

The Wildlife Conservation Society (WCS) saves wildlife and wild places worldwide through science, conservation action, education, and inspiring people to value nature. To achieve our mission, WCS, based at the Bronx Zoo, harnesses the power of its Global Conservation Program in nearly 60 nations and in all the world's oceans and its five wildlife parks in New York City, visited by 4 million people annually. WCS combines its expertise in the field, zoos, and aquarium to achieve its conservation mission.

The New York Aquarium is located along Brooklyn's famed Coney Island Boardwalk. The aquarium connects visitors to marine life in New York waters and around the world through innovative exhibits and world-class animal care, educates more than 60,000 youth and adults in our formal education programs and conducts field research and conservation policy action in the waters of New York. The aquarium is accredited by the Association of Zoos and Aquariums (AZA).

Over the last two years, and as part of our work to protect and conserve the rich marine life in the New York Seascape, we have engaged with Equinor's Empire Wind team. Beginning in 2017, our discussions have ranged from the availability of baseline information about marine wildlife that exists in the NY Bight to best conservation practices that might be followed by the Empire Wind project.

Equinor and WCS recently have agreed to undertake a multi-year collaboration involving the collection of near real-time acoustic monitoring for several baleen whales species in the Empire Wind lease area. This effort will yield information critical to the conservation of whales in the New York Bight, and might help Equinor reduce potential impacts to whales in the NY Bight. The collaboration also includes a public outreach and education component through our New York Aquarium.

We have appreciated the constructive engagement with Equinor, and their willingness to consider approaches to conserve marine species and important habitats. Equinor has expressed their desire to undertake responsible development of offshore wind resources consistent with New York's environmental goals.

Thank you for your time and consideration.

Jon Forrest Dohlin
Vice President and Director
WCS's New York Aquarium
602 Surf Avenue

ATLANTIC MARINE CONSERVATION SOCIETY
Promoting Conservation Through Action

February 4, 2019

Equinor Wind US LLC
120 Long Ridge Road Ste 3E01
Stamford, CT 06902

RE: Empire Wind Project

To Whom It May Concern:

On behalf of the Board of Directors, staff, and volunteers, I am pleased to hear of Equinor Wind US LLC's commitment to the development of renewable energy in an environmentally conscious manner. I look forward to building a relationship promoting marine conservation and, in particular, investigating marine mammal and sea turtle strandings in the region.

The Atlantic Marine Conservation Society (AMCS) is a multi-faceted organization promoting marine conservation through action. In addition to our grassroots efforts involving community outreach and educational programs, we are authorized by NOAA Fisheries and the New York State Department of Environmental Conservation to respond to stranded marine mammals and sea turtles throughout New York. The primary functions of AMCS are to coordinate and manage stranding response for all deceased marine mammals and sea turtles in New York waters and to develop and implement response plans for live large whale strandings and fishery interaction cases. AMCS conducts investigations on the causes of strandings, whether human induced or natural. As part of our stranding response program, we compile and analyze data to assess trends.

AMCS's team is comprised of individuals that have investigated marine mammal and sea turtle strandings for more than two decades. These team members have responded to over 5,400 strandings in New York waters alone. Since its inception, AMCS has responded to over 350 whales, dolphins, seals and sea turtles. In the last two years, AMCS has reported an unprecedented 28 large whale strandings. AMCS's team is currently working closely with NOAA Fisheries concerning four ongoing Unusual Mortality Events (UMEs) in the Northwest Atlantic involving humpback, minke, and North Atlantic right whales and harbor and gray seals.

Our twenty-five years of experience is not just related to responding to stranded marine mammals and sea turtles. AMCS's team also conducts land, boat and aerial surveys of marine mammals and sea turtles throughout the Northwest Atlantic to collect and disseminate data to

ATLANTIC MARINE CONSERVATION SOCIETY
Promoting Conservation Through Action

environmental managers, ensuring the long-term survival of critical members of our ocean ecosystems. We have also conducted health assessments on seals and sea turtles and satellite tagged over 200 marine mammals and sea turtles throughout North America to gain insight into the effects of climate change, marine traffic, and other man-made changes to the environment. Our team also works closely with NOAA Fisheries' large whale and sea turtle disentanglement teams to provide support for operations in the New York region.

AMCS's relationship with Equinor Wind will help us continue our efforts to better identify and understand changes in the marine environment and, specifically, with stranding occurrences. Without this continued effort, many animals will go undocumented and causes of mortality will remain speculation. Through this relationship, AMCS hopes to enhance its response capabilities and to build our health assessment and monitoring programs in the New York region. We also hope that through this relationship we can expand our outreach efforts, so we can better inform the public of the threats facing the marine environment and identify ways in which concerned citizens can minimize their negative impact.

Please do not hesitate to contact me should you require any additional information.

Very truly yours,

Robert A. DiGiovanni, Jr.
Executive Director and Chief Scientist

Re: Empire Wind Project

To whom it may concern,

As northern New Jersey, and New York City and Long Island fishing guides, we are writing to express the growing support among recreational anglers for offshore wind power development in our region. We are seeing the impacts of fossil fuel pollution, including climate change, first hand, and see offshore wind power as an important clean energy solution.

Evidence from European developments and America's first offshore wind farm off of Block Island, Rhode Island, demonstrate that the turbine bases act as artificial reefs, attracting numerous sought-after game species as well as the anglers and charter boats that pursue them.

We both support the goals of Anglers for Offshore Wind Power, an organization that advocates for responsibly developed offshore wind power that can benefit recreational fishing if done correctly. We call for guaranteed fishing access within wind farms, commitments to monitoring fisheries impacts before, during and after construction, and opportunities to connect with developers and agencies to ensure our voices are heard in all stages of project development.

As licensed captains, we know development of offshore wind turbines within the Equinor lease area would attract the attention of private and for-hire captains from both New York and New Jersey. Assuming this project follows the pattern of the Block Island Wind Farm, on any given day we could see dozens of fishing vessels in the Empire Wind project area within a few years. At 20 miles offshore, the turbine bases could also attract highly sought after pelagic species like tuna and mahi-mahi.

In New York alone, recreational fishing supports 10,000 jobs and generates more than $1.1 billion in sales. Responsibly developing the Equinor lease area will benefit local saltwater anglers as well as the businesses they support. We hope that the state of New York will consider the support of recreational anglers for responsibly developed offshore wind power, as well as our economic impact, when evaluating the costs and benefits of all offshore wind projects competing to sell power to New York.

Signed,

Captain Paul Eidman
Tinton Falls, New Jersey

Captain John McMurray

Albany, NY 12203

RE: Empire Wind Project

Dear Ms. Barton:

The International Brotherhood of Electrical Workers (IBEW), Third District is pleased to be working with Equinor Wind US, LLC ("Equinor Wind") and the Empire Wind Project. The IBEW has been in active dialogue with Equinor Wind regarding potential employment opportunities associated with the Empire Wind Project.

Since 1891, the IBEW has steadfastly represented the interests of workers in the electrical industry, throughout the United States and Canada, with our current membership at approximately 775,000 members. Our members work in a wide variety of fields, including construction, utilities, manufacturing, telecommunications, broadcasting, railroads and government. In New York State alone, the IBEW represents approximately 50,000 members in various trades ranging from construction to utility jurisdictions. It is because of our diverse membership that we are confident we would be well positioned to adequately meet the needs of the Empire Wind project.

Furthermore, the IBEW has been engaged for a number of years in helping the State of New York achieve its offshore wind and clean energy goals while also establishing the state as a hub of offshore wind development with the most skilled and experienced workforce in the industry.

In conclusion, the IBEW once again confirms its support of the offshore wind industry, and the potential to grow the industry in New York State. We believe that should Equinor win the solicitation they would be a be a good partner in providing good union jobs. We look forward to drawing upon our many years of experience to deliver high-quality jobs to New York and further contribute to the local economy.

Sincerely,

Ellen A. Redmond

WRISE
Women of Renewable Industries and Sustainable Energy

2/10/2019

E’Lon Hall
Operations Manager
WRISE
155 Water Street
Brooklyn, NY 11201

Re: Empire Wind Project

To whom it may concern,

On behalf of Women in Renewable Industries and Sustainable Energy (WRISE), I am pleased to have an opportunity to express our gratitude to Equinor Wind US for supporting WRISE as a corporate sponsor. As New York prepares to lead the new US offshore wind industry, it is crucial that companies competing to power New York understand the importance of creating an industry that is open to all workers, and does not perpetuate the exclusion of women in the way the fossil fuel industry historically has.

WRISE promotes the education, professional development, and advancement of women to achieve a strong diversified workforce and support a robust renewable energy economy. We appreciate Equinor Wind’s sensitivity to the importance of both workforce training that includes women, as well as hiring practices that promote diversity.

WRISE strongly supports Equinor’s commitment to implement these values in developing and building the Empire Wind Project in New York.

Sincerely,

E'Lon Hall

E’Lon Hall
Operations Manager

Building and Construction Trades Council of Nassau and Suffolk Counties

February 8, 2019

Equinor Wind US, LLC

RE: Empire Wind Project

Dear Sir/Madam,

The Nassau and Suffolk Building and Construction Trades Council ("NSBCTC") is looking forward to partnering with Equinor Wind US, LLC ("Equinor Wind") under the terms of a Project Labor Agreement as required by the bid specification for the Empire Wind Project.

The NSBCTC represents sixty thousand (60,000) men and women in the construction trades on Long Island and due to the size and strength of our affiliate unions and related apprentice training programs, are uniquely positioned to support the Project. We look forward to helping New York State achieve its offshore wind and clean energy goals by utilizing the safest, best trained and most skilled workforce in the industry.

In conclusion, NSBCTC once again confirms its support of Equinor Wind and the offshore wind industry and looks forward to our workforce delivering high quality jobs to the local and New York economy.

Yours truly,

Nassau and Suffolk Building and Construction Trades Council

Re: Empire Wind Project

To whom it may concern,

On behalf of Triple Five I am pleased to have the opportunity to express our support for Equinor Wind US LLC ("Equinor Wind"), as it works towards development of the Empire Wind Project.

Uniting Long Island's institutions with local businesses, will centralize the technology and innovation needed to support offshore wind. Triple Five is excited about establishing a workforce training program to assist in the development and maintenance of a skilled and diverse talent pool establishing a unique opportunity for job seekers, as well as a path toward meaningful career advancement and economic sustainability.

I particularly appreciate Equinor Wind's willingness to engage in an open dialogue with my office and keep us updated about the progress of the project. I am optimistic about the potential impact that development of the Empire Wind Project will have on establishing New York as a hub for offshore wind development. I wish Equinor Wind continued success as it pursues development of the Empire Wind Project and look forward to the project's completion.

Sincerely,

Stuart Bienenstock

Stony Brook University

Office of the Dean
College of Engineering and Applied Sciences
Stony Brook, NY 11794-2200

Tel: 631.632.8380
Fax: 631.632.8205

February 5, 2019

To Whom It May Concern,

Based on our ongoing offshore wind R&D collaboration with Equinor, and in my role as the Dean of Stony Brook University College of Engineering and Applied Sciences (CEAS), I am delighted to offer my support for Equinor Wind US LLC's Empire Wind project in the New York Bight. CEAS has collaborated with Equinor on the subject for the last 1.5 years and we plan to intensify and solidify the partnership going forward.

The CEAS and Equinor's collaboration to date has focused on innovation through optimization of offshore wind farms, as well as uncertainty reduction and integration of offshore wind into the power grid. Key aspects include wind resource estimation and advanced farm control. As part of this joint research effort, Equinor has visited CEAS at Stony Brook, following which I have paid two visits to Equinor's research and technology center in Trondheim, Norway. Our joint efforts on offshore wind technology development could contribute to a more efficient and sustainable development of offshore wind resources – including in New York State – in the future.

Sincerely,

Fotis Sotiropoulos, PhD
Dean, College of Engineering and Applied Sciences
SUNY Distinguished Professor

Re: Empire Wind Offshore Wind Energy Development

To whom it may concern,

The School of Marine and Atmospheric Sciences (SUNY Stony Brook; SoMAS) is in the process of completing a study funded by BOEM and NYSDEC and lead by Professor Michael Frisk to better understand the spatial and temporal distribution of Atlantic sturgeon in the New York Bight; specifically, the New York Wind Energy Lease Area (Equinor, Lease OCS-A 0512). Equinor Wind has facilitated this effort through additional monitoring, by facilitating the installation of three of our acoustic receivers on their Metocean moorings within their Lease Area. These were installed in December 2018, with a fourth to be installed in spring of 2019, potentially resulting in up to two years of additional data beyond the original study scope.

Equinor Wind and SoMAS have also worked together to ensure there is minimal conflict between Equinor Wind's geophysical survey activities and the array of SoMAS Atlantic sturgeon moorings installed within the Lease Area. We look forward to continuing our collaboration, including potential to accommodate more of our sensors on future Equinor moorings.

We appreciate Equinor Wind's consideration for environmental data collection in the lease area and their efforts and openness to collaborate on research. We authorize Equinor Wind to include this letter in its application for Offshore Renewable Energy Certificates to NYSERDA.

Sincerely,

Michael G. Frisk

Re: Empire Wind Project

To Whom It May Concern:

I am pleased to have an opportunity to express my support for Equinor Wind US as it works towards development of the Empire Wind Project.

As the Empire Wind team began their project development, they reached out to me regarding job training for offshore wind energy technicians. This happened just as I was working on a grant proposal to help design a robust offshore Wind Turbine Technician (WTT) program with my colleagues from SUNY Maritime. The Equinor Wind team is now serving on the steering committee for the Offshore Energy Center, helping to advise on what training their future employees will need to operate and maintain Empire Wind.

I particularly appreciate Equinor Wind's willingness to engage in an open dialogue with me and keep me updated about the progress of the project. I am optimistic about the potential impact that development of the Empire Wind Project will have on establishing New York as a hub for offshore wind development. I wish Equinor Wind continued success as it pursues development of the Empire Wind Project and look forward to the project's completion.

Sincerely,

Barbara Christe

To Whom it May Concern,

ULC Robotics, Inc. is pleased to submit this letter to express its support of Equinor US Wind's proposal to NYSERDA (ORECCRFP 18-1). Equinor is a champion for the creation of renewable energy, and a leader in the offshore wind industry. Their track record of success extends to the two largest offshore wind markets, Germany and the United Kingdom, and helps provide clean energy to over 1 million homes.

ULC encourages Equinor's intention to replicate that success in the United States, beginning with the Empire Wind project, which is located 20 miles off the cost of Long Island. Equinor's US vision based upon current and planned offshore leases has the potential to power more than 1 million homes once complete.

ULC Robotics and Equinor have been working to explore the creation of advanced, purpose-built vertical take-off and landing aircraft to support the entire lifecycle of offshore wind farms, a concept that is well-aligned with Governor Cuomo's ambitious plan to generate 9,000 megawatts of offshore energy by 2035. Equinor's experience in offshore wind project siting, planning, permitting, construction, and operations and maintenance will help establish New York as an industry leader through job creation, reduced cost and risk, and the improved safety of workers.

For over 15 years ULC Robotics has been a leader in supporting the energy industry with high-value robotic solutions and has been in discussion with offshore wind experts worldwide to develop purpose-built aircraft and robotic crawlers to support the industry. The partnership between Equinor and ULC Robotics will be well-suited to achieve NYSERDA's RFP-stated objectives, specifically Section 6.4 (Reduce risk and drive down costs) and Section 6.4.16 (New York economic benefits).

ULC Robotics looks forward to working in collaboration with Equinor US Wind to develop and deploy advanced technologies to benefit New York-based offshore wind projects and the industry as a whole.

Sincerely,

Gregory Penza
President
ULC Robotics, Inc.

Re: Empire Wind Project

To whom it may concern,

I am pleased to express my support for Equinor Wind US LLC ("Equinor Wind"), as it works towards development of the Empire Wind Project. I particularly appreciate Equinor Wind's willingness to engage in an open dialogue with my office and keep us updated about the progress of the project. I am optimistic about the potential impact that development of the Empire Wind Project will have on establishing New York as a hub for offshore wind development. I wish Equinor Wind continued success as it pursues development of the Empire Wind Project and look forward to the project's completion.

Sincerely,

Sammy Chu

Re: Empire Wind Project

Dear Sir/Madam,

Amato Law Group, PLLC ("ALG") is delighted to be considered for the role of local real estate counsel to Equinor Wind US LLC ("Equinor Wind") in its efforts to develop the Empire Wind Project. Since October of last year, ALG has been in an active dialogue with Equinor Wind to provide legal services. ALG appreciates the opportunity to be part of the team seeking to make the Empire Wind Project a reality.

Operating since 1995, and with its twenty (20) attorneys possessing extensive experience in transactional, leasing, land use, environmental and litigation work on behalf of an array of real estate clients, ALG is well positioned to support Equinor Wind in its efforts in developing the Empire Wind Project. As a full-service real estate firm, ALG will be able to identify and resolve any and all legal issues that may arise during the permitting and construction phases of development. Given this experience, ALG looks forward to playing a role in helping the State of New York achieve its renewable energy goals. Additionally, we look forward to further developing our relationship with Equinor Wind to help them deliver the Empire Wind Project in the most efficient and cost effective manner.

ALG supports Equinor Wind's efforts to bring the offshore wind industry to Long Island. If selected, ALG will draw upon our many years of experience to deliver real estate legal services for the Empire Wind Project balancing the interests of time, budget and attention to client's needs. Once again, ALG appreciates the opportunity to be a part of Equinor Wind's team and looks forward to a fruitful relationship for all involved.

Sincerely,

Alfred L. Amato, Esq.
Manager

Wind energy project off Long Island to be called Empire Wind

Newsday
By Mark Harrington
October 23, 2017

The developer is Norwegian, but the name of the first wind-energy array off Long Island's South Shore will be distinctly New York: Empire Wind.

Officials from developer Statoil are in New York this week to attend a wind-industry event in Manhattan and on Tuesday will announce the name of the project. Empire Wind was chosen, they say, to reflect the location.

"We wanted to find something that's associated with New York, to make it local," said Christer af Geijerstam, who was recently named Statoil's project director of Empire Wind. A website, www.empirewind.com, will go live later this week.

Statoil, which is two-thirds owned by the Norwegian government, won the bidding to develop 79,000 acres of ocean off Long Island through a federal auction in December 2016. Statoil's bid was $42.5 million, besting New York State, the second-final bidder.

Geijerstam indicated that Statoil has ambitions beyond the Empire Wind project. New York State this month identified more than 1 million acres of offshore waters for future wind arrays for at least four additional wind farms beyond the Statoil project. "It's fair to say Statoil has the northeast of the U.S. as a priority area and we'll be looking at ways to increase our efforts and engagements in this area," he said.

For Empire Wind, the tentative plan is to erect 80 to 100 turbines 14 miles south of Long Beach and extending south-eastward. The project would produce up to 1,000 megawatts of energy, enough to power hundreds of thousands of homes, but Geijerstam noted production will be based on contracts the company negotiates with the state or power companies.

"At this stage we'll keep all options open" in terms of the size, he said.

Record $42.5M Bid Wins LI Wind-Farm Lease

Innovate Long Island
By Gregory Zeller
December 16, 2016

The U.S. subsidiary of a Norwegian energy company has placed a record $42 million bid to win the lease rights to build a wind farm 11 miles off Long Island.

Stamford-based Statoil Wind US LLC, a subsidiary of Norwegian mega-utility Statoil, topped five other bidders – including the New York State Energy Research and Development Authority – in a 33-round U.S. Department of the Interior auction that kicked off Thursday.

The auction covered 79,350 acres of ocean real estate – roughly 127 square miles – between the southern Long Island and northern New Jersey coasts, and as the saying goes, things accelerated fast: Statoil Wind's winning bid of $42.46 million was a far cry from the $158,700 (roughly $2 per acre) opening bid required by the Interior Department's Bureau of Ocean Energy Management.

Six contenders – including Oregon-based Avangrid Renewables, German energy company Innogy SE and Denmark-based companies DONG Energy Wind Power and Alpha Wind Energy – answered the bell. But by close of business Thursday, with bids pushing past the $25 million mark, only three bidders remained.

For its winning bid, Statoil Wind secures a preliminary one-year lease for the 79,000-plus acres, during which time it must submit a site-assessment plan to the Bureau of Ocean Energy Management. If the assessment plan is approved, the company will have an additional 54 months to submit a construction and operations plan, which the bureau will review – including a public-comment phase – and measure against other possible site uses.

With an approved construction plan, the company would have an additional 25 years to build and operate its wind farm, which it says could ultimately include more than 200 turbines and produce 1 gigawatt of power – roughly enough to power three-quarter-of-a-million homes.

The $42 million-plus bid – a record for an offshore U.S. lease, according to the Interior Department – gives the Norwegian parent company, which boasts operations in 30 countries, its first U.S. foothold, while wrapping up tidy bow on a 2016 marked by aggressive expansion.

Earlier this year, Statoil acquired 50 percent of the Arkona Wind Farm, located in the Baltic Sea off the German coast, which is slated to begin producing electricity in 2019. The company already held a 40 percent share in the Sheringham Shoal Wind Farm, which has been providing electricity to the UK since

2012, and expects to begin producing energy at its Dudgeon and Hywind farms – located off the western coasts of England and Scotland, respectively – next year.

Calling the United States "a key emerging market for offshore wind," Statoil Executive Vice President Irene Rummelhoff said her company was "excited to have submitted the most competitive bid in a highly attractive project."

"We now look forward to working with New York's state agencies and contributing to New York meeting its future energy needs by applying our offshore experience and engineering expertise," Rummelhoff said. "As today's announcement shows, Statoil is well positioned to take part in what could be a significant build-out of offshore wind in New York and other states over the next decade."

Although it rivaled – and ultimately defeated – NYSERDA in the Interior Department auction, Statoil Wind will "work closely with the New York State Energy Research and Development Authority on these studies and throughout the permitting process," the executive VP added.

Heather Leibowitz, director of NYC-based watchdog Environment New York, said the completion of the Bureau of Ocean Energy Management auction marked a giant leap in the global struggle against climate change – while giving New York "a great opportunity to be a national leader in tackling climate change and developing offshore wind."

"The successful lease sale of New York's first Wind Energy Area is a great step forward to tapping into this tremendous clean, pollution-free resource," Leibowitz said. "We look forward to continuing to work with local, state and national officials to bring offshore wind to New York."

Statoil Wind wins right to build wind farm off Long Island

Newsday

By Robert Brodsky and David M. Schwartz

December 16, 2016

Statoil Wind won leasing rights Friday to build an offshore wind farm in 79,350 acres of ocean 11 miles off Jones Beach with a record-setting bid of $42.46 million, the federal Bureau of Ocean Energy Management said.

Statoil Wind US LLC, an international energy company with offices in Houston, outlasted five other bidders, including the New York State Energy Research and Development Authority, in an online auction that lasted 33 rounds.

"We are excited to have submitted the most competitive bid in a highly attractive project, Statoil's first offshore wind lease in the United States," said Irene Rummelhoff, the company's executive vice president for New Energy Solutions.

U.S. Interior Secretary Sally Jewell said the auction "underscores the growing market demand for renewable energy among our coastal communities."

Statoil said it would work with the state energy authority, runner-up in the auction, as it conducts studies of the project area.

Headquartered in Norway, Statoil operates in 36 countries and has 22,000 employees worldwide focused on oil exploration and production.

Other bidders were Avangrid Renewables LLC, DONG Energy Wind Power Inc., Innogy US Renewable Projects LLC and wpd offshore Alpha LLC.

The auction began Thursday with participants agreeing to pay a minimum of $158,700, the original asking price set by the Ocean Energy Management bureau, part of the Interior Department. The number of bidders dropped to four when the price reached $14.46 million, and another dropped out when the price hit $19.46 million.

At day's end Thursday, the three participants were each bidding $25.46 million. On Friday, the field narrowed to Statoil and the state authority as the price reached $33.46 million.

"We have seen robust competitive interest for this auction, as evidenced by 33 rounds of bidding — the most we have seen for any of our lease sales to date," said Abigail Ross Hopper, the bureau's director.

The previous record for a U.S. offshore wind lease was $8.7 million, paid in 2014 to develop two ocean zones off Maryland, said Tracey Moriarty, a spokeswoman for the bureau. Auction proceeds go to U.S. Treasury Department, officials said.

The Department of Justice and Federal Trade Commission will conduct an anti-competitiveness review of the auction before the lease is executed, officials said.

Statoil also must submit a plan detailing its vision for the project, conduct an environmental review and give the public an opportunity to comment on the plans.

If its plans are approved, Statoil would have 25 years to construct and operate the project.

Fishing groups, including the largest commercial fishing association on Long Island, filed suit this month seeking to block the project, alleging the 194 turbines would hinder access to vital fishing grounds.

The auction marked the first time in six auctions for Atlantic Coast wind-energy areas that a government entity bid against private developers, Moriarty said.

The state energy authority said it "remains committed to the development of cost-effective offshore wind that will benefit all New Yorkers by producing clean, renewable energy, while growing a robust offshore wind infrastructure that supports new jobs."

Kevin Law, president of the Long Island Association, the region's largest business organization, called Statoil's win "good news" for Long Island's "renewable energy efforts."

POLITICO NEW YORK

Norwegian company tops state agency in auction for offshore wind rights

Politico New York
December 19, 2016

In a record-breaking auction of U.S. offshore wind development rights, a Norwegian oil and gas company has beaten out a New York state agency for the right to develop 80,000 acres off Long Island.

The federal Bureau of Ocean Energy Management last week declared Statoil, a state-owned company, to be the auction's provisional winner with a final bid of $42.5 million. That's more than the combined $15 million in revenue reported to the U.S. Treasury from previous lease auctions for a million acres for offshore wind development since 2013.

The New York State Energy Research and Development Authority came in second place. There were six bidders in total, two of which made it to the auction's final round of bidding.

Statoil, which is developing multiple offshore wind projects in Europe, plans to develop 1 gigawatt of electricity from turbines 11 miles off Long Island.

The high price reflects growing interest in offshore wind as development costs go down. The area is also close to high-cost, high-demand load centers in New York City and Long Island.

"This is a very good place to be with respect to wind resources," Irene Rummelhoff, Statoil's executive vice president for New Energy Solutions, said in an interview. "The combination of the natural resources and the attractive market make it very intriguing. Also for us this is a first foothold into the larger offshore wind market, which we believe will grow very rapidly."

Statoil will have to secure additional regulatory approvals, a power purchase agreement to sell the electricity and a connection to the electricity grid. NYSERDA had planned to package those additional pieces needed for offshore wind development and then re-sell it.

NYSERDA officials said this would speed up the first offshore wind project in New York and provide the best deal for ratepayers.

Statoil did have the option to step aside and let NYSERDA win the auction as the second-place bidder, according to BOEM spokeswoman Tracey Moriarty. But Statoil declined to do so.

Rummelhoff said the process would not be "straightforward" but that the company looks forward to working with NYSERDA and other state agencies.

NYSERDA also plans to continue looking for additional offshore wind development sites by working with coastal communities, the fishing industry and advocates, spokeswoman Kate Muller said in a statement.

The agency is developing a master plan for offshore wind in New York, set to be released by the end of 2017.

“NYSERDA remains committed to the development of cost-effective offshore wind that will benefit all New Yorkers by producing clean, renewable energy, while growing a robust offshore wind infrastructure that supports new jobs," Muller said.

The auction still faces a legal challenge from a group of fishing industry trade groups, businesses and communities. In a federal lawsuit, the Fisheries Survival Fund and others argue that BOEM did not consider options that would do less harm to habitats where squid, scallops and other marine life are harvested.

Clean energy and environmental advocates have said further environmental review is part of the process after the auction. Those groups praised the auction's results.

"It shows that there’s a lot of confidence in offshore wind in New York," said Anne Reynolds, executive director for the Alliance for Clean Energy New York, referring to the high bids the auction drew. "The state’s participation lent seriousness and confidence to the whole thing."

The Washington Post

The Energy Department helped start a revolution – and doesn't know who to hand it off to

Washington Post
By Chris Mooney
December 19, 2016

As the Obama administration prepares to leave office, it is seeking to underscore just how much has changed in the last eight years in the way we get energy — and to take some credit for it.

Since 2008, costs for wind and solar have plunged by 40 and 60 percent, respectively, according to an analysis provided by the Energy Department. That's even as the United States has installed 100 gigawatts, or billion watts, of generating capacity in the two technologies combined (75 gigawatts of wind, 25 of solar).

Meanwhile, we now have 500,000 electric vehicles on the road, thanks largely to a 70 percent drop in battery costs. The federal government can't take credit for all of this (industry invested too, states also promoted renewable energy, and so on), but it helped drive much of it through research investments over decades, said David Friedman, the Energy Department's acting assistant secretary for energy efficiency and renewable energy.

"The Department of Energy has really changed the world when it comes to energy, and that's part of a global competition that's underway," said Friedman. He spoke to the Post to preview remarks he planned to deliver Monday in Chicago at an event being put on by the Clean Energy Trust, the Chicago Council of Global Affairs, and Business Forward.

"Electric vehicles, we can take very I think direct credit for the lithium ion battery of today," Friedman added. "That core chemistry…was developed and improved at Argonne National Labs through DOE funding."

But the timing for this message, which overlaps heavily with a report that the Department released shortly before the 2016 election, couldn't be more challenging. In a month, a new administration will take over, guided by a president who talked extensively on the campaign trail about reviving the glory days of fossil fuels.

The transition has already been a painful one at the Energy Department in particular. A questionnaire revealed by the press showed that the Trump transition team had not only asked the agency for the names of career staffers who had worked on Obama climate policies, but also seemed to hint at plans to cut the department's funding.

One question asked, "If DOE's topline budget … were required to be reduced 10% over the next four fiscal years [does] the Department have any recommendations as to where those reductions should be made?"

Another asked, "What is the Department's role with respect to the development of offshore wind?" This technology, the next step for ramping up wind energy in the United States, is finally arriving in this country at a time when the next president has been particularly critical of offshore wind farms, having battled them in Scotland.

The U.S.'s first offshore wind farm, in Rhode Island, just became operational last week and **in a massive auction, the Norway-based oil major Statoil set a new record by laying down nearly $ 42.5 million on a bid for a huge offshore area off the coast of New York.** It was "the highest bid ever for a U.S. offshore wind energy area," according to the American Wind Energy Association.

"We believe that the area that we have now leased…has the potential to develop more than 1 gigawatt of offshore wind, which is a sizeable offshore wind park," said Irene Rummelhoff, Statoil's executive vice president for New Energy Solutions. "The biggest ones in Europe are about that size."

While this type of slow greening of the U.S. energy system should continue no matter who is president, it's less clear if the clean energy research investments that Friedman hails will remain a priority at the federal level — or if, instead, countries like China and Germany will take the next steps. (The Energy Department invested $ 2.4 billion in wind energy technology research from 1976 through 2014.)

Under Trump, the Department of Energy is set to be run by former Texas Republican governor Rick Perry, who once argued that the department shouldn't exist — and yet is credited with a wind industry expansion in Texas on his watch. Still, there are fears that his nomination suggests a realignment of department priorities towards fossil fuels and away from renewables.

It remains unclear how closely the vision implied by the memo, attributable to the Energy Department transition team rather than the incoming secretary, will also match Perry's approach.

But already, one point of sharp contrast is clear. Under Obama, the department was run by two scientists — Steven Chu and Ernest Moniz. In contrast, Perry is a politician who has repeatedly questioned a fundamental scientific reality — human-caused climate change.

Friedman, in the interview, strongly defended the career Energy employees who were viewed as being targeted in the memo.

"Energy efficiency, and being competitive in manufacturing, have been bipartisan issues for decades, and it has been the career employees who've continued pushing these technologies forward," he said. "The people who are going to be there on January 21 are the people who…have been the true engines behind all this progress."

And indeed, there is a broad U.S. bipartisan tradition — not only at the Department of Energy — of the federal government investing in scientific research, and then watching as the resulting technologies take root in this country and stoke new industries.

Yet it's just unclear how much this matters to Donald Trump, who has not yet named a White House science adviser.

“While the men tapped by the president-elect to run Energy, Interior and EPA have expressed doubts about the reality of human-caused climate change, there are hundreds of scientists in their agencies who can offer them expert advice,” said Neal Lane, a physicist at Rice University who served as a science adviser to President Bill Clinton. “But the president, who has said he has an ‘open mind’ on the subject, needs his own science adviser to help him devise a climate policy strategy.”

Friedman, an Obama appointee, was unabashed in making an argument that echoes one Hillary Clinton made in her losing campaign — if we don’t keep making the scientific and applied research investments to push green technologies forward, other countries will and they’ll eat our lunch.

“We’re facing a fundamental question in this country,” said Friedman. “Are we going to invest in the technologies that have been revolutionizing the world of energy, and that other countries are waking up to and investing in, or are we going to let that multi-trillion dollar opportunity slip by? And we’re not going to know the answer until post January 20th.”

HUFFPOST

Norway's Top Oil Company Is Building A Huge Wind Farm Off New York's Jones Beach

Huffington Post
By Alexander Kaufman
December 20, 2016

Winds off the coasts of the United States are so dependably strong, turbines built offshore could produce four times the amount of electricity that's currently generated from all sources in the country.

At least, that's what Norway's biggest oil company is betting.

Statoil, the fossil fuel cash cow that made Norway the world's seventh richest country, won a $42.5 million bid last Friday to lease 79,350 acres of federal waters starting roughly 14 miles off the coast of Long Island. There, the company's U.S. subsidiary plans to build a massive offshore wind farm to send clean energy back to New York City and its suburbs.

Before Statoil can begin construction, the firm plans to survey the waters, which go as deep as 131 feet in places. It's unclear how many turbines the project will include, but the first phase is expected to produce up to 600 megawatts. By 2030, New York Gov. Andrew Cuomo (D) wants to get half of the state's electricity from zero-emissions sources.

"New York state has really good wind conditions and, obviously, also a very attractive market close to the wind resource," Irene Rummelhoff, Statoil's top boss in charge of renewable energy, told *The Huffington Post*. "We think it's a good foothold into a potentially very exciting offshore wind market in the future."

The U.S. produces roughly 75 gigawatts of wind energy already, almost all of which comes from land-based turbines in windswept states like Texas, California and Iowa. But offshore wind, popular in Western Europe, has failed to take off until this year.

Last week, the first offshore wind farm in North America — a five-turbine operation abutting Rhode Island's vacation hub Block Island — began producing electricity. The project, which took seven years to complete, marked a historic turning point for a long-stalled subsector of the renewable energy industry. Developers had hoped a proposed 130-turbine farm off the coast of Massachusetts might jump-start the industry. But fierce opposition delayed the project, first proposed 15 years ago, and it may now never be built.

As offshore wind languished in the U.S., the industry thrived abroad. Europe added 114 commercial offshore wind turbines in the first six months of 2016 alone. Last year, nearly 1 out of every 3 new turbines built in Europe went offshore. The cost of offshore wind energy has plunged as the supply chain for building turbines improves and competition heats up. The price of a megawatt-hour of offshore wind is now between $75 and $140, compared to $67-$72 for gas and coal, according to The Guardian.

The United Kingdom alone gets about 5.1 gigawatts of electricity from 1,465 turbines operating at 27 separate wind offshore farms, according to data from the trade group Renewable UK. In 2012, Statoil completed its first commercial offshore wind farm, an 88-turbine project called Sheringham Shoal, off the eastern coast of England. That farm now powers up to 220,000 British homes. The company is building a second farm in deeper waters, roughly 20 miles off the North Norfolk coast in England, that is expected to produce enough power for up to 401,000 homes. Statoil's third British farm, set to begin production off the coast of Scotland next year, could become the world's first floating wind farm.

greentechmedia:

Statoil Wins NY Offshore Wind Rights for $42M

Greentech Media
By Katherine Tweed
December 20,2016

Norwegian state-owned oil company Statoil is the winning bidder for the right to build a wind farm across nearly 80,000 acres off the coast of New York.

The U.S. Department of the Interior's Bureau of Ocean Energy Management's auction was for an area approximately 12 miles off the west end of Long Island, which should be able to accommodate up to about 800 megawatts of wind power. A wind farm that size would rival some of the largest offshore wind farms in Europe.

There were approximately a dozen bidders that were qualified to bid, but only six took part in the auction. The bidding went through 33 rounds before Statoil ultimately emerged victorious.

Statoil's bid of $42.5 million is hardly the final price tag, as the Norwegian company still needs to go through various environmental and feasibility studies, as well as to find an offtaker for the power it will eventually produce.

The other bidder in the final rounds was the New York State Energy Research and Development Authority. NYSERDA hoped to lower the cost by winning the acreage and then bundling that with an offtake agreement. But Statoil's win suggests that an individual developer thinks it can do it for cheaper than buying the bundled package from the government. NYSERDA's approach was similar to how many offshore wind auctions work in Europe.

No matter the approach, the project will certainly be more expensive than similar ones in Europe, which has about 11 gigawatts of offshore wind. NYSERDA will also still be heavily involved, providing assistance with studies and permitting. Just last week, NYSERDA put out an RFP for expert consultants as the state finalizes its offshore wind master plan.

"We are excited to have submitted the most competitive bid in a highly attractive project, Statoil's first offshore wind lease in the U.S.," Irene Rummelhoff, Statoil´s executive vice president for New Energy Solutions, said in a statement. "We now look forward to working with New York's state agencies and contributing to New York meeting its future energy needs by applying our offshore experience and engineering expertise."

That expertise draws on Statoil's growing interest in offshore wind and long history in offshore oil and gas. It is a joint developer for a handful of wind farms off of the coast of the U.K., and is developing a floating offshore wind farm that will also be paired with energy storage.

One of the U.K. projects is Dogger Bank Wind Farm, which is more than 100 miles offshore of Yorkshire and is expected to have a target installed capacity of at least 7 gigawatts of wind power, and potentially up to 13 gigawatts.

Although NYSERDA will not lead the project, it will be critical for getting buy-in from local communities, especially the fishing community.

"NYSERDA will continue to work closely with coastal community members, the fishing and maritime industries and advocates to identify additional offshore wind energy sites to be included in New York's Offshore Wind Master Plan," the agency said in a statement.

Enthusiasm and acceptance for the project is critical not only for Statoil and New York state, but also for the larger offshore wind industry in the U.S. Europe has gigawatts of offshore wind and some of those projects are now coming in at well under $100 per megawatt-hour. By comparison, the U.S. has only a single offshore wind farm off of Rhode Island, which is delivering 30 megawatts of power to Block Island.

New York, Massachusetts and other states, however, are getting more serious about offshore wind. Massachusetts has a goal of 1.6 gigawatts of offshore wind in the next decade and New York has a goal of getting half of its electricity from clean generation sources by 2030.

To get there, the U.S. offshore wind industry will have to scale up quickly from virtually nothing. It will require larger projects and more support from state governments for permitting. But with lessons learned from Europe, many in the industry feel the time is finally right for offshore wind to become a viable market in the U.S.

"Over the past decade, there has been consistent progress toward the realization of offshore wind power's potential in America," Nancy Sopko, the manager for advocacy and federal legislative affairs at the American Wind Energy Association, said in a statement. She added that the construction of the New York project alone could produce thousands of jobs.

Statoil said the project will be a phased development, with the first phase delivering 400 to 600 megawatts.

EcoWatch

Norway's Biggest Oil Company to Build Huge Offshore Wind Farm Off Coast of New York

Eco Watch
By Lorraine Chow
December 21, 2016

If everything goes to plan, New York City and Long Island will be harnessing the Atlantic Ocean's strong and dependable winds as a source of renewable energy.

Norway's biggest oil company will be developing an offshore wind farm outside of New York. Statoil submitted the winning bid of $42.5 million to the U.S. Department of the Interior's Bureau of Ocean Energy Management last Friday to lease nearly 80,000 acres of federal waters roughly 14 miles off the coast of Long Island, the Huffington Post reported.

The company estimates that the leased area could host a 1,000-megawatt offshore wind farm, with the first phase of development expected to begin with 400 to 600 megawatts. The first plan of action is to survey seabed conditions which can be as deep as 131 feet, grid connection options and wind resources at the site.

"We now look forward to working with New York's state agencies and contribute to New York meeting its future energy needs by applying our offshore experience and engineering expertise," Irene Rummelhoff, Statoil's executive vice president for Statoil's renewable energy branch, New Energy Solutions, said in a statement.

New York state aims to generate 50 percent of its electricity needs from renewable resources by 2030 and is betting big on offshore wind to help meet that goal. The Long Island Power Authority, with the support of New York Gov. Andrew Cuomo, is slated to approve a contract for a 90-megawatt offshore wind project 30 miles northeast of Montauk.

Offshore wind is resource begging to be tapped in the U.S., which has a projected 4,223 gigawatts of electric generating potential, LEEDCo estimated.

"The U.S. is a key emerging market for offshore wind—both bottom-fixed and floating—with significant potential along both the east and west coasts," Statoil's Rummelhoff said.

Still, the U.S. lags behind other countries in utilizing this form of emissions-free electricity. U.S. offshore wind development has faced a number of stumbling blocks, such as the embattled Cape Wind Project in Massachusetts that has stalled for more than a decade.

Europe, in comparison, has embraced this form of energy and developed several offshore wind farms projects, as the Huffington Post detailed:

> "The United Kingdom alone gets about 5.1 gigawatts of electricity from 1,465 turbines operating at 27 separate wind offshore farms, according to data from the trade group Renewable UK. In 2012, Statoil completed its first commercial offshore wind farm, an 88-turbine project called Sheringham Shoal, off the eastern coast of England. That farm now powers up to 220,000 British homes. The company is building a second farm in deeper waters, roughly 20 miles off the North Norfolk coast in England, that is expected to produce enough power for up to 401,000 homes. Statoil's third British farm, set to begin production off the coast of Scotland next year, could become the world's first floating wind farm."

In fact, Europe's offshore wind is now cheaper than fossil fuels. According to The Guardian, the price for a megawatt hour is between €73-€140 ($76-$146) for offshore wind compared to €65-€70 ($68-$73) for gas and coal.

On a more positive note, America's first offshore wind farm—the 30-megawatt Block Island Wind Farm in Rhode Island developed Deepwater Wind—switched online just last week. And at least 10 other U.S. offshore wind projects are in development.

The country's renewable energy sector as a whole has been buoyed by federal tax credits that help reduce the price of developing such costly technologies such as offshore wind. For instance, the $30 million Block Island wind farm is eligible for a tax credit worth 30 percent of the project's cost.

However, under a Donald Trump presidency and a potential cabinet consisting of fossil fuel execs and climate change deniers, federal support of the country's renewable energy sector could weaken.

Wind farms, in particular, are a sore subject for the president-elect. Trump has waged legal battles against an offshore wind farm near his golf courses in Scotland because it was a "blight" on the view and once said "the wind kills all your birds."

That federal renewable energy subsidy is set to be lowered in 2019. An extension will require support from both Congress and the Trump administration.

With new interest in offshore wind, state agency re-calibrates strategy

Politico New York
By Marie J. French
March 16, 2017

As a new proposal for an offshore wind project looks likely to trigger a federal auction for development rights, a state agency that was willing to spend big in a previous auction is rethinking its strategy.

German-based PNE has submitted plans for a 400 megawatt offshore wind farm off the coast of Fire Island. The project, submitted to the U.S. Bureau of Ocean Energy Management, would put as many as 50 turbines in the 40,000 acre area.

That's likely to spark competitive bidding on the area, said Alliance for Clean Energy's Anne Reynolds, and could move offshore wind along more quickly in New York.

But the New York State Energy and Research Development Authority may not be one of the bidders. The agency said in a statement it "may, but does not expect to" participate in future bidding.

"NYSERDA is executing a strategy to create competition for offtake agreements for areas that meet our standards and provide the best path to cost effectiveness for New York State consumers," the agency said. "We look forward to working with any successful winning bidder to help us achieve these goals."

The agency made an aggressive bid in a December auction of 80,000 acres 11 miles off Long Island. But the agency placed second to Norwegian oil giant Statoil, which posted a winning bid of $42 million.

NYSERDA had been willing to spend as much as $36 million to secure the leasing rights. CEO John Rhodes said the state's plan was to package the leasing rights with all necessary regulatory approvals and an agreement to buy the power.

Gov. Andrew Cuomo has committed to a goal of 2,400 megawatts of offshore wind to supply energy about 1.25 million homes by 2030. NYSERDA is leading the state's effort with the development of a comprehensive plan to locate multiple projects in the Atlantic Ocean, due out at the end of this year.

"Companies noticed how much Statoil paid for the lease and they definitely noticed the governor's commitment … and they know it's a very high-demand place close to New York City," Reynolds said. "What we need in New York is competition between different offshore wind developers to push down the price and get the best deal for New York."

PNE cited political support for offshore wind in New York, high electricity costs for energy in Long Island and New York City, constraints of on-shore generation and planned retirements of plants as reasons for its interest. While praising the state's support for offshore wind, the company's application says more work is needed.

"PNE is convinced of offshore wind's long-term potential in meeting New York's generation needs," the application states. "Going forward, however, what is essential is developing a viable policy framework and an established process that mandates the procurement of offshore wind capacity in New York, as implemented to date in states such as Maryland and Massachusetts."

Maryland and Massachusetts have specific requirements for utilities to buy credits from or directly procure offshore wind energy.

New York's Clean Energy Standard, which supports a goal of 50 percent renewables by 2030, is "agnostic" on technology but requires utilities to buy credits linked to renewable energy projects. Utilities can also directly buy energy from renewable projects, including offshore wind, to lower the amount of credits they must buy.

The PNE project, or one by another developer in the same area, would ostensibly be the third offshore wind farm for New York. The company predicts it could be completed by 2027.

Besides the Statoil lease, which is facing a legal challenge and requires numerous regulatory approvals, the Long Island Power Authority approved a 90-megawatt project off the coast near Montauk in January.

All of this action, with rave reviews from environmental groups, does not come without its detractors. Long Island's commercial fishing industry fears the placement of dozens of wind turbines in waters that have been fishing grounds for hundreds of years will devastate their way of life.

"You don't destroy the ocean environment to save the environment," said Long Island Commercial Fishing Association executive director Bonnie Brady. "If they keep selling off these portions of the ocean indiscriminately without determining first where they shouldn't be going, it'll be too late… You'll be bankrupting these coastal communities."

Brady said the area where PNE wants to build includes fishing grounds for scallops, squid, black sea bass and many other species of fish.

The fishing industry and some coastal municipalities in Long Island have filed a legal challenge to the sale of leasing rights to Statoil. They argue the environmental review should not just consider the effects of building a wind farm but whether other sites would be less harmful to marine life or if it should be built at all. That lawsuit is pending.

NYSERDA has said it plans to consider the concerns of all stakeholders, including the fishing industry, as part of the master plan for offshore wind.

Newsday

Norwegian energy company seeks beachhead in New York area

Newsday
By Mark Harrington
April 29, 2017

Statoil, the Norwegian energy conglomerate that won lease rights to build a wind-energy array off the coast of southwestern Long Island, is establishing a beachhead in the metropolitan area as it marches toward development of more than a gigawatt of wind power here beginning in 2024.

The company, which spent $42.5 million to outbid a contingent of energy conglomerates and New York State in December to advance its first U.S. wind project, has begun staffing here as it begins the four- to five-year process of acquiring the more than two dozen state and federal permits needed before construction can begin.

Irene Rummelhoff, executive vice president of new energy solutions for Statoil, said the company is still deciding whether to approach construction for the 79,000-acre lease area about 14 miles south of Long Beach in phases or all at once.

Under the first scenario, 400-600 megawatts could be developed by 2024, with the remaining number phased in over the next several years. Statoil expects to develop more than 1,000 megawatts of wind energy in the area, using turbines that can produce at least 10 megawatts or more each. That would amount to about 100 turbines in all. A megawatt of wind energy can power at least 360 homes.

"We're a big company with a serious interest and intent on developing this lease as quickly as possible," Rummelhoff said in an interview in Manhattan Wednesday. "We could build it quicker, but we need to do it the right way."

The company, which has offshore wind projects in the United Kingdom and Germany, has also expressed ambitions for wind-energy arrays in California and Hawaii, said Michael Olsen, senior director of business development. Its vast holdings in offshore oil and gas exploration and production have given it expertise in offshore work that will benefit the new renewable energy plans, Rummelhoff said. Statoil is two-thirds owned by the Norwegian government.

The Long Island project, while supported by environmentalists, has already run into opposition from commercial fishing groups that charge it will reduce access to, and potentially destroy, vital fishing grounds, particularly for scallops, squid and other groundfish. They have filed suit in federal court seeking to block the lease award, an effort that initially failed, though the suit is pending.

"Our industry is being ambushed," said Bonnie Brady, director of the Long Island Commercial Fishing Association, one of the plaintiffs in the suit. "If everyone put solar panels on their roofs, there would be no reason to destroy the fishing grounds" for wind turbines.

Rummelhoff said the company plans to have an "informative and respectful dialogue" with fishing groups. She allowed that there could be impacts during the construction phase, but said "after that it's quite possible" that fishing could continue around the turbines. Fishermen have expressed doubt about the claim.

Fishing, Rummelhoff noted, is a big industry in Norway. "We've learned how to co-exist," she said. "We think we can manage this by approaching stakeholders with an open mind and listening." Officials also broached the notion that some of the 79,000 acres "will not be developed."

Rummelhoff said the company has already begun the work of meeting with local and state officials to inform them of the plan and address concerns. She and her team visited with state lawmakers in Albany on Tuesday, and have plans to meet with Long Island groups, including fishing groups, in coming weeks and months.

At 14 to 30 miles from shore, she said, the turbines for the Long Island project aren't expected to be seen on the horizon. "We'll try very hard not to make them visible," she said. The company has a floating platform technology that can allow for siting the turbines in much deeper water than currently feasible, she said.

Rummelhoff said the company has been encouraged by the increased activity for offshore wind in the United States, after Europe has carried the offshore wind flag for more than a decade. The Trump administration, despite telegraphing doubts about climate change and green energy, last month completed a successful offshore lease for waters off North Carolina. Meanwhile, a German developer, PNE Wind, has made an unsolicited offer for a wind farm just east of the proposed Statoil project in waters 12 miles from Bayport. LIPA already has signed a separate contract for a 90-megawatt wind farm with Deepwater Wind off the Rhode Island coast.

Statoil has been encouraged by state and Long Island energy plans, which anticipate renewable energy playing a greater role in the next dozen years, Rummelhoff said. The company is working on a study "to understand the Long Island market and beyond," including how to reach the markets that demand new energy sources. A plan by Gov. Andrew M. Cuomo to shutter the Indian Point nuclear plant in Westchester by 2021 could further create a need for Statoil's wind energy, she said.

Newsday

Long Island's energy future may be blowin' in the wind

Newsday
By Editorial Board
May 6, 2017

Diesel generators that date to 1925 were shut down on Block Island last week as the nation's first offshore wind plant, a few miles off its coast, began providing full power to the island's electrical grid.

Earlier this year, final agreement was reached between the Long Island Power Authority and that same wind plant's developer, Deepwater Wind, to provide power to Long Island's South Fork. The electricity from 15 turbines at the wind farm, about 30 miles off Montauk, could begin flowing in six years.

Statoil, a Norwegian firm that won an astonishingly high-priced federal auction in December to lease 79,000 acres in the Atlantic Ocean 14 miles off Long Beach, is gearing up to face regulatory battles and to build community support it needs to start its own wind project. Statoil says it could be producing power for this region as soon as 2024. In addition, LIPA might have other choices for wind generation; a German company is getting ready to propose an offshore project south of Bayport.

Wind power from inland?

And it's not just sea breezes that could be a power source. LIPA is expected next month to choose among bidders offering renewable generation to replace small aging gas plants known as peakers. One of the bidders, Invenergy, offers an ambitious proposal to build wind and solar farms in rural Ohio, West Virginia, Pennsylvania and North Carolina, and to send us that power via the existing grid and a new underwater cable. Land is so expensive and solar arrays need so much space that it's unlikely there will be any new large-scale solar projects built on the Island.

Gov. Andrew M. Cuomo greatly expanded this market for renewable energy by setting a goal that the state will draw 50 percent of its power from green sources by 2030, and Long Island will be the centerpiece of that effort. New York stands with California, Oregon, Vermont and Hawaii as states with the highest standards for renewable energy.

Yet it was quite a torturous, if not ironic, path that got us to this point.

The failed Shoreham nuclear plant resulted in the state taking control from a private utility, the Long Island Lighting Co., 29 years ago. Instead of profits, however, it was politics that ruled local decision-making until superstorm Sandy exposed inadequacies and new state legislation overhauled LIPA's governing structure in 2013. Often those politics were designed to appease local officials, resulting in bad decisions, such as not challenging assessments on overtaxed plants or awarding too-generous community payments in lieu of property taxes. Now that state control can be turned into a benefit if the political decisions support enlightened policy that embraces new technology and moves away from outsized dependence on fossil fuels.

Long Islanders will still have the same basic concerns about reliability and affordability, which must always be at the center of the conversation. But the moldy focus on how to salvage the oil- and gas-fueled baseload power plants of the last century must evolve. The latest study from LIPA, its long-awaited Integrated Resource Plan, and an independent review of a PSEG Long Island analysis of existing generation, must start a new dialogue.

The resource plan, as well as the PSEG review by the Brattle Group, a consultancy, confirm that Long Island and the nation are consuming less electricity, due in part to more efficient appliances, light bulbs and sustainable design. At the same time, the New York Independent Service Operator, which manages the flow of high-voltage power on the state's grid, has reduced requirements for how much backup power LIPA needs to have at the ready and how much of that must be produced on the Island.

As a result, there is widespread agreement that no additional generation is needed until 2030. The current open bids are to replace aging peakers with renewables and more efficient plants. And when the decision is made in five to seven years about what should be built to meet new needs, it certainly won't be enormous plants using fossil fuels. Even now, 54 percent of LIPA's generation is idle at any given time; the national average is 44 percent.

Another reason for reduced power need is rapidly changing energy markets — from competitively priced renewables to plentiful and low-cost natural gas. The studies conclude that there is no need to rebuild — euphemistically called repowering — the older plants at Port Jefferson and Island Park. The plants are still used, but sparingly, and their value has depreciated. Contracts with owner National Grid on those plants, as well as the workhorse of the system in Northport, expire in 2028 and shouldn't be renewed. The studies also confirmed that there is "no compelling reason" to build a second Caithness plant in Yaphank. LIPA says going forward with repowering and a second Caithness plant would increase customer bills by $5 billion through 2030.

These findings are going to make some communities on Long Island and their elected officials very displeased because the $189 million LIPA customers pay for the taxes on these old plants only benefit the jurisdictions in which they are located. But the time for stalling and maneuvering is over. Incredibly, one of the reports that buries the dream of repowering was requested by the State Legislature, hoping it would prove the opposite.

LIPA's tax grievance litigation against Nassau County, and Brookhaven and Huntington towns, should be settled so plans for other uses of the sites of those aging plants can move forward. Port Jefferson, for example, is ideally situated for one of the new and more efficient peaker plants LIPA will need in the near future.

Will the findings of today change? Of course. The key assumption in these studies, that the trend toward reduced consumption will continue, must be closely monitored. If it changes, LIPA will need to have new power sources in place before 2030. The premise that the massive wind project off Long Beach will soon supply bountiful renewable energy could dissolve if state and federal regulatory hurdles mount and if there are construction delays.

Keeping the old standards, the old thinking and the old politics will lead to costly mistakes. Almost half of a LIPA bill, the charges called "power supply," rest on these decisions. Managing them smartly can not only keep our already high cost of electricity in check, but power Long Island into the future.

THE WALL STREET JOURNAL.

Plans for U.S. Wind Farms Run Into Headwinds

Wall Street Journal
By Erin Ailworth
July 19, 2017

After two decades spinning power from the gusts that sweep Europe's North Sea, the offshore wind industry is finally turning to the U.S. A big hurdle: getting its giant turbines to American waters.

No one in the U.S. currently makes turbine towers sizable enough for use in deep waters—one of the many challenges impeding the buildup of offshore wind on the other side of the Atlantic Ocean.

The first offshore wind installation in the U.S., a $300 million, 30-megawatt project off Rhode Island, began turning six months ago. Companies including Denmark's Dong Energy AS , Norway's Statoil AS A and Spain's Iberdrola SA IBDRY -1.13% are now pursuing more than a dozen projects that would dwarf it.

But the Block Island wind farm in the U.S. currently generates power for 24.4 cents per kilowatt-hour, while offshore wind projects in Europe can come in well under 10 cents per kilowatt-hour. Developers are optimistic that, as occurred in Europe, prices will go down as more projects begin and a supplier network takes shape in the U.S.

"They are really viewing this as a real market if you are attracting players like Dong and Iberdrola and Statoil," said Maxwell Cohen, a senior research analyst at IHS Markit . "I've heard some pretty major companies that are not in offshore at least being asked, 'Why not?'"

If all 17 of the proposed farms are built, the wave of U.S. offshore wind projects, primarily concentrated in the Northeast, would add 9.1 gigawatts of generating capacity, according to the American Wind Energy Association. That is enough to power 3 million homes.

Offshore wind farms require hundreds of millions to billions of dollars to construct depending on their scale, and analysts say not all of the proposed U.S. farms will be built. But state-level policies that promote renewable energy are providing momentum.

Earlier this year, New York Gov. Andrew Cuomo, a Democrat, called for 2.4 gigawatts of offshore wind to be developed by 2030. Massachusetts Gov. Charlie Baker, a Republican, signed legislation last year to have the state add 1.6 gigawatts of wind power offshore by June 2027.

Statoil won an auction late last year for the right to build a wind farm 14 miles off the New York coastline. Dong, meanwhile, has two proposed U.S. projects: one about 15 miles off Martha's Vineyard that it has teamed with Eversource Energy , a Northeast utility, to build; and another off the coast of New Jersey.

"I can really feel the appetite and the interest in the market now," said Thomas Brostrom, president of North American operations at Dong, which has built 22 offshore wind farms in Europe. "This is the moment."

Avangrid Renewables, an Iberdrola subsidiary, has joined with developer Copenhagen Infrastructure Partners to also build a separate wind farm off Martha's Vineyard.

Most of the 17 proposed projects are in federally designated wind energy areas. Such zones were created to help cut through some of the red-tape and community opposition that for more than a decade has blocked Cape Wind, a more than 400-megawatt project proposed for federal waters off Martha's Vineyard.

Jim Gordon, the man behind Cape Wind, is unwilling to concede defeat, saying the wind farm's lease is still active and that he hopes to see it built one day.

Block Island didn't have the same troubles, in part because it was much smaller and developer Deepwater Wind built it in state waters, which required fewer federal permits. But hurdles remain for large offshore wind projects in the U.S., including how to build out a supply chain that can regularly ship giant turbine towers from Europe.

Components like the enormous stands that anchor offshore turbines will have to be brought up from places like the Gulf Coast. That is because many U.S. Atlantic ports are small, and large vessels need to navigate busy shipping lanes, hurricane barriers and bridges.

This proved a challenge for the Block Island farm, said Meaghan Wims, a spokeswoman for Deepwater Wind. Its stands were brought up on barges from the Gulf Coast. The turbine towers and blades were shipped from France.

A Norwegian ship carrying the nacelles—the housing that holds the main generating machinery—couldn't fit under the Newport Pell Bridge that spans Narragansett Bay in Rhode Island, so it skipped coming into port and went straight to the construction site offshore.

It can also still take considerable time to get the necessary permits and approvals for offshore wind farms from state and federal regulators. Mr. Cohen of IHS Markit said he doesn't expect to see the industry really ramp up in the U.S. until the mid-2020s.

Still, developers are confident that manufacturers and other suppliers will set up shop in the U.S., and costs will come down, once sizable projects are built.

"We've done this in Europe and we have absolutely the same opportunity in the U.S.," said Stephen Bull, Statoil's senior vice president for offshore wind.

State launches public hearings on site of offshore wind farm

Long Island Herald
By Bridget Downes
July 20, 2017

The New York State Energy Research and Development Authority launched a series of public meetings at the Long Beach Public Library on July 11 as part of an outreach effort as the state moves forward with a plan to build wind farms off the South Shore.

The meeting engaged the public, as well as stakeholder groups such as fishermen and the maritime industry in order to generate feedback as early as possible in the planning process for wind farms that would be located 14 miles off the coast of Long Beach, according to state officials.

The efforts coincide with Gov. Andrew Cuomo's goal to pursue options like offshore wind to produce 50 percent of the state's electricity needs from renewable energy sources by 2030.

Cuomo announced in his 2017 State of the State address that New York aims to develop up to 2.4 gigawatts of offshore wind in 13 years off the Atlantic coast — enough to power 1.25 million homes.

Doreen Harris and Greg Matzat, of the large-scale renewables team at NYSERDA — a state agency that is leading the effort to develop offshore wind — offered information about their Offshore Wind Master Plan, which is expected to be completed and released by the end of the year.

As part of the plan, state officials said, NYSERDA is conducting more than 20 studies in a 16,740-square-mile area of the Atlantic Ocean. Only 2 percent of the study area, though, would be needed to meet the state's goal of 2.4 gigawatts by 2030. According to Matzat, that would require 240 to 300 turbines.

The results of the studies will be available to project developers and various stakeholders, and will suggest the best possible sites for wind development and establish guidelines for developers.

"That's really the point of the master plan — to advance offshore wind for the state in a way that is responsible and takes into account the varying uses of our ocean in our planning activities," Harris said. There are "three major components: identify sites that are best suited for the development; create guidelines as a state; advance offshore wind to the point where it's competitive."

Additionally, the offshore wind industry is expected to support 160,000 jobs over the next 30 years, according to the U.S. Department of Energy, and help protect the environment by reducing harmful emissions by 5 million tons per year.

Harris and Matzat also explained that the turbines would not be visible from the shoreline. The state plans to set guidelines that developers must abide by, which will include a minimum distance from the shore that turbines can be constructed.

The fishing industry won't be impacted, either, according to NYSERDA, because the state does not plan to impose any restrictions on fishing around the wind turbines, which will likely be about a mile apart. The aim is to allow the wind farms and the fishing industry to co-exist.

So far, wind farms off the coast of Long Island are in their early planning stages.

"To date, the [U.S. Department of the Interior's Bureau of Ocean Energy Management] has leased six areas for offshore wind between New Jersey and Massachusetts," Matzat said. "All these leases have been awarded to companies through competitive auctions that the BOEM has had. The leases give these companies the rights to do site assessments and propose projects for construction.

The Long Island Power Authority recently approved a contract submitted by Deepwater Wind for operation of the South Fork Wind Farm, a 90-megawatt development 30 miles west of Montauk that is in its early planning stages, according to state officials.

"These megawatts are the first towards our 2,400-megawatt goal," Matzat said. He added that the South Fork Wind Farm is expected to be completed in 2022 and operational in the mid-2020s.

Last week's meeting came after another company won a lease off the Long Beach coast in February. With a bid of $42.5 million at an auction held by the federal government, a Norwegian energy company, Statoil Wind US LLC, won the lease for an area that would provide the state with about 800 megawatts of offshore wind power.

Cuomo called on NYSERDA to work with Statoil to ensure that the project delivers power "cost-effectively and responsibly." Last year, the governor rejected plans to build a liquefied natural gas terminal about 16 nautical miles off the coast of Jones Beach because it would have conflicted with the site of potential wind farms.

"This is part of a much longer trajectory, and we in Long Beach and on the South Shore stood against the Port Ambrose liquefied natural gas terminal a year and a half ago to make room for a project just like this," said State Sen. Todd Kaminsky.

"We're really excited that we're moving forward with our energy goals, that we're being progressive in promoting renewable energy. You can count on one hand the amount of big renewable wind projects in the United States, and for us to be the home for one of them I think is tremendous."

"It's a very inclusive and very exhaustive process because it needs to be done right," said George Povall, director of a local environmental group called All Our Energy. "As an environmental group, we really support that. We'd like to see it done faster, but it's not going to happen. We want to make sure it's done right."

New York Seeks to Lead US in Offshore Wind

RTO Insider
By Michael Kuser
August 7, 2017

New York state wasn't the first out of the gate on offshore wind, but it will be the biggest player if it meets Gov. Andrew Cuomo's 2,400-MW target. State policymakers are embracing offshore wind for its utility-scale generation, its ability to be developed close to the major load centers of New York City and Long Island — and its potential jobs.

"Right now, there are over 300,000 jobs in the offshore wind industry in Europe," Sierra Club Senior New York Representative Lisa Dix said last week when she moderated a panel at the Infocast New York Energy REVolution Summit at Times Square.

The federal government has identified more than 100 GW of offshore wind potential off the Atlantic coast, and the Bureau of Ocean Energy Management has moved forward with the offshore wind lease process in New York and seven other states. **The first offshore wind lease for New York, a nearly 80,000-acre site off the Rockaways in Queens, went to Norway-based Statoil last December.**

"Offshore wind provides power when it's needed the most, at peak times," Dix said. "And it's at a scale that the state needs not only to fulfill its renewable energy policy goals, but also to help combat climate change, where New York City and Long Island are really on the front lines."

State and Stakeholder Support

Chris Wissemann represents the U.S. activities of Germany-based offshore wind developer Innogy, which he characterized as being four times the size of Consolidated Edison and generating enough electricity to serve the entire load of New York state.

"Long-term, stable policy is what makes this become cost-effective," Wissemann said. "Along those lines is the corollary, which is the four P's: politics-proof purchase program. Look at Cape Wind, several years ago: The minute their benefactor was out of office, they lost their [power purchase agreement]. New Jersey's OSW economic development program was never implemented because of politics."

Cuomo in January called for 2,400 MW of offshore wind projects by 2030, starting with the 90-MW South Fork Project off Montauk, Long Island.

The growing breadth and depth of support for offshore wind is spectacular, but not surprising, said New York Offshore Wind Alliance director Liz Gordon. All the different interest groups don't necessarily have the same reasons to support OSW, she said.

"Environmental groups clearly see clean, reliable offshore wind power as a climate change solution, or at least a mitigation," Gordon said. "Labor in New York state is all-in; they're vocally supporting offshore wind because they see massive job potential — good jobs, quality jobs. That will depend on there being a reliable pipeline of projects and ideally a port or two here in New York."

Leasing Moves Forward

Greg Matzat, senior adviser on large-scale renewables at the New York State Energy Research and Development Authority, said: "New York has the largest goal for offshore wind in the country of 2,400 MW. Massachusetts is behind us at 1,600. But we're the only state that doesn't have enough areas currently leased to support our goal. Massachusetts has more than 1,600 MW [in leased sites] available, so it's really important for us to identify sites that make sense for New York and hopefully work for BOEM too … so we can move forward with more leases."

The Statoil site has room for about 800 MW, only one-third of New York's target.

James F. Bennett, chief of renewable energy programs at BOEM, described the 13 commercial OSW leases contracted so far, extending from Cape Cod to Cape Hatteras.

"There's at least one off of every state, from Massachusetts to North Carolina, and obviously where the greatest demand would be," Bennett said. **"New York is one of these areas, obviously, where that demand is indeed great. In particular for New York, we have the one area that was leased in December of last year to Statoil for $42 million, which was an incredible milestone for the program.** And we also had a sale in North Carolina in March of this year that went for $9 million to Avangrid. **Both of those are indicators that the industry, if it hasn't arrived, it's arriving. We're very optimistic about activities in the future."**

According to Bennett, New York has great OSW potential because it has all the factors that make a wind project succeed: wind resources are prime; shallow water off the continental shelf supports seafloor foundations; strong demand that constitutes a good market; and state support.

"I don't know if there is a stronger demand than immediately from New York," Bennett said. "All of these leases have occurred with state involvement and state input, and in particular New Jersey and Massachusetts are great examples of states that have put the time and effort into putting the environmental and stakeholder interests together, and that's the lead that New York is following."

NYSERDA is drafting a master plan that will include a plan for transmission to get wind-generated power to shore. "Some of this you'll see in our Public Service Commission filings," said Matzat, "but the master plan will include recommendations on how to move pre-permit forward for OSW and a timeline on how we see this going."

BOEM manages the lease process and step one is planning and analysis to identify a wind-energy area, "which is where we are now in the process for New York," Bennett said. "It's obvious that the biggest one [lease area] is the one to the north, from New York to Nantucket, and right now that probably will include a couple leases off Martha's Vineyard, which went unleased just two years ago, and we expect very high demand for those areas and are looking to 2018 for an auction for that. Beyond that, and we're always hesitant to get nailed down to a date, but after that we think we're in a position to go forward with another sale in New York."

Docks and Dolphins

NYSERDA applies a similar evaluation process to ocean areas and to the shoreline for the ports needed to fabricate the huge turbine blades and host the purpose-built vessels used in building OSW installations. The authority is looking at 75 sites. The turbines off Block Island, which are 6 MW each, stand 600 feet above the water. The turbines NYSERDA is looking at will average 10 MW and approach 700 feet tall, plus their 200-foot foundations.

"We're looking at the whole supply chain, so we're not just looking at New York Harbor and the Port of New York and New Jersey, but we're looking around Long Island and we're looking up the Hudson too," Matzat said.

Certain activities should be done as close to the wind farm as possible, such as staging for assembly, but other parts of the supply chain, such as manufacturing cables or blades, can be done farther away, he said. Most parts cannot be put on a truck and must be put on a ship, so a large part of the supply chain has to be on the water.

"But that doesn't mean you couldn't build up on the Hudson, where there are areas of labor that might fit a particular part of the supply chain, and bring that down on a barge to an assembly area," Matzat said.

NYSERDA is now conducting public comment sessions, with four for the fishing industry alone this month.

"Another big group that isn't 100% on board with us is the fishing industry, so we've really made a point of reaching out to the fishermen, and we've had a dedicated fishing liaison who just goes around to docks, not just in New York but in other states too, to talk to fishermen and understand their concerns," Matzat said.

The master plan also includes intensive surveys of the shoreline and coast.

The authority has a survey vessel about 15 miles south of New York City doing sediment profiles and sediment samples of the sea bottom over a couple million acres so planners can understand the habitat on the seafloor and what the seafloor is made of, which has environmental as well as construction-planning value.

"I don't believe any state has ever done that in advance of identifying areas for offshore wind," Matzat said. "Usually that's done later by developers."

NYSERDA also is conducting a digital aerial wildlife survey, using a plane with high-resolution cameras to photograph more than 12,000 square miles of ocean four times a year over three years. It has already completed the first year.

New York a leader in wind energy, feds say

Newsday
By Mark Harrington
August 8, 2017

New York is ahead of most other states in wind-energy production and planning, ranking third in small land-based wind arrays and planning for potentially hundreds of offshore wind turbines over the next decade, the federal government said.

In a series of reports released Tuesday, the U.S. Department of Energy noted the state in 2016 added 13.3 megawatts of small wind-energy installations — arrays of less than 100 kilowatts — primarily upstate.

New York also added 78 megawatts of larger, utility-scale turbines last year, increasing that sector's total to 1,827 megawatts statewide — 13th in the nation.

Long Island's handful of land-based wind farms are primarily single turbines on East End farms, including vineyards in Peconic, Mattituck and Cutchogue.

The reports take note of the whirlwind of offshore wind activity around Long Island.

LIPA announced a 90-megawatt project off the coast of Rhode Island last year, and **Norwegian-based energy company Statoil is planning a 1,000-megawatt array off Long Island's coast.**

"When you look at the state of New York it has been a leader in all aspects of wind," Jose Zayas, director for the Wind Energy Technologies Office in the Office of Energy Efficiency and Renewable Energy at the U.S. Energy Department, said in an interview.

He cited state incentives, a strong wind source and economics as the primary drivers for the state's growth.

"It's a little bit of everything," Zayas said.

The New York State Energy Research and Development Authority has identified a large study area for other offshore wind installations. Nearly all of it is off Long Island's South Shore.

NYSERDA has been holding briefings in recent weeks to formulate an offshore wind blueprint by year's end.

The energy department's optimism about wind energy is noteworthy as the administration of President Donald Trump has placed greater public focus on development of fossil fuels such as coal.

Zayas said the administration has an "all of the above" attitude on energy, "looking at all these options and letting the market pick" which to advance.

The federal reports make note of the large gains by wind-energy overall.

Led by Texas, Iowa and Oklahoma, the U.S. wind industry added 8,200 megawatts in 2016, accounting for 27 percent of all new-energy additions for the year. Wind now supplies about six percent of the nation's total electricity.

In New York, a megawatt of wind is estimated to power 360 to 500 homes.

Nationwide, small-scale wind installations produced 992 megawatts of capacity last year from 77,000 turbines in the 50 states, Puerto Rico, Guam and the Virgin Islands.

The report singles out New York as the number-three state for wind-energy projects installed since 2003 using U.S. Department of Agriculture incentives, behind Iowa and Minnesota.

Federal tax incentives for wind power that once covered a third of project costs are set to expire Dec. 31, 2019. Zayas noted, "There will be an impact, the question is how much of an impact?"

Statoil's New York Offshore Development Now Known As Empire Wind

North American Wind Power
By Betsy Lillian
October 24, 2017

Empire Wind has been selected as the project name for Statoil's offshore wind site off the southern coast of Long Island, N.Y.

The 79,350-acre site, secured by Norway-based Statoil in a federal auction in December 2016, has the potential to generate up to 1 GW of offshore wind power, making it a key part of New York State's plan to deploy renewable energy sources to meet the state's electricity needs, says Statoil.

Statoil has also launched an Empire Wind website, where members of the public can obtain information on the project and register to receive updates.

"The name Empire Wind captures the pivotal role that this important project will play in helping New York achieve its ambitious renewable energy goal," says Statoil's Empire Wind project director, Christer af Geijerstam. "Empire Wind also speaks to the leading role that New York State is taking in advancing the deployment of offshore wind technology in North America."

Statoil is in the early stages of developing the facility. The Empire Wind project team is currently conducting an extensive evaluation process by gathering detailed information about the seabed conditions, grid-connection options and wind resources characteristic to the area. Statoil currently has seven offshore wind projects online or under development in Europe.

New York's Clean Energy Standard mandates an increase in the share of renewables in its energy mix to 50% by 2030. As part of that effort, Gov. Andrew Cuomo has called for the development of up to 2.4 GW of offshore wind power by 2030.

"Statoil looks forward to working with all stakeholders as we move forward with the job of bringing offshore wind energy to New York," adds Geijerstam. "We are committed to working with other developers, state officials, unions and the business community to develop a U.S. supply chain for this and other offshore wind projects. Our goal is to help make offshore wind a leading option for generating clean and affordable energy in New York."

WORKBOAT

Statoil launches Empire Wind project off New York

Work Boat
10/24/17

Norway-based Statoil ASA announced it will develop its 79,350-acre federal lease off New York as the Empire Wind project, with the potential to generate up to 1 gigawatts of power toward the state's plan for shifting to renewable power sources.

The company also launched a new website, www.empirewind.com, to promote its project to the public. Offshore wind developers like Statoil and Rhode Island-based Deepwater Wind have powerful political backing from state leaders – New York Gov. Andrew Cuomo wants up to 2.4 gigawatts of offshore wind power by 2030 – but siting plans around Long Island are getting intense scrutiny from maritime and fishing industry groups.

"The name Empire Wind captures the pivotal role that this important project will play in helping New York achieve its ambitious renewable energy goal," said Christer af Geijerstam, Statoil's Empire Wind project director, in announcing the formal launch. "Empire Wind also speaks to the leading role that New York State is taking in advancing the deployment of offshore wind technology in North America."

The project is in its very early stages of evaluating the site, a triangular patch of ocean south of Long Beach, N.Y., flanked by shipping traffic separation lanes to the port of New York and New Jersey. Statoil officials say their team is gathering detailed information about the seabed conditions, grid connection options and wind resources.

"Statoil looks forward to working with all stakeholders as we move forward with the job of bringing offshore wind energy to New York," said Geijerstam of Statoil. "We are committed to working with other developers, state officials, unions and the business community to develop a U.S. supply chain for this and other offshore wind projects. Our goal is to help make offshore wind a leading option for generating clean and affordable energy in New York."

Statoil currently has seven offshore wind projects online or under development in Europe, including the Hywind offshore wind project in Scotland that is using the world's first operational 30 mW array of floating, anchored wind turbines. Statoil is betting the technology could open deepwater wind areas farther offshore, including the U.S. west coast and Hawaii.

New York sets high bar for wind energy

United Press International
By Daniel J. Graeber
October 26, 2017

The state of New York aims to become a new hub for the wind energy industry with its unique geographical position and ambitions goals, a state leader said.

New York ranks 11th in the nation in terms of installed wind energy capacity and is the 15th windiest. As of 2014, the state had 20 wind energy projects in service, with a total capacity of 1.8 gigawatts of capacity. The state set a goal of 2.4 GW by 2030.

"New York intends to be the preeminent global hub for the next generation of the wind industry," Lt. Gov. Kathy Hochul said during the opening remarks of a wind energy conference. "We're making unprecedented investments in infrastructure and laying the groundwork for the offshore wind industry, which is primed to benefit from New York's talented, ambitious workforce."

A clean energy mandate in New York states that renewable energy should account for half of the installed capacity on the state grid by 2030. This week, managers at Norwegian energy company Statoil named their early-development project off the Long Island coast Empire Wind.

Statoil secured the 79,000 acre plot during a federal auction in December and said the facility has a design capacity of 1 GW of offshore wind.

The Board of Trustees of the Long Island Power Authority voted in favor of the 90-megawatt South Fork Wind Farm in January. Gov. Andrew Cuomo's broader state energy vision calls for a reduction in greenhouse gas emissions and includes a $5 billion investment in clean-energy technology.

There are more than a dozen offshore wind energy projects in various stages of development in the United States, representing more than 9.1 GW of installed capacity. One GW is enough to power 100 million LED light bulbs.

"Unlocking America's vast offshore wind potential will reliably deliver large amounts of clean power, grow jobs, and cement American energy dominance," Tom Kiernan, the CEO of the American Wind Energy Association, said.

The AWEA hosted the New York wind energy conference.

Statoil Christens NY Offshore Wind Project

Oil And Gas Facilities
By Pam Boschee
November 1, 2017

Statoil selected the name "Empire Wind" for its offshore wind site located off the southern coast of Long Island, New York. The 79,350-acre site, secured by Statoil in a US Department of the Interior's Bureau of Ocean Energy Management (BOEM) auction in December 2016, has the potential to generate up to 1 GW of offshore wind power. It will be constructed by private investors, and the company said investments for a 1-GW project are typically about $3 billion.

The name Empire Wind captures the pivotal role that this important project will play in helping New York achieve its ambitious renewable energy goal," said Statoil's Empire Wind Project Director Christer af Geijerstam. "Empire Wind also speaks to the leading role that New York State is taking in advancing the deployment of offshore wind technology in North America."

The company is in the early stages of developing the offshore wind farm with the potential to provide New York City and Long Island with a significant, long-term source of renewable electricity. The project team is currently conducting an extensive evaluation process, gathering detailed information about the seabed conditions, grid connection options, and wind resources characteristic to the area.

Statoil will submit a Site Assessment Plan to the BOEM, and site assessment and characterization studies and surveys are scheduled to start spring 2018. The results of these studies and surveys will provide the data necessary to compile a Construction and Operations Plan (COP) for the project. BOEM requires submission of a COP within 5 years. Statoil said Empire Wind can generate power as early as the mid-2020s.

New York's Clean Energy Standard mandates an increase in the share of renewables in its energy mix to 50% by 2030. As part of that effort, Governor Andrew Cuomo recently called for the development of up to 2.4 GW of offshore wind power by 2030.

Wind Portfolio Grows

Statoil currently has seven offshore wind projects online or under development in Europe, including the world's first floating offshore wind project, Hywind Scotland. The 30-MW installation, located 25 km from Peterhead in Aberdeenshire, Scotland, began producing power in September, and started delivering electricity to the Scottish grid in mid-October. At peak capacity, the wind farm will produce enough electricity to power 20,000 homes. The company's website characterizes this as a technology which could prove pivotal in generating offshore wind power for the US west coast and Hawaii.

First Step into Solar

Statoil also recently announced its first solar investment in the 162-MW Apodi solar asset in Brazil. The company signed an agreement in October to acquire a 40% share in the construction-ready asset from Scatec Solar, a Norwegian independent solar power producer. The project will provide approximately 160,000 households with electricity. Statoil and Scatec Solar have also agreed on an exclusive cooperation to jointly develop potential future solar projects in Brazil.

Statoil will also acquire a 50% share in the project execution company, enabling it to participate in building and operating solar projects in the future.

"Brazil is a core area for Statoil where our ambition is to deliver safe and sustainable growth in a significant energy market. Entering into solar in Brazil adds to the positions we have already in the producing Peregrino oil field and in the offshore licenses BM-S-8 and BM-C-33 which include the yet to be developed discoveries Carcará and Pão de Açúcar, respectively. We are excited to have entered our first solar project with an experienced partner like Scatec Solar," said Irene Rummelhoff, executive vice president of New Energy Solutions in Statoil.

Statoil will pay a combined acquisition price of $25 million for access to the Apodi solar asset and the project execution company. Construction of the solar plant was targeted to begin in October, aiming to deliver electricity from the end of 2018. Total project capex is estimated to $215 million. The Apodi asset will be funded 65% by project financing and 35% equity contribution, of which Statoil's equity share will be approximately $30 million.

The Apodi asset, located in the municipality of Quixeré, Ceará State in Brazil, is fully permitted with grid connection. The asset holds a 20-year power purchase agreement awarded in 2015 at an auction organized by the Brazilian government.

The construction and operations phase for this project will be led by Scatec Solar with Statoil contributing with staff and services from Brazil as well as Norway.

The Wave

Residents Slam Latest Pipeline Proposal

The Wave
By Ralph Mancini
November 23, 2017

Local activist groups and residents banded together in the fight to thwart an energy company's proposal to build a controversial 23-mile gas pipeline that would connect to the Rockaway Lateral, at a Thursday, Nov. 16 information session at the Knights of Columbus Hall.

Noelle Picone of Surfrider Foundation NYC briefed listeners on an application filed earlier this year by The Williams Companies to a federal agency for approval to build a pipeline system, known as the Northeast Supply Enhancement Project (NESP), extending from Raritan Bay, New Jersey to the lateral area just south of the Marine Parkway Bridge.

Picone and representatives from groups, such as the Sane Energy Project (SEP), New York Communities for Change (NYCC) and Food and Water Watch (FWW) argued that adding another pipeline would be unnecessary in light of a diminishing need for natural gas over the next 10 years.

In fact, SEP Director Kim Fraczek clued attendees in on the renewable energy solutions coming to New York in the near future.

Gov. Andrew Cuomo, according to Fraczek, recently made a commitment to purchase 2,400 megawatts of offshore wind operating about 12 miles off the Rockaway shore.

"The developer's name is Statoil. They are moving into renewable energy and we're happy that they are doing this," said the wind farm advocate, as she delved into the 'Reforming the Energy Vision' program (REV) endorsed by New York State.

"There's a plan from Gov. Cuomo to move us on to renewable energy. In my opinion, he's not being aggressive or fast enough. We want to be 100 percent into renewables and ditch fossil fuels," said Fraczek.

The meeting also brought to light the potential harm the pipeline could inflict to both human and marine life. As noted by environmental spokesperson JK Canepa, The Williams Companies' construction endeavor would entail the excavation of a large trench across New York Harbor – one that would churn up an assortment of toxins, including lead, arsenic, cadmium and zinc, into the water.

Reportedly, those contaminants would eventually be washed ashore by tidal activity and poison various forms of marine life. What's more, it was pointed out that turbulence and vibrations produced by the digging would interfere with the migratory patterns of local whales, seals, turtles and birds.

Pete Sikora, an NYCC senior advisor, painted a dire picture for beach communities – Rockaway included – if companies like Williams are afforded free rein to continue installing miles of pipeline infrastructure.

He informed the crowd on how the enhancement project would only perpetuate thermal expansion that has already resulted in stronger winds and increased storm surge witnessed during Superstorm Sandy.

Siroka cautioned: "The Rockaways are not going to survive change if we don't do something. It's that serious [of] a situation. So, the mainstream science on this [forecasts] a two-to-six-foot sea-level rise coming. That gap means life or death for this area and the difference is what do we do with fossil fuels right now?"

Also weighing in on the topic of pipeline safety was Rockaway Park-based activist and local board member Danny Ruscillo, who brought attention to the fact that Wikipedia has a 73-page list of pipeline accidents, ranging from rupture and leak-induced fires to recent explosions, from 2000 to 2017 alone.

"Many of us here in Rockaway fought hard to make sure the LNG Platform was not placed off our shores. If an accident occurred, it would have caused major environmental damage," offered Ruscillo. "Well folks, the same goes for Williams Transco Pipeline; it's just another accident waiting to happen."

Furthermore, the one-time 100th Precinct Community Council President admonished attendees not to fall for the natural gas producer's charitable tactics, such as doling out community grants and buying scoreboards for Little League ball fields.

"Do you really think they care or have your best interest in mind? People, it's the money and their big profits they care about," Ruscillo professed.

The business aspect of another pipeline being "forced down the throats" of Rockaway residents was a primary concern among both the speakers and spectators, as more than one protestor referenced a previously-built 2.3-mile structure that went live in 2015.

Sara Gronim of 350 Brooklyn, an organization that works to reverse climate change and achieve climate justice through local action, declared that Williams would recoup the dollars spent on pipeline installation by selling their gas to National Grid, along with applying a 14-percent interest and/or surcharge.

Those fees to recover the approximately $924.5 million being spent by the Oklahoma-headquartered energy conglomerate would ultimately trickle down to individual residents, who will invariably be hit with mark-ups, according to Gronim.

"There's no skin off National Grid's nose," she concluded. "It's our pockets that will pay for this pipeline and it's a pipeline we don't need."

Although Williams' Companies personnel weren't invited to give their side of the story at the meeting, Chris Stockton, a media relations representative, reached out to The Wave to challenge specific claims.

In addition to stating that the firm's Transco pipeline system has safely and reliably met the city's natural gas needs since the 1950s, Stockton purported there's a growing demand for natural gas in New York City to heat, cool and power buildings.

To make his case, Stockton referenced a 2017 New York Building Congress report indicating the need for added pipelines due to the planned closure of the Indian Point nuclear plant.

He went on to cite natural gas' lower cost and environmental benefits compared to oil as a major factor influencing customers to obtain their services from National Grid. A Con Edison study, moreover, estimates a 25-percent surge among local inhabitants in favor of gas heat.

In terms of safety, the corporate communications spokesperson related that the company's 2015 pipeline installation was performed without incident and was even lauded by environmental groups, such as the Jamaica Bay Ecowatchers.

But while Stockton mentions "increased demand" as a primary reason for the project in question, West Hempstead (Long Island) resident Joseph Varon highlighted other corporate incentives in play.

He opined that the pipeline would be added not so much to service local citizens, but rather to export fracking gas from the east coast to Europe since gas prices are higher in that part of the world.

Others who vehemently opposed the proposal were former firefighter Joe Hartigan, who expressed concern over the pipeline's proximity to three major airports (Newark, LaGuardia and JFK International), and civic leader John Cori, who described The Williams Companies as being "relentless."

"They're going to keep on doing it. You have to be eternally vigilant…and we will be," promised Cori. "This is an appeal to everybody to come out and fight with us. If you can lead, lead. If you can follow, follow. But if you can't do either, then get the hell out of the way."

Echoing Cori's passion and sentiments was New York Organizer for Food and Water Watch Laura Shindell, as she encouraged everyone at the conference to vent their frustrations by calling the governor at 888-997-5380. She also pushed residents to sign a petition on the matter.

The various members of the coalition against the Williams Companies' initiative seemed to agree that the only way to win their battle is to get Cuomo to throw down the gauntlet on the project, instead of relying on the federal government to take action.

SITE SELECTION MAGAZINE

Norway's Trump Card

Site Selection Magazine
By Adam Bruns
January 1, 2018

"What's so great about Norway?" some are asking in the wake of President Trump's stated immigration preference.

A lot of things, it turns out. (Which might prompt some to wonder just how badly Norwegians would really want to emigrate.) And many of the nation's positives come thanks to the fortunes of state-owned energy company Statoil, the second-largest gas exporter to Europe and the world's largest offshore operator.

Arctic Now in December reported on the €5-billion (US$6.1-billion) investment by Statoil in an Arctic oil project called the Johan Castberg that will produce between 450 million and 650 million barrels of oil over 30 years. First oil from the project is scheduled for 2022, as the company's oil and gas plays venture north — the Castberg project is at the 72nd parallel.

It's one of over 40 Statoil assets spread across 30 fields on the Norwegian Continental Shelf, which includes the North Sea, Norwegian Sea and Barents Sea. Statoil is responsible for over 70 percent of all oil and gas production on the NCS, and since 2010 has increased its annual investments there by 75 percent.

Statoil's projects play out in other directions too, with 20,000 employees in more than 30 countries. Its portfolio includes a 100,000-bpd oil field offshore Brazil; exploration and development in the Gulf of Mexico from shale and tight rock formations throughout the US. The company manages upstream activities from a base in Houston, and midstream, marketing and trading activities from Stamford, Connecticut, not far from where the company in October named a new wind farm offshore Long Island, New York, the Empire Wind project.

The 79,350-acre (7,372-hectare) site, secured by Statoil in a federal auction in December 2016, has the potential to generate up to 1 gigawatt (GW) of offshore wind power — enough to power about 1 million homes, or the equivalent of the number of homes that could be powered by the company's European wind farms combined.

New York's Clean Energy Standard mandates an increase in the share of renewables in its energy mix to 50 percent by 2030. As part of that effort, Governor Andrew Cuomo recently called for the development of up to 2.4 GW of offshore wind power by 2030.

"Statoil looks forward to working with all stakeholders as we move forward with the job of bringing offshore wind energy to New York," said Statoil's Empire Wind Project Director Christer af Geijerstam.

"We are committed to working with other developers, state officials, unions and the business community to develop a US supply chain for this and other offshore wind projects."

Statoil currently has seven offshore wind projects online or under development in Europe, including the world's first floating offshore wind project in Scotland — "a technology which could prove pivotal in generating offshore wind power for the U.S. west coast and Hawaii," says the company. Statoil also recently announced its first solar investment in the 162-MW Apodi solar asset in Brazil, which will provide approximately 160,000 households with electricity. Another 385-MW wind farm, Arkona, is being constructed in the Baltic Sea by Statoil and Germany's E.ON.

Underwater Factories

But the billions that have long provided the ballast for the Norwegian economy continue to come from the growing clusters of rigs proceeding from Norway's coastline further and further into the Arctic, such as the Johan Castberg. The firm was called "The Norwegian Paradox" by The New York Times last year because of its vaunted clean energy push above-ground while the drilling for oil and gas continues underneath. And even as the nation's $1-trillion investment fund considers a proposal to divest from petroleum companies, the oil and gas work continues.

"This is a great day! We have finally succeeded in realizing the Johan Castberg development," said Margareth Øvrum, Statoil's executive vice president for Technology, Projects and Drilling, in December when the company, along with Eni and Petoro, submitted a PDO (plan for development and operation). "Johan Castberg has brought challenges. The project was not commercially viable due to high capital expenditures of more than NOK 100 billion [US$12.7 billion] and a break-even oil price of more than US$80 per barrel. We have been working hard together with our suppliers and partners, changing the concept and finding new solutions in order to realize the development. Today we are delivering a solid PDO for a field with halved capital expenditures and which will be profitable at oil prices of less than US$35 per barrel."

"Johan Castberg will be the sixth project to come on stream in Northern Norway," added Arne Sigve Nylund, Statoil's executive vice president for Development and Production Norway. "The field will be a backbone of the further development of the oil and gas industry in the North. Infrastructure will also be built in a new area on the Norwegian continental shelf. We know from experience that this will create new development opportunities."

The Johan Castberg field will have a supply and helicopter base in Hammerfest and an operations organization in Harstad. Together with other operators of oil discoveries in the Barents Sea, Statoil is investigating the possibility of finding a profitable oil terminal solution at Veidnes.

Statoil has developed a strong specialist environment in Harstad based on 40 years of experience from operation in the north. Finnmark is another area the company will look to for workforce for the offshore component, which will require 90-100 professionals spread across three shifts.

"To ensure a long-term development of petroleum-related specialist jobs in Finnmark, Statoil will, in collaboration with other operating companies, suppliers and local authorities before the plan for development and operation is submitted to the authorities, look at possible initiatives to upgrade the general petroleum competence level in Hammerfest and Finnmark," said Siri Espedal Kindem, senior vice president for the operations north cluster in Statoil, in December. "In the longer term this will lead to more local recruitment to the industry, and Finnmark may strengthen its position in the technology-driven development of the Barents Sea."

The costs of operating the field are estimated at some NOK 1.15 billion (US$146 billion) per year. "This will represent about 1,700 man-years nationwide, some 500 of which will be located in Northern Norway," said the company, counting both direct and indirect employment effects. The subsea development includes 30 wells, 10 subsea templates and two satellite structures. Aker Solutions will do much of the work. "We are pleased to see that Norwegian suppliers again demonstrate their competitiveness and will play a key role in the development of Johan Castberg. The jobs generated nationwide during the development are estimated at almost 47,000 man-years," Øvrum said.

The Undiscovered

According to the Norwegian Petroleum Directorate and the Norway Ministry of Petroleum and Energy, the Norwegian continental shelf covers an area of 2,039,951 sq. km. (787,625 sq. miles), with oil exploration expanding from the North Sea to the Norwegian Sea and Barents Sea since 1980. "The North Sea is still the powerhouse of the Norwegian petroleum industry with 62 fields in production at the end of 2016," says the directorate. "In addition, there are 16 fields in production in the Norwegian Sea and two (Snøhvit and Goliat) in the Barents Sea."

The Norwegian part of the Barents Sea covers an area of 313,000 sq. km. (120,850 sq. miles), and is the largest sea area on the Norwegian continental shelf. The Barents Sea — home to only the Snøhvit and Goliat fields thus far — is also the sea area with the largest hydrocarbon potential. Only the area south of 74° 30' N is open for petroleum activities.

Currently, gas from Snøhvit is transported by pipeline to the Melkøya onshore facility, where it is processed and cooled down to produce liquefied natural gas (LNG), which is delivered to the markets on special LNG vessels, Statoil explains. "Produced oil and gas from Goliat are transported onto a Floating Production Storage & Offloading (FPSO), where the oil is processed, stabilized and stored for further export in tankers, while the gas is reinjected into the reservoir."

"Most of the Barents Sea is considered to be a frontier petroleum province, even though there have been exploration activities here for more than 30 years, and the first discovery was made in the early 1980s," says the company. "It is estimated that approximately half of the undiscovered resources on the Norwegian continental shelf are in the Barents Sea."

Oil Giants See a Future in Offshore Wind Power. Their Suppliers Are Investing, Too.

Inside Climate News
By Lyndsey Gilpin
January 11, 2018

Transporting an offshore wind array from the factory floor to the ocean floor is no easy feat. Giant, specialized marine vessels must carry the blades and turbines—which sit atop rigs hundreds of feet tall—out miles from shore. Steel or concrete foundations are built to hold them in place, and underwater cables are laid on the seabed to transfer the power to land.

One other industry has spent decades constructing and maintaining such massive energy infrastructure that can survive the storms of the open ocean: oil and gas. Now, with global demand for wind power growing, major oil and gas companies like Shell and Statoil are diversifying their portfolios by developing offshore wind, and the companies that provide services to offshore fossil fuel platforms are seeing a new market rising in their wake.

"Offshore wind developing seemed like a natural skill set for offshore oil and gas companies," said Stephen Bull, senior vice president of wind and carbon capture storage for Statoil, a Norwegian oil and gas company. "From the Gulf of Mexico to Brazil and beyond, we see a similar supply chain and skill set and can grow within this area."

Statoil, which is building the world's first floating wind farm near Scotland, is planning development for its first offshore wind lease in the U.S., an 80,000-acre area off the coast of New York that could generate more than a gigawatt of power. Ørsted (formerly DONG Energy, short for Danish Oil and Natural Gas), has a 1.3 gigawatt wind farm under construction off the UK and is exploring developments off Massachusetts and New Jersey. Shell is leading the development of two wind farms in the Dutch North Sea.

Globally, 17.6 gigawatts of wind power capacity have been installed offshore, with most of it in Europe, and the industry is growing. Bloomberg New Energy Finance raised its offshore wind forecast this week, with an expectation that it will reach 115 gigawatts worldwide by 2030.

The U.S. market, however, has gotten off to a slow start.

Cape Wind, a large-scale offshore wind project planned near Massachusetts, was officially killed late last year, leaving only one small working offshore wind farm in the U.S., and 13 offshore leases from Massachusetts to North Carolina, according to the Bureau of Ocean and Energy Management (BOEM). Other projects are in various stages in the South Atlantic and Pacific Ocean.

According to a 2017 Wood Mackenzie study, annual revenues from wind and solar could represent one-twelfth of the revenues in oil and gas by 2035. As major global oil and gas companies and supply chain companies are moving into the offshore wind game, the market is ripe for large-scale projects that could not only generate more wind power in the U.S. but bring costs down and create jobs in local communities.

"Building on the success of the oil and gas industry and their work in the open ocean for several decades now, we think it's a great business opportunity for them," said Nancy Sopko, director of offshore wind and federal legislative affairs at the American Wind Energy Association. "And it's a great starting point for offshore wind to utilize the skilled workers, infrastructures, the vessels and the body of expertise that comes from oil and gas to catapult another new ocean industry resource."

Using Oil and Gas Industry Strengths

Just south of Rhode Island, the only working offshore wind farm in the U.S. has been successfully supplying power from five turbines to about 2,000 customers for just over a year. Years ago, Europe started with small projects like that, Bull said. But as oil and gas giants entered the market, they have been able to take on larger projects that generate more electricity. Since then, Europe has become the world leader in offshore wind, with about 13 gigawatts installed and more in the works.

"What we see now has scaled dramatically on the industrial level—turbines are much larger and farther from shore to capture better resources," Bull said. "Oil and gas companies are used to carrying that kind of investment."

Oil and gas supply chain companies are also getting into the market.

Gulf Island Fabrication, based in southern Louisiana, manufacturers foundations for offshore oil rigs—and for offshore wind turbines. The company built foundations modeled after oil platforms for the Block Island Wind Farm.

The Houston-based engineering firm Zentech, which specializes in rig platforms and offshore oil drilling and construction vessels, announced plans this summer to tackle another hurdle facing the wind industry: with Renewable Energy Resources International of Virginia, the company is building the first U.S. offshore wind-turbine installation vessel. Under the Jones Act, only U.S.-built, U.S.-based ships with U.S. crews can carry goods between U.S. ports. When the Block Island Wind Farm was built, a European ship had to be used, and it wasn't allowed to dock in the U.S. before delivering supplies. After some "fine-tuning" of the designs, the new U.S. vessel is on track to be completed by mid-2019, Zentech Vice President Sundaram Srinivasan said.

The wind industry provides an opportunity for companies to reinvent themselves and diversify, Bull said, and for employees to find work in a new market. "These workers have been building things for open ocean use for decades," he said, adding that he's hoping American offshore oil supply chain companies will get into the offshore wind industry to help create local jobs.

"That will be essential for us to win the hearts and minds, not just with politicians, but with local people," he said.

Statoil is interested in utilizing the oil and gas supply chain along the Gulf Coast to build foundations, vessels and turbines, and using port authorities in New Jersey and New York and other local vendors to help with the New York project.

"It's a true redeployment of the American workforce," Sopko said. "It will create great-paying jobs and increased energy independence and attract investment in infrastructure and manufacturing."

Streamlining the Process

There has been a surge in demand for offshore wind from many coastal states, with about 14 gigawatts of leased wind energy area capacity in the Northeast alone. Several states have set goals for offshore wind power:

- New Jersey's incoming governor has pledged 3.5 gigawatts by 2030.
- New York's governor has a goal of 2.4 gigawatts by 2030.
- Massachusetts is calling for 1.6 gigawatts by 2027.

California has been pushing for offshore wind, too. Floating wind farms, which are now being tested off Europe, have more potential near California and Hawaii, where the seafloor drops off quickly, Bull said.

But an offshore wind project can take up to a decade to complete. After the long bidding process, it takes time to choose and assess a site, figure out financing, and do an environmental impact analysis—all before a developer begins construction.

"The key thing about renewables is that we need and want to develop as fast as we can but the regulatory process stops it for so many years," Bull said.

There are ways to streamline the process at the federal level, Sopko said, and AWEA has been lobbying the Department of Interior and BOEM to do so. For instance, she said, a floating wind farm doesn't have the same environmental impacts as one on the seafloor, so it shouldn't be held to the same environmental assessment requirements.

"That could shave two years off process for a developer," Sopko said, "which is going to keep attracting investment."

There are also hold-ups at the state level, where some lawmakers and communities have pushed back against offshore projects. Along the East Coast, fishermen groups are fighting plans for offshore wind projects; Cape Wind was set back for years because of political opposition from the Kennedy and Koch families.

"Each developer must demonstrate safe and responsible development plans to the regulators as well as to a plethora of other agencies and local stakeholders," said Walt Musial, manager of offshore wind at the National Renewable Energy Laboratory.

However, as those processes are smoothed out and fossil fuel companies scale up offshore wind projects, he said, the costs will likely come down. "The oil and gas industry is in an excellent position to capitalize on this nascent industry," Musial said. "It possesses the skills and know-how to step into this business, which could see revenues of well over $20 billion in the next decade."

The Wave

Dancing With The Wind

The Wave
By Ralph Mancini
October 4, 2018

A Thursday, Sept. 27 presentation on the part of New York State Research and Development Authority (NYSERDA) representatives offered lots of sizzle, but a scarcity of concrete plans for wind energy supporters to sink their teeth into.

Though the information session provided a glowing report of the host of environmental and economic benefits that could result from the development of renewable offshore wind energy, agency experts were unable to communicate a firm date for its implementation with proposed siting areas awaiting state and federal approval.

In fact, during a half-hour Q&A period following the walkthrough of NYSERDA's Offshore Wind Master Plan, one spokesperson claimed that it wouldn't be until sometime in the mid-2020's at the "earliest" before the installation of any turbines and/or any other steel components would break ground.

"Our Clean Energy Standard mandate requires that 50-percent of our energy come from renewables by 2030, which is very substantial [and] one of the leading commitments to renewables in the nation," said NYSERDA's Director of Large-Scale Renewables Doreen Harris.

"It's accompanied by an equally aggressive goal of offshore wind development. New York State's goal of 2,400 megawatts of offshore wind by 2030, which places us in a position of leadership in advancing what we believe is a resource that can not only benefit New Yorkers from an environmental perspective, but from an economic perspective as well."

NYSERDA's Principal Engineer for Offshore Wind Adrienne Downey detailed a few of the environmental dividends of achieving the state's wind energy goal, including the reduction of greenhouse gas emissions by more than five million tons, which she estimated to be tantamount to removing about one million cars from the road.

Improved air quality, she added, would result in 8 to 18 fewer premature deaths annually.

As for the economic rewards, she cited the Workforce Opportunity of Offshore Wind in New York study, which forecasts that the state would benefit from more than $6 billion in investments and approximately 5,000 new jobs in installation, operations, maintenance and manufacturing.

Joining Downey to touch on NYSERDA's public engagement and outreach efforts was Greg Lampman, the group's program manager for its environmental research program, as he recounted how he and his colleagues have met with several fishing organizations to understand what their concerns are.

"We've been developing a commercial recreational fishing technical working group, the core of which is going to be comprised of fishing organizations. They represent the regional states of Massachusetts, Rhode Island, New Jersey and New York and we're working with that group to expand that list to include more," informed Lampman.

Prior to NYSERDA's master plan presentation, The Wave spoke to Julia Bovey, a corporate rep from Equinor U.S. Wind (a Norway-based wind energy provider, formerly known as Statoil, that will be bidding into the procurements of local offshore wind projects) on the subject of the impacts of wind power infrastructure on the fishing industry.

The external affairs director stated that the American Wind Energy Association has spoken to numerous fishermen who ply their craft in the surrounding waters of Block Island (the location of the first offshore wind farm in the United States) who "seem happy" with the work done by Deepwater Wind to complete the steel construction and turbine installation.

"They can fish right up to the turbines…and there's certainly fears in the fishing community that their access will be restricted, but the plan is it absolutely not be. We don't even have the right to restrict their access. During construction, if there's a safety issue, that's one thing, but once the project is up and operating, anyone with a boat can [fish]," she said.

Currently, New York State is proposing six sites along the northern east coast as existing lease areas for offshore wind, including three in New England, one off the coast of New Jersey and one in the New York City area.

The Bureau of Ocean Energy Management (BOEM), an agency within the United States Department of the Interior, is reportedly considering siting areas that go beyond New York State's recommended locations.

While many local activists, such as John Cori of the Rockaway Beach Civic Association, JK Canepa of Sane Energy and Joan Flynn of the Rockaway Women for Progress among others, have fully endorsed the move to wind energy, others had questions about the number of ways the Rockaway peninsula could be affected by an advent of wind farms.

Animal communicator Jill Lauri, in particular, voiced her quality-of-life concerns for the Rockaway community when asking if her hometown's "laid back" character would change with all the incoming economic activity that will be one of the byproducts of offshore wind infrastructure once it's in full operation.

"I think it's important to note also that any siting of activity here in the Rockaways, where the intention would be to bring jobs and to bring economic activity into the region, would also likely go through rounds of local permitting certainly," replied NYSERDA Technical Advisor Matt Vestal. "I think that effectively what I'm telling you is before any type of facility is placed locally, there would be additional engagement with the local community to ensure that it is in alignment with the ambitions of the people who live here."

Similarly, Rockaway Waterfront Alliance's Director of Planning and Development Ana Fisyak expressed her own set of apprehensions about New York State's bold energy agenda, as she implored the guest speakers to expound on the windmill components in terms of where they'll be produced, their life cycle, maintenance and disposal plan when parts will eventually have to be replaced.

Vestal and BOEM Energy Program Specialist Luke Feinberg tackled the issue with the former mentioning that the offshore wind industry is grounded in Europe, but predicted that the "seismic shift" in the attention that the renewable energy source is gaining in the U.S. will soon lead to the domestic manufacturing of infrastructure components.

Feinberg, on the other hand, addressed the other topics by conceding that there would certainly be oil lubricants involved in the process of maintaining and operating a wind farm, but noted that the federal government has no jurisdiction over the equipment and/or materials used by providers.

"If they need to change a blade, for example, that's not something that I'm aware of that we would play a part in," he said.

In addition, Feinberg offered insight on leasing agreements with wind energy developers by pointing out that as the landlord of the siting areas that will be selected, BOEM requires stipulations and regulation in their leases that mandate everything be restored to the original conditions after the expiration of their lease agreements.

"If we grant a lease to a project and it's installed, if for some reason, the developer is not able to live out the entirety of that lease, the taxpayer is not stuck with the liability of deconstructing it," he said.

After an Uncertain Start, U.S. Offshore Wind Is Powering Up

Yale Environment 360
By Roger Drouin
January 11, 2018

This summer, the Norwegian energy company, Statoil, will send a vessel to survey a triangular slice of federal waters about 15 miles south of Long Island, where the company is planning to construct a wind farm that could generate up to 1.5 gigawatts of electricity for New York City and Long Island — enough to power roughly 1 million homes.

Construction on the "Empire Wind" project, with scores of wind turbines generating electricity across 79,000 acres of leased federal waters, is scheduled to begin in 2023, with construction completed in 2025.

Farther south, 27 miles off the coast of Kitty Hawk, North Carolina, Avangrid Renewables, an Oregon-based company, has already begun planning for a major wind energy farm on 122,000 acres of federal waters, a project that could eventually generate 1.5 gigawatts of electricity.

And about 10 miles off the New Jersey coast, between Atlantic City and Cape May, Danish clean-energy giant Ørsted, which has a large portfolio of offshore wind farms across Europe, is talking with local officials, securing state permits, and doing seafloor surveys on a 160,000-acre site, where it plans to build its 1–gigawatt Ocean Wind project. Company officials say they are hopeful that the wind farm will come online between 2020 and 2025.

After years of false starts and delays, the offshore wind industry in the United States finally seems to be gaining some momentum. Although far behind the burgeoning offshore wind energy industry in Europe, companies such as Statoil, Avangrid, and Ørsted are joining other wind energy developers — both from the U.S. and Europe— to pursue a slate of projects along the U.S. coast.

According to the U.S. Department of Energy, more than 25 offshore wind projects with a generating capacity of 24 gigawatts are now being planned, mainly off the U.S. Northeast and mid-Atlantic coasts. And although some of these projects may not be built, and only one commercial offshore wind farm has actually been constructed —the tiny, five-turbine "Block Island Wind" project off Rhode Island — analysts say that U.S. offshore wind is expected to enjoy significant growth in the coming decade.

"The real nuts-and-bolts of making this industry happen are going to come together in 2018," says Stephanie McClellan, director of the University of Delaware's Special Initiative on Offshore Wind.

Several key factors are driving the long-awaited takeoff of U.S. offshore wind: Sophisticated turbine technologies and economies of scale are driving down costs; advances in construction are allowing wind farms to be built in deeper water farther offshore, significantly lessening the public's concern about seeing turbines close to the coast; states across the Northeast and the mid-Atlantic, as well as California and Hawaii, are pushing development of offshore wind projects; and some European wind turbine manufacturers, as well as several U.S. firms, have decided to locate research, development, and wind turbine production facilities in the U.S.

And to the surprise of some companies and renewable energy analysts, the Trump administration — which has aggressively promoted the development of fossil fuels over renewable energy — seems to be supporting the offshore wind energy sector.

Interior Secretary Ryan Zinke, whose department oversees the federal Bureau of Ocean Energy Management, endorsed offshore wind in his proposed fiscal year 2018 budget and praised the leasing of federal waters to Avangrid for the Kitty Hawk project as a "big win." In December, U.S. Secretary of Energy Rick Perry announced the creation of a consortium to develop innovative offshore wind technologies. Ninety percent of the announced $18.5 million in federal funding for the consortium will go to research and development, largely to decrease turbine costs and improve turbine efficiency.

President Trump, who once disparaged many aspects of wind power, could still decide to throw up roadblocks to the offshore wind industry. But for now, analysts are cautiously optimistic about the sector's prospects, especially since Congress's recently passed tax reform bill preserves tax credits for the wind energy industry for several more years.

Bruce Hamilton, director of energy practice at the consulting firm Navigant, has been skeptical of the prospects for U.S. offshore wind energy, in large measure because establishing wind farms offshore has been far more expensive than building onshore facilities. But he now sees encouraging signs of life in the sector, as offshore wind costs have fallen substantially. "European developers, major companies, are interested in participating, and that is telling," says Hamilton.

Stephen Bull, Statoil's senior vice president for offshore wind, told *The Wall Street Journal* last year, "We have done this in Europe, and we have absolutely the same opportunity in the U.S."

Europe now has a total installed offshore wind capacity of more than 12,600 megawatts (12.6 gigawatts), generated by 3,589 grid-connected wind turbines in 10 countries. The U.K. is the world's most developed offshore wind market and accounts for about 36 percent of installed capacity, followed by Germany in the second spot, with 29 percent, according to the Global Wind Energy Council. In 2016, China passed Denmark to achieve third place in the offshore rankings with 11 percent. Denmark, now in fourth place, accounts for 8.8 percent of installed global offshore wind capacity. The Netherlands has 7.8 percent, Belgium 5 percent, and Sweden 1.4 percent.

The capital costs of offshore wind generation in Europe are falling sharply, from $3.8 million per megawatt of electricity in 2016, to $2.2 million per megawatt at the end of 2017. The primary driver for these reductions is the increase in turbine capacity, and this ongoing advancement in turbine and platform technology will continue to drive down the cost of offshore wind, according to Hamilton.

"It is incredible how much the costs per megawatt [for offshore wind-generated electricity] have dropped this year alone in Europe," says Hamilton. "As a result, two projects were bid with zero subsidies that will be built in the mid-[20]20s. That kind of cost improvement will come here, too."

The nascent offshore wind energy sector in the U.S., at least initially, is expected to produce more expensive electricity. According to the U.S. Energy Information Administration, the projected cost of electricity per megawatt-hour in the U.S. in 2022 will be $140 for coal, $110 for natural gas, and $157 for offshore wind — excluding any tax credits, which boost wind power's competitiveness.

Laura Beane, the CEO of Avangrid Renewables, which is the developer of the Kitty Hawk wind project, says the offshore industry has been preparing to move ahead with offshore wind growth without incentives, such as the federal Production Tax Credit, which is scheduled to be phased out over the next three years under the 2017 federal tax overhaul. Yet Beane says the offshore wind industry is aiming to soon produce electricity at a cost equal to, or lower than, coal or natural gas.

Offshore wind turbines and other components are primarily being produced in Europe and China — with the notable exception of G.E. Renewable Energy, the U.S. turbine manufacturing leader, which has facilities in South Carolina, Florida, and California.

But some companies are beginning to develop advanced offshore wind power technologies in the U.S. For instance, Louisiana-based Keystone Engineering is experimenting with the newest platform foundations designed to anchor turbines at U.S. offshore wind farm sites. The company, rooted in the oil and gas industry, has designed a structure called the "Twisted Jacket" foundation that reduces costs and storm risk compared to other foundations.

Other companies in Texas, Louisiana, and South Carolina are already interested in participating in the new offshore wind industry, according to James F. Manwell, director of the Wind Energy Center at the University of Massachusetts, Amherst. Furthermore, a Denmark-based turbine maker, MHI Vestas, is developing a groundbreaking 9.5-megawatt turbine — reportedly the world's most powerful — in South Carolina at Clemson University. This powerhouse prototype would likely be used in the first batch of large offshore wind projects built in the U.S., and according to the University of Delaware's McClellan, the South Carolina facility is an important sign that the offshore wind industry is poised for steady growth in America.

Meanwhile, numerous states — including New York, New Jersey, Massachusetts, Delaware, Maryland, Rhode Island, Hawaii, and California — are moving aggressively to develop offshore wind projects:

In New York, the state's Clean Energy Standard mandates a significant increase in the share of renewables in its energy mix. As part of that effort, Governor Andrew Cuomo has called for up to 2.4 gigawatts of offshore wind power by 2030, a move that helps create a reliable market for offshore wind-generated power, says Statoil's Empire Wind project director, Christer af Geijerstam.

In New Jersey, Democratic Governor-elect Phil Murphy has proposed a strong plan to advance offshore wind initiatives sidelined during the tenure of his predecessor, Republican Chris Christie. During his campaign, Murphy, who takes office January 16, called for developing "the most ambitious offshore wind target in the country" and promised to bring 3.5 gigawatts of offshore wind to the state by 2030.

Last May, Maryland utility regulators approved two offshore wind farm projects, to be constructed respectively by U.S. Wind and Deepwater Wind, the developer of Block Island Wind. State utility regulators have approved subsidies for these projects.

In Massachusetts, where the controversial Cape Wind project in Nantucket Sound was recently abandoned, the state has been actively trying to develop offshore wind projects. About 15 miles off Martha's Vineyard, Avangrid, in partnership with Copenhagen Infrastructure Partners, is vying for another federal lease. The state of Massachusetts is requesting utility providers to submit proposals to purchase power from the project, which will be connected to the mainland via buried transmission lines. Massachusetts and Rhode Island have both passed laws that require utilities to enter into long-term contracts, known as power purchase agreements, with economically competitive offshore wind projects. In California and Hawaii, efforts are now underway to identify the best locations for offshore wind farms. Statoil is marketing its floating wind turbine technology — already in use globally — to both states. Hawaii is eyeing offshore wind as part of its effort to power the island with 100 percent clean energy by 2045.

Although exploratory at this time, the Gulf of Mexico is an area of interest for offshore wind development because of the design, infrastructure, and workforce synergies between offshore wind and the Gulf's oil and gas industry. The region has less-powerful winds than the Atlantic, but it offers a number of advantages for offshore wind, including shallow water that makes turbine installation easier and higher accessibility because of close proximity to existing offshore oil and gas infrastructure.

The Trump administration's policies on energy and utilities have the potential to impact offshore wind. For instance, Energy Secretary Perry recently put forth a measure that would have tipped U.S. electricity markets in favor of coal and nuclear power by subsidizing struggling coal and nuclear plants. But this week, the Federal Energy Regulatory Commission, which oversees those markets, rejected Perry's proposal.

Offshore wind proponents remain cautiously hopeful that Trump, as well as Republican governors in coastal states, will warm to what they see as the immense potential of offshore wind-generated electricity. "There is an opportunity to create a new American heavy industry," says McClellan.

Running With The Wind

The Wave
By Ralph Mancini
February 15, 2018

In its ongoing mission to promote sustainable power sources on the Rockaway peninsula and beyond, the Sane Energy Project (SEP) recently hosted an information session that saw the group sing the virtues of building a wind farm along local shores to replace hazardous fossil-fuel methods.

Renewable energy advocates Kim Fraczek and JK Canepa appeared at the Challenge Preparatory Academy's Central Avenue campus on Feb. 9 to fill in community members on their partnership with the New York State Energy Research and Development Authority (NYSERDA) to lay the groundwork for the installation of wind turbines on Rockaway's coastal waters.

Fraczek detailed a commitment on the part of Gov. Andrew Cuomo to procure two separate 400 milliwatt installments of offshore wind in 2018 and 2019 in his effort to make New York an increasingly renewable state.

"The process is going to get started this year. Right now, we're doing a big study of this area. We know we can do better than fossil fuels. We need to move into the future and New York is poised to be a leader," said Fraczek.

The Brooklyn-based activist referenced a wind-energy pilot project that was recently developed and currently in service on Block Island, located just south of mainland Rhode Island, as evidence that this alternative power source is indeed viable.

She stated that five turbines are supplying the entire island area that is no longer using diesel generators that have since been placed out of commission.

In addition to highlighting the fact that wind energy doesn't pollute the air like traditional power plants that continue to rely on fossil fuels, such as coal and natural gas, the speaker touched on the economic benefits of the sustainable power option in the form of jobs.

"We want to make sure there are jobs created right here. We want to [secure] the $15 million Gov. Cuomo has promised for those offshore wind farms right here on the Rockaway peninsula. This is a frontline community of this offshore wind farm."

However, it was noted that that SEP's affiliation with the international energy firm Statoil will be key in converting the environmental coalition's vision into a reality. Statoil's commitment to opening new renewable energy opportunities, according to Fraczek, would provide the necessary training to allow individuals to switch careers and enter the wind power industry.

The Wave caught up with Fraczek and Canepa after the meeting to ask about how wind-generated energy would impact residents in terms of their monthly dues; they replied that it's too early to forecast any kind of rate decrease. So, while wind power is inherently cost-effective, the "system" is currently stacked in favor of nuclear and fossil fuel sources that are extending public subsidies, as per Fraczek.

“We are actively working on esoteric policy with the Public Service Commission to have renewable energy benefit low to moderate income New Yorkers. Cuomo needs to hear from the people that we won’t stand for it anymore, as he controls the PSC,” indicated Fraczek in a subsequent email. “We have a big fight ahead of us and need all hands on deck to make sure the renewable revolution functions in favor of the people and no longer the corporate model.”

In the meantime, SEP is leading the fight to oppose a request submitted to the Federal Energy Regulatory Commission (FERC) by The Williams Companies to install a 23-foot pipeline transporting fracked natural gas from a compressor station in York County, Pennsylvania through the waters of Rockaway and into additional valves and facilities along the east coast.

The new pipeline would reportedly feed into the Rockaway pipeline which travels under the Gateway National Park through Jamaica Bay and into Floyd Bennett Field, where it would then be metered back onto Flatbush Avenue and into the National Grid network.

Canepa encouraged those protesting the plan, also known as the Northeast Supply Enhancement Project (NSEP), to register with FERC and become intervenors, which would empower them to develop a stronger stance on the issue and subsequently comment on it. The steps require that individuals create an account at ferc.gov/multimedia/efile.asp and visit ferconline.ferc.gov/FERCOnline.aspx to file their concerns.

Forbes

New York Is Moving Aggressively To Harvest Its Offshore Wind

Forbes
By Peter Kelly-Detwiler
March 9, 2018

The East Coast of the United States is about to become a major offshore wind hub, with 7,500 megawatts (MW) being committed by Massachusetts (1,600 MW), New York (2,400 MW), and New Jersey (3,500 MW). Other states such as Connecticut, Maryland, and Rhode Island are likely to get into the game as well.

For years, the harvest of this resource seemed somewhat of a pipe dream, especially as observers watched the lengthy, contentious, and ultimately unsuccessful travails of Cape Wind. All that seemed to change once Deepwater Wind successfully installed its 30 MW project off Block Island. Suddenly, these projects began to look a lot more feasible. In fact, within a few short years, the East Coast of the United States may find itself a bustling hub for offshore wind development, much the same way the European countries around the North Sea – with over 11,000 MW of offshore wind installed – are today.

A conversation with NYSERDA's CEO Alicia Barton: the role of NYSERDA

Of the states with articulated offshore targets, none is moving faster than New York State. In his 2018 State of the State address, Governor Cuomo set a goal of procuring no less than 800 MW of offshore wind in two solicitations this year and next.

In an effort to better understand the implications of this commitment, and the potential of offshore wind for the Empire State, I lined up a conversation with Alicia Barton, president and CEO of the New York State Energy Research and Development Authority (NYSERDA). Barton is quite familiar with the issues at hand: some years ago she was CEO of the Massachusetts Clean Energy Center when the Commonwealth was architecting its initial plans for developing the offshore wind resource.

Barton noted that while the near-term 800 MW goal is going to require a concerted effort, New York has actually been preparing for this for many years. Her agency has helped lay the groundwork for this effort, coordinating a 'War and Peace' length Master Plan complete with 20 supporting studies. These cover everything from the obvious impacts on wildlife, commercial fisheries and navigation, to the assessment of ports and infrastructure capable of supporting these massive projects, and the economic impacts of developing the wind resource. The studies also examine some perhaps less obvious areas including cultural resources (such as shipwrecks and underwater archaeological sites) to the impact on potential future underwater sand and gravel mining sites (an $8.2 bn U.S. industry). In other words, they have tried to thoroughly address all possible relevant aspects of the proposed projects.

NYSERDA has many responsibilities related to promoting energy efficiency and renewables, but the offshore wind challenge is one of the bigger ones. Here, its main job is to move the process along and coordinate the alphabet soup of agencies that are tasked with supporting and regulating these complex projects. Barton's goal for the state is to help make it a leader, "positioning ourselves at the forefront of an industry that is taking shape in the United States" and observes that the Master Plan is "the most comprehensive effort any state has taken to date in looking at offshore wind across the board in terms of siting cost, economic development and workforce needs."

East Coast commitments will create industries and drive economies of scale Barton is optimistic that the combined commitments of the East Coast states will lead to economies of scale that will drive costs down, and she points to Europe, where thousands of megawatts of projects have helped create a supply chain that has created numerous efficiencies and lower costs.

That's a big part of what gives us confidence that this is a good investment for NY State. Those rapid cost declines in Europe. The U.K. auction last fall with prices at half what they were two years prior is very heartening about the industry's ability to deliver a cost-effective resource.

Those cost declines follow an increasingly positive trend: according to Wind Europe, the December 2013 levelized costs of European offshore wind energy were €140 (roughly $174 U.S., as of this writing). By late 2016, they had plummeted to €40 ($49.60).

NYSERDA's CEO sees similar dynamics eventually coming into play in the United States, once the commitment is large enough and the supply chain migrates from Europe to the U.S. In NYSERDA's analysis, she observes, we concluded that over the course of that 2,400 MW and the time horizon between now and 2030, we would expect offshore wind to be cost-competitive with land-based renewables. We see offshore wind as being cost-competitive with onshore wind in the U.S. based on the experience in Europe.

As far as the size of the commitment necessary to create a robust and cost-competitive supply chain on the East Coast, Barton indicates that it could be around 1,000 MW although different suppliers give different numbers. But with many of the East Coast states in the offshore game, we will see economies of scale…collectively we have 7,500 MW of commitments, which means we will be much better positioned to optimize the supply chain and bolster the ability of domestic businesses to collaborate.

The big developers have signaled interest, and they will deploy massive machines

As of the end of 2017, Europe boasted nearly 16,000 MW of offshore wind. So 7,500 MW of East Coast offshore wind is a pretty attractive prize. As a result, Barton indicates, all of the major players are eyeing the potential, evaluating the opportunity, and communicating with NYSERDA.

"We engage all developers, and those that hold leases in particular, whether Statoil, Deepwater Wind, Orsted, or Copenhagen Offshore Wind. We have engaged with all those folks, and we see a robust appetite from other European companies that don't hold leases to seek leases from the government."

These include major enterprises such as Shell and BP, as well as U.S. companies like Avangrid (the latter holds a lease off North Carolina).

These companies are quite comfortable in the world of big money, complex undertakings, and big machines. They will need to be: Barton indicates NYSERDA made assumptions for their cost analysis that turbines would be in the 8 MW range (those machines have started going into European projects over the past year and will soon be commonplace). Indeed, this assumption may turn out to be modest: just this month GE announced a 12 MW turbine for offshore deployments, expected to hit the market in 2021. It may be too late to be included in the earliest offshore projects, but GE has indicated it is eyeing the East Coast as a market for this new machine.

This is all good news for Barton, who notes that “As those machines get bigger, as we expect they will, costs will come down faster than they otherwise would.”

The next moves to getting turbines on the water

The next steps, Barton indicates, have to do with actual procurement, and they must happen soon to meet the Governor’s near term goals.

We need to procure no less than 800 MW in 2018/19 to send a signal that NY is serious about moving ahead. Now we have to figure out what’s the mechanism for procurement… That’s where the policy discussion is and where the workflows for New York and NYSERDA will be.

This process will involve a technical conference, followed by requests for public comments from the Public Service Commission (PSC), ultimately leading to a PSC decision later in 2018 that will specify how to move forward. The process may likely involve NYSERDA, since the agency manages solicitations for other large-scale renewables.

Led by NYSERDA, the state will also continue to evaluate the capabilities of its ports and existing industries. These ports may include not only the obvious ones like those in New York City, but also other facilities further up the Hudson River. Some are already being used for staging of large infrastructure projects like the new Tappan Zee Bridge and may be adapted for the offshore wind endeavor.

Ultimately, Barton concludes, the East Coast is likely to be one of the next big global frontiers for wind energy. Given the size of the prize and the implications for both the State’s ambitious clean energy goals and its long-term economic development, it’s important to get this right. “We concluded this is a pretty substantial opportunity for the State, with up to 5,000 jobs and $6 billion in investment.”

E&E NEWS

U.S. can replicate Europe's wind build-out, executives say

E&E News
By Saqib Rahim
March 28, 2018

The CEO of a U.S. offshore wind company says project costs in America could one day approach the low costs seen in Europe.

It just takes three things, said Deepwater Wind CEO Jeff Grybowski: "projects, projects and projects."

Speaking at an energy conference in New York City, Grybowski, whose company has built the only offshore wind farm in the United States to date, lauded the states trying to hurry up and build projects. He said that's the same way solar and onshore wind slid down the cost curve.

"There's no reason that offshore wind is going to have any different of a story," he said on a panel at the Advanced Energy Conference. "There's no reason why offshore wind ought to be really cheap in Europe and not so cheap in the United States. There's no magic here the U.S. can't replicate."

"What will get us there? It's not engineering; that's not the issue. It's projects," he said.

Grybowski's European rivals agree. "The fundamentals are as good here in the Northeast as anywhere in the world," said Lars Thaaning Pedersen, an executive with Copenhagen Infrastructure Partners who heads up its North American offshore wind portfolio. He estimated the United States could approach European project costs in the next decade.

The comments came as policymakers prepare policies that could establish offshore wind as a utility-scale energy resource in the next few decades.

So far, only one project, a five-turbine installation off Rhode Island, exists in the United States. With that demonstration-scale achievement, policymakers in Maryland, Massachusetts, New Jersey and New York are advancing policies meant to erect wind farms in the hundreds of megawatts. By some estimates, their current commitments add up to a 4-gigawatt "pipeline" of projects.

Europe has built 15.8 GW to date. Grybowski, and his European competitors now eyeing the U.S. market, are trying to persuade policymakers that the bigger they go, the bigger the benefits will be, in terms of both project costs and job creation.

"It's basically the amount of projects that's going to determine how much supply chain you're going to get in the U.S.," said Christer af Geijerstam, project director for Statoil ASA's proposed project off New York. "So if the supplier sees a pipeline of, say, 10 GW of projects in the next X number of years, they can make the investment to put manufacturing capabilities in the U.S."

For now, states are tiptoeing carefully at the top of the cost curve.

Maryland regulators have awarded subsidies to 368 megawatts of offshore wind projects, expecting them to be up and running by 2022. Last year, Massachusetts held its first solicitation for projects going toward its 1,600-MW mandate. New York hopes to launch an 800-MW solicitation by next year. New Jersey regulators are currently designing an 1,100-MW solicitation.

One key issue is financing. Developers say they cannot build offshore wind without some form of state support, but states have been wary of overpaying. Officials are exploring creative financing tools that can get the maximum projects built but with minimum ratepayer ask.

Grybowski is a fan of power purchase agreements (PPAs), long-term contracts for power, because it's the gold standard in the electricity industry and is easy to finance.

Maryland and New Jersey have so far favored the OREC, or offshore renewable energy credit — a direct subsidy to the project developer. For the projects awarded in Maryland, an OREC is worth $131.93 per megawatt-hour, for 20 years.

But as Grybowski said, and his competitors agreed, coming up with the precise financing tool isn't the most pressing issue before U.S. policymakers. It's putting up windmills.

New York regulators currently have seven financing options before them, and they're taking public comments on each. But time is of the essence; the state's goal is to launch its first-ever offshore wind solicitation by the end of this year.

Speaking at the conference, one state official said the Public Service Commission may prefer the ORECs now and another tool later.

"It's unlikely that the commission will pursue a PPA at this point for phase one," said Thomas Rienzo, a staffer at the state's Department of Public Service. "This is very time-sensitive, and we don't want to propose an option that's going to be challenged in court."

WORKBOAT

New York City to reactivate South Brooklyn Marine Terminal

Work Boat
By Kirk Moore
May 14, 2018

A 64.5-acre block at the South Brooklyn Marine Terminal is being reactivated, as the first step in what New York City officials say will be a new cluster of maritime activity and waterfront industry.

More than 250 jobs are expected in the near term as the city's selected Brooklyn-based property operators, Red Hook Container Terminal and Industry City, open up what's being dubbed the Sustainable South Brooklyn Marine Terminal, according to the city Economic Development Corporation.

With a long-term lease through 2054, operators will move over 900,000 metric tons of material annually through the port, including waste paper recycling and export, lumber imports, salt and aggregate material. South Brooklyn will also become a new hub for the same kind of container-on-barge (COB) operations that Red Hook Container Terminal now hosts at its namesake Brooklyn location to the north. RHCT will be the new terminal operator and stevedore.

The 72-acre South Brooklyn terminal has lain fallow for too long, and "our partnership with Industry City and NYCEDC will transform the terminal into a vibrant cluster of industrial maritime activity over the coming decades," said Mike Stamatis, RHCT president and CEO, in a joint statement with the EDC.

The Economic Development Corporation worked with the neighborhood Sunset Park Task Force and other local Brooklyn leaders on revitalizing the terminal, with the goal of maintaining its industrial waterfront and creating good-paying maritime jobs. Gentrification is a major issue in the borough, driving up housing costs and converting what once were job-generating business locations.

"New York City's working waterfront has long been a source of economic vitality, fueling industries and good-paying careers for over a century. Sustainable South Brooklyn Marine Terminal will build on that legacy to advance the future of the New York Harbor," said James Patchett, the EDC president and CEO.

So far the city has spent $115 million to upgrade the South Brooklyn property, including improved rail connections. Goals include making it the one location on the east side of New York Harbor that can accommodate deep-draft bluewater cargo vessels, and using its container-on-barge capacity to help reduce truck traffic, congestion and air pollution on the port's crowded highways.

"By reducing the use of trucks for long-haul movement of freight and moving cargo across water, we can reduce emissions, while helping diminish traffic congestion on local highways and bridges," said Rep. Nydia M. Velázquez, D- N.Y.

South Brooklyn is also a potential future hub for building and servicing offshore wind energy arrays, which would bring in a whole new industrial base, Velázquez said. One of the first planned wind turbine developments is Statoil's Empire Wind project just outside the harbor approaches, and New York State energy planners say there could be 2.4 gigawatts of energy coming from offshore wind by the 2030s.

"Establishing a home for the emerging offshore wind industry on our working waterfront is a once-in-a-generation opportunity," said Ben Margolis, executive director of the Southwest Brooklyn Industrial Development Corporation.

WORKBOAT

Washington must come to grips with offshore wind conflicts

Work Boat
By Kirk Moore
May 16, 2018

Offshore wind energy developers have momentum building for them in East Coast waters. But other maritime industries want to ease up on the throttle.

The federal Bureau of Ocean Energy Management recently held another round of public meetings in New Jersey and New York, gathering information for what could be a future round of lease offerings in the New York Bight. Secretary of Interior Ryan Zinke has promised to help fast track future permitting.

Already Statoil has plans for its Empire Wind turbine array, tucked into a 79,350-acre federal lease near the apex of ship traffic separation lanes near the entrance to New York Harbor. That could mean a lot of new maritime jobs, along with a new kind of navigational risk.

The Maritime Association of the Port of New York and New Jersey supports renewable energy, said Edward Kelly, the association's executive director, at a May 9 meeting BOEM hosted in Newark, N.J.

"Our ultimate goal is safety," Kelly stressed. The port gets more than 10,000 deep draft vessels calling every year, he said, and handles the largest volume of petroleum products of U.S. ports.

For separating turbines from ship traffic, "we feel the setbacks are absolutely essential…we would like them to be at least one nautical mile," said Kelly.

Others have argued there needs to be much more space now, with the arrival of 1,200'x140' ultra-large containerships that need more like 2.5 miles to stop.

Those final decisions are up to BOEM. The Coast Guard is busy in an advisory role to the agency, while also starting work toward what could be a new East Coast routing system that would create shipping safety fairways.

"Each wind farm is different, each port is different," said Chris Scraba, deputy waterways chief with the Coast Guard Fifth District headquartered in Virginia. That will affect how wind farm buffers and setbacks are established, he said.

State governments in the Northeast and Mid-Atlantic are promoting big plans for offshore wind energy, even as they oppose the Trump administration's wishes to open Atlantic waters to oil and gas drilling. But wind turbines in the wrong place could pose their own danger of a spill.

"If we have one accident, one spill, that potentially could have generational impact," said Scraba. "It's critical we get this right."

Commercial fishermen have a case in federal court over the Statoil lease, and litigation seems certain to reignite. The arrival of foreign-flagged survey vessels in New Bedford, Mass., to explore sites leased by European wind developers energized fishermen opponents.

"We have the Magnuson Act (federal fisheries law) because we want to have American fishing grounds for American fishermen," said Meghan Lapp, fisheries liaison for fishing company Seafreeze Ltd., North Kingstown, R.I. "BOEM is plowing ahead regardless. They have not slowed down."

Skeptics may be getting some traction. A day after BOEM's meeting there, New Jersey Gov. Phil Murphy, a strong proponent of wind energy himself, asked the agency for a six-month extension of its information-gathering stage to absorb concerns of the fishing industry.

In lengthy comment letters April 30, the National Marine Fisheries Service and Massachusetts Division of Marine Fisheries weighed in, pointing out shortcomings in BOEM's environmental analysis so far and providing laundry lists for new research.

"It's going to take more than a one-year NEPA (National Environmental Policy Act) analysis," said Lapp. "You can't fast-track the analysis of something that's never been done before."

Competition, Cooperation and Costs the Talk at OSW Conference

RTO Insider
By Michael Kuser
June 11, 2018

Competition among states to set the highest offshore wind energy targets and to secure supply chain jobs is gradually giving way to a regional cooperation, the head of the Bureau of Ocean Energy Management said last week.

"In our view, all of the federal leases, they don't belong to any particular state, and we need to be thinking about how to manage those assets on a regional community basis," acting BOEM Director Walter Cruickshank said at New Energy Update's U.S. Offshore Wind Conference, held June 7-8.

"And we're certainly seeing that already," Cruickshank added. "We've seen projects that were leased off of one state getting agreements with neighboring states."

He cited the collaborative development efforts of Massachusetts and Rhode Island, of "Virginia and the Carolinas, and obviously in the New York Bight, where there are a lot of states that have stakeholder interest."

In May, Vineyard Wind, a partnership between Avangrid Renewables and Copenhagen Infrastructure Partners, won a contract to supply Massachusetts with 800 MW of offshore wind energy. In the same solicitation, Rhode Island picked Deepwater Wind to build a 400-MW version of its Revolution Wind proposal.

Picking up the Pace

Panelists at the conference also discussed ways to reduce costs and speed up permitting.

The Department of Energy's 2015 Wind Vision report set a goal of deploying 86 GW of offshore wind by 2050. The U.S. would need to use about 4.2% of the total technical resource area to reach the goal, according to the National Renewable Energy Laboratory's September 2016 Offshore Wind Energy Resource Assessment. The technical resource area includes areas of the Great Lakes and the Atlantic and Pacific coasts with wind speeds of at least 7 meters/second and water depths of less than 60 meters (Great Lakes) or 1,000 meters (the oceans).

The 11 BOEM leases issued so far could produce 20 GW by 2030 "based on the physical capacity of these leases," said Tom Harries of Bloomberg New Energy Finance. The typical timeline from lease to operation is five to seven years.

Stephen Bull, senior vice president at Norway-based Equinor (formerly Statoil), said he'd like "to see BOEM interact more at the state level, to really try to fast-track or work quicker to get wind energy areas out there."

Conference chair Stephen Pike, CEO of the Massachusetts Clean Energy Center, a state agency in charge of offshore wind development, asked about having BOEM pre-permit the leases to speed up development, as is done in Europe.

"That's not the way the federal government works," said Cruickshank, explaining that the bureau has no funding for capital-intensive marine surveys.

Although BOEM's leases to date have been off the Atlantic Coast, BOEM is also looking to the Pacific, which will require floating wind technology because of the much greater water depths, Cruickshank said.

"We're cautiously optimistic we'll be able to move ahead with some of those leases later this year."

Daniel Simmons, principal deputy assistant secretary for DOE's Office of Energy Efficiency and Renewable Energy, said improving floating platforms "is an important area for us just because so much of our wind resources offshore is in deep water."

Walter Musial, manager of offshore wind at the National Renewable Energy Laboratory, who explored the levelized cost of energy for floating turbines, said about 58% of potential offshore wind areas are deeper than 60 meters.

"Floating obviously starts out a bit more expensive, but it's a maturity thing, so fixed and floating turbine costs converge over time," Musial said. "Actual costs are confidential — they don't report them in the newspaper."

Manufacturers need to see the market demand in order to develop optimized turbine systems for floating platforms, he said. "Up till now, every single deployment has been with a turbine that was actually designed for a fixed bottom system, so we're sub-optimum," he said.

But the industry is now moving beyond the floating prototype phase. "I've counted about 11 projects totaling 229 MW," Musial said. "These are going in with some subsidies, but also with regular financing, and they're going in all over the world."

NREL wind analyst Garrett Barter agreed, saying the current design paradigm of offshore turbines "won't give you a cost-competitive floating system."

Engineering and design are just a fraction of the total cost for a floating wind turbine. Most of the costs are the operational expenses, logistics, assembly and installation, and financing, he said.

"So you really need a systems approach that can tackle all these complexities at the same time, and not just focus on the turbine itself," Barter said. He recommended multidisciplinary analysis and optimization, which is "a tool and also a state of mind where you connect the whole power production process, the whole load path, the controls that sit in between those two, and the whole balance sheet over the lifecycle of the plant."

He said the offshore industry may have to evolve into a structure like that of the aerospace industry, where a global supply chain serves a system owned by the prime contractor.

Driving Down Costs

Experts say it will take several years for the U.S. market to mature before it matches the separate cost curves for the established European market

“We think the transition happens around 3 to 4 GW of installed capacity, which should be in 2028 in the U.S., and the industry will move onto the established cost curve and really see price reductions,” Harries said. “The regulatory route gets simplified, and then gradually you build your experience and you move down this cost curve. Supply chains gain experience, and routes to market become very clear.”

Jonathan Cole, managing director of offshore for Avangrid parent Iberdrola’s renewable business, wants to see nearly that much capacity entering the pipeline each year.

“As soon as possible, get to a place where this market is being fed with 2 to 3 GW of new projects every year, which means you’ve got enough volume to support a local supply chain,” Cole said. “That’s when you’ll truly see cost reductions and the industrialization happening.”

Cole said that so far, they’ve been able to lower development costs through tax credits, which are now being phased out.

“We’re hoping that the downside of removing the tax credits is going to be more than compensated by the positive … making a more efficient and optimized installation,” he said.

Northeast Advantage

Vineyard Wind CEO Lars Thaaning Pedersen said tax credits are an important part of the price structure in Massachusetts, but “the benefits … these projects will bring to the southeast coast” of New England may be more important, such as avoiding the high cost of building transmission lines to bring hydropower from Canada.

The state “has taken a bold step already … and I’m confident that Massachusetts will be at the center of the industry,” Pedersen said.

Francis Slingsby, head of strategic partnerships at Orsted, congratulated Pedersen. Despite not winning the first round of the Massachusetts-Rhode Island solicitation, Slingsby said Orsted is committed to developing its Massachusetts lease areas, “which in our estimation are superb.”

“Wind speeds increase as you move farther north along the coast, which gives New England an innate advantage,” he added.

Massachusetts Energy Secretary Matthew Beaton referred to the previous day’s tour of the New Bedford Marine Commerce Terminal, which was built for the deployment of offshore wind, as evidence of the state’s chance to lead the industry.

"To see international companies come in with Massachusetts companies made me realize … this thing's for real, this thing's happening, and we have all the pieces that we need," Beaton said. "Eight hundred megawatts is just the starting point."

Bill White, MassCEC director of offshore wind development, said, "Growth in Massachusetts is really about … what it will cost to ratepayers."

John B. Lavelle, head of offshore wind for GE Renewable Energy, said volume will be the biggest driver of cost reductions. Lavelle said GE will "compete in the U.S. with our 12-MW platform that we just announced."

Operating costs will come down partially through "a lot of automation," Lavelle said. "You don't want to send people 15 miles off the coast if you don't have to."

NY, NJ, Md. Moving Forward

Elisabeth Treseder, senior regulatory adviser for Orsted, said New Jersey's commitment in May to build 3,500 MW of offshore wind by 2030 — surpassing New York's target of 2,400 MW — "provides a lot of certainty and reassurance" to the market. (See Gov. Signs NJ Nuke Subsidy, Renewables Bills.)

"We're still waiting for the New Jersey Board of Public Utilities to finish its plan, which for us means focusing on the local supply chain and workforce development," Treseder said. "New Jersey was very wise in passing a $100 million tax break for offshore wind manufacturing, which left them an additional pool [of incentives] for suppliers."

Kenneth J. Sheehan, director of economic development and emerging technologies at the BPU, said the state is working to develop its master plan and its first solicitation.

"We are looking for suppliers, transmission, for all the factors that go into it, and the OREC [offshore wind renewable energy credit], the single price, up-front method of funding, takes all this into consideration," Sheehan said.

Jim Lanard, CEO of Magellan Wind, asked Sheehan what his state's position is regarding wind energy areas that could serve both New York and New Jersey.

"Half the New York Bight is in New Jersey, so we're not practically upset about additional project development off our shore," Sheehan said, referring to the Atlantic Coast region between Cape May, N.J., and Montauk Point on Long Island. "At the start, it's every state for itself. … Everything could be supplied from New Jersey. And New York thinks the same of itself."

Kevin Knobloch, president of transmission developer Anbaric's New York Ocean Grid, said that particularly with New Jersey's goal of 3,500 MW, there's a sense of great urgency to get the first turbines in the water.

"We believe the wise approach is from the very first solicitations to separate generation from transmission, and open it up to competition," Knobloch said. "In so doing, the state decision-makers still reserve the right to go with an offer that's bidding on both attributes."

Doreen Harris, director of large-scale renewables at the New York State Energy Research and Development Authority, said the agency is also identifying new wind energy areas off New York City. There is a proceeding before state regulators now "to make the first utility-scale procurement later this year," she said.

Christer Geijerstam, director of the Empire Wind project for Equinor, which bought the first New York lease in 2016, said that aside from preparing for a state bid, the company is "focused on project technical issues to reduce asset risks" prior to the hoped-for start of construction.

John Hartnett, business opportunity manager of U.S. offshore wind for Shell Wind Energy, said his company "had really jumped into the U.S. markets driven by the evidence of the northeast. Right now, we are investigating the upcoming lease opportunities, both in Massachusetts and New York, and are very hopeful to have site control in time to participate in the upcoming auctions."

The Maryland Public Service Commission approved two offshore wind projects totaling 368 MW in May 2017, allowing the developers to receive ORECs. The projects are estimated to create 9,700 full time equivalent jobs and result in more than $2 billion of economic activity in Maryland, including $120 million of investments in port infrastructure and steel fabrication facilities.

Samuel Beirne, wind energy program manager for the Maryland Energy Administration, said that "most offshore wind developers have to contract through the state Public Service Commission [to obtain ORECs] … and most use a third-party consultant to help them."

Aileen Kenney, senior vice president of development for Deepwater Wind, said the company's 120-MW Skipjack project off Maryland will start construction in 2021 and go online the following year.

"Right now we're mapping all the seafloor, doing bathymetry analysis," Kenney said.

Production Tax Credit

According to DOE, the federal renewable electricity production tax credit is an inflation-adjusted 1.9 cent/kWh tax credit for wind for the 2017 calendar year. The credit lasts 10 years after the date the facility is placed in service.

The tax credit is phased down for wind facilities as a percentage reduction: for wind facilities beginning construction in 2017, the PTC amount is reduced by 20%; for 2018, 40%; and for 2019, 60%.

State talks plans for wind power

Long Island Herald
By Bridget Downes
October 11, 2018

New York State Energy Research and Development Authority officials announced last month that the agency was seeking feedback on a draft request for proposals from potential offshore wind developers.

More than 50 people gathered on the sixth floor of City Hall on Sept. 26 to learn more about the state's efforts to advance offshore wind energy and ask questions about the RFP process. NYSERDA sought comments from potential offshore wind developers and other stakeholders in the hope of finalizing the RFP, which would be issued this winter.

On Monday, a report from the United Nations' Intergovernmental Panel on Climate Change said that if greenhouse gas emissions continue at the current rate, the world could see intensified droughts and flooding, disappearing coastlines and extreme heat that could lead to food shortages by 2040, according to The New York Times. The United States is the world's second-largest greenhouse gas emitter, behind China.

NYSERDA's efforts coincide with Gov. Andrew Cuomo's goal of producing half of the state's electricity needs — up to 2,400 megawatts, enough to power 1.2 million homes — from renewable energy sources by 2030.

Agency representatives said the benefits of offshore wind energy include clean, locally produced power, support for investment in coastal infrastructure and the creation of thousands of short- and long-term construction, manufacturing and operations jobs.

NYSERDA has led the way in promoting the New York State Offshore Wind Master Plan, which encourages the development of offshore wind power in a way that is mindful of the environment and the maritime industry as well as economic and social issues, according to the agency. Since 2016, it has conducted 20 studies, officials said, and engaged with stakeholders and the public to "ensure the responsible and cost-effective development of offshore wind."

The state and federal governments have collaborated on the plan: The Department of the Interior, through the Bureau of Ocean Energy Management, identifies areas for offshore wind development, while the state commits to buying the power from those projects.

There are currently six areas in New York waters that the federal government is leasing to wind developers: three east of Long Island, near Massachusetts, owned by Deepwater Wind, Orsted and Vineyard Wind; **one south of Manhattan, owned by Equinor (formerly Statoil);** and two southwest of Long Island, near the New Jersey coast, owned by US Wind and Orsted. On Monday, Orsted, which is based in Denmark, acquired Deepwater Wind for $510 million, according to Orsted, and the two companies plan to merge.

“We think the work that the master plan has advanced really serves as a solid foundation for the federal government’s decision-making,” said Doreen Harris, NYSERDA’s director of large-scale renewables. “And further, again, to realize this very exciting and robust industry for us as a state, we think we need more areas to help us do so.”

Last year, NYSERDA officials recommended areas that they thought were best suited for offshore wind development to the federal government. The Bureau of Ocean Energy Management then began work on identifying more lease areas for potential developers, and NYSERDA officials said they would like to see that development happen as soon as possible.

“We see these new lease areas as being critical to our future development,” Harris said, “but in the meantime, we’re really excited to say that we are advancing New York’s first solicitations for offshore wind in the very near future.” The agency was recently awarded an $18.5 million grant from the Department of Energy to lead an offshore wind research and development consortium.

At the Sept. 26 meeting at City Hall, representatives of NYSERDA and BOEM invited audience members’ questions. “I was very pleased to see that a project labor agreement is a requirement of the RFP,” City Council President Anthony Eramo said. “I greatly appreciate that for the workforce for New York state.”

He asked if a change in the state’s political administration would affect the rollout of the wind development process. “All of the actions that have been taken in terms of the effectuation of the governor’s goal are actually through the New York Public Service Commission, through the orders of the Public Service Commission,” Harris explained. “So, in fact, these orders hold. They aren’t governed particularly by who is in office [at] that particular point in time. We’ve been working on renewables as a state for a very long time, and we’ve done it through many administrations. NYSERDA’s agreements stay in force.”

“I was kind of surprised to find out this has gone as far as it has,” said East Hills resident Cary Ratner, “because I don’t think that the public really understands what they’re getting for their money. My question is, What concern do you have to address the actual cost? Because everything you people have touched in the power industry in this state has been nothing but crap.”

A handful of audience members repeatedly yelled, “Time!” to cut Ratner off from speaking any longer than the allotted two minutes.

NYSERDA “did study, quite extensively, the cost of offshore wind,” said Matt Vestal, a technical adviser for the agency. “The cost of offshore wind has come down dramatically over the last even 12 to 18 months across the world. We saw the cost of offshore wind basically be cut in half in Europe from 2016 to 2018. This is obviously an issue that NYSERDA is taking very seriously. . . . The premiums associated with offshore wind above conventional fuel technology [are] rapidly diminishing over time, and this is great news for the industry and for New York ratepayers.”

NYSERDA accepted public comments on the draft RFP until last week, and is reviewing the input and working to finalize the document.

POLITICONEW YORK

New York offshore wind call draws record amount of interest

Politico New York
By Marie French
January 3, 2019

Five developers have told New York they will submit bids in the state's current solicitation for offshore wind projects targeting 800 megawatts of new capacity.

The level of interest is greater than in several other states seeking to take the lead on offshore wind and is expected to support Gov. Andrew Cuomo's goal of securing 2,400 megawatts of offshore wind by 2030. It also highlights the growing momentum for the industry in the U.S. as big-name players in the European offshore wind market step up their efforts here.

"We've seen this coming and we know that New York will be the center of gravity with regards to offshore wind development," said Doreen Harris, director for large-scale renewables for the New York State Energy and Research Development Authority. **"The five companies that have submitted … represent not only a significant scale — a larger scale than any other state has seen with regard to participation — but also these are very significant, major developers who are going to bring this industry to the U.S. even more quickly than some had expected."**

The five developers expressed interest by the notice of intent deadline on Dec. 20. NYSERDA will pay subsidies collected from ratepayers for electricity produced by selected projects.

The interested developers control 700,000 acres of federal lease areas and could accommodate as much as 7,000 megawatts worth of turbines, according to NYSERDA. Three of the lease areas are off the coast of Massachusetts: Bay State Wind LLC, a joint venture of Denmark power company Ørsted A/S and Northeast utility owner Eversource Energy; Vineyard Wind LLC, backed by Copenhagen Infrastructure Partners and Avangrid Renewables; and Mayflower Wind Energy LLC, a joint venture of Shell New Energies and EDPR.

Massachusetts, Connecticut and New Jersey received only three bids from interested developers in recent offshore wind solicitations. The last two interested developers are **Equinor, formerly Statoil, offering the area it won in November 2016 that's south of Long Island and east of Sandy Hook, N.J.,** and Atlantic Shores Offshore Wind LLC, a joint venture of EDF Renewables and Shell New Energies, which holds a lease off the New Jersey coast.

There is some overlap of projects among the various states. Vineyard Wind has already secured an 800 megawatt power purchase agreement through Massachusetts' procurement.

Mayflower Wind, Atlantic Shores and Equinor have all submitted bids in New Jersey's solicitation. The state has a goal of 3,500 megawatts of offshore wind by 2030 and is currently conducting an 1,100 megawatt solicitation. Bids were due on Dec. 28 and the Board of Public Utilities has said it will act by July 1.

Harris said it would be a benefit for New York if projects were expanding to serve multiple states because of the potential for economies of scale.

“These are very large areas that can support delivery to multiple markets,” Harris said. "We don't see it as a one or the other... If a developer is building a project for location A and expands it to serve New York, the unit cost for New York ratepayers will be less."

Final bids for NYSERDA's process are due by Feb. 14. Awards are expected in April with contracts finalized in June, allowing developers to take advantage of expiring federal tax credits. If NYSERDA awards 800 megawatts or more, the agency would need approval from the Public Service Commission to conduct another solicitation in 2019.

The state is splitting its offshore wind effort into two phases, with a fierce debate ongoing about which form the second phase should take to achieve the balance of Cuomo's goal. Much of the focus among stakeholders has been on how to deal with transmission in the most cost-efficient manner.

The initial request for proposals requires bidders to provide both a fixed price offshore renewable energy credit, or OREC, price and an indexed one that will fall as energy prices rise. But NYSERDA is not only accounting for price in its bid evaluation, requiring developers to offer information on what investments in jobs and the supply chain they plan to make in the state.

“What we see is all of them are taking quite seriously the fact that we’re looking for a New York project with New York benefits, which may include a New York interconnection as well,” Harris said.

Only one wind project proposed in waters off LI, filings show

Newsday
By Mark Harrington
January 12, 2019

Only one of five developers who intend to vie for a New York State contract for off-shore wind energy is proposing its project off Long Island waters. The rest would be off Massachusetts/Rhode Island or the New Jersey coast, according to recent state filings.

The New York State Energy Research and Development Authority, or NYSERDA, which is overseeing the bids and will award contracts for upward of 800 megawatts of offshore wind energy this year, said the five notices of intent to participate in the state bid represented the strongest response to any state solicitation to date. One megawatt of offshore wind powers around 360 homes. Formal bids are due Feb. 14.

The project located in the New York wind-energy area is off Long Island's South Shore in waters previously identified by the federal agency responsible for leasing water rights. Another possible developer has offered a project off the New Jersey coast. A state official said all projects would get careful review, and downplayed the notion of their distance from New York.

"I think you have to look beyond the geography," said Doreen Harris, director of large-scale renewables for NYSERDA, noting that all projects will be reviewed based on their proposed price of energy but also their benefits to the New York economy. She also noted that studies have shown a greater wind-energy resource from the Massachusetts/Rhode Island offshore area and other factors which could offset the potential higher cost to transmit power from the distant turbines.

New York wants to become a major East Coast hub for the wind-energy industry, and even the bids for projects more than 50 miles from Long Island are expected to include ways to involve the state in wind-energy employment, development, manufacturing and maintenance.

The closest proposal for the waters off Long Island is by Norwegian energy giant Equinor called Empire Wind off the coast of Long Beach. Equinor, formerly known as Statoil, in 2016 won an auction for 80,000 acres of offshore wind water rights to erect a wind farm it expects to produce up to 2,000 megawatts, enough to power 1 million homes, at a cost of some $6 billion.

The former Deepwater Wind, the Rhode Island-based company recently acquired by Danish energy company Orsted, already has a contract for 90 megawatts of wind energy it expects to deliver to Long Island Power Authority by the end of 2022, and is bidding in another project in the area in a joint venture with Eversource Energy called Bay State Wind. The company also won authorization by LIPA to increase the size of the project to 130 megawatts.

Two other potential bidders in the Massachusetts area are Vineyard Wind and Mayflower Wind Energy. Atlantic Shores Offshore Wind has proposed the project off New Jersey.

Harris explained that the major reason the projects were based in the Massachusetts/Rhode Island area was that the U.S. Bureau of Ocean Energy Management, or BOEM, had not completed a lease auction for the other areas in the waters off New York, and may not until this year's end or next year.

The current New York bid solicitation required that developers currently hold lease rights to their proposed projects.

And while it's not an ideal situation for those proposing New York projects to have operations more than 50 miles away, Harris said NYSERDA was keeping an open mind about the projects. She said the state viewed all the projects as "regional."

"I had to rethink my view of these large areas of being beholden to one particular state," she said. "They're really regional projects."

Some of the developers have filed applications to bring their energy to the state using a variety of connections, from the LIPA grid to interconnections owned by Con Edison. Some may even connect to grids using the nearby New England grid system, Harris said, and transport energy over interstate transmission lines to New York. Others could enter through the Mid-Atlantic grid known as PJM.

One other complication about using New York as a hub of operations is the limitations caused by bridges, particularly the Verrazano Bridge linking Brooklyn and Staten Island. Harris noted there were "air-draft constraints" for getting particularly tall wind-farm parts to and from Brooklyn ports because of the bridge height limitation, but noted that New York wasn't the only state dealing with such issues.

And she said companies were looking for ways to creatively deal with it, including shipping tall parts horizontally rather than vertically and considering certain ports that didn't have air-draft constraints.

In the end, she said, the cost of energy from a project will be the major deciding factor in awarding a contract. Around 70 percent will be based on the price of energy in the company's offer. Twenty percent will be factored for economic benefits for the New York economy, and 10 percent project viability, Harris said, quoting a Public Service Commission order.

INTELLECTUAL CAPITAL FOR EXECUTIVES

Equinor Moves Forward with Planning for Empire Wind

Maritime Executive
February 8, 2019

Norwegian energy company Equinor is moving forward with planning for a giant offshore wind farm in the "New York Bight," an 80,000 acre lease area just off the entrance to New York Harbor. It has deployed a high-tech buoy to measure wind speed, direction, wave conditions and other characteristics on site to determine the resource potential of the site. The floating LiDAR buoy device uses laser light detection and ranging to take wind measurements, and its solar panels, onboard wind turbines and batteries allow it to operate for extended periods without intervention.

“The deployment of this specialized buoy marks another step forward in the multi-year process of bringing a reliable source of renewable energy to the New York / New Jersey area,” said Christer af Geijerstam, President, Equinor Wind US. “Offshore wind power today is made possible by a host of innovative technologies, from larger and more efficient turbines to sophisticated LiDAR systems like this that enable us to gauge invaluable information about the characteristics of this offshore lease area.”

Equinor won the federal lease auction for 80,000 acres south of New York and east of New Jersey in 2016. The company is currently working on two potential projects at the site - Empire Wind for New York and Boardwalk Wind for New Jersey. Late last year, it also paid $135 million for a giant lease area off Massachusetts in the highest-value wind auction in U.S. history.

Equinor (formerly Statoil) derives almost all of its revenue from oil and gas, but it is moving to expand into renewables. It holds four projects in the UK and Germany, generating enough electrical power for one million homes, and it recently commissioned the world's first commercial floating offshore wind installation off Scotland. Floating wind platforms are a technological solution borrowed from offshore oil and gas, and could expand wind's potential into much deeper waters.

Equinor deploys floating lidar at its "New York Bright" offshore wind lease site

Windpower Engineering & Development

Equinor Wind US has deployed specialized buoy that's designed to gather information, an important step in the development of its offshore wind lease site in the "New York Bight." This area is expected to provide wind energy to the New York and New Jersey regions and help achieve the renewable energy goals recently set forth by Governor Andrew Cuomo.

The Floating LiDAR (Light Detection and Ranging) device will measure wind speed, wind direction, wave conditions, and several other marine characteristics that help inform critical decisions in regard to the resource potential and eventual development of the wind farm. It will be deployed to record this information for two years.

"The FLiDAR itself is an example of renewable energy innovation," Christer af Geijerstam, President, Equinor Wind US, said. "The floating system, using solar panels, wind turbines and large batteries in its hull, can operate autonomously throughout a full winter season offshore New York. Access to good quality wind recordings like those provided by the FLiDAR system is essential to the development of any wind energy project today."

Equinor Wind US won the federal lease auction of 80,000 acres south of New York and east of New Jersey in 2016. The company is currently developing projects in the lease area for the offshore-wind markets in New York and New Jersey, with the projects named Empire Wind in New York and Boardwalk Wind in New Jersey.

In December 2018, Equinor submitted a winning bid of $135 million for a lease area offshore Massachusetts in an auction held by the US Department of the Interior's Bureau of Ocean Energy Management. The new lease, located south of Massachusetts and east of New York, gives Equinor a strong strategic position in the region.

The company now holds leases within reach of some of the most important markets for offshore wind in the U.S., with the potential to provide over two million homes with clean, renewable power.

"The deployment of this specialized buoy marks another step forward in the multi-year process of bringing a reliable source of renewable energy to the New York and New Jersey area," Christer af Geijerstam, President, Equinor Wind US, said. "Offshore wind power today is made possible by a host of innovative technologies, from larger and more efficient turbines to sophisticated LiDAR systems like this that enable us to gauge invaluable information about the characteristics of this offshore lease area."

February 8, 2019

Equinor has deployed a floating lidar buoy in the New York Bight to gather data to help with the development of the company's offshore wind lease area.

The device will measure wind speed and direction, wave conditions and several other marine characteristics that will help inform decisions on the resource potential and eventual project development.

The company said the device will be deployed for two years.

Equinor Wind US won the 32,370-hectare federal lease south of New York and east of New Jersey in an auction in 2016.

The company said it plans to develop two projects called Empire Wind and Boardwalk Wind in the area.

Equinor Wind US president Christer af Geijerstam said: “The deployment of this specialised buoy marks another step forward in the multi-year process of bringing a reliable source of renewable energy to the New York/New Jersey area.

“Offshore wind power today is made possible by a host of innovative technologies, from larger and more efficient turbines to sophisticated lidar systems like this that enable us to gauge invaluable information about the characteristics of this offshore lease area.”

He added that the lidar itself is an example of renewable energy innovation.

“The floating system, using solar panels, wind turbines and large batteries in its hull, can operate autonomously throughout a full winter season offshore New York.

“Access to good quality wind recordings like those provided by the flidar system is essential to the development of any wind energy project today.

“It’s yet another example of the technological innovation that Equinor is bringing to offshore wind development in New York.”

Equinor Launches High-Tech Buoy

World Energy News
By Michelle Howard
February 8, 2019

Equinor Wind US has announced deployment of a cutting-edge, specialized buoy designed to gather information, an important step in the development of its offshore wind lease site in the “New York Bight,” which will provide wind energy to New York and the region to help achieve the renewable energy goals recently set forth by Governor Andrew Cuomo.

The Floating LiDAR (Light Detection and Ranging) device will measure wind speed, wind direction, wave conditions and several other marine characteristics that help inform critical decisions in regard to the resource potential and eventual development of the wind farm. It will be deployed to record this information for two years.

“The deployment of this specialized buoy marks another step forward in the multi-year process of bringing a reliable source of renewable energy to the New York / New Jersey area,” Christer af Geijerstam, President, Equinor Wind US, said. “Offshore wind power today is made possible by a host of innovative technologies, from larger and more efficient turbines to sophisticated LiDAR systems like this that enable us to gauge invaluable information about the characteristics of this offshore lease area.”

“The FLiDAR itself is an example of renewable energy innovation,” af Geijerstam said. “The floating system, using solar panels, wind turbines and large batteries in its hull, can operate autonomously throughout a full winter season offshore New York. Access to good quality wind recordings like those provided by the FLiDAR system is essential to the development of any wind energy project today. It’s yet another example of the technological innovation that Equinor is bringing to offshore wind development in New York.”

Strong Presence on the East Coast

Equinor Wind US won the federal lease auction of 80,000 acres south of New York and east of New Jersey in 2016. The company is currently developing projects in the lease area for the offshore-wind markets in New York and New Jersey, with the projects named Empire Wind in New York and Boardwalk Wind in New Jersey.

In December 2018, Equinor submitted a winning bid of $135 million for a lease area offshore Massachusetts in an auction held by the US Department of the Interior's Bureau of Ocean Energy Management. The new lease, located south of Massachusetts and east of New York, gives Equinor a strong strategic position in the region.

The company now holds leases within reach of some of the most important markets for offshore wind in the U.S., with the potential to provide over two million homes with clean, renewable power.

Growing Renewable Energy Portfolio Worldwide

Equinor is building a material position in renewable energy and evolving into a broad energy company. Equinor now powers more than one million European homes with renewable wind power from four projects in the United Kingdom and Germany. Equinor commissioned the world's first floating offshore wind farm last year, off the coast of Scotland, a technology essential to the development of offshore wind in many locations around the world, including the west coast of the US. Equinor is also developing offshore wind in Poland, as well as solar energy in Brazil and Argentina.

WORKBOAT

Equinor deploys data buoy for New York offshore wind energy

Work Boat
By Kirk Moore
February 8, 2019

Offshore wind energy developer Equinor has deployed a high-tech buoy to gather data to help design the Empire Wind turbine array near the approaches to New York Harbor.

The buoy carries a FLiDAR (floating light detection and ranging) system, using laser technology to measure wind direction and speed, wave conditions and other weather and oceanographic conditions over the next two years.

The buoy was launched in New York Harbor and towed to the Empire Wind site, a 79,350-acre federal lease that Norway-based Equinor (formerly Statoil) acquired in 2016. It is the latest in a series of data collection projects, from Martha's Vineyard off Massachusetts to the New Jersey coast, as developers work on designing turbine arrays.

"The deployment of this specialized buoy marks another step forward in the multi-year process of bringing a reliable source of renewable energy to the New York-New Jersey area," said Christer af Geijerstam, president of Equinor Wind US, which is developing Empire Wind and the planned Boardwalk Wind project off New Jersey.

"Offshore wind power today is made possible by a host of innovative technologies, from larger and more efficient turbines to sophisticated LiDAR systems like this that enable us to gauge invaluable information about the characteristics of this offshore lease area."

"The FLiDAR itself is an example of renewable energy innovation," said af Geijerstam said. The buoy is powered by small wind turbines and solar panels that charge its battery banks, so the system can operate autonomously throughout a full winter season offshore from New York, he said.

"Access to good quality wind recordings like those provided by the FLiDAR system is essential to the development of any wind energy project today," said af Geijerstam. "It's yet another example of the technological innovation that Equinor is bringing to offshore wind development in New York."

Equinor's latest lease acquisition was a successful bid of $135 million In December 2018 for one of three areas south of Massachusetts that were offered by the federal Bureau of Ocean Energy Management. The bid was more than three times as much that Equinor paid for its Empire Wind tract, a signal of escalating interest in the U.S. offshore wind industry, according to BOEM officials.

The company says its leases now are "within reach of some of the most important markets for offshore wind in the U.S., with the potential to provide over two million homes with clean, renewable power."
